AGEING IN RUSSIA: QUALITY OF LIFE AND SOCIAL POLICIES REGARDING SENIOR CITIZENS

Irina Khiznyakova

Abstract: For Russia it is important to develop efficient social policies regarding senior citizens because even now 21.6%[1] of Russian citizens are pensioners and this number is growing. But do they have real opportunities for self-actualization and quality life?

This paper discusses the data of the research aimed to explore social policies regarding pensioners and quality of life of Russian senior citizens. Several Russian cities[2] different in size, economical and social level have been chosen for research. In each of these cities several employees of different governmental and non-governmental organizations working with older people were interviewed[3]. About a hundred of pensioners in each city were interviewed, too[4].

Research discovers that governmental organizations provide just basic needs: basic medical services and small retirement benefits. However, pensions provided by the government (which is the only source of income for most pensioners) are reported to be too low by about 90% of respondents. Non-governmental organizations help in those cases where government is weak. But non-governmental organizations do not have enough resources to help everyone. Some of interviewed nonprofit organizations even avoid publicity and are not widely known.

Another problem is lack of communications between organizations. For example, there are several gerontology centers in Russia but they do not use best practices of each other because they do not share their experience. Of course it slows down development of gerontology.

Communications with society, leisure activities and opportunities for self-actualization are aspects of life quality. But there is lack of dialogue between pensioners and society in Russia. Most of pensioners don’t know how to use Internet or have no access to it; there are few TV-programs, newspapers and entertainments for pensioners. Pensioners are often left alone.

Government has no efficient policy regarding senior citizens. Pensioners should have information about their rights and opportunities.

[3] About 5-10 interview in each city
[4] About 100-200 feedback forms in each city

CONSUMPTION, PRACTICES AND SOCIABILITY IN THE LIFE COURSE. LEAVE THE LABOUR MARKET AS A TURNING POINT?

Hélène Eraly

INDIVIDUALS’ VIEWS ON PENSIONS AND PENSION REFORMS IN AN AGEING SOCIETY. NEW EVIDENCE FROM FOCUS GROUPS AND IN-DEPTH INTERVIEWS

Katrin Prinzen

Abstract: Whereas there is a huge public discourse on pension reforms in an ageing society, we know little about individuals’ views on this topic. I conduct an analysis of what people think about the pension system and pension reforms in an ageing society. I analyze qualitative data of 12 focus groups and 12 in-depth interviews conducted in Germany (2009-2011) that were stratified by education and age. Both characteristics matter as they are standard explanatory factors for welfare state attitudes and I thus expect to capture a wide heterogeneity of attitudes. Additionally, age is important as it determines the membership to a certain generation that gains similar experiences with regard to the pension system in certain demographic settings. The thematic analysis of verbal statements gives a good picture of how individuals perceive the pension system and its current reforms in the context of an ageing society.

In contrast to the meagre findings from quantitative survey research, the qualitative study yields a multitude of highly relevant opinions that occupy individuals. The data analysis yields for example the following: (1) Individuals regard their contributions to the German public pay-as-you-go pension system as personal savings. As a result, they uttered expectations of pension entitlement and judged pension cutbacks as hurting the norm of equity. This could cause problems in case of pension retrenchment in a society with a shrinking size of the contributors’ group size. (2) Young individuals, though being well informed about the importance of a private pension insurance for their generation, perseveringly ignored to conclude such an insurance themselves due to their general perceived insecurity resulting from welfare state reforms, rising public debt and societal changes. (3) Individuals perceived a new conflict between future pensioners, namely between those who could afford private pensions insurance and those who could not afford such a private provision life phase of work. (4) Young and middle-aged individuals that could not afford a private pension insurance uttered feelings of disappointment and frustration. In their view, the state abdicates from its responsibility for the poor in society. The
CIVIC ENGAGEMENT OF OLDER PEOPLE IN RUSSIA
Timur Zulkarnaev

Abstract: The number of older people is growing very fast. The number of Russians aged 60-64 increased in 2040 by 60% and over 80 years - more than 120%[1]. Today we can see, that the role and participation of older people in various organizations and social movements through which they can convey to the public their positions are increasing. But this situation is typical only for West countries, but not for Russia. The image of ageing in Russia is negative. It is believed that when a person reaches old age (or having retired) he lives out his years, not realizing that life can start in this period. So older people are below the public life. That is why the problem of civic engagement of older people requires extensive research.

There are two main purposes:

1. To study how the civic engagement is developed in Russia and abroad.
2. To see what can be useful in foreign experience, and how it can be applied in Russia.

According to these objectives there are three aims of the research:

a) How is the inclusion of senior citizens realized in the discussion of political, social programs?

b) How are the older people involved in self-government at the local level?

Older people in Russia connect most of their problems not with the material well-being (45%), but with the psychological moments (55%)[2]. About 40% of interviewed older Russian people have a proactive stance and participate in several organizations.[3] Not only NGO’s but also state authorities declare that the Western (mostly Scandinavian) system of working with the elderly is the best.

1. Civic participation of the elderly in Russia is at a low level.
2. There is a potential for the development of the civic participation, which is incorporated in the pensioners themselves, because they become more active.
3. Some useful experience is accumulated in Western countries, which can be successfully adapted in Russia (volunteering, older people as consultants and other)

[1] The project «Creating the conditions of realizing the social potential of senior citizens at the municipal level» HSE.

[3] Based on the depth interviews with the older people in several Russian countries.

INTERGENERATIONAL RELATIONSHIPS OF ELDERLY RUSSIAN-SPEAKING MIGRANTS – AN ISRAELI–GERMAN COMPARISON
Sharon Shiovitz-Ezra 1, Claudia Vogel 2

1 The Hebrew University of Jerusalem, Jerusalem, Israel, 2 University of Vechta, Vechta, Germany

Abstract: In modern ageing societies, families face new challenges regarding care for the growing elderly population and exchange of support between generations. Although migrant families in ageing societies generally face the same challenges regarding the provision for old age, very little is known about their ageing and familial exchange processes in the countries of destination.

We study the familial exchange of resources and the development of intergenerational relationships in migrant families. Specifically we investigate the structure and the development of the social networks that are available to them in case of need and the exchange of help within their families.

We focus on one country of origin and two destinations, because Russian-speaking migrants are one of the largest immigrant populations in both German and Israeli societies. In Germany not much is known about the life of these migrant families, their family structures, employment history, housing and health situation – and least is known about the ageing and the elderly among them. In Israel, on the contrary, migration has been in the focus of gerontological research already at the edge of the 21st century.
With the Israeli data from 2010 of the Survey of Health, Ageing and Retirement in Europe (SHARE) – a representative analysis of the intergenerational relations within families of Russian-speaking migrants is possible. A different research strategy however is necessary for the analysis of intergenerational exchange among elderly migrants in Germany. Consequently we will conduct a supplementary survey among Russian migrant families in selected counties of Lower Saxony based on about 500 telephone interviews.

We expect to find some similarities among Russian migrants in both countries of destination with some differences that are mainly due to cultural norms and welfare arrangements.

OLDER IMMIGRANTS AND SOCIAL INEQUALITIES:
STATE OF THE ART, ARISING QUESTIONS AND METHODOLOGICAL CHALLENGES

Claudio Bolzman 1, Étienne Christe 1, Laure Kaeser 1, Ülku Dagli 1
1GRADUATE SCHOOL OF SOCIAL WORK, UNIVERSITY OF APPLIED SCIENCES WESTERN SWITZERLAND, Geneva, Switzerland

Abstract: Various papers published in Switzerland and elsewhere in Europe have highlighted an improvement in the living conditions of new cohorts reaching retirement age. However, these findings concerning an improvement in the living conditions of older people were not, for reasons of cost and language difficulties, based on samples that were sufficiently large or representative of the population of former immigrant workers who reach retirement age and have to face up to the problems of ageing. These people, who mostly came from countries of southern and eastern Europe as well as countries of the developing world, nevertheless make up a significant fraction of the working class in the countries of central and northern Europe, having been recruited for the most part between the 1950s and the early 1970s to do low-skilled jobs. The result is that studies on ageing in European societies largely fail to reflect the situation of a significant part of the older working-class population.

On the other hand, there are already some specific studies on the relationship between age and migration. These local studies show that older migrants have specific life trajectories, conditions and level of well being compared to the general population. This suggests that they may have special needs and will have to require particular resources to face old age. This paper will underline the main results that arise from an overview of the international scientific literature and will present a methodological strategy elaborated to compare the situation of older immigrants and Swiss born within the framework of a Sinergia project financed by the Swiss National Scientific Foundation.

RELIGION AND WELL-BEING OF FINNISH OLDER ADULTS IN COSTA DEL SOL, SPAIN

Jenni Anna-Liisa Spännäri 1, Antti Karisto 1
1UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: The debate on “aging well” has in the recent years extended it’s scope towards values, morality and spirituality – elements traditionally sustained by and interlocked with religion. This paper takes a multi-dimensional approach both to ageing well and religion in the lives of older adults.

The study is based on qualitative data (texts and interviews) and quantitative data (a questionnaire survey) of Finnish older adults residing in, during the winter season or otherwise, or frequently visiting the Spanish Costa del Sol. The Finnish pensioners in Spain form an interesting winterbird community, with a great geographical distance but mental proximity to the country of provenance, and with religious organizations at the hub of social life. A specific feature is also the abundance of engagement with religious activities among persons considering themselves none too religious.

The data demonstrates that spirituality, religious activities and religious communities play various roles in the social and personal lives of older adults, and that religion in its multiple forms can support well-being in older age via various dimensions of good ageing. This paper aims to point out the factors contributing to this phenomenon, to identify the processes where these factors promote good ageing and to suggest ways to support these processes in other communities. Also the future of religion as an element of well-being for the older adults is discussed.

THE SIGNIFICANCE OF ETHNICITY IN PENSIONS: A QUANTITATIVE OVERVIEW

Orla Gough 1, Anita Sharma 1, Roberta Adami 1, Andrea Carosi 2
1WESTMINSTER BUSINESS SCHOOL, London, United Kingdom, 2University of Bologna, Bologna, Italy

Abstract: The research provides an overview of the variation in employment patterns, pension participation and poverty levels at retirement between the white majority and ethnic minorities in the UK and highlights differences between the various ethnic minority groups. Using data from the Family Resources Survey (FRS) from 1991 to 2007 we show the differences that still exist in terms of employment status, income, pension contributions and pension benefits between ethnic minorities and the white majority. We use socio-economic and demographic variables such as age, gender, income, education and family background as indicators of an individual’s future retirement income. Our analysis spans across different age groups including those in the early stages of their working life as well as those aged 65+ who are already in retirement. We show how disadvantage in the labour market affects retirement prospects of ethnic minorities and often leads to poverty in old age. By comparing the first generation of immigrants to Britain with the younger second generation in terms of employment, income and pension contributions, we provide an insight into the current and future attitudes to retirement planning among ethnic minority groups.

TRANSBORDER IDEALS OF CARE: ELDERLY TURKISH-BORN MIGRANTS IN SWEDEN

Öncel Naldemirci 1
1Department of Sociology, UNIVERSITY OF GOTHENBURG, Göteborg, Sweden

Abstract: The number of elderly migrants in Europe is increasing. Many early-in-life immigrants prefer staying in the host country due to the social and economic rights that they gained and for family and kinship networks, some shuttle between the host and origin country. Care facilities and networks in both countries are significant in this mobility. On the other hand, care for old migrants in their frail age is considered to embody the paradox of multicultural
policies and the tension between universal right to receive care and culturally informed ideals, norms and practices. In the example of elderly care, certain cultural patterns are demanded as an important component of care giving and receiving. Nevertheless, there are also significant divergences from cultural norms, depending on different biographies and contexts in which care encounters happen. In this paper I argue that transborder citizens live also across the borders of countries in terms of their imagination, aspiration and deployment of care relations and resources. They concoct their imagination about care through different identifications and encountering different ideals and practices. Following an ongoing ethnographic research with Turkish-born elderly in Sweden, this paper aims to describe and discuss particular stories of frail old age which are anchored in the context of migration and to add another significant layer into the complexity of care.

AGING AND THE OLD AGE IN THE CONTEXT OF CHANGING CITIES
Dana Sykorova

Abstract: The paper aims at opening debate about the specific aspects of aging and old age, especially focusing on the examination of the relationship between old age, resp. seniors and the urban environment. It covers the issues that are currently not at the center of attention of the (Czech) gerontosociology research.

The author tries to dispute the generally persisting tendency to characterize the cities as areas that are unsuitable and hazardous for the ‘aging in place’ as well as the tendency to interpret the consequences of the urban development processes in terms of social exclusion. Therefore she brings the question whether the actual lived experience of aging and old age in the city corresponds with the generally accepted notion.

The research has been carried out as a part of the project ‘Ageing in the Environment: Regeneration, Gentrification and Social Exclusion as New Issues in Environmental Gerontology’ supported by the Grant Agency of the Czech Republic (No. P404/10/1555). The relevant data have been collected by the methods of focused groups and semi-structured interviews.

The presented results of the qualitative data analysis are indicating that the picture of everyday life of the elderly inhabitants in urban areas as well as their strategies of coping with the possible negative impacts of the urban changes on their quality of life seem to be rather plastic and multidimensional.

AGEING SINGLE MEN IN RURAL AREAS
Magnus Nilsson

Abstract: The rural context has consequences for the ways that gender structures the lives of people throughout the life course, both materially and socially. Norms of masculinity remains strong in rural areas and there is less room for deviations than in urban areas. This is not least connected to the scarcity of meeting places, and above all to that of alternative spaces. Men in rural areas who have remained unmarried throughout their lives and live without a partner tend to live in the areas where they were born. The identity and ways of living of unmarried men is often tied to the places where they live, but it is also connected to notions of heterosexuality and couplehood. In this paper I will explore the ways that unmarried and childless older men talk about relationships and childlessness in relation to norms of masculinity and heterosexuality, notions of ageing, growing old and approaching death.

NATIVE MINORITY LANGUAGE AS RESOURCE OF EVERYDAY LIFE IN OLD AGE IN TORNE VALLEY, NORTH SWEDEN
Tarja Tellervo Tapio

Abstract: Only the members of the oldest generations are still speaking the native Meänkieli, a recognised minority language spoken in villages in Torne Valley, North Sweden. Using their native language separates them from wider Swedish-speaking society and members of the younger generations that speak only Swedish. Additionally Meänkieli is a spoken language and people cannot write or read in it, even though they speak it on a daily basis. Despite this, it is a crucial resource for the everyday life of the oldest Meänkieli-speaking generations. The importance of using the native language is not only a question of communication and speaking: it also reinforces agency and provides continuity. In my paper I will focus on the way native language in Torne Valley emerges as a resource for the oldest generation belonging to an ethnic and national minority, tornionlaaksolaiset. The research took place in a small, rural village of less than 140 residents in Torne Valley, near the Arctic Circle. A group of seven native speakers, aged between 65 and 75, participated in the research process. Storytelling was used as a research method and the stories were recorded in the village in 2005. Telling stories in Meänkieli is a way of articulating ethnic identity and knowledge based on the traditional way of life in Torne Valley. I will illustrate the way native language forms a resource for the daily life of the oldest local generation. I will also explain the research process in which native-language storytelling was used as a research method. The paper is based on my doctoral thesis, published recently at the University of Jyväskylä, Finland.

RETIREMENT – NOT NECESSARILY A FAREWELL TO YOUR WORKPLACE
Anne Inga Hilsen, Robert Salomon

Abstract: Due to financial and demographic reasons, many countries are trying to increase the actual retirement age. Pension reforms are taking place in countries as France, Greece and the UK. Norway has recently introduced a new pension reform from January 1st 2011 to encourage longer work life careers. The reform is flexible in the sense that people can retire at the age of 62 with a modest pension. Their pension rights will then improve for every year they work beyond 62 years to 75 years.

These reforms may lead to a variety of options on life/work balance choices at the later stages of working life. Based on earlier studies by Walker and Taylor and our own studies we have identified three overlapping phases of good managerial practices and worker responses affecting the employment of older workers. We developed an analytical model (“a three phase perspective on senior policies”)
of organisational orientations towards older workers. This paper will focus on a possible fourth phase at the end of the working career as well as the transition from work to retirement. The fourth phase consists of both an economic and a social link between employer and employee.

Our contribution will be based on empirical data from a Norwegian case study of nine separate workplaces. The nine cases include the state sector, municipalities and private companies. The researchers interviewed managers, employees, and pensioners from the case enterprises as well as the unions in each of the cases, using both individual qualitative interviews and focus groups.

The paper will present a comparative study of the economic link, demonstrating how pensioners and management enter into certain flexible and (often) short term paid assignments in the cases. Furthermore, the paper will examine some cases of social links between pensioners and their previous workplaces, and how they function and are assessed by the pensioners and management. We will also discuss how established links may be threatened by mergers and restructuring processes. Finally, we will analyze how the economic and social links are functioning together, especially illustrated by observations on flexible symbiosis between a hotel, local workers and the whole community.

The paper will contribute to further development of action theories concerning policies for older workers.

**WISDOM AND SOCIAL UNCERTAINTY: LEARNING FROM OLDER PEOPLE**

Ricca Edmondson

1School of Political Science and Sociology, NATIONAL UNIVERSITY OF IRELAND GALWAY, Galway, Ireland

Abstract: From the earliest discussions of wisdom onwards, this trait (or set of practices or abilities) has been associated with the capacity to tolerate the uncertainty and contingency of human circumstances, both personal and public or political. The paper begins by interrogating some standard debates on wisdom as well as examples of ‘wise’ older people in historical and contemporary literature, in an attempt to become clearer about what this capacity is thought to entail. It uses these debates and examples to contrast the structure of wise arguing, which characteristically begins from premises which acknowledge uncertainty in a number of ways, with personal and public interactions which attempt to respond to conditions of uncertainty. There are, it suggests, a range of ways in which ‘wisdom’ classically promises to offer resources here. It explores some interrelations between them and shows how they are reflected in contemporary ethnographic evidence.

The paper distinguishes between conditions of uncertainty which characteristically hold sway in different ways in different life stages, and conditions of uncertainty which are perceived as holding sway across entire societies and generations (though the equality of their distribution is disputed). Can we acquire evidence, from documentary sources or from ethnographic interviews, that casts light on how the development of wisdom or wise practices supports individuals, families or other groups in dealing with the potentially undermining effects of different sources of social uncertainty?

Lastly, older age itself, in most contemporary versions of its social construction, poses specific challenges to the imaginative negotiation of human lifetime. The paper therefore tries to become clearer about whether responses to uncertainty associated with ‘wisdom’ offer support in predicaments related to these challenges in particular.

**A TASTE OF WHAT’S TO COME: CHANGES IN INDIVIDUAL EXPECTATIONS ON AGEING AND LATER LIFE IN TIMES OF WELFARE STATE REFORMS AND ECONOMIC CRISSES**

Andreas Motel-Klingebiel, Julia Simonson

1GERMAN CENTRE OF GERONTOLOGY, Berlin, Germany

Abstract: Resources, needs and evaluations are dimensions of quality of life and pre-conditions for autonomy and life planning. Projections of older people’s future living standards in Europe predict declining levels and increasing inequality due to pension reforms and changing employment patterns. Effects of ongoing economic crises need also to be considered as well as changing needs, expenditures and values of older people.

Recent data from the German Ageing Survey (DEAS) demonstrate stable socio-economic resources and increasing inequalities among retirees. The most important trend over time is a remarkable increase in concerns about future living standards which is very significant from a social policy as well as from a gerontological perspective. Based on this data, the presentation calls for its sources and conclusions to be drawn. It presents descriptive information and results from multi-level modelling. It heightens awareness of changes in later life due to reforms and crises and will contribute to a wider understanding of multi-level interactions between individual resources, evaluations and societal development.

The DEAS is an enduring representative cross-sectional and longitudinal survey of those aged over 40 (n=8,200 in 2008) in Germany, funded by the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth (BMFSFJ).

Three hypotheses – a) hypothesis of social structure effects, b) hypothesis of cohort change of later life, c) hypothesis of differentiation of inequality patterns – are tested and mostly supported by the study. Analyses show that increasing concerns influence the individuals’ demands for welfare state intervention. Concerns interact with income and portfolio structures but are partly independent of education and gender. Moreover, differences between regions mirror context effects.

**EXTENDING THE EMPIRICAL BASIS FOR WEALTH INEQUALITY RESEARCH USING STATISTICAL MATCHING OF ADMINISTRATIVE AND SURVEY DATA**

Anika Rasner, Joachim R. Frick, Markus M. Grabka

1Socio-Economic Panel, DIW Berlin, Berlin, Germany

Abstract: Social security entitlements are a substantial source of wealth that grows in importance over the individual’s lifecycle. Despite its quantitative relevance, social security wealth has been thus far omitted from wealth inequality analyses. In Germany, it is the lack of adequate micro data that accounts for this shortcoming. Using population representative survey data from the German Socio-Economic Panel and administrative pension records from the Statutory Pension Insurance, the authors compare four statistical matching and imputation techniques to complement survey information on net worth with social security wealth (SSW) information.
from the administrative records. The unique properties of the linked data allow for a straight control of the quality of matches under each technique. Based on three evaluation criteria, Mahalanobis distance matching performs best. Exploiting the advantages of the newly assembled data, the authors include SSW in a wealth inequality analysis. The analysis shows to what extent the inclusion of social security wealth affects the level and the distribution of individual net worth as well as overall inequality. The present value of pension entitlements (including entitlements from the statutory pension system as well as from the separate system for civil servants) amounts to 5.6 trillion Euros, which corresponds to an average of 78,500 Euros per person – thus almost doubling the level of net worth. Compared to results based on net worth only, inequality of our amended wealth measure is about 25 percent less. Moreover, we present significant differences in pension entitlements across occupational groups with civil servants gaining most from the inclusion of public pension wealth in the extended wealth measure and self-employed benefiting the least. Overall, our results provide clear indication for the relevance of including the notional wealth held in pension entitlements providing a less biased picture of the level and the socio-economic structure of wealth in Germany. Above and beyond such within-country variation, our findings may also be most relevant for comparative analyses across welfare-regimes.

**INFLUENCING POLICY DEVELOPMENT FOR OLDER PEOPLE IN IRELAND: IMPACT OF THE RECESSION**

Aine Ni Leime 1*

1Irish Centre for Social Gerontology, NATIONAL UNIVERSITY OF IRELAND, GALWAY, Galway, Ireland

Abstract: This paper considers the strategies used by civil society organisations (CSO’s) representing older people who are engaged in social partnership in Ireland in achieving their goal of developing policy to enhance the lives of older people. It explores the impact that the recession has had on their level and manner of engagement with social partnership and with the wider political system. Ireland has introduced the concept of the Developmental Welfare State and the Life Cycle approach to social policy development and service provision. This approach places the individual at the heart of policy provision and development and acknowledges that people may encounter particular vulnerabilities based on their stage of the life cycle. Certain civil society organisations have been given an opportunity to influence policy development and service delivery in Ireland as part of the Community and Voluntary Pillar (CVP) in social partnership. The CVP is one of five pillars (employers, trade unions, farmers and the environmental groupings) that are directly consulted regarding policy development in Ireland. This paper considers the specific institutional environment in which civil society organisations representing older people operate and the level of resources they have to draw upon; it draws some comparisons between the operation of civil society organisations in the older people’s stage and those in other life cycle stages (Children, People with Disabilities and People of Working Age).

The paper is based on a study that consulted all seventeen organisations involved in the Community and Voluntary Pillar using a Participatory Action Research (PAR) methodology. The advantages and challenges of using this methodology will be discussed.

The paper concludes that CSO’s representing older people in Ireland are potentially significant agents for policy transformation and for the protection of existing rights for older people. However as might be predicted by a political economy approach to ageing, a global crisis such as the current recession can have severe impacts on their efficacy and highlights the need for strategic adaptability on their part.

**NORDIC SOCIAL SERVICE STATES IN ELDER CARE**

Minna Zechner 1, Lina Van Aerschot 2

1School of Health Care and Social Work, SEINÄJOKI UNIVERSITY OF APPLIED SCIENCES, Seinäjoki, 2School of Social Sciences and Humanities, University of Tampere, Tamperé, Finland

Abstract: Nordic welfare states have been referred to as social service states, meaning that a great part of the public support is offered to citizens as services instead of insurance-based social security systems (Anttonen 1990). This paper looks firstly at the idea of a social service state and, secondly, examines with the help of international and national statistics whether the Nordic countries of Denmark, Finland, Norway and Sweden can be defined as social service states in elder care.

Our starting point is that the core values of the Nordic welfare model are universalism, solidarity and decommodification (Esping-Andersen 1990) and on the operational level social services are the key element of the Nordic welfare states (Abrahamson 1997; Sipilä 1997; Cox 2004). Thus we are examining the social services and especially care of older people as ageing of the population has been named as one of the main challenges to the Nordic welfare states (Greve 2007; Normann et al. 2009). The central features of a social service state in the context of elder care are: social rights attached to services, all social classes use public services, services are offered rather than cash benefits, low service fees, little private spending on services, majority of elder care is formal instead of informal and service sector is an important employer for women. Most of these features will be analyzed in our conference paper by using statistical data mainly from the European Union (EU), Nordic Council (NC) and the Organisation for Economic Co-operation and Development (OECD).

**REVISITING THE ROLE OF INFORMAL CARERS IN FAMILIALISM: A DISCUSSION ON RECENT REFORMS IN LONG-TERM CARE IN PORTUGAL**

Alexandra Lopes 1

1Sociology, UNIVERSITY OF PORTO, Porto, Portugal

Abstract: The recognition of the importance of informal care but, at the same time, of the present and future challenges that it faces, has led many countries across Europe to put in place policies to support informal carers. Recent developments in long-term care reforms have been reflecting precisely the recognition of informal carers as crucial agents in the global picture of care provision to older people. This has been taking place under different forms: by providing cash benefits to carers, by recognizing them as carers or by providing specific services to assist them in their caring tasks. It is a trend that has been taking place in different countries, with different traditions in welfare provision mechanisms. In Portugal, however, that has not been the dominant element in recent reforms in the long-term care system.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
The paper will discuss recent developments in long-term care reforms in Portugal and show how those remain strongly entrenched in the core principles of familialism, with a particular emphasis on the relative position informal carers are given in the system. Two main domains of policy reforms will be discussed: the implementation of cash benefits to improve the living conditions of the elderly; the implementation of a national long-term care network. It will be shown that policy instruments remain biased towards the elderly themselves and do not acknowledge informal carers as an object of social policy. This characteristic remains truly faithful to the principles of familialism and more specifically to the taken for granted willingness of families, and women in particular to perform the role the system assumes they should perform. The paper will continue showing that the conditions for that role to be effectively performed are changing quite rapidly which suggests that the pressures on the formal care system will increase.

STRETCHED, SQUEEZED AND OVERWHELMED: USING PHOTOVOICE TO EXPLORE THE EXPERIENCES OF FEMALE MULTI-GENERATIONAL CAREGIVERS

Caroline Julie Moore¹
¹Health and Social Care, THE OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: Demographic trends in the United Kingdom include an increasing ageing population, changes in family structures, an increase in women in paid employment and an increase in the number of young adults who live with their parents (O.N.S., 2008). These changes mean that more women are simultaneously occupying multiple demanding roles. These may include the roles of wife, partner, mother, grandmother, employee and carer. The challenging demands of these roles may not only affect women's lifestyle, personal time, career development and financial stability, but may also impact on their health.

Literature concerning the experiences of female multi-generational carers and of how they cope with their situation appears to be sparse.

Twenty multi-generational caregivers were recruited for interview and were asked to take photographs of images which they felt represented their everyday care-giving. During a second interview, photographs which they had selected were used as discussion prompts (photovoice) to enable them to reflect and discuss their experiences. By using the photovoice method these multi-generational caregivers identified situations, places and objects which they felt were significant to them and enriched the quality of their everyday care-giving experiences.

A grounded methodology was used and Maintaining Caregiver Equilibrium emerged as the core category. Related concepts that underpinned the participants’ ability to cope with their care-giving situation were Intergenerational Ambivalence, Multi-generational Caregiver Satisfaction and Health Effects. Work and Faith were found to be key coping strategies used by these caregivers.

This research may inform policy makers about how to support female multi-generational caregivers in the future, providing effective relief to projected care burdens in these situations.

SUPPORTING FRAIL ELDERLY AND THEIR FAMILIES: BEST PRACTICES IN ITALY

Stefania Giada Meda ¹, Donatella Bramanti¹
¹Department of Sociology, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: The study analyses best practices for frail elderly and their families, able to provide qualified answers to the complex needs of the last stage of life.

The recent explosion in population ageing is one of the most remarkable demographic changes with implications for governments, economic and welfare systems, and individuals. Concern over consequences of ageing on family relations is gaining consent, highlighting macro morphogenetic trends such as generational inequalities and vertical deprivation; the onset of multigenerational families and a sandwich generation.

To prevent psycho-social risks, families of and with elder frail people must be helped to face stressful events of the family life cycle.

Hence, it becomes crucial designing and implementing policies and interventions aiming at caring for elderly in a family friendly perspective.

The concept of best practice identifies services of excellence as for efficiency and efficacy and indicate, according to a relational perspective, programs promoting the we-relation at family level, which is the family’s capability to keep on generate relational goods. Indeed, each stressful event, as the impairment of one family member, defies family life and compels the subjects to act some reflexivity on their modus vivendi.

Best practices are thus measures where elders and families participate in the process of coping with ageing-related issues, in a perspective supportive of the kinship networks’ coping skills.

The paper illustrates findings of a comparative analysis of best practices to support families with elderly in three different Italian Regions: Liguria (North-West), Lombardia (North), Sicilia (South).

Researchers have selected 8 best practices and carried out in-depth case studies.

The study highlighted some major findings:

• Focus is on the elder, his/her family and/or other caregivers;
• Localisation in the community, perceived as a place rich in resources to use in a perspective likely to trigger community development;
• Presence of social partnerships between State and Third Sector organisations;
• Direct involvement of families as beneficiaries, and suppliers of help;
• Sustainability, both at cost level and human resources;
• High satisfaction expressed by all the involved stakeholders.

The research gives indications to professionals working alongside families and policy makers.

THE IMPORTANCE OF A STRONG SOCIAL NETWORK AND OF SATISFACTION WITH CARE FOR THE EMOTIONAL WELL-BEING OF OLDER PERSONS LIVING AT HOME

Jonathan Bennett ¹, Matthias Riedel ¹, Robert Fluder ¹
¹Social Work, BERN UNIVERSITY OF APPLIED SCIENCES, Bern, Switzerland
Abstract: From September 2009 to January 2010, 712 persons aged 64-98 years (M=81.9; SD=6.2), living in the Swiss cantons of Aargau, Bern and Zurich were interviewed face-to-face at home with a standardized questionnaire. The sample was randomly drawn from the customers of a Swiss health insurance company. Among the topics covered in the interview were the following:

- perceived need and use of formal and informal home care,
- perceived lack of care,
- the strength of respondents’ social network (number of relatives, friends and neighbors with whom they related regularly, whom they could ask for help and easily discuss private matters; Lubben et al., 2006)
- general as well as psychological well-being.

Logistic regression analysis revealed that the strength of the social network (OR=1.44; p<.01) and non-satisfaction with received care (OR=0.5; p<.01) were the most important predictors of general life satisfaction. On the other hand, the degree of dependence in activities of daily living, the amount of received formal and informal care and the number of illnesses treated by a medical doctor in the past 12 months did not prove to have any significant predictive value.

Results were largely similar concerning psychological well-being (Bullinger & Kirchberger, 1998). However, other than in the case of general life-satisfaction, the number of illnesses being treated by a medical doctor during the last 12 months did have a significant predictive value for psychological well-being.

Our findings demonstrate that emotional well-being in persons living at home is possible even amid strong dependence on care. An important prerequisite is the existence of a strong social network allowing for the seeking of help and the discussion of private matters. In addition, in order to sustain emotional well-being, persons must be satisfied with the care they receive. Our data also show that satisfaction with care is related to the quality of relationships to important informal caregivers. This is in line with other research stressing the importance for emotional well-being of the quality of relationships to informal caregivers (Katz, 2009; Merz & Huxhold, 2010).

INFORMAL ELDER CARE IN THE MODERNISATION PROCESS: IMPACT OF SOCIAL MILIEUS IN RUSSIA’S AND GERMANY’S WELFARE REGIMES

Irina Siegel

1Institute of Sociology, UNIVERSITY OF FREIBURG, Freiburg, Germany

Abstract: This paper builds on the theoretical framework of the bilateral pilot project studying social distributions of different solidarity types in Russia and Germany and addresses how informal elderly care is anchored in the social structure and affected by welfare regime.

In micro-sociological perspective we believe that sociostructural and cultural resources impact decisions of intergenerational solidarity. It is assumed that structure of actions and situations of informal care are of little compatibility with preferences typical for “modern concepts of life” (Blinkert, Klie 2004). The latter are measured as attitudes to women’s role. At the macro-level the welfare state’s distributive justice and elderly care policy shape intergenerational solidarity, whereas at the meso-level availability and usage of local care infrastructure are crucial.

Demographic change paradigm tackles though future availability and ability of informal carers (Uhlenberg, Cheuk 2008; Johnson 2008) but not their motivations. The way informal care changes under the sociocultural change affecting motivations and preferences is in the focus of Freiburger’s approach. Informal care is found mainly in the milieus that have become less important (“milieu of tradition-conscious unprivileged class”) and is particularly seldom observed in the milieus gaining on meaning in the modernisation process (“milieu of liberal middle class”) (Blinkert, Klie 2004).

Socioeconomic status was found to be decisive for filial help in conservative-corporatist and familial but not in social-democratic welfare regimes (Sarasa, Billingsley 2008). Neither differentiated social stratification concepts or theoretical explanations were applied to studying familial caregiving nor was Russian’s welfare regime of the former-USSR type (Fenger 2007) in the focus of previous cross-cultural research (Sundström, et al. 2008).

We utilise data of two samples with 200-240 F2F interviews being currently collected in the Russian city of Samara and the German city of Freiburg. Though both samples are not representative of the whole Germany or Russia they allow us to make descriptive between-group comparisons in each country and, in a restricted sense, between countries and thus to reveal important trends. The study relies on the well-proven questionnaire used in German studies adopted for Russian sociocultural conditions and for comparative needs by harmonising socioeconomic variables.

WHAT IS THE BEST CARE FOR DEPENDENT ADULTS? NOT COVERED NEEDS BY TYPE OF CARE IN SPAIN

Jesús Rogero-García 1, Karim Ahmed-Mohamed 2

1Department of Sociology, AUTONOMOUS UNIVERSITY OF MADRID, 2Spanish Sociological Research Center, Madrid, Spain

Abstract: In this study for Spain, not covered needs of dependent adults are analyzed. Four types of dependent adult care can be established according to caregiver identity: unpaid care, private care (fully funded by the dependent person or/and the family), public care and care from non-profit organizations. Both in academic and policy making spheres there is a burning debate about the most appropriate measures to promote dependent people autonomy and the satisfaction of their needs. In spite of its importance, there are few studies examining to what extent each type of care covers the needs of dependent people. The aims of this work are: (1) To identify what type of care achieves the highest coverage of adult dependent needs, and (2) to identify factors influencing higher coverage of needs within each type of care. This study is based on a sample of 4.782 dependent adults (>17 years old) whom reported receiving care in the Survey on Disability, Personal Autonomy and Dependency Situations 2008 (National Statistical Institute). Statistical analysis included characteristics of the dependent persons and households. Logistic regression models were used to identify factors related to the non-coverage of needs. Adults receiving only private care had a higher probability of having their needs covered, in comparison to those receiving any other type of care. People in public care had the lowest probability of having their needs covered, even when it was combined with family care. Coverage probability was higher among dependent adults living with their caregiver, as well as when the family caregiver did not have a paid job. These data highlight significant differences in terms of
coverage of dependents adult needs, and provide relevant findings for policy making.

CARING FOR CARERS OF THE ELDERLY IN SPAIN: CURRENT FRAME AND EVALUATION OF PROGRAMMES
Alberto Veira-Ramos 1, Maria Silveria Agulló-Tomás 1, Maria Teresa Martín-Palomos 1, Rosana Saiz-Villar 1, Esteban Augllo 2, Jesús Javier Sanchez-Barricarte 1
1Sociology, Universidad Carlos III de Madrid, Getafe, 2Psicology, Univeridad de Oviedo, Oviedo, Spain

Abstract: Over the oncoming decades European societies will be facing various challenges derived from demographic ageing. One of the most important will be the growth of the number of dependent people, and with it, the increase of the number of persons who devote part of their time to look after them in a non-professional fashion. The first part of this presentation addresses the profile of Spanish informal carers contrasting it with the profiles of carers from other European countries, describing some of their problems around this experience. This was done by using information from the 8 waves of the European Community Household Panel data. The second part describes the main features of the programmes offered in Spain by public institutions and from NGO’s to try to solve some of these problems that informal caregivers face. They are training programmes, psychosocial support, therapies and so on. The pathway should be a move towards the quality of care for dependent elderly and their caregivers, both support professionals and the families. Different objectives of this evaluation research are achieved from a combined approach: quantitative techniques (data mining and electronic survey) and qualitative (in-depth interviews and focus groups to carers). All this forms the basis of current research entitled “Caregivers of older people: situation before the Dependency Act and evaluation of programmes for carers” (2009-2012), funded by the Ministry of Science and Innovation (CSO2009-10290, under the Sixth National Research Plan R+D+i).

ACTIVE AGEING AND INTERGENERATION
Maria Ester Vaz 1
1Industrial Studies and Management Higher School, OPORTO POLYTECHNICAL INSTITUTE, Vila do Conde, Portugal

Abstract: This work reflects about the current notion of active aging and the perspective of older people himself. This topic has been discussed worldwide, namely by the World Health Organization and the United Nations. In the late XX century there was a commitment to defining political strategies and the implementation of social intervention measures. This concern sought to convey a new image of old age, considering it as a social category and culturally constructed. The deepening of the theme in this study followed a qualitative methodological approach with interviews, highlighting the images and representations that older people have regarding old age. The data presented were collected to 24 persons with the age fifty-five years old or more.

The respondents experience indicated that there was a different ways in the process of aging. The evidence is the extreme importance of convivial ways in old age especially with younger people. The study shows that the intergenerationality is seen as an important issue for old people in the sense that the relations are promoters of active aging who provide a mutual aid and a mutual learning.

DYADIC RELATIONSHIP BETWEEN THIRD AND FOURTH AGE AND THE DISCIPLINARY PRACTICES SURROUNDING AGEING BODIES
Jaroslava Hasmanova Marhankova 1
1Department of Sociology, UNIVERSITY OF WEST BOHEMIA, Plzen, Czech Republic

Abstract: In the 1990s the World Health Organization adopted the term active ageing, which currently represents a key vision of old age in the western societies that face the situation of demographic ageing. The imperative of activity penetrates gerontological knowledge, social policy and social work and is a crucial component of the disciplinary discourse surrounding elderly people. The paper is based on three-years ethnographic study (participant observation, 47 in-depth interviews with clients and employees) of two centres in the Czech Republic that offer leisure time activities for seniors. This segment of seniors-oriented social services represents an institutional context for the manifestation of the discourse of active ageing and strongly refers to the idea of third age. The paper highlights the role of third-fourth age distinction for the construction of social position in the centres. The clients and employees of the centres use the participation in the activities as an important mechanism of group identity construction. This identity is at the same time constructed in strict opposition to “other” seniors who are not active. The active lifestyle embodied in the idea of active ageing offers a positive representation of ageing that has become a significant resource of self-esteem for the clients of the centres. In that respect, the idea of active ageing represents a welcomed change in the ways old age was traditionally constructed. On the other hand, the closed connection between activity and old age epitomized in the discourse of active ageing represented by the centres pose a new set of demands on ageing subjectivities and bodies. Although the representations of fourth age are missing in the centres, the distinction between third and fourth age represents a key dimension that is constantly present in the daily running of the centres. The boundary between superior third age and stigmatized fourth age functions as a form of disciplinary practice mobilized contextually by various agents. This paper analyze the daily practices of the management of ageing bodies by means of penetrable thin boundary between third and fourth age.

IMAGINES OF THE FUTURE ABOUT AGING, WELLBEING AND SOCIAL AND HEALTH CARE SERVICES IN 2030 BY NORTHERN FINLANDS BABY BOOMERS
Maire Hannele Vuoti 1, Arja Isola 1, Petri Kinnunen 2
1Institute of Health Sciences Department of Nursing, UNIVERSITY OF OULU, Oulu, 2Faculty of Social Sciences, University of Lapland, Rovaniemi, Finland

Abstract: In the future there are more people who live into old age than at any time in past. Population ageing is seen as major force transforming at various level like in health and social care services and in society as a whole. In this research, respondents are Finnish Baby Boomers (BB) who were born between 1945 and 1950. This
generation was exceptionally large and that kind of phenomenon has not been seen before or after in Finnish history. This generation is elderly people in future and the aim of this research is to describe their imagines of the future about aging, wellbeing and social- and healthcare services. The method used in this research is qualitatively driven mixed methods. Qualitatively driven approaches mixed methods offer great potential for generating new ways of understanding the visions and imagines of the future that is in contexts of social experience. Qualitative method in this research was Method of Empathy-Based Stories (MEBS). MEBS in this research produced stories about the future. The respondents received orientation and a script to assist them in writing essays or stories about their aging, wellbeing productive factors and social and health care services in future. Instructions had the temporal perspective for the stories focused till the year the 2030. The stories were analyzed qualitatively by categorizing the responses in into the following themes: 1. aging as subjective and social experience, 2. wellbeing productive factors from the perspective of lifecontrol and environment, and 3. social and health care services from the perspective of operational environments and resources. Based on these themes questionnaire was build. The aim was to investigate BB’s attitudes, beliefs and feelings toward aging, wellbeing and social and health care services in the future. Data was collected from Northern Finland’s 405 BB and analyzed by Principal Component Analysis, K-Means Cluster Analyze and Correspondence Analyze. Findings from this study will give insights on BB expectations and responses to societal aging and contribute to the new vision of aging and wellbeing and BB social and health service expenditures. It is important that we know about elderly people’s possibilities and limitations as it appears to them in relation to their own agendas, expectations and emotions about their future. Final results will be published in the autumn of 2011.

'THEY PREFER TO STAY AT HOME': THE PORTRAYAL OF ELDERLY PEOPLE IN THE DISCOURSE ON CARE

Bernhard Weicht

1University of Utrecht, Utrecht, Netherlands

Abstract: Care at the beginning of the 21st century can be characterised by a discourse on the difficulties related to aging societies in combination with a decline of traditional family structures. The Austrian arrangement for the provision of care for elderly people is largely based on informal settings, usually within the care receiver’s family. The traditional dependence on the nuclear family and other informal bonds correlates with a construction of care work being based on emotional attributes such as proximity, closeness, love and intimacy. These values and virtues can be found in both public and private discourse and can thus be summarised as a moral consensus in society. Similarly ‘staying at home’ is described as everyone’s wish in old age and living ‘independently’ is constructed as the main aim of social policy in relation to elderly people and people in need of care and support.

In this paper I analyse the portrayal of elderly people in the discourses on care in Austria. Data collected in the context of research on the moral construction of care, consisting of newspapers and focus group discussions will be re-analysed using Critical Discourse Analysis to identify how elderly people are talked about and constructed. Why is there an almost total absence of elderly people in the public discourse? To what extent are elderly people constructed as passive and dependent? To what extent are ‘wishes’ and ‘ideals’ of elderly people constructions of the public discourse? The main aim of this research is to highlight the significance of the way elderly people are portrayed in relation to their absence as actors in the discourse. Theoretically, I will draw on the writings of the disability movement and their argumentation for support and empowerment, as well as on the ethics of care approach and their focus on interdependencies. An understanding of the public construction of elderly people in the context of care enables to question both public constructions of elderly people and social policies which are related to the public construction of care. The way society speaks about the elderly impacts significantly on people’s life chances and their quality of life. The way elderly people’s lives are described also influences political decision making processes. Both aspects need to be analysed and challenged in order to deal with questions of ageing and care in a fair and just way.

DETERMINANTS OF HEALTH-FUNCTIONING CONDITIONS AND THE RESIDENTIAL ENVIRONMENT ON THE QUALITY OF LATER LIFE IN SPAIN

Fernima Rojo-Perez 1, Gloria Fernandez-Mayoralas 1, Maria Joao Forjaz 2, Pablo Martinez-Martin 3

1Institute of Economics, Geography and Demography; Centre for Human and Social Sciences, Spanish National Research Council (IEGD, CCHS, CSIC), 2National School of Public Health and Consortium for Biomedical Research in Neurodegenerative Diseases (CIBERNED), 3Research Unit, Alzheimer Centre Reina Sofia Foundation and Consortium for Biomedical Research in Neurodegenerative Diseases (CIBERNED), Carlos III Institute of Health, Madrid, Spain

Abstract: Objective. This paper aimed at examining the relationships between health-functioning conditions and residential environment (both measured by means of objective and subjective indicators), and their effects on Quality of Life (QoL) among community-dwelling older-adults in Spain. The assumption is that better personal and living conditions are associated with a better QoL.

Methods. The data come from a nationally representative sample of 1,106 people aged 60 years and over (CadeViMa-Spain). To analyse the structure of the data set (living arrangements and household features, residential characteristics, health and functioning conditions, satisfaction with life as a whole as QoL indicator), reduce its dimensionality and find out the effects of the selected variables in quality of later life, bivariate and multivariate statistical techniques are applied (factor analysis, optimal scaling method and multivariate linear regression analysis).

Results. Thirty percent of the variance of the QoL is explained by the regressions predictors (household perceived socioeconomic status and satisfaction with living arrangements; objective and subjective health vs. depression and morbidity; and residential satisfaction related to housing, neighbourhood and neighbours). The higher the satisfaction with household, health and residential environments as well as the lower morbidity and depression, the better the Quality in Later Life will be.

Conclusions. The results indicate the high predictive power of the perceptual or subjective information, in line with others results in Quality in Later Life (Rojo-Pérez et al., 2001). Future research will deepen on a global QoL model that takes into consideration other important dimensions (family and social networks, participation and leisure activities, economic resources) according to the meaning of QoL in old age (Fernandez-Mayoralas et al., 2007).
HEALTHY AGING: DO SOCIAL NETWORKS PROMOTE DAILY PHYSICAL ACTIVITY?

Florian Herbolzheimer, Thorsten Nikolaus, Richard Peter
Institute of Epidemiology and Medical Biometry, University of Ulm, Germany

Abstract: Background: There is a need for describing the impact of social networks on promoting daily physical activity (PA) in older adults. The aim of the study is to determine if different network sizes and ties are related to physical activity levels.

Design and Methods: The ActiFE-Ulm baseline screening is a German cross-sectional study of 1321 community dwelling older adults aged 65 years and over (mean age of 76.6 years) recruited from both urban and rural neighborhoods surrounding Ulm. The risk of social isolation was screened by the short form of the Lubben Social Network Scale (LSNS-6) that was conducted by an interview-administered questionnaire. PA was objectively measured by an advanced accelerometer over a period of one week. This devise, which was attached to the leg, considerably improves conventional estimates of physical activity and even allows further differentiations according to activity patterns (sitting, standing and walking).

Multivariate regression models that were adjusted for age, sex and the relationship of family networks on PA disappeared after full adjustment, larger friendship networks showed a significant increase in PA levels. Beside the friendship subscale, separate analysis revealed a significant impact of the LSNS-6 family subscale on PA, whereas the relation of family networks on PA disappeared after full adjustment, larger friendship networks showed a significant increase in PA levels. Beside the friendship subscale, separate analysis revealed a significant impact of the LSNS-6 family subscale on PA.

Implication: Information on friendship ties based on the LSNS-6 family subscale is a beneficial for the assessment of the personal risk of inactivity and planning of targeted interventions enhancing daily physical activity in an older population. A lack of friendship networks is an important determinant for the level of physical activity among older adults.

TOWARDS A GENERAL MODEL OF WELLBEING

Björn Halleröd
Dept. of Sociology, University of Gothenburg, Gothenburg, Sweden

Abstract: Social scientists need to better understand how different aspects of peoples’ wellbeing are tied together and how these ties differ between individuals at one point of time and within individuals over time. Our aim is to theoretically outline a general model that considers the multi-factorial structure of peoples’ wellbeing. We will utilize the potential of latent variable modeling to find strategies and procedures for statistical design and analysis of a unique Swedish database, the Panel Survey of Ageing and the Elderly (PSAE).

The approach demands the development of an inclusive and flexible theoretical model that considers the interactions between semi-autonomous domains (material resources, social position, psychosocial factors, lifestyle, etc.). Our empirical study is at this stage based on cross sectional PSAE data and focus on people that are 55 years old or older (N=5,374). The analysis goes beyond traditional structural equation modeling (SEM) and utilizes recent developments in statistical theory and software in the field of latent variable modeling to bring about a more realistic, dynamic and theory confirming analysis of a multifaceted and stratified phenomenon such as wellbeing. One of the contributions is that the latent variable framework allows the specification of nested measurement models that takes advantage of non-random residual information.
important information that in most analyses is left unconsidered. We will also test to what degree it is necessary to differentiate the measure of wellbeing between different age groups and between men and women.

The research process includes the following stages: A) Choosing domains and variables. B) Formulating a tentative general model. C) Testing the relevance of the theoretical model. D) Validate the confirmative model. E) Analysing the outcomes of the model in relation to predictors such as socioeconomic status, gender, and age.

SOCIAL RESOURCES: A KEY DIMENSION IN ELDERLY COMMUNITY-DWELLING POPULATION ASSESSMENT

Rogério Manuel Clemente Rodrigues 1, Luis Manuel de Jesus Loureiro 1, Silvia Manuela Dais Tavares da Silva 1, Zaida de Aguiar Sá Azeredo 2

1ESCOLA SUPERIOR DE ENFERMAGEM, Coimbra, 2ICBAS-Universidade do Porto, Porto, Portugal

Abstract: Background: Functional abilities and limitations are a very salient issue related to ageing. The Older Americans Resources and Services (OARS) is a functional multidimensional assessment instrument that evaluates the functional status in the five determining areas for the elderly quality of life: social resources, economic resources, mental health, physical health and activities of daily living. Its use is relevant for the knowledge about the functional disability in physical and mental areas in old people. The aim of this study is to analyse the applicability of the OARS (Questionário de Avaliação Funcional Multidimensional de Idosos - QAFMI – in the Portuguese version) in elderly community-dwelling population group.

Methods: comparative analysis of quantitative studies of descriptive-correlation type with a cross-sectional temporal dimension. The samples in all studies were taken in a randomized and probabilistic trial, from the users’ files of Health Centres and nursing homes. The data were presented by gender and age group (65-74; 75-84; ≥85).

Results: The evaluation tool showed its capabilities to collect a great volume of information. Its use should count, in the evaluation of functional areas, with the classification according to the score model of QAFMI, because of the divergences verified with the evaluation realized by the interviewer. Only by this way we can compare, safely, results of evaluations and possible interventions. The diverse areas that are implied in the quality of life of the elders, and the diversity of technicians and services involved, suggest, as implications to the practice, a coordinated intervention, capable of generating and promoting an effective intervention that maximize, and promotes, the social and health resources distribution.

Conclusion: All the work developed with the Portuguese version (QAFMI) of OARS lead us to consider this instrument very useful to define the functional status of the elders in the specific evaluation areas and the needs, becoming right to the planning of older care services. Therefore, OARS (QAFM) in Portuguese version) is a measurement instrument of quality for older people providing significant information to interventions and improve adequate social, and health, care strategy on this population group.

GET UP AND GO! THE YOUNG AT HEART!

Liz Mcgettigan 1

1Libraries and Information Services, THE CITY OF EDINBURGH COUNCIL, Edinburgh, United Kingdom

Abstract: Well-being is undoubtedly about more than medicine and health and with a longer, healthier life as a goal, we should all be turning more of our attention to staying active, enjoying life, making friends, waging war on our waistlines, and extinguishing our cigarettes for good.

It is indeed about the ways that we interact with the environment, our encounters, our routine activities such as walking to work, to the shops, to school, aspects of work, play and relaxation.

With all of this in mind we developed Get Up and Go- a brochure for 50+, the young at heart!, a brochure that is unique to Edinburgh. Jam-packed with articles and information and over 300 organisations and activities, from quilt making to canoeing, there is something for everyone in it.

The aim was to encourage healthy minds and physical activity and to make access to these opportunities easier for all of our citizens to all of the opportunities across the city of Edinburgh.

It is also about Libraries as community spaces for older people, places where they can volunteer, learn and socialise.

Methodology:
• We worked with an over 50s advisory and editorial group
• We sourced, catalogued and categorised information on activities from across the city
• We also made the information available electronically. http://www.youedinburgh.info/engage/
• We linked it to Get Up and Go for IT to teach the senior citizens the skills they need to add to it
• We made it widely available across the city in health centres, libraries community and leisure centres.

Outcomes: We created a network of people interested in the project and a resource that is now well recognised across the city.

CARE FOR OLDER PEOPLE BETWEEN STATE AND FAMILY: EVALUATION OF HOME CARE SERVICES IN SLOVENIA

Valentina Hiebec 1

1UNIVERSITY OF LJUBLJANA, FACULTY OF SOCIAL SCIENCE, Ljubljana, Slovenia

Abstract: The development of formal services for older people living at home is studeid. Firstly, the service is described in Slovenian context with regard to formal requirements of the program and aims and goals the service should tackle. Then, we evaluate the program with regard to Slovenian strategy of development of care for older people. We found out, using cluster analysis of municipalities, that several distinct models of organization of the service has emerged in the past 5 years. These models differ in financing sources (municipality, state and user), efficient use of finances (money with regard to number of services) and quality (equal and consistent access to services). Key elements of future development are outlined on the basis of empirical evidence.
Mika Simonen

Department of Social Research/Sociology, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Conversation analysis (CA) is a method for analyzing the organization of social interaction. In this presentation, I will suggest that CA can be used for developing new social and health care services for aging people.

Methods and materials: We video recorded 52 clinical assessment interviews, conducted in the context of three projects developing assessment of functional capacity. The data were transcribed and analyzed using CA. The analysis shows how the assessment of the client’s functional capacity is produced in and through the interviewer-interviewee interaction.

Results: The professional teams that were responsible for developing the assessment practices considered the results of the Conversation analysis of the assessment interviews as very relevant, because the recordings and the transcriptions provided “an unobstructed view” to the interview. Conversation analysis explicited the ways in which the assessment interviews proceeded and also showed the difficulties involved in them. The project staff and policy makers were impressed by the level of detail that CA could provide.

Conclusion: The teams responsible for the projects developing assessment of functional capacity used the results of Conversation analysis in developing their new services. Recently, a national initiative for functional capacity measurement and assessment in Finland published recommendations for municipal service need assessments. The recommendation acknowledges that the social interaction between an aging person and health care personnel should be considered when assessment interviews are conducted.

FAMILY COHESION AND ELDERLY CARE FOR SENIORS

Hynek Jerabek, Romana Trusinová

Faculty of Social Sciences, ISS, Dep. Sociology, Charles University in Prague, Prague, Czech Republic

Abstract: The growing and accelerating need for care for elderly citizens is generating a continuous need for family care for seniors in contemporary Czech society. In our research, we prepared a standardised survey and used it to interview 400 families in an attempt to answer several key questions: “How do the families of seniors in institutional care differ from the families caring for a senior at home?”. We decided to select one hundred seniors aged 75 or over with a high level of assistance (measured using the BADL index) who are in institutional care and three hundred seniors who live at home and whose care is arranged for or provided by the family. The question remains as to what we regard as “family cohesion”? A family with strong cohesion is one that exhibits strong positive emotional ties (affectual solidarity), enjoys opportunities for abundant family relationships and a proximity between the caring family and the senior (structural solidarity), and has a high frequency of contacts (associational solidarity), and intergenerational assistance (adult children helping their parents – seniors) (current functional solidarity). We ask: “What interrelationships exist between these dimensions of family cohesion?” A family with partial (asymmetrical) cohesion is one lacking in significant ties: either there are no or there are weakened emotional ties (affectual solidarity), or the frequency of contact is not high (associational solidarity), or the opportunities for or proximity of the ties is weak (structural solidarity), yet there is still a high degree of intergenerational assistance (current functional solidarity). In these cases it is important to determine – and we asked – “What mechanisms is this intergenerational assistance based on?” Hypothetically the main motivational factors can be considered to be: 1) either a strong sense of family obligations (normative solidarity), or, conversely, 2) the proximity and opportunities for assistance (structural solidarity), or 3) frequent contacts (associational solidarity), or 4) the emotional relationship (affectual solidarity). It can be considered very unlikely that a high rate of intergenerational assistance (current functional solidarity) would occur with the simultaneous absence of the normative, affectual, associational and structural components of intergenerational solidarity.

FOSTER CARE: NEW FAMILIES FOR FRAIL OLDER ADULTS?

Alice Delerue Matos, Rita Borges Neves, Elisabete Martins

Sociology, Research Centre for Social Sciences, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: Family foster care for older adults represents an alternative to classical institutionalization as care is provided to frail older people in a family context. It involves the development of intergenerational relationships, and intimacy. This research intends to shed some light on the dynamics of these singular intergenerational relationships that have a contractual ground. Semi-structured interviews and participating observation was undertaken on 17 older persons in foster care families.

Intergenerational dynamics established between the elderly and the care family do not seem to depend on factors such as age or health of the former. Results stress that the relationship dynamics in terms of quality and intensity of emotional and services exchanges, and activities shared are affected by: 1) needs of an intimacy space, 2) strategies to preserve it and 3) interiorization of roles.

Intimate, close, neutral or detached categories were defined to describe the style of the relationship between elderly and foster family members, on the perspective of the older adult.

Foster care represents more than the availability of permanent care to the aged. Despite the advantages of personalized care this may be a disempowering experience for the elderly.

THE POLITICS OF VIOLENCE IN RESIDENTIAL CARE FOR OLDER PEOPLE: GENDER, STRUCTURE AND SUFFERING

Albert Banerjee, Tamara Daly, Pat Armstrong, Marta Szebehely, Hugh Armstrong

Re-imagining Long-term Residential Care, York University, Toronto, School of Health Policy & Management, York University, Toronto, Department of Sociology and Women’s Studies, York University, Toronto, Canada, Social Work, Stockholm University, Stockholm, Sweden, School of Social Work, Carleton, Ottawa, Canada

Abstract: Comparisons between Scandinavia and Canada indicate that the frequency of violence against workers in Canadian nursing homes is extreme, with Canadian frontline careworkers six times more likely to experience violence than their Scandinavian counterparts. This presentation outlines the findings of an international
comparative study of long-term residential care serving elderly populations across three Canadian provinces (Manitoba, Nova Scotia, and Ontario) and four countries following a Scandinavian model of care (Denmark, Finland, Norway, and Sweden). We focus on the experience of Canadian frontline caregivers who provide the majority of direct care. The violence Canadian caregivers experience from residents and their family members is physical, verbal, racial and sexual. Ninety percent of those surveyed reported experiencing some form of physical violence and 43 percent experienced physical violence every day. Focus groups revealed a culture of tolerance, where violence was considered routine. However, in this presentation we endeavour to do more than identify prevalence rates, and introduce the concept of “structural violence” (Gal-tung, 1969) to offer an expanded explanation of violence that accounts for the role systemic and organizational factors – such as excessive workload, insufficient staff, lack of autonomy, gender – play in setting the context for personal violence. Current working conditions cause Canadian workers great suffering and fail to enable them to provide the kind of care they know they are capable of providing, given sufficient time, resources and support. The concept of structural violence helps name this failure as a form of violence, and raises pressing questions around the links between violence, work organization, and social care policy.

PREMIÈRE ANNÉE DE VIE DANS UN ÉTABLISSEMENT MÉDICO-SOCIAL: ANALYSE DES PROCESSUS D’ADAPTATION

Murielle Pott, Jérôme Debons

1Unité de recherche en santé, HécSante, Lausanne, 2Sociologie, Université de Genève, Genève, Switzerland

Abstract: Il est établi que la majorité des résidant-e-s des établissements médico-sociaux de long séjour (EMS) sont de sexe féminin, âgé-e-s de 80 ans et plus et souvent très affaibli-e-s par des problèmes de santé (troubles physiques et cognitifs). Nonobstant, la société contemporaine pose un sérieux défi à ces âné-e-s: celui de pouvoir se préparer au départ de leur leur lieu de vie, synonyme dans plus de 80% des cas de dernière résidence avant la mort. Or, le déménagement en établissement médico-social induit une rupture dans la trajectoire identitaire du sujet. Vécu par plus d’un âné-e comme une dépossession, mort sociale préfigurant la mort physique, il sous-entend de quitter un lieu symboliquement fort (la maison, le “chez-soi”) pour une résidence en collocation, loin des repères habituels. De leur côté, les directrices et directeurs d’établissements appliquent toute leur attention à atténuer la violence symbolique de l’institutionnalisation. Contre les anciens hospices et autres asiles de vieillards, les EMS ont été conçus pour être de véritables « lieux de vie » fondés sur une triple logique de soin, d’accueil et d’ouverture sur l’extérieur et enfin d’animation. Nous menons actuellement une recherche sur cette thématique dans un EMS du canton du Valais; ce projet a pour but d’observer, dans une démarche socio-ethnographique et en suivant une dizaine de résidant-e-s sur une période de 1 année (recherche longitudinale), comment ces dernier-e-r é s s’adaptent à leur nouveau lieu de vie, et corolrairement, ce que l’institution met en place pour favoriser cette adaptation (recherche monographique). Dans le cadre de l’atelier vieillesse RN01 Aeging in Europe, nous souhaitons proposer un poster en français présentant d’une part les particularités de la structure institutionnelle d’un EMS dans le contexte actuel en Suisse, et d’autre part, les résultats des premières analyses ethnographiques sur les trajectoires d’adaptation des résidant-e-s qui suivent. Nous présentation ouvrira ainsi la discussion au sujet de certains aspects de la prise en charge formelle des personnes âgées aujourd’hui en Suisse.

AGEING, DISABILITY AND PAIN: A STORY ABOUT AGEING PERCEPTIONS AND REALITIES IN FRENCH-SPEAKING SWITZERLAND, 1960-2011

Michel Ortis, Julia Henke, Christophe Luthy

1Sociology, 2Centre for interdisciplinary Gerontology, UNIVERSITY OF GENEVA, Carouge, 3University Hospital, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: In Europe, the canton of Geneva and the central area in the canton of Valais are exceptional since four interdisciplinary surveys have been run from the early 1960s until 2011 about the living conditions of the elderly. While life expectancy and even more healthy life expectancy progressed, we moved from a very negative perception of ageing associated to senility, disability and last step to death, to the vision of a new stage of life, the so-called third age, where healthy wealthy retired could maintain their development and self-realization. Such drastic change in the perceptions has hided realities of disabilities, pains, discomforts affecting the elderly, especially the growing population of the oldest old. Pains - especially those of the low back - are an old problem but the topic has only recently really been addressed by scientists, observing the limitations of the drug treatments among the elderly. Thanks to the four surveys done in French-speaking Switzerland between 1963 and 2011 and to an historical assessment of the gerontological publications, our contribution will highlight the discrepancy between changing perceptions and enduring realities.

EXPERIENCED AGE-DISCRIMINATION AND ATTITUDES TOWARDS ELDERLY PEOPLE: REGIONAL FINNISH AND SWEDISH TRENDS OF AGEISM

Fredrik Nils Christian Snellman, Mikael Nygård, Susanne Jungerstam

1Department of Social Work, UMEÅ UNIVERSITY, Umeå, Sweden, 2Department of Social Sciences, Åbo Akademi University, 3Nokia University of Applied Sciences, NOVIA, Vasa, Finland

Abstract: Few aspects permeate our social life in the same way as the category of age. We all know from our own experiences and from anecdotal evidence that age matters in many different ways in our lives. However, aspects such as experienced age-discrimination and attitudes towards elderly people are rarely in focus of attention in research.

The approach in this article is descriptive and differential based on cross-sectional data. The aim is to examine trends in the extent to which ageism is experienced and reported as a structural and individual phenomenon. More specifically, how has the personal experience of being discriminated against on the grounds of age changed between 2005 and 2010? According to the Eurobarometer an increase is not to be expected. Secondly, how have the generally experienced attitudes towards the elderly changed between 2005 and 2010 in different domains of society? (Eurobarometer: increase to be expected. Cross-sectional data from the GERDA (GERontologi-cal Regional Database) population study, among individuals born
1930 and 1940 is analysed. Data collection was carried out in 2005 (n 3370) and replicated in 2010.

The presentation will shed light on the currently available data from 2005 and the comparable data from 2010 (coding of data completed spring 2011) within the same age cohort. Regional data on age-discrimination and attitudes towards the elderly is contrasted against idealistic trends that have been shown to exist at a European level.

Remarks about the validity of the items used will be discussed. The measures are not direct reflections of the prevalence of age-discrimination and attitudes towards elderly people. However they are measures of the ideas of these two phenomena. Ideas that people have will affect them in different ways. We need to recognise that people have these ideas because having them is a part of the reproduction of ageism. Ageism exists by the power of people’s idealistic views that are independent of any realistic evidence that it actually does. Ageism gains ontological status through validated claims that something is age-discrimination and through the ideas that something is believed to be age-discrimination. Having knowledge about the contingent trends in these ideas can guide us in intervening in the negative aspects of the reproductive circle of ageism.

**SPACES OF (NON) AGEING- A DISCOURSE PERSPECTIVE**

Monika Wilinska\(^1\)

\(^1\)Research School of Health and Welfare, JÖNKÖPING UNIVERSITY, Jönköping, Sweden

Abstract: This paper explores discourses of old age within the welfare state context, in Poland. Acknowledging the socially constructed nature of ageing, this study seeks to identify societal spaces of ageing, spaces where people are supposed to grow old. In this, the study adopts a welfare culture perspective that highlights the contextual, emotional and unstable character of the welfare state that undergoes indefinite processes of change. It points out to the processes of people production based on instilling in them norms and principles that should govern their lives.

The study is based on multiple data that follows the theoretical adherence to the concept of discourse. It focuses on things that are said about old age, done to old age, and heard about old age within the welfare state context. The study analyses discourses of old age present in mass media material, social policy documents, organizational and personal narratives, and social welfare actions.

The findings of this study indicate that there is a lack of spaces of ageing in the welfare state context. Discourses, which are examined in this study, illuminate the process of resentment and decline of old age. People are expected not to grow old; old age remains to be a misunderstood phenomenon. Contrary to the surplus knowledge against old age, there is a considerable lack of knowledge for old age. Therefore, spaces of non-ageing are invoked in order to elaborate on those processes. Spaces of non-ageing identify various societal domains and show what needs to be done in order not to grow old. Spaces of non-ageing repudiate the idea of old age as something terrifying and, on many occasions, immoral.

**THE RE-NEGOTIATION OF OLD AGE IN TURBULENT TIMES. THEORETICAL CONSIDERATIONS AND EMPIRICAL RESULTS ON ACTIVE AGEING IN GERMANY**

Silke Van Dyk\(^1\), Stephan Lessenich\(^1\), Tina Denninger\(^1\), Anna Richter\(^1\)

\(^1\)Institute of Sociology, UNIVERSITY OF JENA, Jena, Germany

Abstract: Over the past years older people have been increasingly discovered as active citizens, which is particularly true for the “young” and non-frail elderly. They are regarded as capable of living a self-reliant life, being able to contribute to the public good as well as striving after meaningful engagement. Even though we face this re-negotiation of old age recently, the scientific report on this development is often anecdotal or restricted to specific areas of interests. In fact there is a lack of systematic research in two respects: Whereas social security and demographic issues are in the forefront of age-related discussions, the encompassing shift of age-related norms, values and images over the last decades is neglected – and this holds true first for the medial and political discourse as well as secondly for the individual (self-)concepts and images.

The contributed paper is based on the research project “From retirement to active ageing? Images and practices of old age in the transformation of the German welfare state after reunification”. The project explores shifts in the meaning of “old age” in the context of the demographic and welfare state changes Germany has been witnessing after 1989. Based on a systematic analysis of 1500 newspaper articles, party manifestos, government programs and advertisement from 1983 to 2009 the project investigates to what extent and in which way there are age-related images and expectations of activity and productivity. In a second step, based on biographic, in-depth interviews with 60 older people in East and West Germany the project explores how individuals reflect and process the new public imagery of “active ageing”. In addition, individual self-conceptions of the elderly are contrasted with their actual activities in everyday life, which have been studied on the basis of standardised questionnaires. In this way, the project aims to ascertain the social acceptance, and thus the political success, of the “activation agenda” pursued by German social policy. The submitted paper offers insights in major empirical results and theoretical considerations out of three years of research on social and individual re-negotiations of old age. Special attention is paid to the fact that even two decades after reunification, there are still significant differences in the social construction of old age and ageing between East and West.

**AGE OF AUSTERITY: ON WHOM DOES THE AXE FALL HARDEST?**

Jay Ginn\(^1\), Sue Himmelweit\(^2\)

\(^1\)Institute of Gerontology, KINGS COLLEGE LONDON, coulsdon, \(^2\)Economics, Open University, London, United Kingdom

Abstract: The UK Coalition government has introduced measures to reduce the national deficit by 2015, claiming the planned cuts in welfare benefits and in services are fair, distributing the pain across the whole of society.

In this paper, we outline how the cuts will affect older people, using estimates that quantify their financial cost to pensioners, analysed by gender and whether living alone or in a couple. Women single pensioners will be the hardest hit. This is largely driven by cuts in social care and housing support.

If similar strategies are used more widely in Europe, similarly regressive effects can be expected.
EVERYDAY MOBILITY AMONG STAYERS AND MOVERS IN LATER MID LIFE

Satu Heikkinen 1,2*, Åsa Aretun 2

1Sociology, Department of Behavioural Sciences and Learning (IBL), 2Mobility, actors and planning processes, VTI, Linköping, Sweden

Abstract: This paper explores changes in everyday mobility (i.e. transportation) in later midlife. Assumptions on midlife as a settled stage in life, concerning for example housing and travel patterns, is prevalent in research and has resulted in a lack of studies on processes and variations in midlife in a life course perspective. This means that the understanding is limited of what happens with travel patterns and travel needs during midlife and how these relates to earlier experiences as well as correspond to future plans. The aim of the paper is to focus on everyday mobility in later midlife by highlighting two life course related events, empty nesting and (planning for) retirement.

A qualitative interview study was conducted with 45-66 years old people in two Swedish cities (Vadstena and Norrköping). Two focus groups interviews (one in each city) and 20 in-depth interviews (10 in each city) were analysed in accordance with extended-case methodology. One important finding was that many interviewees had not only changed everyday mobility related to the processes of empty nesting and (planning for) retirement but had changed residence as well. In those instances change of residence affected everyday mobility and the analysis had to consider interactions between residential mobility and everyday mobility. One example of change in everyday mobility when children were moving out of home was “hypermobility”. Individuals showing this characteristic stayed at their residence while investing in their working career. They were “free” to travel as never before in work and also became more car-dependent. Another change was to move from suburban areas to the inner-city. By changing residential location in this way car-driving was replaced by walking and bicycling.

SOCIAL EXCLUSION OF THE ELDERLY: A MIXED METHODS STUDY IN SLOVENIA

Masa Filipovic Hrast 1, Matic Kavcic 1, Valentina Hlebec 1

1UNIVERSITY OF LJUBLJANA, FACULTY OF SOCIAL SCIENCE, Ljubljana, Slovenia

Abstract: The elderly are in many ways more vulnerable than other groups in society. To research the vulnerabilities of the elderly, we will employ the concept of social exclusion which is less often used in gerontological research. A particularly innovative approach is taken in this study as secondary quantitative data are used in the explanatory mixed methods model for the analysis of social exclusion, which is then combined with in-depth interviews and the grounded theory approach. With quantitative data we initially try to discover which areas of social exclusion particularly affect older people in Slovenia. Then we try to understand the social exclusion of the elderly in greater depth by analysing their coping strategies in each area of social exclusion.

The qualitative data yielded an in-depth insight into the most problematic areas of social exclusion. We found that the study of coping strategies is a very useful tool for understanding social exclusion. The numerous strategies applied show the resourcefulness of the elderly, yet they also indicate that the majority of strategies did not lead to an exit from exclusion, only the reduction of exclusion in a certain area. Therefore, even though it is dynamic in nature social exclusion seems quite static for the elderly, who have few ways of exiting it. For example, the use of past savings only temporarily means a reduction of financial deprivation and cannot be seen as an exit strategy. Many of the strategies observed therefore seem to be often directed to the depletion of resources (financial, individual or other) and in the long run might even indicate a future worsening of the situation regarding exclusion.

SOCIAL EXCLUSION, DIVERSITY AND AGEING IN RURAL IRELAND AND NORTHERN IRELAND

Kieran Walsh 1

1Irish Centre for Social Gerontology, NATIONAL UNIVERSITY OF IRELAND GALWAY, Galway, Ireland

Abstract: The intersecting elements of social exclusion, and their concentration in particular places, can impact on people’s social, economic and health lives. However, there has been no research addressing social exclusion among older people living in diverse rural areas in Ireland or Northern Ireland, with a cross-border analysis completely absent. Aside from a lack of understanding around age itself as a mediator of social exclusion, existing research on place typically concentrates on urban areas. Our knowledge of different kinds of rural communities (i.e. village rural, dispersed rural, remote rural, island rural and near-urban rural) as places of residence for older people is also limited. Consequently, there is a dearth of information on how diverse rural places can facilitate or protect against social exclusion as people age.

This paper explores how age and rurality combine over the life-course to impact on the likelihood of social exclusion from material resources, social relations, and services in five contrasting rural contexts (i.e. village rural, dispersed rural, island rural, remote rural and near-urban rural) in Ireland and Northern Ireland. The research draws on focus groups with local stakeholders and 100 face to face interviews with a diverse group of older people in 10 case-study sites across Ireland and Northern Ireland. Participants were recruited on the basis of age (younger old and older old); socio-economic status; composition of household, gender; isolation; health status; recent versus long-term residency. Preliminary findings from this research will be presented and discussed with reference to individual, place and structural components of social exclusion. The role of cumulative advantage and disadvantage is also examined.

PERCEIVED INEQUALITIES: CAUSES ADVOCATED BY ELDERLY WOMEN AND MEN IN TWO NATIONAL CONTEXTS

Fredrik Nils Christian Snellman 1, Clary Krekula 2

1Department of Social Work, UMEÅ UNIVERSITY, Umeå, 2Department of Social Studies, Karlstad University, Karlstad, Sweden

Abstract: This paper focuses on elderly’s perception of inequalities. The aim is to illustrate the reported prevalence of inequalities among elderly women and men in Finland and Sweden, and particularly, to examine perceived inequalities based on gender and age. Elderly people are often foreclosed from quantitative studies due to unwarranted expectations that they will not be able to fill in a questionnaire. Hence, there is still a lack of knowledge about how elderly in general and subcategories specifically perceive inequali-
ties. Our approach is descriptive, differential and contextual. Instead of focusing on any particular single inequality cause, we are applying a broader perspective, and thereby identifying the inequality causes described as most important. Data from the GERDA (Gerontological Regional DAtabase) population study, among individuals born 1930 and 1940, carried out in 2005 is analysed.

Respondents were asked “do you think that everybody has got the same opportunities in today’s society”. 13.4 % of the respondents answered yes, and 86.6 % no, statistically significant by gender and age. Additionally, if responding no, respondents were asked to answer the follow up question, ”what do you consider to be the most important causes for inequality” (max 3 choices). The most frequently mentioned alternatives were illness/disability (46.3 %), economy (44.6 %) and education (42.4 %). Age (34.8%) is perceived as the fifth most important inequality cause and gender (23.1%), surprisingly, as the ninth most important. An eye-catching difference is observed between country of residence and all inequalities. In general the residents in Sweden report the inequalities to a higher extent compared to residents in Finland.

In Sweden, the gender inequality debate has been especially intense historically and it still is. Anti-discriminatory legislation has also focused gender, while discrimination on the grounds of age was prohibited as late as in 2009. In Finland, on the other hand, gender inequality is not, and has not been, debated to the same extent. Gender equality legislation exists, and anti-age-discriminatory legislation has existed for a longer period of time compared to Sweden. The empirical data reflects these national conditions. The subcategory Swedish women report gender inequality – and Finish women age inequality – to a considerably higher extent compared to the other groups.

AGING IN EUROPE AND SPECIALY IN SPAIN. LONG-TERM CARES. SHARE PROJECT
Ana Maria Lopez Narbona1
1SOCIOLGY, UNIVERSITY OF MALAGA, MALAGA, Spain

Abstract: As says the World Bank, the EU member states and specially Spain are facing a rapidly aging population. One of the consequences of these demographic changes is the expected increase in demand among the older population for long-term care (LTC). The future demand for LTC services will be driven by two factors: first, the size of the older population (+65), especially the very old (+75) and second, the percentage of older people dependent or severely dependent, and therefore requiring help with Activities of Daily Living (ADL).

Specialist David Casado Marin considers that to date, both in Spain and virtually all the other EU countries, dependency has been seen to be a fundamentally private problem to be dealt with by the family concerned. In this way, whether through informal carers or contracted professionals, in the domestic environment or in care homes, it is the dependent person themselves and their families who currently bear the majority of the costs. In light of this, current concern lies in the social change that is coming on, mainly the accelerated aging process and the increased participation of middle-aged women in the labour market, which heighten the need for collective organisation of that which until now has been resolved within family circles.

In this context, at the same time that the Government has issued a “Long Term Care Law” in 2006, I am going to analyze the main issues such as the dependency problems and its eventual future evolution, the characteristics of the current Spanish long-term care system; the role that health services should have in the dependency issue; and finally, the family involvement in long-term care of old people and the benefits and drawbacks of the main alternatives that the Administration could manage in case it intends to increase its involvement in this field.

I will analyse also the Survey of Health, Ageing and Retirement in Europe (SHARE) which is a multidisciplinary and cross-national panel database of micro data on health, socio-economic status and social and family networks of more than 45,000 individuals aged 50 or over. As said in the web page of SHARE, it responds to a Communication by the European Commission calling to “examine the possibility of establishing, in co-operation with Member States, a European Longitudinal Ageing Survey.

CARING FOR OLDER PEOPLE: DIVISION OF CARE WORK BETWEEN FAMILY AND NON-FAMILY CARE
José São José1
1CIEO, UNIVERSITY OF ALGARVE, Faro, Portugal

Abstract: This presentation focuses on a topic that has been neglected in previous research: the division of care work between family carers and non-family carers. An analytical framework that goes beyond the conventional models of the interplay between informal and formal care is used, which has proved to be very fruitful in revealing different forms of division of care work. The data was gathered through qualitative research carried out in the Lisbon region. The results show a more complex picture than that one depicted by the conventional models referred above. For example, they show that the specialization of care work between family and non-family carers assumes different degrees (strong or weak) and different forms (resulting from different combinations of the roles played by family and non-family carers in terms of care tasks provided and time spent in care provision). They also demonstrate that the division of care work is clearly shaped by the level of financial resources available in families. It is also revealed that family carers idealize to maintain the elders in the community for as long as possible with the help of extensive non-family care.

PROBLEMS EMERGING FROM ELDERLY CARE IN "CARE TRIANGLE": ELDERLY PERSON, CAREGIVER AND CLOSE RELATIVES OF ELDER
Ayse Canatan1
1SOCIOLGY, GAZI UNIVERSITY, Ankara, Turkey

Abstract: Aging, elderly people and their care are new concepts for Turkey. The ratio of older people is 7% in whole population. While traditional extended family was maintaining several functions such as child care, elderly care and some homemade productions; today modern nuclear family of the modern urban society cannot continue all these functions because women are working outside the home. In this point, elderly care is a problem of the modern urban families. Elderly care is a difficult process for the sides of "care triangle". Elderly people, their close relatives and caregivers are elements of care triangle. All sides of this triangle have different positions in this care process. These three sides of care triangle have some problems and difficulties beside of the advantages. Further-
more, elderly care is a process which needs seven days and 24 hours demands foreign nationality care givers. In our research, this “care triangle” was studied with 32 families living in Ankara and in Istanbul. In this study, it was made interviews with 32 elderly people, 32 care givers all are foreign nationality women, and 43 close relatives of elders. The study will be concluded by presenting positive and negative effects for each side in elderly care process. This presentation mainly focused on problems or negative effects for each three sides.

THE MANY LIVES OF WOMEN CARING FOR AN ELDERLY PARENT WITH ALZHEIMER IN PORTUGAL

Sanda Samitca

1INSTITUTE OF SOCIAL SCIENCES UNIVERSITY OF LISBON, Lisbon, Portugal

Abstract: Portugal like other European countries is facing an increasing number of elderly persons suffering from chronic disease, and Alzheimer’s disease (AD) in particular.

Focusing more specifically on daughters, the paper explores how, in a context of a high rate of female employment and low availability of services, women do experience and face the situation, both at the practical and symbolic levels.

Drawing on qualitative interviews with daughters providing care to one of their parent with AD while working, we investigate what are the main care arrangements set up by families.

Adopting a work-life balance perspective, the analysis highlights different patterns of caregiving, according to how the child faces this new situation and defines new ways of being together in a situation of loss of references. Those patterns are also linked to various attitudes toward formal care services. We examine the main difficulties carers have to face, the coping strategies they develop, as well as the different patterns of reconciling work and care.

We will show how, in order to face the caring needs of persons suffering from AD, complex care arrangements are required. Moreover, in order to reconcile work and care, both demanding tasks, daughters rely upon various kind of support. Care arrangements are organized most often by combining informal and formal care, in and outside the house, in a complementary form.

The paper will also present how caring while working is highly challenging and has important repercussions on carers’ personal and social lives, as well as on their professional lives. However, most often family plays a central role and is willing to assure this crucial task even when working. In fact, although working induces constraints, it is also mentioned as a resource to face the caring situation.

WORKING CAREGIVERS AMONG POLISH POPULATION 50+

Jolanta Perek-Bialas 1, Justyna Stypinska 1, Konrad Turek1

1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: The presentation focuses on the group of carers aged 50 and more, with a special regard paid to the group of working carers in comparison to the non-working cares.

Poland may in the future face a serious problem of provision of informal (via family networks, family members) and as well formal care services (not sufficient system of institutions providing elderly care, which additionally are not very positively perceived by the society) for older people on sufficient level. The presentation joins to the discussion about the role of individuals 50+ in adult care and elderly care in Poland, the effects of caregiving for carers and how it might evolve in the future while care demand will increase. What impact do the care responsibilities have on the labour market participation of caregivers aged 50-plus in Poland? What impact do care responsibilities have on everyday life of the caregivers? In what way does the reconciliation of work and care influence the psychical and psychological wellbeing of the carers?

The analysis shed some light on better comprehension of the situation of working caregivers and the problem of reconciliation of work and care in Poland. Regression modeling provides clear conclusion that the likelihood of being sad and depressed is much higher in the situation of dual burden or work and care, rather than in situation of single burden - either work or care. As many working carers are not able to quit work or care, the direction for improvement of their situation would be to introduce solutions helping them combine these obligations. Such improvements could be introduced by employers, local and central governments, welfare care systems, health care institutions, or private companies.

The presentation presents data and results (for Poland) of few international projects. Firstly, it refers to the results of qualitative project “Carers @ Work” (aimed at working carers). Secondly, it uses data from ASPA quantitative survey (first such big, nationwide survey among Polish employers about older workers). Thirdly, it bases on data from SHARE survey (international survey on population 50+).

THE FORMAL AND INFORMAL CAREGIVERS: COMPARATIVE ANALYSIS BETWEEN THE FAMILY AND INSTITUTIONAL CONTEXTS

Telma Maria Queiros 1,*, Maria do Céu Ribeiro 1

1Department of Practical Pedagogical Supervision, POLYTECHNIC INSTITUTE OF BRAGANÇA, Bragança, 2CIF2D, Faculty of Sport - University of Porto, Porto, Portugal

Abstract: Population aging has become an emerging problem in society. The combination of several factors led to an increase in life expectancy, which is reflected in a number of people with a more advanced age and therefore more dependent. Thus, this led to greater demands for formal and informal support. In this sense, with this study we aimed to (i) know the type of care which are provided to the older people, by Formal and Informal Caregivers; (ii) understand the perspective of Formal and Informal Caregivers about the care provided, in family and institutional contexts; (iii) identify the main difficulties involved in providing care for the Formal and Informal Caregivers and (iv) identify the support (e.g. social, technical) that are delivered to the caregivers.

This study used two questionnaire surveys. A survey consisting of thirteen closed questions was applied to ten Formal Caregivers (FCs), employees of a Private Institution of Social Solidarity, in a city of the north of Portugal. Both were female, aged between 20-59 years. The second survey consisted of fourteen closed questions and was applied also to ten Informal Caregivers (ICs), living in the rural area of the same city. Nine were female and one was male,
aged between 40-65 years. A comparative statistical analysis was used.

Results had show that the FCs provides social and physical care, while the ICs provide emotional and physical care. Participants consider as priority care, physiological, psychological and social care. FCs appointed two reasons to exercise this function: like to work with older people and like to feel competent. For the ICs, the reasons are being familiars of the elderly and therefore feel they have the obligation and duty to exercise that function. Both indicated that the main difficulty is the physical fatigue. Moreover, the FCs point to a lack of cooperation from the elderly and ICs indicate the lack of housing conditions and technical support. Despite these issues, they consider institutionalization as an alternative. They believe that the elderly are satisfied with the care provided.

PARTICIPATION IN LEISURE ACTIVITIES AMONG PORTUGUESE OLDER ADULTS

Paula Jerónimo¹, Pedro Alcântara Silva¹ ², Pedro Moura Ferreira², Manuel Vilaverde Cabral¹ ²
¹Instituto do Envelhecimento - UL, ²Instituto de Ciências Sociais da Universidade de Lisboa, Lisboa, Portugal

Abstract: This paper explore the impact of social networks on the uses of free time on leisure and social activities throughout the aging process, giving particular attention to the processes of transition, particularly in the transition to retirement, widowhood or even for situations of dependency caused by health problems. The data were collected from eight focus groups and from a representative survey of the Portuguese population over 50 years, conducted within the research project: Ageing processes in Portugal: time use, social networks and living conditions of the Institute of Aging, University of Lisbon.

The analysis identifies the diversity of trajectories and transitions to retirement, as well the differential impact on the reconfiguration of recreation and leisure occupations of individuals from different social groups. The survey shows that the practice of leisure and social activities varies depending on the configuration of their social networks, which result are related with social demographic attributes, such as gender, education and social economic status. Finally, the results suggest a strong association between engaging in leisure activities and social activities and quality of life of individuals.

RETIRED WOMEN IN FRANCE : BETWEEN VOLUNTEERING AND FAMILY INVOLVEMENT

Melissa Petit¹
¹University Paris Descartes, Paris, France

Abstract: In the collective imagination, the world of women is one of giving and relationships. This quality as donor, women are traditionally confined to the domestic sphere. This way of thinking was imported into the public sphere and they are now expected to act through volunteering. At retirement, the individual is faced with a hand full of time, and may, if desired, adjust his time by incorporating various activities, including volunteering and helping relatives.

The communication will aim to tackle the question of structuring the time of retired women, whose gift is one of their characteristics, both in terms of the public sphere with the volunteering as well as the private sphere with the family involvement. The time for retired women is likely to be organized around these two forms of engagement and new forms of interaction they prefer.

SOCIAL CAPITAL OF THE ELDERLY IN POST-COMMUNIST COUNTRIES ON THE EXAMPLE OF POLISH ACTIVISTS IN CATHOLIC ORGANIZATIONS

Stella Grotowska¹
¹Institute of Sociology, UNIVERSITY OF WROCLAW, Wroclaw, Poland

Abstract: Engagement in various community organizations may expand social network of the elderly and contribute to reduction of their social isolation. The problem is of increasing importance in the face of demographic tendencies emerging in the western world.

Social networks may be examined in view of the support and care that they may provide for the elderly free of charge (where the elderly appear to be recipients). Application of the perspective of the social capital allows to notice that the elderly perceive themselves as members of partnership networks that transgress in their intentions (and sometimes in their consequences) particular interests of individuals and their nearest environment, and expectations that they have of religious movements, community groups and organizations concern mainly other cases.

Situation of the elderly in Poland differs from that of their peers in western countries: (i) Although they are equal in their level of education, their education activity is less intensive. Reasons for the situation do not pertain to legal regulations, but social norms – it is said that youth is the appropriate time for studies. (ii) The engagement in local communities of the elderly in Poland is typically rather low, they hardly enter the public space, save for healthcare related institutions (medical centers, hospitals). (iii) Problems of this group are rarely presented in media, and even if they appear, they are influenced by the old age negative stereotype. (iv) Their problems rarely become a focus for politicians.

Since religion and religious structures – related to the Church or religious denominations – are one of the enclaves of public space, where presence of the elderly seems – also to themselves – natural, I am going to analyze: (i) the process of the social capital emerging as a result of participation of the elderly in religious organizations; (ii) social consequences of that process (for the participants, local communities, the society).

THE ACTIVATING AND MARGINALIZING FUNCTIONS OF THE UNIVERSITIES OF THE THIRD AGE. THE POLISH CASE

Paulina Świątek¹, Małgorzata Rakoczy¹
¹Departament of Sociology and Social Anthropology, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Cracow, Poland

Abstract: Nowadays, the Universities of the Third Age (UTA) are one of the most popular forms of continuing social and intellectual activity in retirement. Currently, only in Poland there are
almost 110 UTAs, which constitute an important form of spending free time for a constantly growing group of seniors.

Without a doubt, the UTAs are specifically designed for the seniors’ activation. They help the old people maintain intellectual activity and build interactional networks. Rarely is it noted that in a less visible way they may contribute to the marginalization of seniors. Examples of such marginalization may be: specific subjects of classes, which focuses almost on the problems stereotypically linked with ageing, isolation of seniors from other age groups, lack of adaptation classes and the dysfunction of the lecture halls, so the services seem to be directed mostly to the healthy and efficient seniors, and therefore, may marginalize those who need activation the most (thus we have two different types of marginalization: within UTAs and between UTA students and society). Polish research literature on the UTA is still not impressive. However, existing titles are primarily analytical, enthusiastically referring to UTA activities. Possible marginalizing actions in their work are completely ignored.

The aim of the paper is to defend the thesis that the UTA serve next to the activation also marginalizing functions. Key research questions focus not only on real activating potential of the UTAs, but also on the other side of such institutions, which is a special kind of marginalization of the elderly and whether the profit from their activities for seniors is higher than the potential costs. Answering these questions is particularly important in the context of an increasing number of elderly people in Polish society. Results of analysis will be compared with the activity of UTAs in other European countries.

Empirical material was gathered by the in-depth interviews with the UTA students and lecturers, participant observation and data analysis. Triangulation of research methods can contribute to the comprehensive analysis of this phenomenon. Description of the educational service market provided by the UTA will be made on the example of Krakow – the city in which there is the largest concentration of such institutions in Poland.

OLDER AGE AND LIFESTYLES IN SPAIN

Elena Del Barrio 1, Mayte Sancho 1, Pura Diaz-Veiga 1, Gerardo Zamora 1, Javier Yanguas 1

1INGEMA, Madrid, 2INGEMA, San Sebastian, Spain

Abstract: Daily life is the succession of activities carried out regularly by the individual. The social and economic functioning of society and its development depend of the activities that people do in their normal life. As well, the study of habits can be use as a quality of life indicator. We use here the definition of lifestyle according to Dumasdadier (1965), who states that a lifestyle is the personal form how everyone organises his daily life, in relation to his usual activities.

This paper focuses on lifestyles in old age and their relationship with socio-demographics and wellbeing variables. For the purpose of this paper, we analyze the Survey of Living Conditions in old age from Spain in 2006 (sample: 3,537 people, +65) and used multivariable statistics techniques: factorial and k-means clustering.

Data analysis results were categorised in six different lifestyles in old age in Spain; which were classed according to: (a) activity types (dynamic, sedentary, leisure time, support) (b) social network (frequency contacts), (c) wellbeing variables (emotions, satisfactions, values), (d) socio-demographical variables (sex, age, education, household type) and (e) health (perceived health status, dependency).

There are different lifestyles in old age; older people are very heterogeneous between them, countering the stereotypes about them in Spain (uniformity, passivity). The new generations of older people are active; they carry out a lot of things in their daily life and have internalized the “active aging” motto. We found that there is a tendency toward autonomy; which is a new value in spread. The new generations of older people are active, self-governing, and participate in society.

QUALITY OF LIFE, WELLBEING AND LEISURE ACTIVITIES AMONG OLDER ADULTS IN SPAIN

Gloria Fernandez-Mayoralas 1, Fermina Rojo-Perez 1, Raul Lardies-Bosque 1, Maria-Joao Forjaz 1, Pablo Martinez-Martin 1

1Institute of Economics, Geography and Demography, Centre for Human and Social Sciences, Spanish National Research Council (IEGD, CCHS, CSIC), Madrid, 2Department of Geography and Spatial Management, University of Zaragoza, Zaragoza, 3National School of Public Health and Consortium for Biomedical Research in Neurodegenerative Diseases (CIBERNED), 4Research Unit, Alzheimer Centre Reina Sofia Foundation, and Consortium for Biomedical Research in Neurodegenerative Diseases (CIBERNED), Carlos III Institute of Health, Madrid, Spain

Abstract: Quality of Life (QoL) is a framework for research of great interest to get criteria to be used by policymakers for the maintenance and improvement of living conditions of the population. In this sense, leisure activities, particularly those made after retirement when individuals have more spare time, can be an important source of satisfaction and personal wellbeing (Lardies-Bosque, 2011).

The aim of this study is to identify and assess the influence of leisure, as one of the five most relevant QoL domains in old age (Fernandez-Mayoralas et al., 2011), on subjective well-being, in the context of other QoL domains such as health, family, economic resources and social network, and obtain a typology of people according to the leisure activities they perform, their health, their family and social contacts, their economic resources and their basic demographic and residential characteristics.

The data come from a nationally representative sample of 1,106 community-dwelling adults aged 60 years and over residents in Spain (CadeViMa-Spain, 2008) with no cognitive deficit according to Pfeiffer’s Short Portable Mental Status Questionnaire (Pfeiffer, 1975). Representative variables on objective living conditions have been selected in each of the QoL domains: EQ-SD (health and functioning), frequency of contacts with family and friends (family and social network), level of income (economic resources), as well as socio-demographics (age, sex) and residential characteristics (accessibility to neighbourhood services). Leisure activities have been grouped into five groups: active leisure (physical), passive leisure, cultural leisure, social leisure, and travel and tourism. To measure the level of subjective wellbeing the Personal Wellbeing Index will be used (International Wellbeing Group, 2006). Bivariate and multivariate analysis will be run to get the aims (Regression and Cluster Analysis).
Abstract: Home-ownership is of great importance for the wealth positions of households and therefore influences patterns of social inequalities. The aim of our article is (1) to uncover mechanisms related to socio-economic household characteristics which cause differences regarding the home-ownership rate across Europe as well as to (2) understand variations in the value of housing between and within European countries. The study emphasizes the existence of two steps of inequality regarding home-ownership. The first steps concerns the division of a country’s population into owners and non-owners and the second step concerns differences in housing wealth within the population of owners. Analyses with data from the “Survey of Health, Ageing and Retirement in Europe” (SHARE) reveal that the probability of home-ownership of the elderly strongly varies across European countries, but also within countries following socioeconomic, family, and migrant characteristics. Notable differences are also observable for the value of housing indicating the existence of social inequalities even within the group of home-owners. So far we could show that one can differentiate between four groups of countries. (1) In a first group (e.g. DE, NL) being a home-owner is strongly affected by socio-economic factors. Therefore becoming a home-owner seems to be difficult. But for the group of home-owners there are only slight differences in the value of housing. This means whereas the first step of inequality is rather high, the second step is pretty easy to manage. (2) In a second group (e.g. SE) it is just the other way round: Whereas becoming a home owner seems rather easy, the value of housing strongly differs between different population groups (e.g. income groups). So inequality in housing concentrates on differences in the value of housing. (3) In a third group of countries (e.g. CH) both steps are very hard to climb. And finally (4) there is a forth group (AT, CZ) where inequality is comparatively low both in the chance of being a home-owner as well as with regard to the housing value.

Determinants of Home-Ownership and the Value of Housing Among Elderly Europeans

Nora Müller 1, Kathrin Kolb 1, Hans-Peter Blossfeld 1

1 Chair of Sociology I, UNIVERSITY OF BAMBERG, Bamberg, Germany

Abstract: Gender mainstreaming has been defined as a strategy which aims to bring about gender equality. The concept emphasizes that we must bear in mind the different consequences that legislation and action plans can have for women and men. Since the concept was first proposed in 1985, the vocabulary has been broadly adopted internationally. However, there are various levels of implementation and progress. In both the political and academic debates the differences are substantial, for example with respect to the formulation of goals and how other bases for inequality are addressed. In this paper, I discuss the strategy from an intersectional perspective by way of analysing how gender equality and age based equality interact. By referring to qualitative data I shed light on how different applications of gender mainstreaming can both maintain and challenge asymmetrical age relations. In so doing, theoretical tensions and research frameworks will be reconsidered.

Friend or For? An Age Perspective on Gender Mainstreaming

Clary Kekula 1

Abstract: Gender mainstreaming has been defined as a strategy which aims to bring about gender equality. The concept emphasizes that we must bear in mind the different consequences that legislation and action plans can have for women and men. Since the concept was first proposed in 1985, the vocabulary has been broadly adopted internationally. However, there are various levels of implementation and progress. In both the political and academic debates the differences are substantial, for example with respect to the formulation of goals and how other bases for inequality are addressed. In this paper, I discuss the strategy from an intersectional perspective by way of analysing how gender equality and age based equality interact. By referring to qualitative data I shed light on how different applications of gender mainstreaming can both maintain and challenge asymmetrical age relations. In so doing, theoretical tensions and research frameworks will be reconsidered.

Inheritances and Inequality: New Perspectives on an Old Subject

Harald Künemund 1

1 Institute for Gerontology, UNIVERSITY OF VECHTA, Vechta, Germany

Abstract: Recent research on intergenerational transfers shows that the transfer of financial resources from parents to children remains important throughout the life course, both as inter vivos transfers and as bequests. This influence is unequal, however; some children profit from transfers while others do not. Both common sense knowledge and a large body of literature argue in favor of a Matthew effect: These transfer favor children who are better off and, hence, increase inequality. It has also been argued that find that inter vivos transfers tend to go to the more needy children of a family and, in consequence, reduce inequality. But as inheritances are usually divided equally between all children, the societal picture seems to be clear: Those who already have resources are more likely to receive a bequest, and they are more likely to receive larger amounts of wealth.

New empirical findings based on a longitudinal analysis of the German Socio-economic Panel allow for a more detailed account. It will be shown that the three possible interpretations a) inheritances increase social inequality, b) inheritances reduce social inequality, and c) social inequality is widely unaffected by inheritances, are valid at the same time. These findings contradict both common sense knowledge and a large body of scientific literature. It will be argued that the main reasons for these contradictions are imprecise definitions of inequality (absolute values vs. relative distributions) and imprecise determination of the target population (cohorts of children vs. cross-sectional samples) in both cases.

While large transfers and bequests show a clear Matthew effect by going disproportionately to children who are already better off, they seem to be particularly valuable for the less well off for whom they form a larger share of current income and wealth, and may help them not only to make ends meet but even to accumulate some small wealth. Large transfers and bequests are a way of extending parental status transmission to children well into the latter’s old age, and thus contribute to preserving status inequality from the parents’ to the children’s generation. But this does not mean that they increase overall relative wealth inequality; under the conditions of distribution and taxation valid in Germany, for example, they tend to make the societal wealth distribution somewhat less unequal.

Situation of Older Generations Based on EU-SILC in Selected Central and Eastern European Countries

Abstract: This paper offers a unique overview and joint comparison of some countries of Central and Eastern Europe (CEE): Poland, Lithuania, Hungary, Czech Republic, Slovakia, Latvia, Estonia by presenting the socio-economic situation of older generations using the EU-SILC 2007 and 2008 data. Information about the older generation could be presented using i.e. SHARE but only from the age of 50+, and we would like also to compare some of these results with younger generations (not only below 65 but also below 50 years old).

Recent SHARE data is also a good source of analysis of the population 50+ but again there is a limited source of comparison for all countries in the CEE as in Wave 2nd (2006) only the Czech Republic and Poland were included.

Therefore the aim of preparing this paper is to check if the EU-SILC surveys could be used in an analysis of the situation of older persons and the consequences of population ageing. Currently, there are a lot of indicators by gender and by age (including different ages) available via EUROSTAT’s web page. However, not all of them are interesting from the comprehensive and more in-depth analysis of the socio-economics of ageing. So having the possibility to use individual data from EU-SILC 2007 and 2008, there were more analyses (including multivariate data analysis, analysis of similarities and differences between countries) performed.

We focus on the overall economic situation and living conditions of older persons. We are not only focused on income, poverty or living conditions, but rather on cross topics to show the results for the group of interest (with a comparison to the younger one) according to two approaches: 1) first, the presentation of the situation of a household with an older member (using the household interview), and 2) second, the situation of older persons (using personal interviews).

In this respect, the whole analysis is crucial to assess the quality and usefulness of the EU-SILC in presentation the situation of older generation of Central and Eastern European countries. We present the comprehensive analysis of the situation of an ageing population with stress not only on just the presentation of some results, but mainly focusing on the missing gaps in data/information by offering an analysis of those gaps with recommendations for data collection systems to facilitate future international comparisons.

AGING IN SWITZERLAND: PROGRESS AND INEQUALITIES

Catherine Ludwig 1, Stefano Cavalli 2, Michel Oris 1

1C.I.G., UNIVERSITY OF GENEVA, Carouge, Switzerland

Abstract: In this communication, we present “Vivre / Leben / Vivere” (VLV) a large interdisciplinary survey addressing the life and health conditions of individuals aged 65 and above living in Switzerland. This survey is the third wave of a study initiated in 1979, replicated in 1994/5, and run in the canton of Geneva and in the Central Valais, two French-speaking areas. In 2011, VLV extends the original design to the German and Italian-speaking areas of Switzerland. As a whole, the survey targets a representative sample of 4’200 individuals, stratified by age and sex. Quantitative data are collected by means of one questionnaire and one interview addressing multiple spheres of the individuals’ life, including social relations, participation and values, as well as physical and psychological health, all considered as interacting resources available to the individuals to manage and deal with life constraints. A life calendar is also used to grasp major past life events, and provide hints of life course trajectories. The objectives of VLV are twofold: first it aims at providing an updated view of life and health conditions of the population aged 65 and above in Switzerland, with a major concern in addressing diversity and inequalities. Second, VLV aims at comparing these actual conditions to those reported in 1979 and 1994/5, hence proving means to address the sustainability of the positive trends reported previously. In the face of the fast changing times and growing demography of the aged population, VLV is a rare opportunity in Europe to acquire exhaustive and cardinal knowledge on the heterogeneity of the life conditions of the aged and their changes over the past 30 years.

“I’M TOO OLD TO WORK BUT TOO YOUNG TO RETIRE”: INVOLUNTARY JOB LOSS IN MIDDLE AGE MEN

Rita Borges Neves 1, Alice Delerue Matos 1

1Research Centre for the Social Sciences, University of Minho, Braga, Portugal

Abstract: To the working classes in occidental societies paid work traditionally guarantees the fulfilment of basic needs, is central to identity and enables a sense of control. In fact unemployment not only can deprive from material goods but also cause depressive feelings, anxiety and low self-esteem (1, 2). For older breadwinners economically dependent on paid work, involuntary job loss may represent an early labor market exclusion(3). Bering that in mind, how can middle age men responses to involuntary job loss be understood?

This study intends to shed some light on this overlooked topic as it approaches the impacts of involuntary job loss on older and less qualified actives in terms of wellbeing and self (re)definition.

Life histories were collected through semi-structured interviews on 10 unemployed blue-collar Portuguese men over 55 years old. The interviewees had been made redundant less than a year ago.

Results show that unemployment impacts on wellbeing and self are less negative when i) there is absence of significant financial engagements (as mortgages); ii) the event is perceived as empowering as it releases from work; iii) “retired” or “pre-retired” and not “unemployed” status is interiorized; iv) individuals are less resistant to see themselves as “old”.

Labour market status is deeply intertwined with different stages in the life cycle and for these interviewees ageing “naturally” implies the disengagement from adulthood roles such as work. However as an early exclusion from the labour market, unemployment is perceived as treason to a social pact of work availability and a “normal” life-course. Some of the negative effects of unemployment on wellbeing can be diverted when an aged identity is incarnated and this event is incorporated as part of the ageing “natural” process.

Abstract:

EMPLOYMENT BIOGRAPHY

GAINFUL EMPLOYMENT IN RETIREMENT: WAY OUT OF OLD-AGE POVERTY OR CONTINUATION OF EMPLOYMENT BIOGRAPHY?

Carola Burkert 1, Daniela Hochfellner 2

1Research Network, Institute for Employment Research, Frankfurt, Germany
2Research Data Centre, INSTITUTE FOR EMPLOYMENT RESEARCH, Nuremberg, Germany

Abstract: The withdrawal from employment can be seen as a synonym for standing on the threshold of a new stage. Going into retirement is associated with a loss of resources such as income, social networks and the role identity. In modern societies, the problem for old-age pensioners results out of the income change and hence affects their financial situation. In the case of Germany the statutory pension insurance makes mostly the bigger part of the income of individual household and therefore determines the financial life situation in older age. Especially individuals with short periods of contributions payments or with low earned income are in danger to draw a statutory pension which is not enough to make a living. The lower retirement benefits may cause, that retired individuals pursue a profession to enhance their income and therefore avoid old-age poverty. We analyse the employment propensity of retired individuals. The focus is to find characteristics which influence the probability of being employed during the term of drawing a statutory pension. To answer our questions we used German administrative labour market data and combined them with administrative data of the German Pension Insurance. Hence we had information concerning the biography of 30.000 retired individuals.

The results show that about 20% of the observed individuals do have a job whilst drawing statutory pension payments. If the rising employment propensity of retired individuals could be seen as an indicator of increasing old-age poverty it has to be a specific group of retired individuals who are employed furthermore such as less qualified with low income profiles or incomplete and shorter employment biographies. Because this is mostly the case when a migration background exists, we took account for this in all our analyses.

If the rising employment propensity of retired individuals is not directly linked to old-age poverty one can assume that it is not this specific group that is employed. The problems they had to face on the labour market in younger age are assigned to the stage of retirement as well. Hence, it is not the low-qualified pensioner, who is in danger of poverty, who is employed but the high-qualified pensioner who proceeds the previous employment life despite being retired.

Our study results support the second mentioned scenery, which we would like to present and discuss in detail.

RETIREMENT TIMING IN EUROPE. DOES SECTOR MAKES A DIFFERENCE? EXPERIENCES FROM SHARE

Hanne De Preter 1, Dimitri Mortelmans 1

1Sociology (CELLO), UNIVERSITY OF ANTWERP, Antwerp, Belgium

Abstract: Although the average retirement age in Europe has been increasing, the Lisbon target of an employment rate of 50% among older workers (55-64 year) still has not been reached (Barr & Diamond, 2006; Eurostat, 2010). An often mentioned solution is to increase the retirement age (Meijer et al., 2008), which stresses the importance of understanding the factors that influence the timing of retirement (Fischer & Sousa-Poza, 2006). In the literature, determinants are identified at the personal, household and institutional level (Beehr, et al., 2000; Fischer & Sousa-Poza, 2006; Wong & Earl, 2009). In our research, we focus on the individual level on the influence of sector in which older workers (50+) are employed. In 11 European countries we study the effect of sector on the timing of retirement. This is rather innovative, since previous research is unclear about its effect. Heyma (2001) found for the Netherlands that workers in the industrial and construction sector have the highest hazard on retirement, while Dorn and Sousa-Poza (2004) discovered a very low hazard in construction and manufacturing. Furthermore, Heyma (2004) didn’t find different retirement hazards for employees working in either the private or the public sector. Dorn and Sousa-Poza (2004) and Fisher and Sousa-Poza (2006) on the contrary, found that the public sector has got a larger probability of early retirement than other economic sectors. The effect of sector (NACE) on the retirement timing of older workers will be tested with the use of event history analysis. We control for occupation (ISCO-88) within the sector, for socio-demographic variables
(gender, age, educational level), other personal characteristics (marital status, health, household income) and work characteristics (job satisfaction, firm size, quality of labour, contracted work hours, contract duration). In order to process the model with longitudinal techniques, we use longitudinal micro data of the first and second wave of SHARE (Survey of Health, Ageing and Retirement in Europe). Furthermore, we apply GEE methods to model the clustering in countries to become a reliable estimate of the parameters. Considering the literature and our descriptive data, we expect high retirement hazards for employees working in manufacturing and construction. Further, we expect for employees in the private sector a higher probability of early retirement than in the public sector.

**SHOULD WE BE CONCERNED ABOUT AGE DISCRIMINATION? EMPLOYERS AND OLDER WORKERS IN CONTEMPORARY JOB MARKET IN POLAND**

Justyna monika Stypinska¹
Jagiellonian University, krakow, Poland

Abstract: The problem of age discrimination has been widely discussed in research and theoretical analysis by many scholars in Europe. The results of different studies show two distinctive trends. First of all age discrimination is perceived by large public opinion (from approximately 50 to 70%[1]) as a very important social problem. On other hand, asked about experiences with age discrimination, only about few (5-18 %) percent of adult respondents admit they faced this problem in their real lives. What is then the extent of the phenomenon of age discrimination? How is it to be measured in order to most accurately reflect the social reality?

The paper aims to present the results of empirical studies, both qualitative and quantitative, describing the issue of discrimination on grounds of age in employment in Poland. The results sustain the dichotomous character of age discrimination – the perception of high social gravity of the problem and the relatively small extent of experienced direct discrimination by the older workers. On the other hand, the qualitative analysis of the attitudes of the employers towards older employees and job seekers presents quite widely spread indirect discrimination in form of negative image of the potential of older workers influencing the hiring decisions with little or no experience with this age group of employees.

The paper shows thus the trends in hiring and maintaining older workers in the labor market in Poland and the possible threats concerning the stability of the employment in Poland.

**ECONOMIC SITUATION AND INTERGENERATIONAL RELATIONS OF OLDER PEOPLE IN TANZANIA**

Nele Marie Tanschus¹
¹Department for Gerontology, UNIVERSITY OF VECHTA, Vechta, Germany

Abstract: In the traditional arrangements for social security in old age the younger generation in Tanzania used to provide for the older one (Bossert 1987). It is assumed that due to certain social developments this might change into a direction where younger generations could be unable or unwilling to provide support for the older generation anymore (Kaseke 1996 & 1997, Apt 2002, Mchomvu/Tungaraza/Maghimbi 2002). This suggests that the intergenerational relationships might not work properly as an informal old age security anymore and that the quality of life of old people in Tanzania will decline, because a well working formal social old age security does not exist for Tanzania. If this is the case, it would be crucial to know about the needs and capacities of older people in order to find appropriate solutions for assuring a certain quality of life.

The paper aims firstly at examining if it is true, that the quality of life of older Tanzanians is characterized by specific deficits. The measurement chosen for this analysis are the living conditions reflected in the economic situation of old people in Tanzania.

In a second step the roles which intergenerational relationships play in securing old peoples quality of life will be looked at. By doing so, it is not only important to know, what role the support by others plays in the everyday life of old people. It is also relevant if they themselves provide support to others. This examination of the connection between economic resources of older Tanzanians in the meaning of personal capability to provide support or to reciprocate in case of receipt of informal help might give implications for evaluating the quality of intergenerational relationships and their prospects of helping to make ageing secure.

Empirical findings from the Study on Global Ageing and Adult Health (SAGE), developed by the WHO Multi-Country Studies unit, will be used in the paper to provide first answers to those questions by looking in detail at the income of older Tanzanians, their expenditure for every day life and social support with the focus on private monetary transfer relations. Based on the empirical findings, the quality of life and the status of intergenerational relationships as well as possible implications for social policy will be discussed.

**GRANDPARENTHOOD: A UNIVERSAL ASPIRATION FOR LATER LIFE? ON THE SUBJECTIVE IMPORTANCE OF THE GRANDPARENT ROLE IN GERMANY**

Katharina Mahne¹, Andreas Motel-Klingebiel¹
¹GERMAN CENTRE OF GERONTOLOGY, Berlin, Germany

Abstract: In the light of changing opportunity structures for the transition to and the experience of grandparenthood, we address older people’s attitude towards the grandparent role. We test the overall hypothesis of the social structural universality of the importance of grandparenthood. This implies that the grandparent role is a general aspiration for later life and hence independent of an individual’s position in the social structure. It is, however, assumed that the importance of grandparenthood is closely linked to and varied across different living situations, family settings, and value orientations towards life in general.

Analyses are based on data of the German Ageing Survey, a nationally representative cross-sectional and longitudinal study of individuals aged 40 years and older. Data collected in 2008 provide information on the subjective importance of (prospective) grandparenthood as reported by grandparents and non-grandparents.

Regression analyses show that the subjective importance of (future) grandparenthood does not in fact vary by social class. Instead, we find relationship quality with grandchildren to be most influential and positively related to the perceived importance of the
grandparent role. The same holds true for the non-grandparents and relationships with children. Conservative and familialistic value orientations promote the importance of a future transition to grandparenthood only. Union dissolution is in any event associated with lower levels of grandparenthood importance. Consequently, grandparenthood must be understood as a universal aspiration for later life that is independent of social structure and therefore an independent aspect of quality of life in old age. Given the changing chances and opportunities to experience the grandparent role, grandparenthood evolves into an indicator for inequality in later life.

INTERGENERATIONAL RELATIONS AND POLICIES IN RUSSIA
Gulnara Afruzovna Minnigaleeva 1, 2*

1 Public Policy Department, NATIONAL RESEARCH UNIVERSITY HIGHER SCHOOL OF ECON, Moscow, 2 Senior Resource Center Wisdom Ripening, Tuymazy, Russian Federation

Abstract: Our report discusses findings from the survey of 492 older citizens (women 55 and over and men 60 and over as it is the pensionable age in Russia and a person “officially” acquires the status of an “older person”) in 5 Russian cities different in size, regional and ethnic specifics, and level of involvement of older adults.

Intergenerational relations in Russia are quite different from those in Europe. Clearly, in most families the connection between generations is quite strong.

Unlike in Europe or North America many families live in two or some in three or four generations’ households. On average 36% of the survey participants reported that they live with their children. A significant number of older persons live with their grandchildren (17%). Quite surprisingly more participants in bigger cities (up to 49%) live with their children and grandchildren than in smaller cities (23-38%). This may be explained by the fact that it is much easier and cheaper for a young couple to move in a new flat or house than in a big city.

Also it is common that the older generations help the younger ones financially till quite late (up to the age of 30 of the offspring or even later). And in most cases children support the elderly parents financially and assume the role of caregivers if needed, not trusting this to institutions. About 12% of the survey participants reported that their children support them financially. More older persons in the most financially depressed region and in the most prosperous region reported receiving financial support from children and other relatives.

On the other hand, with the economy transitions and political changes, often people view other generations outside of their households as very different and sometimes even evil. What clearly is missing here are intentional policies and opportunities for intergenerational interactions implemented by governmental or non-governmental organizations. Only 24% of survey participants reported that participation of older persons is planned in most family-oriented events. 33% reported that schools and educational institutions involve older persons in their events for school children. About half of participants admit that events for older adults are usually organized within the community (in community centers, schools, libraries, etc.). However, all the numbers vary greatly (in some cases by 40%) depending on the city.

SOCIAL RELATIONS (NETWORKS) IN AGING SOCIETIES: GERMANY, ROMANIA AND TURKEY
Aylin Cakiroglu Cevik 1, Ozgur Arun 1

1 SOCIOLOGY, MIDDLE EAST TECHNICAL UNIVERSITY, ANKARA, Turkey

Abstract: Social relations (networks) have been considered as an important aspect for the adaptation, integration, adjustment, social capital, social support and subjective well-being of older people since 1980s. Every country has different structure of social relations as well as different story of aging process. The aims of this article are to describe and to compare the structure of social relations of older people from Germany, Romania and Turkey. These countries were selected by the status in the European Union which means that Germany is as old member, Romania as new member and Turkey as candidate country of EU. They will be analyzed by using data provided by European Quality of Life Survey (EQLS) 2007. In addition, the concept of social relations includes directly or indirectly contact with family, friends, relatives; social support; marital status; having children and attending a meeting of social groups or religious service. In short, we aims to figure out the question that how social relations (networks) operate during aging by countries. Analysis has indicated that the majority of older people (65+) in Germany live with her/his spouse/partner (% 60.3) while the ratio of those in Romania and Turkey is relatively lower (respectively % 32 and % 43). On the other hand, the single older people usually live with children except those in Germany (%1.8). Another finding is that half of older people in Romania have no children while this ratio is so low in Germany and Turkey (respectively % 13.7 and % 9.1). When we consider the social support, the most important supporter for elderly in all country is family.

INTRA-FAMILIAL SOLIDARITY OF ADULT GENERATIONS. SOME ROMANIAN EXCHANGE MODELS
Cristina Tirhas 1

1 Social and Political Sciences, AVRAM IANCU UNIVERSITY, cluj, Romania

Abstract: International literature has a long standing tradition in describing patterns of kin support, especially the different ways of exchanges between parents and their adult children. Despite much of the research has focused on patterns of discrete types of support, the tendency is to ignore the linkages between different domains. In the same time, the majority of these approaches are directed towards investigating the role of several variables in determining intra-familial exchange and the existence of inter-cultural similarities, while less is known about the ways in which those involved in such linkages see themselves and the linkages they are involved into. This latter, ‘from inside’ perspective can add important nuance to the study of intra-generational exchanges and my study follows this approach.

In Eastern European areas the nature of kin support in adulthood and its determinants remain almost unknown at the level of explanations given by subjects themselves. In my study, the nature of giving and receiving support between generations in some Romanian rural and urban families is examined in te light of these issues. I engage in the study of four groups of intergenerational exchange which emerged as a result of factorial analis, on a representative
sample of 180 respondents aged 20 and older (adult parents and their parents), from two urban areas and two rural areas. Systematic differences in intergenerational giving and receiving have been observed by age, gender, family structure, socioeconomic status and proximity to kin. One important theoretical view is focused on altruism as one of the factors which lead to parental transfers to children. An alternative perspective suggests that assistance is given to motivate reciprocal exchange over the life course. In investigated areas, our results suggests that the pattern of inter vivos transfer behavior is more consistent with the exchange model than with the altruistical model.

DISJOINTED STRUCTURAL SYSTEMS AND KEEPING WARM FOR THE ELDERLY IN WINTER
Angela Mary Tod 1, 2*, Adelaide M Lusambili 3, Jo Cooke 4, Catherine Homer 5, Kathleen A McDAID 5, Jo Abbott 1
1Center for health nd social care, sheffield Hallam Univeristy, 2Public Health, SHEFFIELD HALLAM UNIVERSITY, Sheffield, 3Public Health, National Health Services/UK, Rotherham, 4Public Health, CLARHC, 5NATIONAL ENERGY ACTION, South Yorkshire, United Kingdom

Abstract: This article presents independent research commissioned by the National Institute for Health Research (NIHR) under its Research for Patient Benefit (RfPB) Programme (Grant Reference Number PB-PG-0408-16041). The views expressed are those of the author(s) and not necessarily those of the NHS, the NIHR or the Department of Health.

Using Sociological Structural Functionalism Theory (SSFT), this paper will discuss how disjointed systems create challenges for older people in keeping warm at home in winter. The selected findings are based on a mixed method qualitative study that was conducted in Rotherham, an area in South Yorkshire Coalfields in the North of England. In Rotherham fuel poverty and excess winter deaths are amongst the highest in the country (KWILLT original proposal 2009: p2). Findings from this study shows that financial constraints, the nature and type of social connectedness, technology and type of housing are significant barriers to older people. Other challenges are a number of social and cultural behavioural mediators such as age, mindset, and fear and trust (see also Boardman 2010; BERR 2008 Maheswaran et al. 2004; Hajat & Haines 2002). While most of these findings seem to concur with the previous closely related studies, the current study provides insight into how disjointed systems that are not integrated and interconnected amplify other barriers. Available information concerning heating and help such as benefits, affordable warmth initiatives are difficult to find and access as systems are disjointed. People struggling with the daily challenges of age are likely to remain cold in winter whilst they remain baffled by fragmented systems. This paper provides insight to inform health and social care providers as well as those developing and implementing policy. Implications of concern related to current policy are considered. The paper reflects on the sociological theory of structural functionalism, on how the components of society work and how failure in one feature affects the whole society. The paper fits in the theme of Sociology of Ageing and Technology (SAT).

EDUCATIONAL DYNAMICS IN MORTALITY COMPRESSION IN SWITZERLAND, 1990-2000
Mathias Lerch 5, Michel Oris 2

1Institute for Demographic and Life-Course Studies & NCCE LIVES, 2Interfacultary Centre of Gerontology & NCCE LIVES, UNIVERSITY OF GENEVA, Genève, Switzerland

Abstract: Fries (1980) argued that although chronic diseases and senescence are progressively postponed to higher ages, improvements in life expectancy get harder to achieve the closer it reaches a much debated biological limit. People stay longer in good health but ultimately succumb at about the same age. If this trend in mortality compression around the population’s mean age at death, as well as the implied rectangularisation of the survival curve, has been confirmed for Switzerland until the early 1990s, life durations kept on lengthening while mortality compression stagnated later on (Cheung et al. 2009). Period trends in mortality compression of the aggregate population may result from different effects: divergent trends in period mortality of educational groups, cohort effects due to the historical spread of education, and differential cohort mortality during the 1990s. If the first effect would point to inequalities in health improvements, the latter two would indicate the impact of a compositional change of survivors. We question to what extent the constant level of mortality compression between 1990-04 and 2000-04 resulted from unequal improvements in health or if it concerned all Swiss inhabitants irrespective of their socioeconomic status.

Our analysis relies on the Swiss National Cohort database – a follow-up study developed through probabilistic record linkages of the census-enumerated population (in 1990 and 2000) and its successive deaths (1990-2005). Given our emphasis on cohorts, we focus on the Swiss-born elderly population in 1990 who either survived until 2004 or died in the intercensal period. Multivariate analysis of cohort mortality between both censuses highlights the primary role of education in shaping cohort selection. Decennial trends in longevity and mortality compression of educational groups are thus described using life-table indicators. We then confront the trend in mortality compression of the total population with three scenarios, assuming respectively: a) no educational differences in period mortality trends between 1990 and 2000, b) equal distributions of education across age groups at both census dates and c) no educational differentials in cohort selection. The aim is to assess whether the recent plateau of mortality compression in Switzerland resulted from differentiated health improvements or from compositional effects.

THE OUTCOMES OF PARTICIPATORY METHODS AMONG ELDERLY RESIDENTS: ATTITUDES AND REACTIONS IN DEVELOPING COHERENT ALCOHOL PRACTICES – DRUG RULES IN SERVICE HOUSING PROJECT 2009-2011
Eija Kaskiharju 1, Anne-Katri Kemppainen 1
1AGE INSTITUTE, Helsinki, Finland

Abstract: Background: Drinking habits and alcohol use of older adults have been studied and discussed in public debate during the last ten years. The theme has been present, for example, in the EU Vintage project and during the Swedish EU Presidency in 2010. In Finland, national and local development projects were carried out to investigate the needs of older adults with their drinking problems.

Objectives: This paper is based on the findings in the project “Drug rules in service housing”. The idea was to include both the staff and
residents to develop joint and coherent practices of dealing with alcohol issues in the service housing environment. Action research was undertaken as an inquiry method with a strong emphasis on participatory methods. Some examples of these approaches included interviews, information sessions with discussions, brochures, coffee parties, small talk and frequenting, voting for and against sessions, reading news on alcohol and elderly sessions. The aims of the participatory methods were to increase interaction between the residents, staff and project workers.

The aim of the participatory methods was to activate and encourage the residents to express their thoughts on alcohol issues in later life. Those who took part in various meetings and interviews gave valuable insight into alcohol and ageing topics that could be utilized in developing the joint and coherent practices for the whole community. However, the whole process of participation was very demanding with many ups and downs.

Aim: The aim of this paper is to present the participatory methods and their outcomes. During the process we found out that speaking about alcohol and ageing can be complex and sometimes even impossible. In the beginning some fear of stigmatisation emerged among the residents. Despite some obstacles and resistance, the project was able to produce new knowledge about attitudes to alcohol use and ways to approach and confront various user groups. Many residents have been interested in hearing the research results and giving feedback to the project workers.

WHERE DO PEOPLE DIE IN EUROPE? ON THE QUESTION OF DYING IN INSTITUTIONS

Michaela Thönnes 1, Nina R. Jakoby 1
1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: There is a great discrepancy in society between the number of people that prefer to die within their home and the number of cases where this wish actually becomes reality. The most frequent place of dying in Western societies is not the home but an institution, such as a hospital or nursing home. There is general agreement that the process of dying and the people involved therein have shifted from the personal privacy of the home to the professional enclaves of hospitals and nursing homes in the past sixty years. The terms institutionalization or hospitalization stand for a process of banishing death and dying from everyday life. The hospital as a place of dying has been the target of much controversy. But what is the actual distribution of places of dying? Can we identify social patterns of dying related to the various places of dying? The presentation provides a theoretical and empirical overview of place of dying as a social phenomenon. Contemporary discourse on the institutionalization of dying is subjected to critical scrutiny in light of the state of the art of research. The investigation is based on European studies that provide data on the frequency of people dying in hospitals, retirement or nursing homes, hospices, or at home. In addition, other factors determining places of dying, such as medical, structural, socio-demographic, and individual factors, will be summarized. Such an analysis raises interesting questions concerning the influence of social inequality on dying.

A COUPLE’S RETIREMENT DECISIONS IN THE FAMILY CONTEXT: AN EMPIRICAL STUDY

Van Thi Mai Bui 1,2*
1Max Planck Institute for Demographic Research, Rostock, 2Institute for Economics, University of Rostock, Rostock, Germany

Abstract: This study investigates the retirement decisions of married couples in Germany between 1984 and 2009 using the German Social-Economic Panel data (GSOEP). We perform separate estimations for husbands and wives under taking into account their spouses’ retirement behaviors in order to assess whether the effects are symmetric. We show that the husbands and wives have more propensities to retire if their spouses were retired. The effects of educational level, occupational characteristics such as self-employed, health indicators, satisfaction with leisure time and age on husbands’ and wives’ retirement are also symmetric. In particular, husbands and wives who have higher education are more likely to exit the labor market earlier than those who have lower education. Satisfaction with leisure time has a positive effect on the propensity of husbands and wives to retire. For those who are self-employed, they are more likely to delay their retirement. Being to be good or very good health induces both husbands and wives to postpone their retirement while being to bad or very bad health leads them to retire early. The variable cumulative duration of employment over the life which is aimed to measure early stages in the employment career has a significantly positive effect on the husbands’ and wives’ retirement. The dummy variable for the legal reforms coming into effect at the beginning of 2001 has a negative impact on the retirement of the husbands and wives. The family context does matter in the married couples’ retirement decisions but this paper indicates the gender asymmetry in response to the family characteristics including owner of the house, total household income, number of persons in the family, and size of the house. Only does the presence of a person in need of care postpone both husbands’ and wives’ retirement but it is still not significant for the wives. In addition, considering dual retirement we perform a separate analysis in which both spouses were employed at the age of fifty since the market roles over life course are highly gendered in West Germany.

DOES WORKING HOURS REDUCTION IN A MOVE TO FULL RETIREMENT WORKS? AN ANALYSIS OF THE EFFECTIVENESS OF THE LATE CAREER WORKING HOURS REDUCTION SYSTEM IN BELGIUM

Dorien Van Looy 1
1SOCIOLOGY, UNIVERSITY OF ANTWERP, Antwerp, Belgium

Abstract: Flexible working time arrangements at the end of the working career are put forward by the European Union as a magical formula to enhance the labour market participation of people aged 50 and over. By guaranteeing a more optimal balance between "work" and "life", people in a later career stage ought to be able to combine family responsibilities, leisure activities, social contacts and financial sustainability. In this paper, we try to answer the question whether people reducing their working hours in a move to full retirement will retire later compared to their counterparts who stayed full-time employed. We ask ourselves how this effect differs according to socio-demographic and job-related control variables? We will answer this question with an event history analysis on the SHARELIFE-data. In the analysis, 2983 Belgian respondents are included. In 2009, 1230 of them were retired. We study their trajectories from work into retirement from the age of 50 on. In the first stage, we determine how much people made a transition from full-time to part-time work in a move to full retirement and situate
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

them in the set of all trajectories from work into retirement. In the second stage, we test whether people who made the transition from full-time to part-time employment, controlled for socio-demographic – and job-related background variables, retire later. In the third stage, the aim is to test interaction-effects to see whether the effect of part-time employment on the effective retirement age differ according to different socio-demographic- and job-related background variables.

HOUSEHOLD DETERMINANTS INFLUENCING THE JOINT RETIREMENT DECISION OF OLDER COUPLES
Kim Denaeghel 1, Dimitri Mortelmans 1, Arie Weeren 1
1UNIVERSITY OF ANTWERP, Antwerp, Belgium

Abstract: Although the retirement decisions of older workers (especially men) have been widely studied, most studies still treat retirement as an individual phenomenon while little attention has been paid to the retirement behaviour of older (married) couples (Henkens, 1999; Hurd, 1990; Jiménez-Martin, Labeaga, & Martinez Granado, 1999). However, a growing literature recognizes that retirement decisions are made within the context of the family (Pienta & Hayward, 2002; Szinovacz & Deviney, 2000; van Solinge & Henkens, 2005).

This paper focuses on the joint retirement hypothesis, which states that husbands and wives tend to retire at the same time (Hurd, 1990). Research has shown that couples often coordinate their retirement decision based on a variety of reasons as many workers withdraw from the labor force at about the same time as their partner (Johnson & Favreault, 2001).

In the analyses, couples aged 50 to 70 years old were selected and a distinction was made between single- and dual earner families. Spousal characteristics influencing the joint retirement decision are age, education, health, finances, activity status and taking care of dependents. Data were drawn from the European Community Household Panel (ECHP) which presents longitudinal data for fifteen West-European countries running from 1994 to 2001. Because of the household level, repeated events are analysed using multi-level event history (Steele, 2008). A random effects logit model, also known as a (shared) frailty model is used to measure the influence of household determinants on the self-defined or self-reported retirement of (older) couples (Wienke, 2003).

Based on previous research from the authors, we concluded that the family context in which labour supply decisions are made is critical to understanding the retirement process (Johnson & Favreault, 2001). Characteristics of the spouse and household determinants are expected to be important predictors of the joint retirement decision of older couples in Europe (Pienta & Hayward, 2002).

LES FINS DE CARRIERE DES FEMMES ET DES HOMMES CONNAISSENT-ELLES LES MEMES TURBULENCES ?
Céline Schoeni 1, Magdalena Rosende 1
1University of Lausanne, Lausanne, Switzerland

Abstract: La communication porte sur les processus de recomposition des inégalités de sexe chez les seniors en emploi. Elle s’inscrit dans le cadre d’une recherche au sein du Programme national de recherche (PNR60) sur l’égalité entre les femmes et les hommes en Suisse et propose d’appréhender de manière novatrice, sous l’angle du genre, la question du maintien en emploi et de la transition vers la retraite des salariés·es âgé·es de 50 ans et plus. Les inégalités entre les sexes en deuxième moitié de carrière constituent un angle mort de la recherche. Les modèles de trajectoire professionnelle qui se dégagent des indicateurs statistiques considérés sont aveugles au genre. Or, en Suisse, la participation des femmes et des hommes au marché du travail diffère fortement selon la classe d’âge. Les parcours professionnels féminins ne sont pas structurés uniquement par le travail salarié. Entre 25 et 40 ans, les maternités et les soins aux enfants en bas âge viennent contrecarrer les logiques propres à la sphère professionnelle. Toutefois, l’état des connaissances sur la conciliation travail-famille ne nous permet pas de savoir si l’injonction à la « conciliation » demeure aussi forte en deuxième moitié de carrière. Par ailleurs, à l’heure où la question des seniors en emploi représente un enjeu social majeur pour les décideurs politiques en Europe, il paraît opportun d’interroger les mécanismes de différenciation sexuée des trajectoires et de mettre en évidence les logiques structurelles, institutionnelles et individuelles qui facilitent ou entravent les parcours professionnels féminins pendant la seconde partie de la vie active.

En croisant des données statistiques relatives à la participation au marché du travail et au régime de protection sociale, nous retracerons les grandes tendances de l’emploi des seniors en Suisse. À l’avant-garde des objectifs préconisés pour l’Europe, le cas suisse s’avère exemplaire dans la mesure où le taux d’activité des 50 ans et plus est particulièrement élevé (76,7% contre 59% dans l’UE) et que la part des femmes dans cette catégorie progresse de manière constante. Plus généralement, en resituant la Suisse dans une perspective internationale, nous nous proposons de questionner la pertinence analytique des modèles de trajectoires de fin de carrière (transition entre activité et retraite, fragilisation de la seconde partie de carrière) récurrents dans la littérature.

THE DOMESTIC CONTEXT FOR RETIREMENT: CHALLENGING MODELS OF INDIVIDUAL CHOICE OF THE TIMING AND MANNER OF RETIREMENT
Sarah Anne Vickerstaff 2, Wendy Loretto 2
2SSPSSR, KENT UNIVERSITY, Canterbury, 2Business School, Université of Edinburgh, Edinburgh, United Kingdom

Abstract: Against a global backdrop of population and workforce ageing, successive UK governments have encouraged people to work for longer and delay retirement. Debates about how to encourage people to extend their working lives focus mainly on factors affecting individuals’ decisions when and how to retire, with little recognition that such decisions are often taken within multifaceted domestic or family contexts. In addition, there has been scant attention to gender roles within these contexts. Drawing upon previous research, mainly in the US, we argue that fuller understanding of retirement can be achieved by taking into account the ways in which individuals’ expectations and behaviours reflect a complicated, dynamic set of interactions between domestic environments and gender roles, often established over a long time period, as well as more temporally proximate factors such as health shocks or unexpected redundancy. On the basis of a qualitative empirical study undertaken in three UK locations we present a number of contrasting case studies of couples following different retirement patterns. These show how established gendered divisions of labour within a household can persist and colour retirement transitions, whilst in other cases temporally immediate
'shocks' such a unexpected health events may disrupt the household’s established ways of distributing paid and unpaid labour amongst its members. Our analysis leads us to conclude that policy aimed at encouraging people to delay retirement needs to move away from the individual adult worker model implicit in much policy discussion and begin to frame retirement decision making more soundly in its social context, typically the domestic setting and gender relations in which the individual is situated.

ARE MARRIED PARENTS MORE SATISFIED WITH THEIR LIFES AND PARTNERSHIP THAN OTHER MIDDLE-AGED AND OLDER PEOPLE? ON THE RELATIONSHIP BETWEEN LIVING ARRANGEMENTS AND SUBJECTIVE WELL-BEING IN THE SECOND HALF OF LIFE IN GERMANY

Heribert Engstler

1GERMAN CENTRE OF GERONTOLOGY (DZA), Berlin, Germany

Abstract: Due to changes of partnership and parenthood histories, the variety of living arrangements is increasing. In Germany - as well as in other western countries - less people reach middle and old age being married and having children. Will this affect their well-being in later phases of life?

Research literature shows mixed evidence on the effects of marital status, union type and parenthood on subjective well-being. While earlier research mainly showed evidence for a general marriage benefit compared to those without a partner and cohabitating couples, more recent research found little difference between marriage and cohabitation in countries where cohabitation is more widespread and socially accepted. There are also ambiguous results on the effects of childlessness and different forms of parenthood on subjective well-being. Additionally, research often lacks the analysis of the interrelated effects of marital status, union type and parenthood on wellbeing.

This presentation addresses this issue using data of the German Ageing Survey 2008, a representative sample of 40- to 85year old men and women (n=4018). Using covariance analyses, it examines the relationship between different living arrangements (marital status, union type, parenthood) and life satisfaction as well as union quality and perceived stability, controlling for other sociodemographic variables.

Results show a generally higher life satisfaction of those living with a partner. Cohabiting couples are as satisfied as married couples, with one exception: the divorced are less satisfied with their life even if they again live in a partnership. Cohabitors judge their relationship to the same degree as being well as married couples do, despite a lower perceived stability. The existence of children does not per se enhance life satisfaction. Having children coincides with higher life satisfaction only for married and cohabiting parents, whereasingle parents feature lower life satisfaction.

Rising numbers of partnerless people who never could establish a union or who got separated or divorced could become more relevant to the levels of well-being in middle and old age than the increase in childlessness.

CONFLICTS BETWEEN OLDER PARENTS AND THEIR CHILDREN IN 14 EUROPEAN COUNTRIES

Marc Szydlik

1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: Recent research has shown a considerable extent of solidarity between family generations. However, so far the investigation of intergenerational conflicts has been neglected. This is all the more surprising given that mass media often report on – allegedly – substantial conflicts between generations from youth to old age. From this perspective, daily conflicts are a regular feature of the relations between adult children and elderly parents and conflicts are seen as an indicator of a crisis of the family and a dissolution of family bonds. Furthermore, it is argued that permanent unsolvable conflicts would prevent generations from helping and taking care of each other which, consequently, may lead to isolation and deprivation in old age.

Within this framework a number of important research questions arise: To what extent are intergenerational relations between older parents and their adult children characterised by conflicts? What are the reasons for and the consequences of intergenerational conflicts? What is the relation between conflict and solidarity on the one hand and family conflict and societal contexts on the other?

The presentation will address these questions. First of all and from a theoretical perspective, conflict and solidarity will not be treated as opposites. Second, conflicts between generations will be compared with conflicts with other people, such as partners, friends and other relatives. Additionally, it will be investigated whether older people rather report on conflicts they have with their children than with their parents. Third, reasons and consequences of conflicts will be explored, for example, in regard to intergenerational contact, income, transfers of time and money, age, health, marital status, gender and migration. Fourth, connections between intergenerational conflicts within families and welfare state contexts will be examined, such as whether family conflicts depend on the extent of public support and whether strong welfare states lead to less family conflict.

The empirical investigations are based on the Survey of Health, Ageing and Retirement in Europe, focusing on 14 European countries, namely Austria, Belgium, Czech Republic, Denmark, France, Germany, Greece, Ireland, Italy, the Netherlands, Poland, Spain, Sweden and Switzerland.

OLDERLY CARE: DISPUTES AND CONFLICTS BETWEEN DEPENDENT PARENTS AND ADULT CHILDREN

Katerina Konradova

1Faculty of social science, Charles university in Prague, Prague, Czech Republic

Abstract: This paper is based on the analysis of quantitative research titled “Family Cohesion in the Elderly Care”, which was led by prof. PhD. Hynek Jerabek, CSc. Standardized questionnaires were used for data collection. The questionnaires investigated relationships in Czech families with dependent parents. The paper focuses on disagreements and disputes between non self-sufficient parents and their adult children. In addition to determining what conflicts families are facing, the study attempts to reveal disagreements which are representative for different phases of care. Typology of family relationships in dependence on which kinds of conflict prevail is created. The paper raises the question what determines belonging to a particular type of relationship, while attention is focused, inter alia, on the socio-economic determinants. The types

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
of relationships are not considered to be static, but are seen as changing over time with various events in the family. The data demonstrate how the degree of representation of each type varies in each phase of care. Conflicts are analyzed within the six dimensions of intergenerational solidarity and thus the paper tries to contribute to the understanding of solidarity and conflict in intergenerational relations, and specifically in the situation when aging parents need support.

THE « PROBLEM » OF INTERGENERATIONAL RELATIONSHIPS: POLITICAL RHETORICS AND SOCIAL INTERVENTIONS

Cornelia Hummel 1, Marie Débois 1, Léonor Després 1, Nora Meister 1, Liilia Isambaeva 1, Alexandre Pillonel 1

1Dpt of sociology, UNIVERSITY OF GENEVA, Genève 4, Switzerland

Abstract: This paper questions the present success for intergenerational topics within the public space. Through the profusion of narrative and practice concerning this issue, the intergenerational relationship appears inevitably as a problem: the demographical, social, economical and political mutations are summoned to explain the weakening – or lack - of intergenerational relationships, as a sign of a deeper alteration of social bonds.

Focusing on the intergenerational relationships outside the family, we analyse the ways these are constructed as a problematic issue in the fields of political discourse and social action in Switzerland. A qualitative analysis has been conducted on a corpus that includes, on one hand, political reports produced at the federal level and, on the other hand, a sample of intergenerational field projects. Which arguments are used to present the “intergenerational problem” as a fact? How is this so-called weakening of intergenerational ties explained? Which preventive or palliative solutions are proposed to restore or maintain the ties between generations?

The results presented in the paper are outcomes of a research conducted in Master’s workshop during one year.

THE PROBLEM OF NOT HELPING RELATIVES AND OTHERS IN WELFARE STATES

elina haavio-mannila 1, mirkka danielsbacka 1, j.p. roos 1

1social sciences, university of helsinki, Helsinki, Finland

Abstract: The core population of this study is European baby boomers born between 1945-50. We attempt to find out why so few of them give informal help to their children, other relatives and friends. To deepen the analysis, we studied the non-helping of grandchildren. Welfare state regime theory, including the crowding-in and crowding-out hypotheses, evolutionary theory and individualization theory were used in developing hypotheses and interpreting results.

The data consist of personal interviews and answers to mailed questionnaires. The information was collected in the second wave of the SHARE survey, which was carried out between 2004-07 in 14 countries. Finnish data from 2007, including comparable questions, was added to the data set. Linear regression analysis revealed that non-helping was predicted by a low level of education, having few children, being of older age, and attitude which supported the role of the welfare state as primary carer.

Of the four welfare state regime types compared there was least non-helping in social democratic (Nordic) regimes, next were insurance and market-based regimes. The most non-helping was discovered in family-based regimes. The crowding-in theory thus gained more support than the crowding-out theory.

Individualization theory assumes that as traditional social norms loosen, helping both diminishes in scope and intensifies: it is only given to those we really feel intimacy towards. Modernization should favour non-relatives as obligations toward relatives lose their importance. However, the non-helping of people’s own adult children was found to be less common than the non-helping of other kin and non-kin. This supports evolutionary theory, which assumes that people behave especially altruistically toward their own offspring.

Key words: non-helping; relatives, children, grandchildren, welfare state regime; individualization; evolutionary theory; altruism

THE CHANGING ROLE OF SOCIAL NETWORKS IN DIFFERENT SOCIO-ECONOMIC STATUS GROUPS OF ELDERLY AS A CHALLENGE TO CITIZENSHIP RIGHTS

Sibel Kalaycioglu 1

1SOCIOLGY, MIDDLE EAST TECHNICAL UNIVERSITY, ANKARA, Turkey

Abstract: This paper discusses the role of personal relationships in later life issues. In this context the significance of non-kin informal networks besides the intergenerational, kin networks for the elderly of different socio-economic status will be discussed. The research is conducted in 2010, on both a qualitative and a quantitative sample from Turkey, over 4,000 individuals over the age of 40. Firstly, in the presentation the effect of social networks on the coping strategies as well as on life satisfaction of the elderly of different SES will be described. Secondly, the existing institutional structure of ageing policies in Turkey will be discussed especially in terms of the challenge to the system of the welfare through the ageing population. Finally, the existence of different social networks will be argued in terms of how they effected the citizenship rights of elderly in Turkey.

AGEING AND HEALTH IN PORTUGAL: A GENDER ANALYSIS

Inês Gomes 1, Rita Burnay 1, Ana Fernandes 2, Maria Amâlia Botelho 3, António Manuel Marques 4, Ana Paula Gil 5

1Cesnova, FACULDADE DE CIÊNCIAS SOCIAIS E HUMANAS - UNL, 2Cesnova, Instituto Superior Ciências Sociais e Políticas, 3Faculdade de Ciências Médicas - UNL, Lisboa, 4Escola Superior de Saúde - IPS, Setúbal, 5Instituto Nacional Saúde Dr. Ricardo Jorge, Lisboa, Portugal

Abstract: The research aims at determining and analysing the relevance of gender to the health condition and health care utilization of the elderly, in Portugal, based on the data of the National Health Survey (NHS). Gender affects most areas of human existence, including health. Gender refers to the culture-bound convention about norms for – and relationships between – women and men. Social differences between women and men are learned, changeable over time and vary both within and between cultures. A National Health Service that is based on equity has to develop a high level
of sensitivity to discrimination issues which clearly includes sex and gender concerns. The importance of health equity in the Portuguese National Health Service creates the necessary background to determine and analyse the relevance of gender to the health condition and health care utilization of the population or population groups. In Portugal, the latest demographic indicators reveal that the main recent demographic trends have remained unchanged: slower population growth and demographic ageing. The inaction of social systems when confronted with demographic ageing will undeniably aggravate its social and economic impacts. Health and long-term care policies can certainly make a difference in transforming the pure demographic effect of ageing into very different social outcomes. For the general population access to health care and promotion is an important health determinant. The population ageing confers greater strategic importance to this determinant, once better health among the elderly will heavily rely on the level of access and services adequacy, especially for the frailest elderly. This way, a gender analysis in health and in health care among the Portuguese elderly may provide fundamental and practical answers to the public system, so that adequate policies may be formulated and better services organized. The NHS is a tool of measurement and observation in health that collects population representative data, creates estimates on health conditions, diseases and its determinants, and studies their evolution through time.

INDIVIDUAL-LEVEL SOCIAL CAPITAL AND HEALTH: A SURVEY OF 65- AND 75-YEAR-OLDS IN A CROSS-REGIONAL SETTING

Fredrica Nyqvist¹, Mikael Nygård ²

¹NOVIA UNIVERSITY OF APPLIED SCIENCES, ²Dep. of Social Sciences, Åbo Akademi University, Vasa, Finland

Abstract: Background: Although previous research has recognised an association between different aspects of social capital and self-rated health, comparatively few studies have been conducted on older adults. Furthermore, most evidence comes from within-country studies. By analysing data in a cross-regional perspective, this paper focuses on the ways in which social capital may function in a trans-regional setting. In this regard, Västerbotten in Sweden and Österbotten/Pohjanmaa in Finland are well suited for our purpose; since these regions are very similar to their socioeconomic, historical and cultural features, the robustness of such relationships can be tested against a contextual background.

Aims: The aim is to investigate the association between two essential indicators of social capital– social participation and interpersonnel trust– and self-rated health among 65- and 75-year-olds in Västerbotten, in Sweden, and in Österbotten/Pohjanmaa, in Finland. We first describe how the distribution of social capital varies between the two regions in Sweden and in Finland, respectively. We then study the ways in which social capital varies within different subgroups of older adults. Finally we return to our main research question to assess how social capital relates to self-rated health.

Methods: This paper utilises unique cross-sectional survey data, collected in 2005, on 65- and 75-year-olds in Västerbotten, Sweden, and in Österbotten/Pohjanmaa, Finland. Not only is this survey unique as to its extensiveness and its focus on older adults, it also yielded a relatively high response rate (71% and 67%, respectively). The research questions are investigated using descriptive statistics as well as multivariate regression analyses.

Results: The results show that social capital is associated with self-related health among older adults in a cross-regional perspective and that there is socio-demographic variation in social capital among 65-and 75-year-olds. Consequently, social capital can be seen as a significant and robust predictor of self-rated health in both regions.

HOW SOCIAL FACTORS, HEALTH AND CAREGIVING INFLUENCE SLEEP QUALITY IN LATER LIFE

Sara Arber ¹, Robert Meadows⁴

¹Sociology, UNIVERSITY OF SURREY, Guildford, United Kingdom

Abstract: Background: Sleep has been little researched by sociologists of ageing, especially the social and health patterning of sleep. The impact of providing care for older or disabled relatives has been widely studied, but limited attention has been paid to how caregiving influences the sleep quality of carers.

Objectives: This paper (i) compares the socio-economic and health patterning of self-reported sleep quality in later life (age >65) with those of working age (20-64 years), and (ii) examines how caregiving impacts on sleep quality and duration at working ages and in later life.

Methods: We analyse Wave 1 of the British Understanding Society survey for 2009 to compare the sleep patterns of older people (n=3131, aged >65) with those aged 20-65 (n=11355). Self-reported sleep duration (hours and minutes), sleep latency (unable to get to sleep within 30 minutes), problems of sleep maintenance (waking at night or early in the morning) and self-reported sleep quality are analysed using nested logistic regression models, which included gender, age, marital status, hours of caregiving, education, income, housing tenure, employment status, self-reported health and health limitations.

Results: Strong associations are found between living in disadvantaged circumstances and short sleep duration, poor sleep quality and reported sleep problems. Older people with less education, lower income and living in public housing are more likely to report poor sleep. These associations with social disadvantage are weaker above age 65 than for the working ages. Self-reported health, health limitations and co-resident caregiving are strongly linked to poor sleep. There is a linear association of hours spent caregiving with poorer quality sleep, which among older people is not moderated following adjustment for co-variants. Non-resident caregiving had no effect on sleep quality.

Conclusions: How socio-economic circumstances and health are associated with the sleep quality of older people has hitherto been neglected. It is important to recognise the adverse effects of co-resident caregiving on the sleep of caregivers.

The SomniA project is funded by the New Dynamics of Ageing initiative, supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009).

WHAT ABOUT DIGNITY? THE MEANING AND EXPERIENCE OF TERMINALLY ILL PATIENTS

Ana Patricia Hilario⁴

⁴DEPARTMENT OF HEALTH AND SOCIAL CARE, ROYAL HOLLOWAY-UNIVERSITY OF LONDON, London, United Kingdom
Abstract: The literature concerning the factors that are likely to influence the experience of dignity at the end of life has been very limited. Just a few studies have drawn attention to the ways in which the process of loss and decay prior to patient’s death is likely to influence their sense of dignity. For example, Armstrong-Coster (2004), Lawton (2000) and McNamara (2001) have underlined the importance of looking to the breakdown of bodily integrity to understand the meaning and experience of dignity at the end of life. Terminally ill patients, in the face of increasing bodily losses, are likely to report a sense of loss of dignity. Hence this study aims to understand how the deterioration of the physical body and lack of self containment due to a terminal illness lead to a loss of dignity. The findings derived from an ethnographic approach developed in two palliative care units in Portugal for cancer and non-cancer patients. Participant observation were conducted during ten months (five months in each unit) to complement interviewing techniques. A total of ten palliative care patients were interviewed for research purposes. Interviews were also conducted with twenty relatives of palliative care patients and twenty palliative care professionals. The findings suggested that while for some respondents dignity is related with individual’s ability to act as an autonomous agent, for others dignity is deeply embedded with the notion of being human. Two categories emerged from this study: an individualist perspective and a holistic repertoire. Both these categories and their defined themes are highlighted on this ongoing doctoral research. This study by looking at the meaning and experience of dignity at the end of life, has served to underline the ways in which formal and informal careers can enhance the dignity of terminally ill patients.

SOCIAL CAPITAL, AGEING AND HEALTH IN EUROPE: COMPARATIVE ANALYSES BETWEEN THREE EUROPEAN COUNTRIES

Eleni Koutsogeorgou 1, Fredrica Nyqvist 2, Mikael Nylgaard 3, Mildi Cerniauskaitė 1, Rui Quintas 1, Alberto Raggi 1, Matteo Leonardi 1

1Neurology, Public Health and Disability Unit, Scientific Directorate, Neurological Institute Carlo Besta IRCCS Foundation, Milan, Italy, 2National Institute for Health and Welfare (THL), 3Åbo Akademi University, Vaasa, Finland

Abstract: This study evaluates the association between social capital and self-reported health in Finland, Poland and Spain, using data extracted from the European Social Survey (ESS) in Round 4 (2008/2009) for respondents over the age of 50. Social capital refers to a wide range of social phenomena; however, in this study we focus on structural aspects such as social contacts and religious participation as well as cognitive aspects including social and political trust. This study also focuses on whether the influence of various aspects of social capital on health operates differently in selected countries of Northern, Eastern and Southern Europe. The research question is evaluated by using descriptive statistics as well as multivariate regression analyses. The preliminary results show that the prevalence of good health is increased by frequent social contacts and high political trust in Finland, Poland and Spain. Furthermore, high social trust is associated with good health in Finland and Spain. After adjusting for sociodemographic variables there is still evidence of an association between social contacts and health in all three countries.

GERONTECHNOLOGY, EVERYDAY LIFE AND ETHICS

Jyrki Jyrkämä 2

2Department of Social Sciences and Philosophy, UNIVERSITY OF JYVÄSKYLÄ, Tampere, Finland

Abstract: The role of the so called wellbeing technology is constantly increasing in the field of old age care and in the everyday life of elderly people. Technology offers us possibilities and alternatives to live in situations where for instance our functional competence is lower and we face problems in the everyday management of normal daily life chores.

However, applying and incorporating technology into everyday life is not unproblematic. It may also result in problems from an ethical point of view to the point that requires outside monitoring. In Finland the National Advisory Board on Social Welfare and Health Care Ethics ETENE has just completed a report concerning technology and ethical issues in the field of social and health care. The aim of the report is to consider how we can use some of the common ethical principles to evaluate technology in the context of everyday life of elderly people.

In my paper I will present the main contents of this report and introduce also some theoretical and methodological tools to approach technology in the everyday life situations of old age care and in lives of elderly people.

“THE HOUSE LOOKS MESSY, BUT IT’S EASIER FOR ME” – APPLIED ETHNOGRAPHY, DOMESTIC ROBOTIC SOLUTIONS AND ELDERLY PEOPLE

Gerardo Zamora 1, Xabier Ansorena 1, Alvaro Garcia 1, Lucia Pigini 2, David Facal 3, Elena Urdaneta 3

1INGEMA, San Sebastian, Spain, 2Fondazione Don Carlo Gnocchi Onlus, Milano, Italy

Abstract: In the definition of ICT-based solutions, ethnography can facilitate ‘capturing of knowledge’ from participants and increase their participation. The SRS project* seeks to develop remotely-controlled, semi-autonomous robotic solutions in domestic environments to support elderly people, which tend to be discouraged from adopting existing robotic products, partly due to inaccurately gathering user requirements. An applied ethnography (AE) was carried out to collect data from frail, elderly users in their own homes as a means to realize how such a robotic solution can better tackle their needs.

OBJECTIVE: The objective was threefold: 1-To properly describe the home environment where older people live; 2-To complete already-collected data from a user requirement study with qualitative data on the context of daily living activities; 3-To add up information about socioeconomic variables.

METHOD: The AE was inquiry-focused (Boyles, Bailey & Mossey, 2011), multidisciplinary (Patterson et. al, 2009), team approached (Hallett, Harger & Eder, 2009), and had formulated research questions to premise fieldwork in several sites (Kleinman, 1992; Savage, 1996). 15 conveniently selected homes (5 in Italy, 10 in Spain) were visited and observed. Unstructured interviews, participant observation, photographs, environmental measures and a “dairy of daily routines” were used to gather data.

RESULTS: 13 women and 4 men with age-related health problems took part in the research. 10 were aged 80 or older. Concerning living arrangement: 12 were single-person households, 2 fe-
male/male couple homes and 1 household with 2 female relatives. Women and men approach Activities of Daily Living in different ways, independent of living alone or not. All had very structured routines and strong home attachment, even though their homes are a source of obstacles for independence. They develop adaptive strategies to minimize these problems. Management of risk situations is thus one of the most accepted functionalities of a potential robotic solution.

CONCLUSION: Applied ethnography is a valuable source of evidence for health care or ICT-based devices.

THE UNCOMFORTABLE MOULDS OF DIGITAL TOOLS.

SENIORS USING CYBERSPACE IN THEIR OWN WAY

Vincent Alberto Querol Vicente

Abstract: In the same manner as other leisure practices outside cyberspace, leisure through digital tools seeks a pleasant strain-emotion level by senior users. However, some digital tools rigidity or net structures prevent, eventually, this emotion through leisure search. Seniors acquisition of technologies makes clear some technology faults in terms of cyberspace flexibilities. In this sense, as any mass communication structure, internet builds up a mould where most uses are being channeled. Nevertheless, when this forms turn out rigid, practices generated in cyberspace go through unexpected ways, a priori, for seniors.

On the other hand, the same structure of cyberspace reproduces an amount of information whose classification or tempts to put in order the data become a hard to manage problem. In this context, disorder information and overload information perceptions affect senior uses of cyberspace. Acquisition of cyberspace by these generations of seniors reveals some incapacies of internet to dose or give priorities to an enormous information data.

A qualitative research was made selecting a sample of 11 seniors. Semi-structured interviews were used in order to capture perceptions, attitudes and practices of these seniors on cyberspace.

TRANSPORT RESOURCES AND UNCOVERED TRANSPORT NEEDS AMONG OLDER PEOPLE

Randi Johanne Hjorthol, Susanne Nordbakke, Liva Vågåne

Abstract: Previous research has shown that mobility and the ability to leave the home are among the essential aspects of older people’s quality of life. An individual’s ability to use the transportation system freely has since long been defined as one of the seven important areas in the Instrumental Activities of Daily Living (IADL) of the elderly. However, surveys of older people’s access to transport resources and the impact of mobility on welfare and well-being are few. Many previous studies are based on small samples or qualitative data. The questions addressed in this paper is how transport resources are distributed among different groups of older people, to which degree the transport needs of these groups are met and how this is related to their well-being. The empirical analysis is based on a Norwegian nationwide survey among 4323 respondents 65 years and older. The respondents were asked about their access to transport resources, both private and public, health problems connected to use of transport modes, their daily activities and mobility, their uncovered transport needs and the importance of different activities for their life quality. The analysis reveals great differences between groups; especially between men and women, but also between different age groups and by different place of living. The special transport offered by the local authorities is seen as insufficient, and with increasing age a great deal of older people have low mobility and an uncovered transport need that reduces their life quality.

REVIEWING RESEARCH ABOUT ASSISTIVE ROBOTIC TECHNOLOGIES FOR ELDERLY PERSONS IN THE EUROPEAN UNION AND JAPAN: THE IMPORTANCE OF INDIVIDUAL AGEING

Priska Flandorfer

1 INSTITUTE OF DEMOGRAPHY, AUSTRIAN ACADEMY OF SCIENCES, Vienna, Austria

Abstract: Taking care of elderly persons is among the major challenges currently faced by an ageing society and it becomes more and more a topic considering the acceleration of the demographic change. Various ways on how to meet those challenges are discussed. According to the technological progress, assistive robotic devices have been proposed as a form of supporting elderly people to stay safe and healthy at their homes for longer times and to maintain their quality of life while relieving caregivers and the care system. Especially in Japan the technological development of such assistive devices is highly advanced and the Japanese government invests much in developing assistive robotic technologies. But also in the European Union (EU) funding for research activities has started both union-wide and at national levels. Since ageing is an individual process with various specific demands, technological products must address these specific requirements. For getting an understanding about how individual aspects of ageing are taken into account Japanese and English (European) research articles about assistive robotics are reviewed on a systematic basis. The aim is to compare research methods and outcomes between Japan and the EU on a cross-national basis and to investigate how socio-demographic factors (age, gender, education, health status) of elderly persons influence the acceptance, intention to use and overall rating of assistive robotic technologies. Results show that previous research is widely diversified due to different technological interventions and that evaluation methods for measuring the technological acceptance are barely consistent. Although such versatility exists the results indicate that only few studies take into account socio-demographic factors. Where studies include these factors it becomes evident that they show a significant impact on the rating of assistive robotic technologies by elderly users. The results further illustrate that cross-national differences exist within European countries as well as between Europe and Japan. Based on these findings we suggest an approach for evaluating assistive robotic technologies by also taking into account socio-demographic aspects of elderly users. This offers the possibility to investigate the importance and impacts of individual ageing on the acceptance, intention to use and overall rating of these technologies by elderly persons.
PROFESSIONAL IDENTITY TRANSITIONS OF OLDER WORKERS. CONCEPTS AND EMPIRICAL EVIDENCES

Francesco Marcaletti

Dipartimento di Sociologia, UNIVERSITÀ CATTOLICA DEL SACRO CUORE, Milano, Italy

Abstract: The identity transitions, within the more general processes of professional socialization, represent a topic of growing interest because of the increase of life expectancy and the consequent need of working longer, extending the duration of professional careers.

The reshaping of the life courses emphasizes the relationship between the biographical and relational transitions that contribute to remodulate the individual specialized identities at work while ageing.

The existentialist perspective, contrary to the nominalistic one, theorizes the identity as a product of the articulation of biographical and relational dimensions, because socialization is always the product of a joint effort of individuals and social institutions. Beside the biographical dynamic required to connect the experience of the past to the anticipation of the future, the relational dynamic ensures or undermine the recognition of the identities claimed by the individuals assumed as social actors. According to this perspective, the identity shaping process is interpreted as a product of a dual transaction process, obtained by articulating the bargaining between absorbed identity and desired identity, on the biographical side, and between attributed identities and claimed identities, on the relational side. Stressing the axis represented by the present/past relation, the identity shaping process can be interpreted as the result of the incorporation of an habitus producing and reproducing - on the basis of past experiences - patterns of behaviour judged possible. Assuming a life course perspective, identity shaping process and incorporation of an habitus can be observed within social trajectories of social groups defined as such and can be remodulated along the temporal axis present/future. The technique of the biographical interview has been adopted as methodological solution for operationalising conceptual categories assumed to describe the professional identity forms and transitions that lies within complex action systems, like business and bureaucratic organizations have become today. Identity forms and transitions of two different samples of older workers within multinational companies have been observed by collecting subjective representations of expectations concerning future choices of retirement or staying longer at work. The narrative arguments collected have been analysed in order to identify different categories of older workers.

THE PEDAGOGICALIZATION OF AGEING SOCIETIES

Tine Fristrup

Department of Education, DANISH SCHOOL OF EDUCATION, AARHUS UNIVERSITY, Copenhagen NV, Denmark

Abstract: Transformations in the age profile of a population are a response to political and economic structures and in relation to public services older people become a burden to the younger working people. The construction of a social problem in relation to population ageing becomes a social pedagogical problem involving a focus on social pedagogical interventions throughout the life course. In order to shape the future of society, the perspective on ageing and old age has shifted from being a determined process to becoming a modifiable process focusing on the processes of optimizing and realizing people’s potentials lifelong. Active and healthy ageing unfolds the cure to the social problem of contemporary ageing societies in order to make tomorrows life in old age better than it is today. The pedagogical issues relate to the normative approaches to the content of ‘a good life’ and takes its departure from the embodiment of the neo-liberal principles of containing the costs of eldercare and maximizing individual effort and responsibility for managing risks of diseases and decline even death in later life.

This paper will discuss the implications of the pedagogicalization of ageing within the framework of a Vision Paper from EU: “More Years, Better Lives: The Potential Challenges of Demographic Change”, February 2011. Disciplining the knowledge production of ageing is a way of controlling the processes of subjectification in old age as the socialization of an ageing person in relation to the disciplining of population ageing: becoming a subject to active and healthy ageing. The future of ageing societies depends on the plasticity of the individual performance underlying people’s personal responsibility for their unsuccessful ageing that manifests in having health problems in later life, because successful ageing would have been within their reach had they maintained a high level of physical activity. PerformAge is a new concept, which makes it possible to unfold the different facets of the phenomenon of individual and societal ageing as a temporal and spatial theorising of ageing; aged by cultural age performativities.

THE LIQUID LIFE-COURSE: THE ORDER OF LIFE-PHASES IN LATER LIFE

Kathrin Susanne Komp

Prentice Institute, UNIVERSITY OF LETHBRIDGE, Lethbridge, Canada

Abstract: Over the last decades, the character of later life changed considerably. Later life covers old age and the life years directly preceding it. Traditionally, old age in modern Western societies was understood as the time after retirement, which was assumed to start with a withdrawal from paid work. Due to stock market crashes and economic crises, however, an increasing number of older people need to work for pay after retiring. This challenges the assumption that old age is free from paid work. Additionally, many people experience spells of unemployment before retiring, due to, for example, structural unemployment and lay-offs in the wake of the economic crisis. This raises the question when old age, meaning the absence from paid work in later life, begins.

The changing character of old age challenges the three-partite life-course model. This model splits the time between birth and death into three subsequent life-phases. The first life-phase is youth, which is the time of socialization and education. The second life-phase is middle-age, which covers the years of paid work. The third life-phase is old age, which stands for a time of inactivity due to poor health. Due to the changing character of old age, people experience situations not included in this model, for example workforce participation in old age. Moreover, people might switch back and forth between paid work and inactivity several times, which is also not possible in accordance with this model. Life has become too diverse and volatile to fit the three-partite life-course model. The previously standardized and institutionalized life-course has turned into a liquid life-course.
This project studies the structure of later life today by testing an expanded version of the three-partite life-course model. This version of the model contains a typical and an atypical kind of each life-phase, with the atypical kind capturing recent developments. This model is used to answer two questions: Which life-phases occur in later life? And in which order do life-phases occur in later life? Sequence analyses of German and US American panel data are carried out. The answers to both questions are used to reformulate the three-partite life-course model.

TRACING THE ORIGINS OF SUCCESSFUL AGING: THE ROLE OF CHILDHOOD CONDITIONS AND SOCIETAL CONTEXT

Christian Deindl1, Martina Brandt2, Karsten Hank1
1Research Institute for Sociology, UNIVERSITY OF COLOGNE, Cologne, 2MEA - Mannheim Research Institute for the Economics of Ageing, University of Mannheim, Mannheim, Germany

Abstract: This study investigates the role of childhood conditions and societal context in older Europeans’ propensity to age successfully, controlling for later life risk factors. Successful aging was assessed following Rowe and Kahn’s conceptualization, using baseline interviews from the first two waves of the Survey of Health, Ageing and Retirement in Europe (SHARE). These data were merged with retrospective life-histories of participants from 13 Continental European countries, collected in 2008-09 as part of the SHARELIFE project. Our sample consists of 22,474 men and women, who are representative of the non-institutionalized population aged 50 or older (mean age: 63.3) in their respective country.

Estimating multilevel logistic models, we controlled for demographics (age, sex), childhood conditions (SES, health, cognition), later life risk factors (various dimensions of SES and health behaviors), as well as country-level measures of public social expenditures and social inequality. There is an independent association of childhood living conditions with elders’ odds of aging well. Higher parental SES, better math and reading skills, as well as self-reports of good childhood health were positively associated with successful aging, even if contemporary characteristics were controlled for. Later-life SES and health behaviors exhibited the expected correlations with our dependent variable. Moreover, higher levels of public social expenditures and lower levels of income inequality were associated with a greater probability to meet Rowe and Kahn’s successful aging criterion. We conclude that unfavorable childhood conditions exhibit a harmful influence on individuals’ chances to age well across all European welfare states considered in this study. Policy interventions should thus aim at improving the conditions for successful aging throughout the entire life-course.

I DON’T WANNA LIVE FOREVER ... BUT APPARENTLY I AM!

Magnus Nilsson1
1KARLSTAD UNIVERSITY, Karlstad, Sweden

Abstract: The age of Ian “Lemmy” Kilmister, singer and bassist in the band Motorhead, has to an increasing extent become part of his status as an legend of heavy metal. Born in 1945 Lemmy is now over retirement age but is still recording and touring the world. His status as a rock star is maintained by a reputation for heavy drinking, smoking, doing drugs and a big appetite for sex.

The title of the paper is taken from the song “Ace of spades”, released in 1981. The song is about gambling, and gambling with your life. In the song Lemmy sings “I don’t want to live forever… but don’t forget the joke. When the song is performed live Lemmy now sings “I don’t want to live forever … but apparently I am”, and thereby confirming his status as a legend by reference to his age.

There have been several documentaries made about Lemmy and his band, one notably called “Live fast, die old”. He has written an autobiographical book. In this paper I will use these to analyze how the decline metaphor is used and contested in the ways that Lemmy is represented, and the way that he himself relates to his age in interviews. I use an intersectional approach to understand how age and masculinity are used in the articulation of Lemmy’s status as a rock star and a legend.

AGE, SKILLS AND PRODUCTIVITY – PERSPECTIVE OF EMPLOYERS

Konrad Turek1
1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: The presentation concerns studies on the relation of age, skills and productivity of workers. It presents views of Polish employers about productivity and skills of older workers and analyses individual and work-related factors affecting the employers’ perception of productivity of older workers. Data comes from the national representative survey of Polish companies from public and private sector (CATI, n=1037) conducted within international project ASPA (Activating Senior Potentials in Ageing Europe; 8 countries involved) - the first such survey of Polish employers in this topic.

Results for Poland show that older workers are valued more for their soft skills (i.e. social skills, management skills, reliability and loyalty), while the younger workers - for their hard skills (creativity, physical health, new technology skills, willingness to learn and flexibility), what affects productivity ratings. Analyses support the concept that job performance is an outcome of both individual and work-related factors and does not have to deteriorate in older age. Even though some work-related capabilities usually decrease with age, there are also some features that usually improve or maintain at the same level through the whole life and could be beneficial at older age. However, work environment and job characteristics may contribute to workers performance as well. Employers, basing on their knowledge and experience, may either intend to improve productivity of older workers or lower the cost by sending senior workers on retirement. Data shows that age management aiming at improvement of job performance of older workers correlates with higher ratings of their productivity. Performance of older workers is generally valued higher in organizations demanding more soft then hard skills, what confirms the theoretical assumptions. Finally, proposition of a conceptualization of productivity with relation to age mediated by workability is presented.

BETWEEN CHOICE AND NECESSITY: WORK BEYOND RETIREMENT AGE IN GERMANY AND THE UK

Simone Scherger1, Thomas Lux1
1Centre for Social Policy Research, UNIVERSITY OF BREMEN, Bremen, Germany

Abstract: The model of retirement choice and retirement necessity has become the framework of analysis for empirical studies of retirement age. With the growing number of older workers in Western European countries the necessity of working beyond retirement age in order to be economically active has to be investigated. The rising number of older workers in Germany is the result of growing life expectancy and the expansion of the pension age. Therefore, the age of retirement varies between country and country and depends on the individual’s situation. Hence, the necessity of working in Germany is quite different from the necessity of working in the UK. The data for the empirical analysis are taken from the SHARE data for Germany and the SHARELIFE data for the UK. The analyses suggest that retirement is decided on an individual level and that older workers in the UK have a higher necessity of working after the pension age compared to the German older workers.
Abstract: The number of retirees who, mostly despite receiving a pension, are (still or again) in paid employment, has been increasing in most European countries during the last decade. Some general reasons of this trend are well known: for example, old age incomes have started to decrease because the regulations of state pension systems have become less generous and because there are more people with discontinuous careers and thus less opportunities to save for retirement, in which form ever.

The paper aims to examine the (hitherto atypical) combination of pension receipt and paid employment in Germany and Britain, countries whose pension systems are very different from each other and form part of different welfare regimes. Whereas the number of old people in employment has always been higher in the UK, considerable numbers of working retirees are a relatively new phenomenon in Germany. Furthermore, the debates around work in retirement are different in both countries, with a much stronger emphasis on the right to work in the UK, and the idea of well-deserved retirement still prevalent in Germany.

On the basis of cross-sectional, descriptive and multivariate analyses of data from the English Longitudinal Study (ELSA) on the one hand, and from the German Ageing Survey (DEAS) on the other, the paper aims to answer the following questions:

• How many pensioners in Germany and Britain do actually work, and how can they be described more closely? Which groups must be differentiated?

• Which are the most important factors leading to paid work in retirement, and in particular, which role does old age income play?

• Which other influences have to be taken into account when explaining paid work beyond retirement, both on the individual and on the macro level?

In this way, the paper will contribute to a differentiated view on work in retirement and its evaluation. The presented evidence can be seen as indication of how important economic necessity is as a motive for paid work in retirement.

CAN FURTHER TRAINING BE AN ANSWER TO TECHNOLOGICAL INNOVATION IN AN AGEING WORKFORCE?

Martina Huber

Abstract: The German labour market is affected by technological and demographic change. Especially older employees are regarded as losers of this development because of their insufficient qualification and the increasing age of retirement. One possibility to expand the technological competences of older employees is further training. But as I will show, older employees still participate less in further training.

New information and communication technologies in establishments affect the work environment and lead to changes regarding working procedures or equipment (Borghans, ter Weel 2002). Additionally, the consequences of the demographic change demand rethinking.

A decreasing number of young employees have to balance an increasing number of old employees (Bellmann, Kistler, and Wahse 2007). Consequently, employees and employers should have an interest to preserve and support the employability and productivity. In this context lifelong learning plays an important role.

Therefore in the project "Further Training as Part of Lifelong Learning" a dataset has been constructed which concentrates on further training as a consequence of organisational and technological change. Furthermore, these data can be compared with French data from the Centre d'études de l'emploi because of the identical survey and questionnaire design. First I will give an overview about the development of the German employment structure. Using multivariate analysis I identify factors on the employer and the employee side that have an effect on the participation in further training of older workers after a technological change. It shows that that older workers have a lower participation in further training as an answer to technological change. The main results show that the society has to prepare much more for the challenges of the technological change and the ageing of the labour force.

ELDERLY POPULATION IN A LABOUR MARKET: RESOURCE FOR THE ECONOMY OR NEW CHALLENGE FOR SOCIAL POLICY (CASE OF RUSSIA)

Yulia Lezhnina

1 HIGHER SCHOOL OF ECONOMICS, MOSCOW, Russian Federation

Abstract: In Russia elderly population traditionally has been the object of social policy as most of it depends on state after retirement. However, the active involvement of senior citizens in productive activities today (about a quarter of them work) and population aging have raised the question if elderly population should be included in the economic life of society. Employment of older people seems to be a resource for the economy as:

• it reduces the retirees need for public support;
• it alleviates the problem of exclusion of elderly people and, hence, governmental spending on its decision;
• it reduces the need for migrants labor and decreases the social tension.

However, the effect of inclusion of retirees in the labor market is not so straightforward, because it poses new challenges for social policy appropriated with additional public investments:

• retirees employment on the positions of unskilled workers (primarily of physical work) is difficult due to poor health. And even in case of working continuation on these positions retirees are relatively inefficient labor force. Changing the situation requires fundamentally new social policy approaches to health care system for increasing the duration of the productive working life. At the same there is a demand for new jobs allowing comfortable transition (easier conditions of work, flexible hours, etc.) from the labour market to the retirement;

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
• employment of retirees as skilled workers (mainly of intellectual work) today not only blocks access to employment for young people, but in most cases leads to the decline in labor productivity as the ability of people to attain knowledge and skills changes through age. Enhancing economic benefits from the elderly employment as professionals and semi-professionals is impossible without new approach to the educational system development - the promoting of learning throughout life.

• employment of retirees replaces their involvement into the education of grandchildren and caring for sick family members. That is why elderly population can be attracted to the labour market only after intensification of social policy in field of social infrastructure (junior schools and medical care).

So these significant changes in the approaches to social policy require not only understanding and developing of an appropriate strategy but large-scale public investments.

RETIREMENT STRATEGIES OF RUSSIANS - TO LIVE ON STATE PENSION OR TO WORK
Olga Evgenjevna Kuzina¹

¹Sociology, Higher School of Economics, Moscow, Russian Federation

Abstract: In my paper I focus on ‘retirement strategies’ of Russians and address two questions: how do people perceive the level of their pensions and what do they do to be better off when they will retire. To base my conceptual enterprise on empirical basis I use the data collected during focus group discussions. Two focus-group discussions with the middle class residents took place in October 2010 in St. Petersburg and Krasnoyarsk. The aim of these focus groups was to find out how people themselves define what retirement strategy is, what options people see, and which factors they think facilitate the implementation of retirement strategies and which ones constraint them and force to behave non-strategically. The quantitative part of the research is based on the data from the all-Russian surveys with identical samples and questions conducted in 2005, 2007, 2009, 2010. The main goal of the quantitative analysis is to reveal what the most popular retirement strategies are and whether anything has changed over five years.

The paper is structured in the following way. In the beginning I discuss the concept of a retirement strategy comparing the ways the concept is approached in Economics and Economic Sociology, then I summaries the findings from the focus group discussions and surveys. The main results are that people do not perceive their future state pensions as sufficient, worry about their incomes during the retirement, however in 2010 29% of working population plan to live on their state pension only, 18% do not know what they can do, 43% plan to continue working after retirement, only 8% use financial strategies to provide enough incomes during their retirement. Current pensioners do even worse: 66% live on state pension, 26% work, only 1% receive supplementary pensions or withdraw their savings, other sources are – family transfers from their children or self-provision. The main reason why the majority of people do not have retirement strategies is not an issue of low income but rather the problem of the lack of trust to financial institutions and very short horizon of financial planning.

LATE BLOOMERS OR LAST RESORT?
ENTREPRENEURSHIP IN THE SECOND PHASE OF LIFE IN GERMANY
Annette Astrid Franke¹

¹Social Gerontology and Life course research, TU DORTMUND UNIVERSITY, Dortmund, Germany

Abstract: Ageing societies and entrepreneurship activities often seem to be incomparably as setting up a new business is still associated with persons in their 30s-40s. On the other hand, demographic changes in western societies bear the potential to reveal late entrepreneurship activities – in particular with regard to the current economic crisis, the increasing rate of non-linear biographies, the still high rate of unemployed elderly, an increasing retirement age, and the aging of the baby boomers. Comparing with academic research on other types of “unusual” entrepreneurs (women, migrants), little is known about late self-employers. This is particularly the case in Germany with its lack of “self-employed culture” in general.

This paper presents findings from a Ph.D-project, which contributes to fill the existing lack of research on elderly entrepreneurs in Germany. This research compares to different aspects as its pays attention both to the entrepreneurs’ and to the experts’ view. According to the Grounded Theory approach by Glaser and Strauss and inductive perpetual theory building the research was realised in the stages of fieldwork approach, qualitative interviews with entrepreneurs 50+ (N=17), and expert interviews with representatives from local banks, politics, consulting institutions etc. (N=17).

The main research questions were:
• How do experts estimate this target group?
• Which branches or businesses are typical to be attractive for late entrepreneurs?
• Which motives for becoming self-employed are typical among the elderly?
• Which role plays the work history?
• What kinds of gender differences can be revealed?
• Which kinds of support at private, public or political level best enable entrepreneurs 50+?
• Which experiences do exist regarding specific social policy instruments and entrepreneurship promotion?
• Which factors are of high importance for the success of a late business?
• How satisfied are 50+entrepreneurs?

This paper provides an insight in specific characteristics, attitudes, opinions and types in the context of late entrepreneurship. Furthermore, this research highlights the influence of the social policy framework to set up a business in the second half of life. The research also refers to the questions of “push” and “pull” self-employment, good working conditions and the options of late entrepreneurship as a “third way” between voluntary activities and further trainings for older (unemployed) workers.

CARING FOR OLD PEOPLE SUFFERING FROM ALZHEIMER DISEASE (AD) AND DEMENTIA: ANALYSIS

Blanche Le Bihan 1, Isabelle MALLON 1, Arnaud CAMPEON 1

1EHESP (SCHOOL OF PUBLIC HEALTH, FRANCE), Rennes, 2University of Lyon, Lyon, France

Abstract: Defined as a brain disorder that causes problems with memory and behavior, dementia—a major issue in the field of Aging. Affecting the old person’s ability to carry out daily activities, the disease cannot be treated only at a medical level. Since the existing drugs may only help to keep symptoms from getting worse too quickly, social care or “non pharmacological interventions”, according to medical terms, provided by families and professionals from health and social sectors, is considered as a major dimension of the treatment to be provided.

In this communication, we investigate the complexity of the situations of dementia, which involve the old person but also the informal caregivers, pivot of the everyday care arrangements, who are a resource but also people in need of support. The analysis exposes the results of a qualitative survey led in France, where AD has been a priority of the political agenda since 2008. What is the role of professionals from the medical (GP, geriatricians, neurologists), paramedical (psychologist) and social (social workers, home helpers) sectors in the diagnosis and follow up of the situation? What is the role of the family? How do the situations evolve as the patients become more vulnerable? 60 situations of dementia have been analyzed, with in-depths interviews led with informal family caregivers (partners or children) and with the health and social professionals involved.

We argue that different representations of the disease develop and that the care trajectories of the patients are the results of these interactions. Three main elements will be exposed:

- The perception of the situation varies according to the profile of the person. Initially considered by the families as problems due to aging, the symptoms are progressively defined as a disease through the perception of the geriatricians and/or neurologists.
- Families and professionals follow two different rationales. On the one hand, the families and the patients adapt themselves to the evolution of the disease; on the other hand, the health professionals try to anticipate the evolution of the situation in order to avoid important difficulties.
- For the geriatricians, the vulnerability does not only concern the patient, but also the informal caregivers, who must be supported in the everyday care of the old person suffering from AD.

EXPERIENCES OF PEOPLE LIVING WITH EARLY-STAGE DEMENTIA

Hanna-Mari Pesonen 1, Anne M. Remes 2, Arja Isola 1

1Institute of Health Sciences, 2Institute of Clinical Medicine, UNIVERSITY OF OULU, Oulu, Finland

Abstract: The incidence of dementia will increase as the population ages. It is estimated that in Europe there are currently over seven million people living with dementia and this number is predicted to increase significantly in the future. The need to pay attention to healthy aging and dignity among people with dementia has been highlighted by European Union. Several European countries either have or are preparing national action plans aimed at improving the quality of life of those affected by dementia. Thus currently there is a strong concern of establishing social and health care services that meet the needs of patients and their family caregivers.

Dementia has a negative and stigmatized image which influences our views of people living with it. However, there has been a growing interest to study the experiences of people living with dementia emphasizing their personhood, citizenship and social inclusion. Hearing the voices of people themselves enables us to understand their needs and coping methods in a changing and challenging life situation.

This presentation is based on an ongoing doctoral study that aims to understand and describe subjective experiences of both people living with dementia and their family members during the early phases of the illness. A qualitative longitudinal design is used in the study. This presentation will focus on the experiences of people with dementia (n=8) after the disclosure of diagnosis of dementia. Research data consists of low-structured in-depth interviews during the first phase of the study and is analyzed using grounded theory - method. This presentation will bring forth some initial findings. Findings can be used to develop supportive services for people with dementia and their family caregivers to attain equilibrium in their life after the diagnosis.

INFORMAL CAREGIVERS NEEDS AND THE DEVELOPMENT OF AN ICT-BASED SYSTEM FOR THE EARLY DETECTION OF ALZHEIMER’S DISEASE AND OTHER NEURODEGENERATIVE DISEASES

Elena Del Barrio 1, Erkuden Aldaz 2, Bernhard Wöckl 3, Andreas Hochgatterer 4, Lukas Roedl 4, Elena Urdaneta 2

1INGEMA, Madrid, 2INGEMA, San Sebastian, Spain, 3CURE, 4AIT, Viena, Austria

Abstract: The early diagnosis of Alzheimer’s disease is a challenging issue. An early diagnosis improves the quality of life patients and caregivers. Studies suggest that first indicators, which raise suspicion of neurodegenerative disease, are subtly manifested in patients’ daily behaviour patterns.

The Bedmond Project* addresses this issue through the development of an ICT-based system for the early diagnosis of Alzheimer and other neurodegenerative diseases founded on the detection of the patient’s behavioural pattern alteration and for the monitoring of the disease once the diagnosis is known. This paper draws on family caregivers’ needs in order to develop the system and on the implications this has on their daily lives.

The results from a series of focus groups with 13 caregivers, conducted in 2 countries (Spain and Austria) are examined. The data analysed included caregivers’ needs, their perceptions regarding the system and narratives on health, disease, care obligations and what care is.

The results analysed show that in the early stage of the disease, some common symptoms in most people with mild cognitive impairment occur. These symptoms can be basically found in the daily routines of the person. Caregivers mainly classified the changes in 3 domains of elderly persons’ daily living: a) cognitive changes (“forgets appointments, not taking medication”, “they lose the lead; if someone encourages them to do something they do otherwise or...”)
they do nothing”); b) personality changes (“if he was previously absent-minded, with the disease this has increased”); and, c) Behaviour changes (“they change their personal hygiene”, “they lose or hide objects”).

Taking into account caregivers’ narratives in the development of the classification of common symptoms in mild cognitive impairment for the early diagnosis and the follow up of the disease proved to be useful and necessary in the definition of ICT-based solutions. A focused and precise qualitative methodology can provide ICT developers with not-easy to find user requirements.

NEEDS OF CARE ANALYSIS FROM A COMPARATIVE PERSPECTIVE
Marta Ortega¹, Mercedes Fernández Alonso¹
¹DERECHO DEL ESTADO Y SOCIOLOGIA, UNIVERSIDAD DE MÁLAGA, MALAGA, Spain

Abstract: The main objective of the study is to determine the most relevant care needs of old people (older than 65) in Andalucia from a comparative perspective.

The study also allows to determine the factors that influence on a good state of health and on a good quality of life; know how to develop actions that permit prevent and retard becoming dependent; deepen knowledge of care needs of the population older than 65 (dependent and not dependent ones); analyse the requirements of the caregivers (under and over 65 years old).

The structure of the present research is divided in three sections: The first one, it focuses on a descriptive analysis of the older than 65 in Andalucia in order to compare the situation with Spain and Europe. The second one, focuses on an explanatory analysis (logit, probit) to answer to the specific objectives. And the third section, analyses the changes on the demand of cares to determine the impact of the Dependency Law in Spain and Andalucia.

The principal database are: Quality of Life of Old People Survey, (Sociological Research Center in Spain, CIS, n. 2.6472; European Quality of Life Survey; Survey of Health, Aging and Retirement in Europe) (SHARE).

Keywords: care, aging, dependent, quality of life, comparative perspective.

PERSPECTIVES ON ALZHEIMER’S DISEASE: PERCEPTIONS AND ATTITUDES OF THE GENERAL PUBLIC, CAREGIVERS, FAMILY MEMBERS AND PROFESSIONALS
Stéphanie Pin¹, Christophe Léon², Julie Bodard³, Pierre Arwidson²
¹Direction of Programs, ²Direction of Scientific Affairs, ³INPES, S-Denis, France

Abstract: Background. Alzheimer’s disease (AD) would suffer from a negative social image which would mix social representations of aging and mental illness. Although the available research on the perceptions and attitudes towards Alzheimer’s disease have increased over the past ten years, these works often involve only one specific population and the people with the disease are rarely involved.

Objectives. Listed in the French Alzheimer Plan 2008-2012, the program of opinion survey on Alzheimer’s disease has three objectives: 1 / to explore the perceptions, knowledge and attitudes of different populations regarding the disease; 2 / to measure the evolution of some indicators; 3 / to provide further direction for research, health education or professional training.

Methods. The methodology combines literature reviews, qualitative studies and quantitative surveys of different audiences. Specifically, four quantitative surveys were conducted among lay public (2 000 people aged 18 to 75), GPs (n = 1000), people with AD and their caregivers (140 dyads) and professional home carers (n = 1213 workers). These surveys included a battery of common items (spontaneous perceptions of AD, opinions, level of information ...).

Results. AD is the third disease feared by the lay public. Spontaneous perceptions are centred around memory loss, addiction and loss of mental faculties as in the general population than among relatives or professional caregivers. The dominant feature of social representations of AD is the predominance of images related to advanced stages of disease. However, this perception is not reflect- ed by attitudes of stigmatization or by a feeling of exclusion from the persons concerned. Main needs are focused on research (for the general lay people and among caregivers) and on support at home (among professional home carers). People with AD complained of being too little involved in medical decisions.

Conclusion. This original program of surveys gives a more complex image of AD. It confirms the presence of severe distress among those directly affected by the disease and high powerlessness among professionals, but it leads in the same way to deconstruct some negative beliefs about AD and its care.
RN 02 Sociology of The Arts

MODERN ART IN POLAND. ART MARKET AND INSTITUTIONAL CONTEXT.
Agnieszka Natalia Szymanska

1Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY IN POZNAN, Poznań, Poland

Abstract: It is said that there were turbulent times for art in Poland. Socialism had been affecting art works for many years. Finally, after 1989 artists started creating mostly critical art. Since that time of social and political change they felt free to comment on what had happened during last years. Something changed about 2000. The new generation came with their new art, which was different from the previous one.

About ten years ago only few people in Poland were able to appreciate and perceive potential in young artists. They took the risk and started to create ‘institutional background’ and art market to make the career of those young people possible. However, the new art needed not only new critics, new galleries but also new public institutions. More still, all that happened.

Nowadays, after ten years of building the right context, the newest art in Poland has finally its institutions: galleries, museums. It has its critics, collectors and audiences as well. But is it sufficient? Are these roles divided precisely between particular people? Or maybe the whole process is still in progress? Last, but not least, how the Polish <i>art world</i> differs from the Western one?

The main aim of this paper is to describe the institutional conditions of the newest art in Poland. The next question is to map the net of brokerage and recognize the most important players. The conclusions presented in this paper are based on some basic theories of art and on the main results of my research among so-called ‘main players’ in Polish <i>art world</i> (gallery owners, collectors, managers of public institutions, curators and artists).

THE IMPACT OF GLOBALIZATION ON CONTEMPORARY ART GALLERIES IN AMSTERDAM AND BERLIN. WHY SPACE REMAINS IMPORTANT IN A DETERIORALIZED ART WORLD

Olav Velthuis

1Sociology and Anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: This paper studies the effects of cultural globalization on the discourse and practices of contemporary art dealers in Amsterdam and Berlin. In particular, it argues that globalization cannot be equated with deteriorationalization, as is frequently stated in the sociological literature on globalization. Instead, in depth interviews with Amsterdam and Berlin art dealers (21 in total) suggest that globalization has done little to decrease the importance of the gallery space. The reason is that this space is the main theater where a set of firmly institutionalized commercial practices of art dealers are displayed. Moreover, the gallery space is intricately tied up with the dealer’s identity. As far as globalization has indeed resulted in a waning importance of the local gallery space, this has not entailed deteriorationalization, but instead a relocation of commercial practices to other highly symbolic spaces such as the contemporary art fair and the virtual space of the gallery’s website.

THEATRE FESTIVALS AS TRADING ZONES. RESULTS OF AN EMPIRICAL RESEARCH

Valerio Zanardi

1 Teoria sociologica/ceups, UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: Theatre festivals as trading zones. Results of an empirical research.

The proliferation and the settled importance of festivals have to be conceived using different analytic frames, because festivals are the context where different subject, agencies, institutions and organizations build and constitute meanings, interpretations, values and where the artistic fields mix themselves. In this sense the category “trading zone” (Galison) or better, “trading zones” could be used as an interesting suggestion for researching what happens in different frames in the same physical contexts. Trading zones in anthropology are spaces, physical objects, contexts, visited and used by an heterogenous plurality of actors that don’t share the same cognitive paradigms, meanings and moral values.

As suggested by Vera Zolberg, I used the concept of “trading zone” for highlighting some facets of theatre festivals, as resulted from a project of investigation on the organizational, the cultural and the social implications of theatre festivals in a comparative perspective.

The research I realized (supported with a grant FI - formation of researchers - of the government Generalitat of Catalunya and directed by Dr Arturo Rodriguez Morató) was focused on 4 different cases, 2 located in Spain (Grec festival of Barcelona and the Fira of Tarrega) and 2 in Italy (International festival of Santarcangelo and the Parma Reggio festival).

This paper, that deepens into a former presentation discussed in the last ISa conference, will briefly introduce the general frame of trading zones in order to set out, focus and discuss the following points:

- The progressive transformation and institutionalizations of theatre festivals, while some aesthetics aspects of their “ancient” counterculture still survive, with changing meanings and references.
- The turn of the traditional artistic programs in a broader offer, that often combine shows and performances with the presence of several activities linked to the attempt to rationalize topics related to “turbulent times” and social problems.
- The growth and the different practice of a new and composite audiences in the 4 different cases analyzed.

THE ART FAIR: AN INTERMEDIARY INSTITUTION OF THE GLOBAL CULTURAL ECONOMY

Christian Morgner

1Universität P.F. Lucerne, Lucerne, Switzerland

Abstract: The global financial market went through a turbulent time recently. Effects on the art market and related institutions, howev-
er, were only of minor importance. The crisis even seems to have
nourished the arts by enabling the opening of reasonable spaces
and creating other opportunities. Our knowledge of the structures
of the art world and art market and, in particular, their relationship
is rather limited. This paper addresses the role of intermediary in-
sstitutions that couple the art world and the art market – art fairs.

The art fair is a relatively new institution, with the first examples
being founded in the second half of the 20th century. Only a few
exhibitions existed for quite some time, but have experienced dra-
matic success in the last 20 years. Although art fairs are now organ-
ised on all continents around the globe, little research has been
conducted on them.

The paper addresses two questions. The first asks what the function
of an art fair is in the global cultural economy. The second regards
how these institutions developed, focusing on historical and global
dimensions. In examining the answers to these questions, the pa-
er raises the issue of the art fair as an intermediary structure be-
tween the economic and art worlds, where art dealers, works of
art, collectors, sponsors and other professionals are intertwined.
The questions are addressed through the examination of various
empirical sources, including statistics on participating galleries and
artists and interviews with fair organisers and art dealers. The pa-
per will also give evidence as to the global orientation of art fairs,
focusing on a few case studies, such as TEFAF and Art Basel, and of
these institutions’ historical development with regard to their
structure and organisation (from evolutionary prerequisites to
sponsors).

**CULTURIZATION OF ECONOMY AND THE CULTURAL
COMMONS**

Juhana Venäläinen1

1Dept. of Finnish Language & Cultural Research, UNIVERSITY OF
EASTERN FINLAND, Joensuu, Finland

Abstract: During the last two decades, we have witnessed an ever-
growing discussion of creative economy or economy of culture. This
prevalent academic and popular discourse, advocated e.g. by Rich-
ard Florida (2002), has disinterred two important processes of so-
cial turbulence: first, the instability in the notion of ‘culture’ but
also – and more importantly – in the notion of ‘economy’. Underly-
ning this discourse is the observation of growing weight of creative
industries, or more generally, immaterial industries (i.a. culture,
education, care and tourism), in the creation of wealth.

While highlighting focal anxieties, these discourses have their limi-
tations: ‘economy of culture’ remains sociologically ambiguous if
not interpreted as a moment of a wider paradigmatic shift in econ-
yomy and production. Moreover, the economical theories developed
for understanding the industrial-Fordist model of capitalism do not
sufficiently consider the role of cultural factors (symbols, meanings,
contexts, social relations, affects and communication) in valoriza-
tion processes (see Boltanski & Chiapello 2005, Marazzi 2008,
Moulier Boutang 2007).

The goal of my paper is to trace and describe a historical shift in the
mode of production – the culturization of economy – in which
commodity production based on material resources is growingly
replaced by immaterial production based on human resources. This
transformation is portrayed through a viewpoint of cultural com-
mons – a new productive basis upon which the wealth creation is
realized.

In the field of cultural commons, the productive logic of “modern
market economy” is fundamentally transformed as the logics of
scarcity, individualism and exclusive personal gain are gradually
replaced with the logics of affluence, collaboration and sharing.
Thus, the modern economical problem of allocating scarce re-
sources has to be accompanied by a “postmodern” economical (or
better, a “neoclassical” sociological) question: what do we have in
common?

**SOCIOLGY, ART AND SOCIOLOGY OF ART: BOURDIEU
AND AFTER**

Arpita Mitra1

1Centre for Historical Studies, JAWAHARLAL NEHRU UNIVERSITY,
New Delhi, India

Abstract: Within the domain of sociology, whose disciplinary history
dates back to the second half of the nineteenth century, the sub-
discipline of sociology of art is a relatively young area of inquiry,
which has already given rise to several theoretical debates and
numerous ways of broaching the question of art from a sociological
point of view (sociology of art works, sociology of art markets, soci-
ology of artistic professions etc.). There is no one way of doing soci-
ology of art. The striking plurality of approaches in this discipline is
proof of its vitality and possibilities.

However, notwithstanding the variety of approaches, certain theo-
retical issues remain common to the discipline (the nature of the rela-
tionship between art and society, agency and subjectivity, for in-
stance). One such common theoretical premise concerns the
specificity of the domain of art as a subject of sociological enquiry.
The very root of the discipline of sociology lies in the study of the
‘general’, the ‘collective’; whereas the domain of art celebrates and
valorises the ‘particular’ and the ‘individual’. The emancipation of a
‘social’ study of art from idealist notions of art and artists enshrined
the moment of triumph for the sociology of art. In fact, it was possi-
ble precisely because of the very specific nature of sociology as a
discipline that foregrounds the ‘general’ and the ‘collective’. This
inherent probability of a tension between sociology as a discipline
and its chosen subject of study in this case – art – has a bearing
upon many of the fundamental theoretical questions in the field,
such as the social fact of being an artist, professionalisation of artis-
tic vocation and vocationalisation of artistic profession, autono-
my/heteronomy of the artistic field, among others.

The proposed paper seeks to chart this debate with reference to
the specific contribution of Bourdieuan sociology of art and some of
its critics. It was quite a battle to establish the socially ‘condi-
tioned’ (for want of a better word) nature of artistic production and
reception. Now, it might be worthwhile to think if art as a specific
field also offers unique possibilities of subversion of social structures that are absent in other social spheres, and can therefore be theoretically very insightful for practising sociologists?

RE-CONCEPTUALIZING ARTISTIC PRACTICES
Graciela Miriam Trajtenberg

Abstract: The core of the sociology of the art theory has conceptualized artistic practices on an implicit assumption which understands them as “sealed” within the boundaries of a defined society i.e. the nation state. This taken for granted view includes quintessential and disparate theorists such as H. Becker (Becker, 1982) and P. Bourdieu (1992). Yet, during the last three decades transnational artistic flows, associated with diverse aesthetic and ideological commitments, have affected domestic fields of arts. The goal of this paper is to examine theoretical developments in the light of current socio-artistic changes. Assuming, that modernity has undergone subsequent globalizing waves, what’re the differences between the contemporary flows of artistic practices and those that’d occurred before? Furthermore, what kind of theoretical concepts are required to understand these transformations? The Field of Arts of the 21st Century occupies a contested space in which groups negotiate authority and achieve (or fail to achieve) recognition. Artistic practices arise in internet linking people in various countries and regions. A diversity of artistic forms are created and distributed by a diversity of producers and distributors. Thus, contemporary field of arts compels both a new, wider analysis as well as a rethinking of basic forms and definitions.

DANCE RESEARCH IN TURBULENT TIMES
Heike Salzer1, Kristine Sommerlade2

1SCHOOL OF ARTS AND MEDIA, TEESIDE UNIVERSITY, Middlesbrough, 2Tees Valley Dance, Stockton on Tees, United Kingdom

Abstract: The current turbulences in the arts sectors of many countries do not only present numerous challenges and threats to the established professional dance landscape but also opportunities for reflection, change and development. Funding cuts will require a rigorous analysis of the dance sector in terms of its capital infrastructure, work force, content production and income generation, in order to effectively adapt to new financial circumstances and their structural implications. A premise to successfully negotiate the above situation is an unbiased and in depth understanding of the complex, art form specific functions and roles of individuals and organisations within the dance sector. However, whilst dance has been very successful in terms of its capital and infrastructural development and its growth in popularity in recent years, the authors suggest that the dance sector is lacking a critical debate that engages with dance in a holistic manner. The dance sector, and many dance scholars, display a certain reticence to engage with issues, such as for example, the sector’s economics or its domination by particular value systems and narratives it is traditionally embedded in. Dance practitioners as well as scholars appear to steer away from reflecting on and/or clarifying their position in relation to established artistic or scholarly modes of viewing and evaluating dance or the demands of the contemporary economic and political landscape. Apart from critical feminist approaches towards dance education which reflect on traditional methods, dance scholarship seems to privilege a theoretical discourse that evolves around aesthetics, textuality and gender. Other research is frequently commissioned to serve as an advocacy tool or it features dance within the canon of the other arts. This inevitably leads to generalizations that lack art form specificity and seem to be underpinned by a romantic notion of practitioners being either successful geniuses or underachieving starving artists.

Drawing on their experiences as artistic director/employer of a dance company and educator/researcher in Higher Education, the authors evaluate how practitioners are viewed in the field. They suggest that the dance sector would benefit from research that focuses on artistic production as located practice, covers more diverse research topics and values practitioners’ input.

S.O.S CULTURE. WILL THE NEW MEDIA SAVE THEATRE AND LIVE ARTS?
Gaia Peruzzi

1Coris - Comunicazione e Ricerca sociale, SAPIENZA, UNIVERSITY OF ROME, Rome, Italy

Abstract: How does the use of new medias transform the daily life of theatres and acting companies and their relationships with the public? Can the free and open spaces of social networks become a concrete resource for artistic non-profit organizations during the economic crisis?

The Web and Facebook have become almost an inevitable meeting point for artists, cultural organizations, operators, theatre enthusiasts or “simple” theatre-goers, particularly those interested in innovative and experimental forms of performance arts.

Today in Italy the most important landscape of the performing arts is constituted by small and medium as well as non-profit theater groups and companies that, while being conditioned by a poor culture market, are now suffering dramatically from the heaviest cuts to public funding.

The proposed paper rises from a research conducted in the autumn of 2009 in the theatres of Tuscany, a region owing a great part of its fame to its cultural life.

The question to be investigated was whether the companies that are investing in digital technologies, by regularly attending social networks, are concretely benefiting from this kind of involvement in terms of social, cultural and economic capital (new contacts, new experiences, new incomes).

The core of the inquiry is a compared study of the organizational life of ten theater companies of different Tuscan cities with active and up-to-dated Facebook profiles. They are all private non-profit organizations of medium and small dimensions, but benefiting by a solid continuity and a good notoriety, even beyond regional borders. Then, all these companies could be defined as “non-conventional”, “experimental” theaters, that are mostly attended by young and youthful people.

The second part of the research was aimed at spreading light on the nature of organizations and the territory. It consisted of two actions: a monitoring of on-line activities of all thirteen Tuscan public theaters and the study of two companies living in metropolitan contexts, Rome and Milan.

The research strategy blended on and off-line methods and tools: analysis of the websites of all the selected organizations, ethno-
graphic observations-participation to their Facebook profiles, face-to-face and mediated interviews to the responsible of communication of all the companies, and to five cultural operators.

ARTISTIC AND CULTURAL SPONSORSHIP IN TURKEY
1990S AND ONWARDS
Gözde Çerçioğlu

Abstract: This paper aims to analyze how art sponsorship in Turkey has been shaped since 1990's with respect to the corporations' and non-profit sector's involvement within the context of economic crisis. This attempt to explore art sponsorship stems from the fact that art sponsorship has risen as a form of support by certain corporations, foundations and nonprofit organizations to the rapidly increasing artistic and cultural activities in urban spheres of Turkey. Consequently, there is a need to understand and explain how and why certain corporations engage in sponsorship of certain cultural and artistic activities as joint project initiators as well as engaging in sponsoring certain events. This not only directs us to think about the corporations themselves and their interest in art but also their ways of negotiating with other actors such as the government; artists; curators; public relations specialists and the public. Besides, the process of negotiation involves a strong organization and institutionalization which needs to be understood in order to explain the main motives behind for sponsoring cultural and artistic events.

This study concentrates on the analysis of the characteristics and the affiliation of the main organizers and sponsors as well as exploring the ways in which they collaborate to initiate and publicize the events, by focusing on the visual and published materials such as events' posters, announcements, commercials, press releases and interviews that are related to the artistic and cultural activities in the urban spheres of Turkey. This analysis aims to elucidate what type of economic and social actors such as corporations and foundations do cooperate in what kind of artistic and cultural activities and how do they define the event’s role in the society and their role as sponsors.

BRITISH CULTURAL POLICY UNDER THE COALITION
government: deep spending cuts and a preliminary analysis of implications
Victoria Alexander

Abstract: In May 2010, the UK General Election failed to give a clear majority to any political party. David Cameron’s Conservatives and Nick Clegg’s Liberal Democrats formed a coalition government, whose main aims, apparently, are to cut government spending in every area. Spending, they argue, had spiralled out of control under the previous Labour Government. The Coalition uses the current economic crisis to reduce government spending at a dramatic rate, and many observers suggest that these reductions are driven more by a neo-liberal political philosophy than a genuine need to cut so deeply. This paper examines the implications of the Coalition government’s actions on funding for the arts in England.

This paper reports on one aspect of a larger project on cultural policy in the United Kingdom examining trends toward the marketisation of public-sector arts, increasing government intervention, and a growing emphasis on managerialism. The project focuses on the analysis of government documents and policies relating to the arts and arts organisations. This paper looks in detail at policy statements made by Coalition Government ministers and some responses by Arts Organisations.

THE IMPORTANCE OF SOCIAL INTERACTION IN MUSEUM EXPERIENCES
Mia Stokmans

Abstract: In Bourdieu’s theory, participation in the arts is mainly determined by social factors, in that participation repertoires are homogeneous within social classes and heterogeneous between social classes. This perspective focuses on social pressure within (reference) groups and social status between social classes. Yet, are these the only influences social groups have on participation? Research indicates that most people prefer to visit the arts with a spouse or friend. Furthermore, experience marketing indicates that an artistic experience can be intensified by active participation. These observations suggest another important social factor in arts participation that finds its origin in the consumption situation.

In a consumption situation, the interaction between an individual and an artistic object may result in psychological benefits (pleasure, self-actualization), whereas the interpersonal interaction may result in psychological as well as social benefits (identification, self-esteem). Interaction ritual chains (Collins, 2004) bring these experiences together in a model. According to this model interpersonal interaction in a consumption situation intensifies the mutual focus of attention, it enhances emotional experiences, it brings about social benefits (such as belongingness and group solidarity), and it paves the way for the construction of homogeneous evaluation schemes within the group.

These ideas are explored in a survey study (N=82) among frequent visitors of museums. It turned out that about 20% of the respondents visited the museum alone, about 50% with family and about 30% with friends or colleagues. Marked differences were found between these visiting groups: Those who went with friends or colleagues were more content with the museum visit and talked more about this museum visit and museum visits in general. However, the groups did not differ in overall evaluation. Further analyses indicated that talking (before, and during) about the museum visit has a positive effect on the evaluation of the visit (expressed in 10 points) as well as the positive emotions experienced, even if all other aspects of this museum visit (contentment with the artworks presented, and other aspects of the augmented product) and mindset regarding museum visits (hedonic and utilitarian attitude and involvement) were accounted for.

BETTER ALONE THAN IN BAD COMPANY? THE SOCIAL DIMENSION IN THE EXPERIENCE OF VIEWING ART IN MUSEUMS.
Elena Pérez-Rubiales, Jordi López Sintas, Ercilia García Álvarez

Abstract: In May 2010, the UK General Election failed to give a clear majority to any political party. David Cameron’s Conservatives and Nick Clegg’s Liberal Democrats formed a coalition government, whose main aims, apparently, are to cut government spending in every area. Spending, they argue, had spiralled out of control under the previous Labour Government. The Coalition uses the current economic crisis to reduce government spending at a dramatic rate, and many observers suggest that these reductions are driven more by a neo-liberal political philosophy than a genuine need to cut so deeply. (Cerdanyola del Vallès), 3Management, Universitat Rovira i Virgili, Tarragona, Spain

Abstract: We have designed a phenomenological research to study the social dimension of the experience of visiting an art museum framed in the symbolic interactionism theory. To elucidate the role of social interaction among museum visitors, we have analyzed their experiences before, during and after their visits. The specific goal of this study is to determine the conditions, social interaction strategies and content of museum visitor experiences. We have conducted 21 interviews with Spanish individuals who visit art museums regularly, which were digitally recorded and, later, transcribed ad verbatim. Transcripts and contextual comments recorded during the field work have shaped the data sources for our project, analyzed with the help of computer assisted qualitative data analysis software (CAQDAS). We have found that cultural capital and social context of individuals influence their social strategy, whether visiting alone or accompanied and, therefore, the content of the experience. On the one hand, visitors with a low contextual cultural capital look for a social experience in the museum visit and, consequently, they attend in company to be able to interact during the exhibition itinerary. On the other hand, visitors with a high contextual cultural capital search a more aesthetic experience and as a result they prefer visiting alone. The social interaction of this second group of visitors, contrary to the previous one, is prominent before and after the aesthetic experience.

Keywords: social interaction, art museums, contextual cultural capital.

VISITING ART EXHIBITIONS - A COMPLEX CULTURAL PRAXIS

Nina Tessa Zahner 1
1Department of Cultural Science, UNIVERSITY OF LEIPZIG, Nürnberg, Germany

Abstract: The visit of art exhibitions as a cultural phenomenon is a complex cultural praxis. As such it cannot be understood on basis of quantitative material as it is produced by visitor studies. These studies find a highly educated public in museums but cannot explain why this is the case. To explain the elite nature of this public they often recur to Pierre Bourdieus famous museum studies from the 1960s. Here Bourdieu developed a theory of art reception that identifies a specific aesthetic knowledge crucial for the reception of an object as a work of art. I will show that this notion of reception is only one position in the highly differentiated art field of today, where the idea of autonomous art is only one conception within a vast plurality of art conceptions. I will present material from several qualitative case studies conducted in an ethnographic manner that investigate how different people make actually use of art exhibitions. The praxis of visiting art exhibitions is being reconstructed from the visitor’s point of view. It is investigated which exhibitions different people visit, how they conduct their visit and what meaning they ascribe to this praxis. I will show that for understanding the praxis of visiting art exhibitions not only a certain knowledge or kind of reception is crucial but the social value that is ascribed to the visit by the visitors themselves.

“SOCIAL ART”: A POLITICAL ART WITHOUT POLICY SUPPORT?

Cláudia Guerra Madeira 1

1Instituto Ciências Sociais, ICS-UNIVERSIDADE DE LISBOA, Lisboa, Portugal

Abstract: Currently there are a series of art projects spread over different artistic fields from public art, to ecological art, to bio-art, to political art, to gender art, among others, that subscribe to a notion of active citizenship, through participation and performative intervention in the public space.

This inscription gives to this intentional “social art” a political status where, however, several notions of politics are struggling, either from the artists sphere or from the political authorities to support art. Taking for example the Portuguese context, we analyze these various notions of politics in art in these global turbulent times.

INFINITE RIFT INFINITE SEAL; ART AND SOCIAL UNREST

Kebedech Tekleab 1

1Foundation Studies, SAVANNAH COLLEGE OF ART AND DESIGN, Savannah, Ga.31410, United States

Abstract: Every time part of the world’s social fabric breaks into pieces there is a need to collect the fragmented parts to put them back together again. Understanding why the breakup occurs and putting the pieces together is difficult since for the most part, the answers lie between the cracks – the voids that are beyond repair. These in-between spaces need to be filled creatively, imaginatively, and philosophically because there is no single rational that can simultaneously provide commonality of the different truth claimed by each broken piece.

As a backdrop my paper will discuss historic and contemporary artworks created during and after major social unrest. It will provide insight into the role of the works that may give solace to some but mainly serve as bridges across the societal rifts created by the turmoil.

The paper also focuses on my visual and literary works as a person who survived years of imprisonment and as an artist who is inspired by humanitarian issues.

The tragedy of the Ethio-Somali war, and my personal experience as a civilian internee in Somalia, is central in my work besides other global humanitarian issues.

The conditions that brought about my capture by Somali fighters started when I was a teenage girl living in Addis Ababa.

In late 70’s and early 80’s the internal civil war in Ethiopia, fueled by the infamous era of the “Red Terror”, made every Ethiopian that did not support the military junta in power, vulnerable. The government was desperate to stop all internal resistances while waging a full-scale war with neighboring Somalia. A number of my friends and I were among the student body that opposed the regime and among fortunate ones who survived the whole scale massacre of the red terror by fleeing the country on foot across the desert. It was our misfortune however; that in our attempt to escape the Ethiopian threat, we strayed into territory controlled by Somali forces and we were captured. For the next ten years we were imprisoned as prisoners of war.

In discussing my work, I will address the issues of
- Memory and imagination that penetrate layers of experience and set visual and literary languages.
when justice borrowed its ethics from the market, the statement should also be that for the first time in human history, advertising of the entertainment business, visited by millions of viewers, open 24/7 all over the globe, make corresponding fields in the art world'sem.'In order to define it in a dialectical, non-dogmatic way.

- We often tend to identify Public Art with the so-called permanent site specific works, made in collaboration with the institutions, which generally tend to loose their dialectical power after a while, like monuments do. Nevertheless the concept can be developed, showing how the concept moved from site specific to audience specific projects, according much more importance to the community of a given space, than to the space itself.

Collecting the most important results in Public Art practices we can systematize an articulated definition, following as research methodology a pragmadietical and rhetorical approach:

- Permanent site specific works: installations which always imply an official project.
- Temporary site specific works: which could be official or unauthorised installations.
- Public Art as de-design: It consists in art actions that seem to be superfluous; they create a sort of disturb, in order to de-structure stereotypes and passive ways of living. Public art goes this way beyond the personal gesture of the artist, trascends pure subjectivity and responds to the urban, social and political structure that defines a given place.
- Public Art as Transculture: Public art can also come in through the back door, like a second class citizen and present itself as the voice of marginal cultures activating a transcultural process, well defined by Fernando Ortiz.

These last two aspects are at the moment the most interesting as they allow social and political engaged art actions which can de-structure stereotypes or improve critical thinking.

- From this short analysis the main findings prove how Public Art left its first “formal” aims in order to achieve an interdisciplinary approach, promoting neighbourhood through a socratic dialogue with the public, who becomes more and more an active subject of the work, able to transform the aesthetic function into a socio-aesthetic one.

**EUROPEAN CULTURAL POLICIES AND THE ‘CREATIVE INDUSTRIES’ TURN.**

Pierre-Michel Menger

Sociology, EHESS & CNRS, Paris, France

Abstract: Cultural policy in Europe is deeply rooted in the Welfare State doctrine that has been prevailing during the last half century. Its implementation has gone along with the invention and rise of educational policy, social policy and health policy. This paper sketches its evolution as a four phase move towards what has been emerging as the central dual content of the current public cultural policy: preserving and promoting heritage, and bringing the creative industries at the core of the so-called knowledge society. The general evolutionary trend shows four distinct phases: 1) the creation of a systematic cultural supply policy based on a limited definition of culture suitable for public financing and based on a vertical concept of democratization by conversion; 2) the gradual decentralization of public action, which leads to an increasing disparity in its aims and functions, and which challenges the initial universalist, top-down egalitarian model; 3) a revision of the legitimate scope of public action, which declares symbolically obsolete the founding hierarchy of cultural politics, that which would oppose high culture, protected from market forces and entertainment culture and gov-

**ART ON TRIAL: WHEN CRITICISM OF REALITY TAKES AN ARTIST TO COURT - ART AS CRIME IN A MARKET-BASED SOCIETY**

Ulla Karttunen

Department of Cultural Research, UNIVERSITY OF EASTERN FINLAND, Joensuu, Finland

Abstract: The contemporary art world is increasingly commodified. Alongside art as brands of luxury objects, there are activist, socially aware tendencies in visual art. In reality art artworks offer commentary on real-world phenomena in spite of creating fictive realms: art becomes part of social criticism. But is there any place for art as a criticism of reality under marketized cultural practices?

This paper studies an art trial case in contemporary Finland. In the Western, pluralistic art world, a work of art seldom leads to a legal case. In Finland a work presented in the gallery of the Helsinki City Art Museum led to criminal proceedings (2008, 2009, and still ongoing with the artist’s appeal to the European Court of Human Rights).

The court ruled that it is not possible in art to criticize the public social realm, as would have been possible in research or journalism. According to the court, it was clear that the artist was critical of the phenomenon in question, but nevertheless this act of criticism was interpreted as a crime. The work was confiscated and declared secret for 25 years, the artist’s computer was wiped as a “means of crime” and in the immense media uproar the artist was reviled as the most despised criminal, which seemed to some observers like a modern-day witch hunt.

What kind of reality was the art work criticizing? The work attacked the business-oriented structure of society by focusing its criticism on open-access pages in the internet and an especially popular part, teen porn galleries. The legal investigation was not interested in the material in its original place – the branded sites were not put under investigation – but only in criticism of them.

There exists in the internet a gallery structure so vast that it could make corresponding fields in the art world seem wholly marginal. These porn galleries are an important part of consumerized popular culture, visited by millions of viewers, open 24/7 all over the globe, marked by the same desire for success and celebrity as other parts of the entertainment business. A sociologically interesting fact should also be that for the first time in human history, advertisement images have become objects consumed by a large clientele.

When justice borrowed its ethics from the market, the statement was clear: critical art shall be silenced.

**WHEN PUBLIC ART GOES GUERRILLA**

Cattani Annalisa

Communication, UNIVERSITY OF TRIESTE-ACADEMY OF FINE ARTS BOOGNA, Imola-Bologna, Italy
erned by the laws of the industrial economy; 4) an increasing tendency to justify cultural policy on the basis of its contribution to economic growth and to the balance of national social diversity, which legitimises the regulatory power of public action as well encouraging the expansion of the creative industries and the demands for the evaluation of procedures and results. The last section of this paper moves away from the state centered perspective and focuses on the city as the incubator of cultural generativity, in order to suggest how a city-centered approach to cultural development challenges the state-centered doctrine of cultural policy.

**FAKE CREATIVE CLASS ENTERTAINING SUPER STARS: A CREATIVE CITY TRAP FOR ANTALYA**

Reyhan Görk

Abstract: The aim of this paper is to analyze the terms of creative class and creative city for the case of Antalya while scrutinizing the relation between cultural policies and global capitalism as well as this relation’s impact on the process of restructuring Antalya into a ‘city of culture’. The flow of creative class for the formation of a creative city is inevitable. However the strategies for transforming Antalya into run production center are not enough to pull the creative class. Instead, it turned into a kind of ‘star hosting organization’ from Hollywood.

Florida (2002b: 7; 2005: 151; 2006: 72) emphasizes the social-cultural dimensions of city life, suggesting that the “creative class does not just cluster where the jobs are […] they cluster in places that are centers of creativity and also where they like to live.” As observed in cities like Vancouver, Milwaukee, Baltimore local “creative clusters” develop within these cities and city regions, and are tightly connected to the international creative industry—comprise a “creative city network” (UNESCO, 2006: 58). According to Landry (2006: 61), in all of these cities called ‘creative’, “most of the strategies and plans are in fact concerned with strengthening the arts and cultural fabric, such as support for the arts and artists and the institutional infrastructure to match.”

For the purpose of the study, various qualitative research methods were used to collect data; individual interviews were conducted (representatives of different interest groups like bureaucrats, local politicians, entrepreneurs, representatives of NGOs, etc.); group interviews of academics were realized; life history accounts (memoirs) were collected; and the news on Antalya in local newspapers were systematically analyzed.

Looking at the process of restructuring Antalya into a ‘city of culture’ in the field of art and culture, it is observed that almost all of the related institutions, foundations and establishments of art and culture have been administered or directed by outsiders, most notably by actors from Istanbul. They have relatively higher cultural, educational, social and symbolic capital and are now commonly seen in Antalya, with their own words “trying to attract global capital to the city” in this age of inter-urban competition. Still, one cannot argue that here is a creative class flow to Antalya.

**LOOKING AT MUSIC SCENES AS CREATIVE INDUSTRIES. THE INDEPENDENT LIVE MUSIC SECTOR OF MILAN**

Silvia Tarassi

Abstract: Within popular music studies, the notion of ‘music scene’ (e.g. Shank, 1994; Straw, 1991) has been often used to take into account music practices taking in place in urban contexts. The music scene has been regarded as being alternative and independent from the music industry, and as being constituted by small music collectives adopting a DIY (Do it yourself) approach. Further research has instead underlined how music production and performance at a local level has become a more professionalized activity (Smith & Maugan, 1997), which can play a central role in the creative economy of the city. The music scene can therefore be studied as a creative subsector, characterized by local creative networks and infrastructures taking place within specific urban areas (Hesmondhalgh, 1996; Scott, 1999; 2000).

There is therefore a need to look at the local specificity, taking account of the ‘soft infrastructures’ constituted by the networks of people involved in the music sector (Brown, Cohen & O’Connor, 2000) and to look at the creative industries sector in a broader sense in order to understand the possible cooperation or competition existing between multiple subsectors.

The paper will therefore present the qualitative research which is conducted in the independent live music sector of Milan by interviewing using the life story approach the different actors involved inside (musicians, booking agents, artistic directors, venue managers) and outside the scene (Music Consultant, Councillors) and by using participant observations in venues and during music events were conducted in order to grasp the different networking practices taking place in the scene. The case study will enable to discuss the explanatory relevance of the term music scene to analyze music practices of production and consumption and to point out the need of popular music studies of combining the theoretical perspective of scene with the debate around the creative industries.

**BALKAN MUSIC IN AUSTRIA UNDER THE LENSE OF BOURDIEU’S FIELD THEORY**

Regina Claudia Sperlich

Abstract: Since 1990, Balkan music has developed to a popular phenomenon in Austria. Considering the development before, already the first generation of migrant workers brought Balkan music to Austria in the 70s and 80s, but to appeal to the Austrian majority this music had to become part of “World music”, a label for all “non-Western” music, which had been invented by the music industry in the 1980s. However, at the beginning of the 90s music of the Balkan region still was not understood as “Balkan music”, but was only known (if at all) by the majority through a few single musicians and bands. One of the first of such bands was the Wiener Tschuschenkapelle, which was founded in 1989 in Vienna. Another early branch was Greek music, which had emerged already in the 1980s, like Lokis & Achwach and Marios & Julie. Since the second half of the 1990s and increasingly since 2000 in Vienna and Graz more and more musicians have dedicated themselves to Balkan music, not only but especially musicians who were born in South-East-Europe. An important context, which must be regarded, was the civil war in former Yugoslavia resulting into a flood of migrants. But over the years not only refugees came, but also students of classical music or jazz. Many of them discovered “their” Balkan music for the first time in Austria. Finally, in the 2000s new musical institutions have appeared, such as ost-klub or the Balkan Fever
**Abstract**

which both have driven the popularization of Balkan music forward. This "little history" of Balkan music is investigated by referring to Bourdieu’s field theory of cultural production. We regard Balkan music as a subfield of music production in which musicians and managers of festivals and clubs struggle for social acknowledgement. Most musicians and managers acting in this field are well educated and belong to the middle class. Though their economic recourses are rather limited they have access to cultural, social and symbolic "capitals". Therefore, they are more likely to mobilize support and to bridge the gap between established and marginalized positions. These issues concerning the development of Balkan music since the early 1990s until today are investigated on the basis of the analysis of Austrian daily newspapers and music magazines concerning this period of time as well as the analysis of qualitative interviews, which were conducted with musicians and managers of festivals and clubs.

MEN AND WOMEN'S ACCESS TO SOCIAL RECOGNITION AND FAME IN THE INTERNATIONAL CONTEMPORARY ART WORLD: GENDER AND SUCCESS IN THE VISUAL ARTS

Alain Philippe Quemin, Clara Léa Lévy

1Dpt of sociology, UNIVERSITÉ PARIS-EST, Paris, 2dpt of sociology, université Nancy-I, Nancy, France

Abstract: Since 1970, German magazines Capital and Manager Magazine have published nearly every year a ranking, the Kunst Kompass, that aims at making public the names of the 100 most visible artists on the international art scene. The ranking is built individually for each artist who receives a certain number of points for his or her exhibitions, either personal or collective in major art institutions such as museums or biennales or for the press cuttings that they get in major international contemporary art magazines. Although the ranking is based on the individual, it is possible to consider groups of artists that share common social characteristics. In this presentation, we will compare male and female artists.

After a critical presentation of the instrument that the Kunst Kompass offers presenting both its limits but also what it can bring, the first phenomenon of the increasing share of women among the most visible international artists and their confrontation to a ceiling that prevents them from perfect integration to the art world will be analyzed.

Besides, not only does the Kunst Kompass make it possible to compare the share of men and women among the most recognized international artists, but it also enables us to compare various social characteristics of male and female artists. Such is the case of careers that can be more or less rapid. At what age do men and women appear in the Kunst Kompass? What is the average age of men and that of women for a given year?

Other criteria will be analyzed. In what countries were male and female artists born and where do they live? In what country is their main gallery (mentioned in the Kunst Kompass) located? What are the main media used by the most famous male and female artists (painting, sculpture, photography, video, performance, installation, environment...) and what movements of contemporary creation do they belong to? This will enable us to study the link between gender and the characteristics of the works. A similar concern for other traits of the works will justify the study of the average prices of the works created by female artists to that of male artists for equivalent positions in the ranking.

In this presentation, we will try and study social characteristics, should they be biographical and related to the private sphere or to the professional space, of female and male artists and try and show the impact of gender on artistic recognition.

**DOES THE LEGISLATION FOR THE ARTS PROMOTING ACTUALLY PROMOTE ARTS: THE CASE OF THE VISUAL ARTISTS IN FINLAND**

Pauli Rautiainen

1School of Management, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The Finnish model of arts and artists promotion is one variant of the Nordic model. The shift into the present policy of promoting the arts and artists in the 1960s was ideologically connected to the expanding Nordic welfare state in all of the Nordic countries. By the end of the 1960s the earlier administrative structures of distributing direct state support to artists were replaced with new administrative bodies and budget appropriations. The reason for this was to consolidate the types of grants and their distribution by legislation. During the period of expanding welfare state the Nordic countries introduced also indirect public support forms that consisted of various legislative schemes to support the individual artists. These schemes are mainly connected to the social security law, tax law and copyright law.

In my presentation I am asking does this legislation for the arts promoting actually promote arts. I am focusing on the visual artists (painters, sculptors, photographers etc.) in Finland. When answering to this question I will mostly rely on a survey carried out in the summer 2010. In addition I will use register data and results from the previous studies (mostly carried out by the Arts Council of Finland). This presentation is closely connected with my on-going research project regarding how the legal regulation promotes and prohibits the artistic work in Finland.

**CULTURE OR PRODUCTION? THE IMPACT OF CULTURAL COMPREHENSION ON WORKING STRUCTURES WITHIN THE CULTURAL INDUSTRIES**

Christiane Schnell

1Goethe-University Frankfurt/Main, INSTITUTE OF SOCIAL RESEARCH, Frankfurt am Main, Germany

Abstract: Referring to the example of TV camera operators the paper will analyse the relation between prevailing concepts of culture and working structures within the cultural industries. It is argued, that camera operators represent an occupational group positioned in between artistic creativity and technological service, which does not fit into the framework, which regulates cultural work in Germany. The argumentation proceeds in three steps: First the emergence of an institutional setting around cultural work is described within its historical context. One pillar of this institutional framework is for example the integration of Artists into the German social security system (Künstlersozialversicherung). Secondly, the explicit and implicit presumptions and consequences of this model are analysed in the face of the structural change of the cultural industries and the shifting relation between public financed cultural production, small
businesses and media corporations over the last decades. Thirdly, the example of TV camera operators is taken to explain how comprehension of culture and old and new working structures within the cultural industries are interrelated.

CONTESTED HOMES: PROFESSIONALISM, HEGEMONY AND ARCHITECTURE IN TIMES OF CHANGE

Hadas Shadar, Zvika Orr, Yael Maizel

Abstract: Professionals possess an authoritative and monopolistic position based on their exclusive professional knowledge. However, in post-modern societies, professions are increasingly forced to compete for their monopoly and autonomy and protect their jurisdiction. This process is particularly salient with regard to the architectural profession, due to its dependency on clients, and because architecture often involves struggles over collective identities and power. Architects’ constructed products are conspicuously visible to the public. Therefore, an analysis of the architectural profession enables us to examine the complex interrelations between the professionals and the general public.

In addition, in hegemonic processes, professionals, including architects, often serve as “traditional intellectuals,” or agents that preserve the interests of those in power. By constructing and delivering the dominant ideologies, epistemologies and symbols, these professionals affect the social order and strengthen the stability of hegemonic structures. Architects have a unique role in these processes, as professionals who can spatially and physically express and symbolize abstract values, ideologies and national identities.

This paper focuses on a critical moment in which a threat is posed to both the architects’ professional autonomy and the established hegemonic structure in which their social group possesses sociocultural dominance. This paper examines the reaction of the architects to this double-threat, by analyzing the discourse of Israeli elite architects under the conditions of hegemonic crisis during the 1980s, which entailed a partial privatization of urban planning and freedom to individuals to design their own homes.

This paper explores the arguments used by these architects in order to contend with this double-threat. This paper shows that the architects attempted to protect the old social structure and hegemonic ideology, while neglecting their exclusive knowledge and tools as professionals, thereby diminishing their professional status. Following the voluntary “recruitment” of the professionals for the “defense” of the hegemonic order, the architects no longer promoted the idea of professionalism as a normative value system. In the long term, this strategy has weakened the status of the architects in society.

VALUATION CRITERIA OF PROFESSIONAL CRITICS IN THE POPULAR MUSIC PRESS

Gunnar Otte

Abstract: Professional critics occupy a mediating position between cultural producers and consumers and are said to act as “gatekeepers”, “tastemakers” or mere “predictors” of artistic success. In recent years, the impact of critics on market success has been studied particularly in the realm of film. There is also work on the historical changes in the techniques that critics have been using in their film reviews. Concrete valuation criteria, however, have rarely been investigated systematically and comprehensively – even less so in the realm of popular music. Drawing on the pioneering efforts of Ralf von Appen, a scoring scheme was developed in order to content-analyze album reviews in three influential German popular music magazines – Rolling Stone, Spex and Intro – on a quantitative basis. The codebook differentiates several dozens of subcategories of compositional, interpretative, emotional and personal qualities as well as references to musicians’ biographies and their positioning in the musical field. Our database also links critics’ valuations to objective characteristics of musicians and their albums as well as their chart success. The sample consists of about 800 reviews in 1995, 2000, 2005 and 2010. The presentation will address the following questions: How frequent are different valuation criteria? What is their relative impact on critics’ overall rating of an album? Do valuation criteria differ between music genres such as rock, hip hop and electronic dance music? Has the evolution of musical styles lead to changes in critical discourse over the fifteen year timespan? How do critical reviews relate to an album’s popular success?

PLAYING, COMPETING AND PRIZEWINNING: WHAT ARE THE ISSUES OF INTERNATIONAL MUSIC COMPETITIONS FOR YOUNG MUSICIANS

Miriam Gina Odoni

Abstract: The international music competition is an organisation with its own staff, its own rules and its own structure. The competition pertains to an array of selection tools allowing to access the professional classical music market. The competition aims to promote the career of young and talented musicians and is an “interface” between education and music production.

The purpose of this research is, using the international music competition as a privileged viewpoint, to study how musicians are selected and brought to the music market. To analyze the impact of prize winning in the career of musicians, we reconstruct and analyze the trajectory of musicians who participated to international music competitions and who want to do an international career. The music market has its own specificities: its actors are very competitive and it functions through project organization. We study how musicians invest this market and how they manage to stay in it.

One issue that we wish to address as such is that this research integrates various research methods: observations during several music competitions and interviews with contestants, a documentary research on international competitions and interviews with organizers of competitions, an online questionnaire sent to about 800 prize winners, “life stories” with twenty prize winners and finally interviews with a control population of ten persons who did not win a competition prize.

What are the reasons for musicians to take part into international music competitions which is an activity with high risk for them (no guarantee of winning a prize and very expensive in terms of money,
work and energy)? How do they live this moment? What are the immediate consequences of winning a prize, and how do they live the time after the competition? Those are the questions we would like to expand upon as we present the first results of this research. And consequently, question issues raised by the participation into international music competitions for a musician.

REPUTATION AND ECONOMIC DISILLUSION: THE CASE OF ARCHITECTS IN PORTUGUESE SOCIETY

Vera Sousa Borges 1

1Instituto de Ciências Sociais, UNIVERSIDADE DE LISBOA, Lisboa, Portugal

Abstract: The literature on artistic reputation has explored it as a phenomenon with implications for the entire society, culture, creativity, economy. Several authors have increasingly been studying the meaning and the survival of artistic reputation and the power of some individuals that accumulate reputational credits, the “winner-take-all-markets”. We will analyse the results of a qualitative research inside 14 ateliers, with 23 Portuguese architects in order to describe: (a) the role of reputation in the organization of work in architecture, (b) the professional disilusion by young architects, characterized by the desire to abandon architecture and by the amount of time without artistic work in the field; finally, (c) we will explore the links between reputation and occupational risk in today turbulent times.

TOWARDS A SOCIOLOGY OF READING FICTIONAL NARRATIVE. THE SOCIAL CONSTRUCTION OF FICTIONAL LITERARY NARRATIVE

Pablo Venegas 1

1Laboratoire de Sociologie de Grenoble EMC2-LSG, UNIVERSITÉ PIERRE MENDÈS FRANCE - GRENOBLE 2, GRENOBLE, France

Abstract: Our central hypothesis is as follows: fictional literary narrative is a socially-constructed cultural object, which means that fictional literary texts in themselves are devoid of meaning. The meaning is constructed from the intellectual and sensitive processes involved in the act of reading by virtue of reception processes and intersubjective type cognitive operations. We maintain that the meaning of literary fiction is that given to it by the participants in what we refer to as the Fictional Narrative Reading Institute, where the actors adopt a predetermined role and assume the norms and conventions which dictate what the fictional narrative should mean.

From the reception of the fictional narrative By Night in Chile by Roberto Bolaño in two countries (France and Spain), we approach the social creation of a fictional text produced by the reading situation, as a sociological phenomenon, as both an individual and a collective process. Thus, the aim is to describe the particular conditions of the social creation of a text from the connection between the literary text itself and its reception by the different readers. We examine the nature of the processes that readers confront when facing a fictional narrative and the manner in which readers confer meaning to the text depending on their origins, cultural background, and the whole array of factors that affect the practice of reading a fictional text.

Marc Verboord 1

1Media & Communication, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: The artistic value that is attributed to cultural products and genres in societies is to a large extent the outcome of interactions among institutionally embedded agents like critics, academics, and other cultural entrepreneurs. Organized into cultural fields, these agents have been legitimated to classify cultural products into symbolically potent categories which signal distinctive structural properties as well as degrees of artistic excellence. Previous work offered studies of individual careers, in-depth analyses of specific cultural institutions and one-moment analyses of a specific form of recognition (retrospective cultural consecration). In this paper, we aim to map transitions in how cultural institutions relate to one another and through their social standing affect the status of individual artists.

More specifically, we examine artistic value attribution by analyzing the choices made in one particular institution (newspaper criticism) in relation to other forms of institutional recognition (retrospective cultural consecration through entries in literary encyclopedias, contemporary cultural consecration through literary awards, commercial recognition through bestseller list success and producers’ status through the prestige of publishers). Our baseline is formed by newspaper critics – cultural agents whose authority to evaluate artistic expressions has been shown in previous studies (e.g. Janssen, Kuipers & Verboord, 2008).

For a sample of newspaper articles from the years 1955, 1975, 1995 and 2005 from 8 newspapers in 4 countries (N=2,419), we retrieved information on the fiction book authors discussed. We then inductively analyze how fiction book authors appearing in these articles can be characterized in terms of the mentioned forms of institutional recognition. We conduct cluster analysis and multinomial logistic regression analyses.

The aim of the paper is threefold. First, we pursue a more detailed examination of how hierarchical differences within one particular cultural domain have evolved in the past 50 years. Second, we attempt to come to a more fine-tuned analysis of how different cultural institutions relate to one another and impact the symbolic value of cultural products. Third, we learn about the mechanisms by comparing the literary fields in four countries: France, Germany, the Netherlands, the United States.

FIGHTING PROFESSORS AND OTHER SCANDALS – THE CHANGING IMAGE OF NON-FICTION WRITERS IN MEDIA

Maaria Linko 1

1Department of Social Resarch, UNIVERSITY OF HELSINKI, HELSINKI, Finland

Abstract: The media publicity in any field of art can be vital for its success. This is also the case on non-fiction books and their writers. The huge changes in media have affected also the ways in which non-fiction writers are represented in media. Media researchers have claimed that the aesthetic paradigm in culture sections of
newspapers has been removed by the journalistic paradigm which among other things has lead to an emphasis of news instead of reviews of artistic works. In addition, the Internet has brought an enormous change which affects the whole book world and, also the media publicity of literature.

In these circumstances, the paper examines the media publicity of non-fiction and especially the writers of non-fiction. How are non-fiction writers being framed in media? Which sub-fields of non-fiction are the winners in the competition of media space? The research data consists of media publicity of non-fiction in three largest newspapers, two tabloids and three magazines. The visibility of non-fiction in the Internet is discussed in the light of the most important websites on which literature is present.

Nine different frames that the non-fiction writers are represented in newspapers and magazines were discerned: non-fiction writers were framed as experts, interpreters, truth-tellers, professionals, politicians, philosophers, art enthusiasts, reporters or therapists.

The tenth frame is that of a celebrity. This frame, however, is a surplus frame which can be added to other frames. The media is interested, if a piece of news can or, preferably a scandal can be reported, and t scandals sell, and publishers are aware of this too. Best selling scandals deal with the private lives of writers or the people they write about. Not even non-fiction writers can remain completely outside the wide-spread therapy culture in which public confessions and disagreements with other people are more interesting than research results of artistic work of exceptional quality.

Two history professors disagreeing strongly about details of war history or a young, award-winning female writer with strong opinions about Finnish men win in the competition of media space. Not to mention biographers and their subjects if there is a scandal to be reported. Still, there is also a notable space for non-fiction writers as experts in media – the question remains, does the reading public notice, that these experts are or also authors?

**IS THIS ART? A TRANSDISCIPLINARY STUDY ON THE DECISION ART / NON-ART IN THE RECEPTION OF NEDKO SOLAKOV’S WORK “A LABEL LEVEL”**

Martin Anton Tröndle 1, Volker Kirchberg 2

1Culture, Communication & Management, ZEPPELIN UNIVERSITY, Friedrichshafen, 2Cultural Sociology, Leuphana University, Lüneburg, Germany

Abstract: Searching for the key word “aesthetics” the Encyclopædia Britannica (2001) states: “Indeed, it could be said that self-definition has been the major task of modern aesthetics.” This Swiss national research project eMotion – mapping museum experience analyses the implicit decision art/non-art of museum visitors in the field of a fine art museum using a truly interdisciplinary approach, from an art theoretical, sociological, psychological and experimental perspective. To gain access to this complex decision-making process of visitor reception in the museum, we developed innovative research methods: A contemporary, complex visitor tracking system, biometric measurements, empirical social science, as well as the experiment itself were integrated in a complementary fashion. Our field study was conducted for several months in 2009 in the Art Museum of St. Gallen, Switzerland. Since then we have been analyzing a vast amount of data which we collected from more than 500 probands in the field.

For this presentation “Is this art?”, the [art]work and its effects on the museum visitors which we have analysed were created by the renown Bulgarian artist Nedko Solakov. In the following we will first describe and discuss the psychogeographic data, i.e., the computer-assisted mappings reflecting the immanent visitors’ experiences of Solakov’s art. We will secondly describe and analyse statistical data on experiencing and remembering Solakov’s art as yield by standarized entrance and exit surveys. Thirdly we will interpret the data gained by the psychogeographically oriented mapping methods and by the quantitative visitor surveys in view of the major sociological art theories which have been discussed in the last decades – some of these may have to be re-thought.

**THE MULTIFACED CONCEPT OF AVANT-GARDE: NEW ART OR NEW SOCIAL PRIORITIES?**

Ilaria Riccioni 1

1Faculty of education, FREE UNIVERSITY OF BOZEN, Bozen, Italy

Abstract: The concept of avant-garde has been rarely inquired in all its different potential facets. However, whenever we talk about art we cannot avoid to consider what kind of art we are approaching. In contemporary times, art is highly connected to economy, market, public relation and ability to communicate. The intent of this paper is heading in a triple direction: 1) find out if the concept of avant-garde is still holding a role in our contemporary art; 2) how is it changed in relation to the original utopic idea of the early avant-garde artists of the early nineties, as we consider that a society which doesn’t have room for utopia is at risk of it inner meaning and orientation. If avant-garde is, in a sense, the outcome of a sort of utopic thinking able to shape society in its fears and wishes, as well as its economical needs, what is the shape of utopia in the recent artistic pieces of meaning? 3) the first sociological considerations on the concept of avant-garde appear with the book of Renato Poggioli, “the theory of the avant-garde”, where the concept is widely considered as a main concept to read modern way of art thinking. A second important contribution to the concept is given by Peter Burger’s, “Theory of the avant-garde”, where the concept of avant-garde is stretched to its meaning to a postmodern interpretation. However, if avant-garde is a way of thinking the role of arts in contemporary society, we cannot avoid considering its relation to time, social organisation, bureaucracy and extended conception of space. What is, therefore, the shape of contemporary avant-garde? Do we still have one? In which areas? Does art still have a leading role?

**SOCIIOLOGY OF THE ARTS AFTER MASSMODERNISM**

Alfred Smudits 1

1Institut für Musiksoziologie, UNIVERSITY FOR MUSIC AND PERFORMING ARTS, Vienna, Austria

Abstract: I will start with the discussion of the terms ‚modernity’, ‚modernism’, and ‚modernization’. In this context several dimensions of modernization, such as rationalisation, individualisation, differentiation, domestication etc. will be identified as well as several stages of modernity (early modernism, bourgeois modernism, mass modernism).

One oft he main issues of any sociology oft he arts was the modernization of the field oft he arts. Max Weber argued that rationalisation in the beginning of early modernism was the main characteris-
tic of the specific development of occidental art. The rise of mass media, in particular of electronic media in the beginning of the 20th century (the beginning of massmodernism) forced sociological theories oft the arts to integrate mass media in their concepts. That means that modernization of society goes along with modernization of the field oft he arts, and altogether these developments ask for a modernization of the sociology oft the arts, the development of an adequate sociological concept oft the arts (objects, practices, structures, functions).

With the emergence of digitalisation a new step of modernization takes place. Sociology oft he arts hast o face the challenges that arise out of this newest step of modernization, which means above all to keep in touch with culture sociology and general sociological theories.

THE CONTEMPORARY SPHERE OF ART FROM THE STANDPOINT OF SYSTEM-THEORETICAL SOCIOLOGY

Erkki Tapio Sevänen

Abstract: Theorists of postmodernity and creative economics hold that modern society consisted of differentiated sub-systems, each of which had its own function in society and which were largely autonomous with regard to each other. However, they go on, today there are no longer cut boundaries between art and other sub-systems, because art is merging with other sub-systems, in particular, with economics.

In contrast to this, Niklas Luhmann stated that we still live in modern society. According to him, in this society the sphere of art is, like other sub-systems, an autopoietic formation, that is, it has its own principles of operation on which its functioning is based and which differentiate it from other sub-systems.

Both of these views are unsatisfactory. A system-theoretical view of the contemporary sphere of art should start from the following principles.

(1) Since the 1960s, an increasing process of de-differentiation has been characteristic of society. On a world scale, single national societies have become more open in relation to each other, and in single national societies different sub-systems are more interlaced.

(2) In the 1960 and 1970s, it was, besides cultural industries, also the avantgarde movements, the movement of political art, young popular artists and, in part, the expansive welfare state that attempted to widen art’s boundaries. However, from the 1980s on the process of de-differentiation has mainly been based on the demands of capitalist economics and neo-liberalist policy; they declare that the whole of society must function like capitalist enterprises do.

(3) As a result of this, the system of art has borrowed principles of operation from economics, and economics has borrowed principles of operation from art. Through this, these systems have lost a great deal of their specific and autopoietic way of operation. Consequently, today there is, in society, a wide interpenetration zone between art and economics. This zone contains elements from both of these two systems.

(4) Yet, the system of art has not merged with economics. Certain genres of art (installations, performances, activist art) inherently resist the process of commodification, and Western states also maintain layers of art that could not survive in a pure market competition.

NEW CULTURAL POLICIES IN EUROPE: TOWARDS A “SOCIAL” FUNCTION OF CULTURE AND ARTS?

Olivier Moeschler 1, Olivier THEVENIN 2

1UNIVERSITY OF LAUSANNE, Lausanne, Switzerland, 2UNIVERSITY OF HAUTE ALSACE, Mulhouse, France

Abstract: Cultural policies and public cultural expenses have often, in the 80′s and 90′s, been legitimated by local and national government by emphasizing the economic contribution of culture and arts, either directly (as an economic sector per se) or indirectly (by increasing the attractiveness of a place for tourists or enterprises). In the past decade, this discourse underwent a considerable change, in the context of both the economic crisis and the increasing social and ethnic diversity of Europe, notably of its large cities.

In this context, metropolitan cultural policies are ready to point at the “social” and integrating function of cultural institutions and events. Art is to provide communication, distraction, solace, but also social cement to increasingly hybrid societies. There is no will anymore to bring underprivileged categories of the population to major works of art considered as valuable, yet untouchable goods. Today the real need seems to be to bring culture in its various and expanding forms to populations which are increasingly mixed socially, ethnically and nationally speaking.

What appears to be a new paradigm of cultural policies in Europe raises some questions. How do authorities argue and elaborate their discourse around this “social” function of culture? What permanent features and local characteristics of these discourses can be identified? Which audiences are precisely aimed at, and how? Which cultural and artistic production is defined in these projects? Mainly based on detailed analyses of discourses and of catalogues of measures formulated by the cultural management of cities in France, Belgium, Germany and Switzerland, this paper aims to understand the changes that public discourse on culture – and culture itself – is undergoing in Europe’s new cultural policies.

ARTWORKS AS SOURCES OF NOVEL EXPERIENCE GOODS. FIVE EPISODES OF ”TRANSFORMATION”

Michael Hutter 1, 2

1Cultural Sources of Newness, SOCIAL SCIENCE RESEARCH CENTER BERLIN, 2Department of Sociology, Technische Universität Berlin, Berlin, Germany

Abstract: The products of the creative industries trigger experiences in users through narratives, sounds and images. To achieve their effects, the creators use inventions originally realized in artworks. How do such transformations happen?

Based on a model of interdependence between autonomous social subsystems or plays of value, five historical cases of successful transformation are reconstructed: an advertising photograph by Edward Steichen, an animation film by the Disney Studio, an office highrise building by Mies van der Rohe, a poster with an art motive by Andy Warhol and a handbag designed by Takashi Murakami. The five items span the spectrum of the experience economy. The cases demonstrate that the metaphor of transformation is inadequate to
capture essential features of the process, and they suggest alternative theoretical categories for understanding the relationship between artistic and commercial worlds.

**STUDIO PRACTICE AND LARGE SCALE PRODUCTION**

Karen Van Den Berg, Ursula Pasero

1Cultural Management, ZEPPELIN UNIVERSITY, Friedrichshafen, Germany

Abstract: How do artists work in the large scaled studio of the 21st century? The presentation is based on an empirical research that examines the working practice and conditions in artist’s studios with more than 10 employees. Large scaled studios at the edge of “the post-studio era” with up to 100 employees – like the one of Olafur Eliasson – have become a more and more widespread phenomenon since the beginning of the 21st century. Our research analyses this particular studio practice in order to create findings about its role models, the careers of the employees, and the forms of knowledge production, which take place in studios of artists, whose practice can be seen as a form new art industry. The analysis is based on 10 guided interviews and studio visits.

The study explores forms of organization, patterns of professionalization, and structures of decision-making in these places. One of the finings is that the artists in question on the one hand are seen as market winners, but one the other hand are confronted with the suspicion to be more part of the culture industries than part of the inner circles of the art field. They therefore developed new forms of legitimization practices. Insofar this new form of studio practice cannot only be equated with delimitation into the broader field of culture industries. Speaking of delimitation loses sight of the powers and efforts, which are immanent to the art field, particularly to mention and mark these limits. Therefore the presentation outlined here also raises questions about attribution patterns which distinguish art and non-art in the art field.

**LINKING CREATIVITY AND ART THROUGH THE MUSEUM SOUVENIRS**

Chia-Ling Lai

1GRADUATE INSTITUTE OF EUROPEAN CULTURE AND TOURISM, NATIONAL TAIWAN NORMAL UNIVERSITY, Taipei, Taiwan

Abstract: Souvenir shops in the museum, not only perform the commodification of museums, but also provide the portable memories and reportable art for visitors when involving the process of translating art ideas into consumable everyday aesthetic designs. This research analyse the museum practice in the National Palace Museum (NPM) in Taipei since 2006, which invited Italian designer company, Alessi, to render the exhibits embodying Chinese heritage into design that can be used in the contemporary everyday context. Alessi Designer, Stefano Giovannoni, appropriates the image of Emperor of Ching Dynasty to create Mr. Chin and Chin Family series of dolls and apply them at the design of daily use utensils, including pepper cans, can openers, egg cups and so on. Compared with the NPM’s previous souvenirs design that emphasis on the antique Chinese cultural elements, Alessi series not only create the hybrid design but also bring the contemporary everyday aesthetic into the old universe of museum souvenirs. It also stirs up public discussion on the ideology of the design and bring up the purchase attention for younger generations. Drawing upon theories of souvenirs (Stewart, 1996; Lury, 1997), aestheticization of everyday life (Featherstone, 1994; Lury and Lash, 2007), and tourism and consumption theory (Miller, 1998; Urry, 2002; Zukin, 2004), this paper analyses how the souvenirs perform and be consumed in the museum. It will firstly analyse the politics of hybrid design in the metonymy used in the Alessi design and the translating process from historical art into everyday design. Also, it will deal with the politics of display when souvenirs performed in the museum shops and museum shop website. Finally, it will explore how the souvenirs are consumed by flâneur visitors/tourists from different background in the museum shops, relating to how souvenirs perform as the ‘portable memory’, ‘reportable art objects’ and ‘gifts as consumer’s love’.

**AN ECOLOGY OF MUSIC GENRES: STUDYING THE DYNAMICS OF CLASSIFICATION SYSTEMS**

Alex van Venrooij

1Department of Sociology and Anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: This paper studies the dynamics of aesthetic categories, i.e. genres, in the field of popular music: a field that is characterized by a turbulent rise and fall of large numbers of (sub)genres and therefore offers an especially interesting case for analyzing dynamic mechanisms in categorical systems. Between 1985 and 2005, the genre diversity in popular music increased substantially, witnessing the rise and growth of, among others, hip-hop, reggae, ska, new wave, punk rock, grunge, heavy metal, house music, techno (Lopes, 1992; Dowd, 2004). Some of these genres had short life cycles, whereas others remained part of the musical landscape. Some spawned many subgenres – electronic dance music almost 300 (McLeod, 2001) – whereas others remained relatively undifferentiated genres. Some genres were more successful in some countries, but unsuccessful in others. Electronic dance music, for example, became - by several indicators - one of the most central genres in Europe, but remained peripheral in the United States. The question I want to address in this paper is how to explain these dynamics? More particularly, the aim of this paper is to develop and test a ‘cultural ecological’ model of the dynamics of genres. The ecological perspective has been successful in analyzing the dynamics of organizational forms (Carroll & Hannan, 1988; McPherson & Ranger-Moore, 1991). One of the most interesting questions, however, is whether this perspective can be applied to the dynamic analysis of ‘cultural forms’ (Kaufman, 2004; McPherson, 2004; Lieberson, 2000; Wuthnow, 1987; Abbott, 2001; Isaac, 2009). This project therefore addresses the research question: do ecological mechanisms explain the dynamics of popular music genres?

**VALUE CONSTRUCTION: AMATEUR JUDGEMENTS OF PHOTOGRAPHY**

Nuné Nikoghosyan, André Ducret

1Sociology Department, University of Geneva, Geneva, Switzerland

Abstract: Our contribution presents a case study of the construction of judgement on photography by amateurs as can be analysed through written comments of the members of a photo sharing website, TrekLens.com. Past studies have dealt with the construction of judgement in other areas of the arts, but such a study concerning photography, and in its online context, has been absent from the literature. TrekLens is a public website with the motto
“Learning about photography through the world” that allows members, professionals and amateurs alike, to alternate between the roles of photographer, critic and audience.

Our research question is as follows: What value systems do the judgements of photographs on TrekLens refer to? In sketching the value systems, our analysis of online comments shall verify two hypotheses: 1) the value systems vary with the genres; 2) the values most referred to are more specific to photography itself, its techniques and aesthetics. Our method is content analysis of the arguments developed in the comments that leave traces of a value system as their source. The final results will be presented in two tables: one crossing the photo genres with the value systems, the other crossing the value systems with the comment’s negative or positive orientation.

Throughout our study of an online space we faced challenges and difficulties that led to methodological reconsiderations. First, considering the internet as a field to be observed and analysed means viewing it not only as a communicative tool, but a place for communication. This field, then, imposes questions of whether or not online data should be separated from the offline, whether they should then be combined for full applicability or can each suffice if taken separately? Moreover, an impersonal relation via internet may limit the researcher’s analysis to textual aspects only. This has the benefit of experiencing the website as its users do, having only written text as a means of exchange, but also the shortcoming of lacking access to face-to-face interviews, arguably more enriching in analysing opinions and judgements. Finally, important benefits and drawbacks not to be neglected result from the specificity of the material, produced by the subjects without the researcher’s intervention, voluntarily, spontaneously and in the heat of the moment. The presentation of our final results will revisit these and other questions of methodology.

SOCILOGICAL ASPECTS ON ESCHATOLOGICAL ISSUES OF MACEDONIAN FRESCO PAINTING IN THE PERIOD BETWEEN 15TH AND 20TH CENTURY

Duska Matevski

Abstract: This research is an attempt to do sociological analyses on the issues of eschatological significance within Macedonian Fresco Painting, i.e. their social-political conditionality and the functionality of these issues in a defined socially determined context. In fact, sacral painting is not just an optically organized formal creation, but also an expression of the attitudes towards the world, which depend on the society.

Christian philosophers considered that the picture performs the most important gnoseological function and also that the human being with his nature is not in position to lift himself on the level of spiritual reception without certain meditation. In their creations they remarkably express the didactic significance of the biography. From the period of Turkish domination on the territory of the Republic of Macedonia, till the modern times, the appearance of social motives in the Macedonian fresco painting is particularly interesting. Their inserting was easiest and most acceptable for the conservative environment within the issues of eschatological significance, Painter’s trend, appointed by the Church and its establishers and protectors was completely clear: to present all negative social appearances that were popular in that period, but also related to certain territory, what finally had to influence the believers in order to decrease moral norms. This mainly refers to the convinced believers who implicitly accept all dogmas that affirm Orthodox Christian religion. A conclusion that can derive from the elaborated issue is that sacral painting had not the effect and influence that it used to have in the past. This is due to the fact that today the messages are mainly communicated through the mass media, what is radical change of the communication form. The creations belonging to the sphere of painting are more and more displaced from individuals’ lives, as a result of mass media expansion. Besides, sacral painting still has its influence in the rural environments, where mass media do not have so a great intensity. Rural population lives in a closed world, where pictures located in their sacral objects actually influence on their spiritual lives.

Key words: eschatology; fresco painting; moral norms

THE ART OF MAKING MUSICAL INSTRUMENTS: WHY ONLY YAMAHA COULD BE A BIG COMPANY?

Yuko Oki, Hideo Yamada

1KYOTO SANGYO UNIVERSITY, Kyoto, 2Waseda University, Tokyo, Japan

Abstract: This article focuses on a study of product architecture of musical instruments. In the musical instrument industry, only Yamaha became a big company in the world. Analyzing case studies of manufacturing the piano, violin and saxophone, we discuss the mass manufacturing system for integral architectural products.

Yamaha targeted the mid-priced segment rather than the high-end one. Gaining such customers, however, required a certain quality level of musical instruments even under mass-production. The case study shows how the company has promoted introducing the state-of-the-art technology and the automation to avoid manual variabilities, and outsourcing module components while ensuring the “integration” which is the key for manufacturing instruments. We demonstrate that the company enables to mass-produce instruments by committing to in-house manufacturing for finished products with the integration as well as its supporting mechanization.

On the other hand, although the company has stood on a par with a leading company in the category of the woodwind and the brass which could be easily standardized, it does not still get reputation from high-end segment of piano and violin which are made of wood under the “ultimate integration.” Instruments demand “connoisseurs” to judge good wood for processing as well as unquantifiable “sound” and “sonance,” thus the competition of manufacturing instruments has been in the “Invisible Dimension” (Kusunoki, 2006). This characteristic makes customers keep traditional brand belief, resulting in a long time to evaluate a new comer.

DECOUPLING THE BOURDIEUAN DISTINCTION STRUCTURE: POPULARIZATION OF HIGH CULTURE AND MIDDLE-CLASS OMNIVORE IN KOREA

Dongyoub Shin, Kangsan Lee, Margeum Kim

1YONSEI UNIVERSITY, Seoul, Korea, Republic Of

Abstract: This paper concerns how the recent popularization of high culture has brought about the decoupling between cultural taste and class in the structure of Bourdieuian distinction. In his famed
framework of class distinction based on cultural capital, Bourdieu underlined the tight coupling between class and cultural taste, which serves as a crucial basis of the distinction among different classes. Bourdieu and his followers, such as Peterson and Kern, further pointed out that members of upper class tend to be cultural omnivore in their taste, and, thus, their cultural preference often ranges over a variety of different artistic genres.

We argue that the coupling between class and cultural taste has been significantly loosened in recent years due primarily to the popularization of high culture. With the world-wide institutionalization of neo-liberalist ideology in the late 20th century, art worlds have also come to be subjected to the pressure toward the hegemonic institutional logics of economic efficiency and financial self-sufficiency. As a result, producers of high culture began to expand their target audience to middle-class masses in an effort to generate financial resources efficiently from high culture the enjoyment of which used to be monopolized by members of upper class. For instance in Korea, producers of high culture have made various attempts to achieve financial self-sufficiency through ticket sales without relying on government funds or public sponsorship by lowering entry barrier to high culture.

However, the popularization of high culture has inflicted unintended disruption on the Bourdieuan distinction structure. Bestowed with an access to diverse high-culture genres, members of middle class have come to accumulate a considerable level of cultural capital over a broad range of high-culture genres by aggressively appropriating the new opportunity structure. As a consequence, the proportion of cultural omnivore among member of middle class has rapidly increased. On the other hand, members of upper class who have lost their cultural basis of distinction began to explore new ways to differentiate their class status from the newly emerging middle-class cultural omnivores in various ways. In this regard, the empirical part of this paper deals with the emergence of middle-class cultural omnivore and the responses of upper-class members to the popularization of high culture in Korea.

(RE) DRAWING A CULTURAL MAP OF SERBIA

Predrag Cveticanin 1, Jasmina Nedeljковić 1, Nemanja Krstić 1

1 CENTRE FOR EMPIRICAL CULTURAL STUDIES OF SE EUROPE, Nis, Serbia

Abstract: Our paper is based on data collected in the course of the surveys “Cultural Needs, Habits and Taste of Citizens of Serbia” undertaken in 2005 within a CCI project of the same name (national proportional probability sample, 1364 respondents); “Cultural Practices of Citizens of Serbia” of the Centre for the Study of Cultural Development from 2010 (national proportional probability sample, 1490 respondents); and “Social and Cultural Capital in Serbia” from 2010 of the Centre for Empirical Cultural Studies of South-East Europe realized within the Regional Research Promotion Programme (telephone survey, national proportional probability sample, 970 respondents) in which authors of this paper have participated.

In the analysis of these data we used the “reciprocal approach” in the application of Multiple Correspondence Analysis (MCA) as outlined in Lebart et al. (1984). First, based on data on respondents’ cultural needs, cultural habits, tastes, cultural knowledge and cultural equipment and possessions, we re-constructed a field of cultural practices in Serbia. Next we superimposed the socio-demographic variables (education, age, income, wealth, gender, place of residence, region of residence) as passive variables to see how they relate to cultural practices constructed in the manner described above. In the central part of this article we compare the results obtained based on the data from all three studies undertaken in Serbia cited above (in 2005 and 2010), while the final section of the paper compares our results with the results of similar studies in Great Britain [Bennett at al, 2009], Finland [Kahma and Toikka, 2009] and Flanders [Roose, van Eijck & Lievens, 2010].

RESEARCH THAT IDENTIFIED VULNERABLE MINORITIES IN GEORGIA, ISOLATED FROM THE COUNTRY’S SOCIAL LIFE TO DIFFERENT EXTENT: THE SOCIOLOGY OF THE ART AND CULTURE OF ETHNIC/RELIGIOUS MINORITIES OF GEORGIA IN TURBULENT TIMES, CAN ART HELP HEAL SOCIAL RiftS WHICH

Marine Solomonishvili 1, Marine Tumanishvili 2

1 Center of, 2 Intercultural Dialogue, INTERNATIONAL FOUNDATION LE & COUNCIL OF JEWISH WOMEN, Tbilisi, Georgia

Abstract: The sociology of the Art and Culture of ethnic/religious minorities of Georgia in Turbulent Times. Contents, production, mediation and reception of the arts influence, manipulate and determine our contemporary life in many ways, and in turn these social structures and processes also have an impact on the arts. We will put an emphasis on those issues that are of sociological interest within arts worlds but also relate to those powerful developments in economy, ecology and ethic contexts on the macro level that influence, manipulate or determine production, content and forms, distribution and reception of the arts in Georgia and Europe. Also, we will carry out the comparative analysis.

In Georgia about 1/3 population ethnic/religious minorities, we investigated influence of different cultures on development of creative potential of artists different ethnic/religious minorities. Research that identified vulnerable minorities in Georgia, isolated from the country’s social life to different extent. Inspiration during these turbulent times can art help heal social rifts which may arise as result. gender dimensions implications in Turbulent Times and etc.

ARTFUL AFFORDANCES IN LEADERSHIP AND MANAGEMENT DEVELOPMENT: INSPIRATION IN TURBULENT TIMES

Ian Damon Sutherland 1

1 POSTGRADUATE STUDIES, IEDC-BLED SCHOOL OF MANAGEMENT, Bled, Slovenia

Abstract: The world is in crisis and the arts are increasingly called into service to save it. To those involved in business and executive education it has become clear rationally based, instrumental, outcome driven management and leadership development does not prepare individuals for the dynamic challenges they face. In fact, they are part of the problem as they do not cultivate holistic, socially responsible views of the world and leadership/management practice. This paper examines the growing position of arts-based methods in this activity.

To develop responsible views of systems of problems which go beyond the individual, organisation, sector, etc. – leaders must develop new ways of sensing and acting. The challenge is to re-
imagine the complex realities faced and re-envision how to approach them. Enter the world of the plastic and performative arts.

Following a grounded theory approach the research conducted studied reflection papers by 24 Executive MBA participants in a choral conducting workshop. By combining emergent trends from this data with arts-based management literature this paper examines the art-mediated affordances of the music and arts in action methods employed. The results describe how art-based methods (experiential learning through storytelling, drama/theatre, painting, music, crafts, etc.) develop unique affordance frameworks of space, time and structure to afford presentational, experiential knowing leading to more dynamic, creative, socially sensitive modes of management and leadership action.

CITY INFORMATION AS CULTURAL PHENOMENA
PERCEPTION ANALYSIS

Miroslava Sergeevna Tsapko

1Department of political sociology, RUSSIAN STATE UNIVERSITY FOR THE HUMANITIES, Moscow, Russian Federation

Abstract: Moscow is overloaded with outdoor advertisement that’s why analysis of advertising campaigns efficiency becomes an extremely actual matter. We use tracking to solve a lot of research tasks, such as determination of the population percentage attracted by any advertisement, correlation between advertising images kept in mind and number of brands or company names recognized, poster attractiveness for target groups of any cultural organization, etc. In spite of considerable measurements, regular sociological surveys in this sphere were only conducted in England, Australia and Switzerland.

We have experience monthly tracking surveys in the outdoor advertising market in Russia. Espar Analyst research agency has conducted the first monthly tracking surveys in the outdoor advising market in Russia. The objects of its research are advertising posters within the territory of Moscow and the matters are cultural events, cinemas and new films.

The goal of the research is to determine an efficiency rate of an outdoor advertising campaign. Efficiency means here the rate of poster penetration and brand recognition. This goal may be achieved in case if the main task of measuring general parameter for evaluation of each outdoor advertising campaign’s efficiency is resolved.

The following factors shall be considered in the analysis of the data obtained:

• number, type and location of advertising media;
• duration of the advertising campaign;
• other media used for advertising the brand and their correlation with the poster creative solution;
• creative solution;
• advertised product category.

From March 2001 up to the present time, 150 research waves have been conducted.

One of the most important results of tracking campaigns is an opportunity to form a limited indicator basis for each group of cultural organisms, which would allow to compare the campaigns and bring their characteristics into correlation with average indicators for different social groups or formats used. Such surveys are aimed at renewal the empirical basis of social sciences, which study the influence of different format advertising images of human consciousness that is extremely important when the so called visual culture is developed.

The city information became habitual making daily occurrence of cities. Features of perception of the city information became an actual problem in sphere sociological practice.

TURKISH THEATRE: CHANGE AND CONFIGURATION OF A CREATIVE INDUSTRY THROUGH INSTITUTIONAL LOGICS

Ozge Can

1Faculty of Economics and Administrative Sciences, YASAR UNIVERSITY, Izmir, Turkey

Abstract: Researchers are interested in the evolution and structure of organization groups, as organizational species, and how they are linked to socio-cultural and institutional frames at societal level. Yet there is lack of a clear understanding of the effect of such historical and cultural contingency in organizational identities and resulting industry classifications. It is an interesting question to ask how institutional logics as societal belief systems might inform individual organizations to produce their identities and to locate themselves in the industry space. My study seeks to unravel both the transformation of a creative industry itself and macro institutional logics influencing it.

Turkish theatre field has undergone important transformations during its development since the establishment of modern Turkey. Contradictory macro logics emerged in different time points and have been sustained unresolved across decades and tend to inform the value and function of theatre. Within this pluralism, search for a distinct identity has always been considered as the central concern of Turkish theatre, questioning the meaning and role of theatre in a late-developing country like Turkey. This rather complex and conflicting institutional influence has been reflected on how theatre companies define themselves and present their creative outputs.

For empirical analysis, I use longitudinal archival data entailing the listing of the plays performed by each active professional theatre in Turkey between 1923 and 1999, as manifestations of their identities. 2624 separate plays were coded with 21 dichotomous variables. With a Cluster Analysis performed, I determined the clusters of play profiles in the field for three different time periods and compared them.

Cluster solutions points that while there are identity profiles which remain intact (or undergo only some slight changes) along different periods regardless of changing social understandings, some new profiles do appear in each coming period. Overall, this indicates that there is a strong relationship between the plays theatre companies choose to perform and the dominant logics of the time. Altering logics imprint the maps of configuration and change in this creative industry by making certain ideological pieces and resources available for field members. Such mapping of industry configuration and how it changes can contribute to the future discussions on the formation of fields.
CAN THE COMPREHENSIVE SOCIAL SIGNALS EMBEDDED IN CORPORATE ART COLLECTIONS AND HEADQUARTERS ARCHITECTURE MAKE BASIS FOR NEW THEORIES WITHIN THE SOCIOLOGY OF ART AND CULTURE?

Målfrid Irene Hagen

School of Business and Social Science, BUSKERUD UNIVERSITY COLLEGE, Drammen, Norway

Abstract: Based on my PhD-project where I examine corporate art collections and headquarters architecture in Norway, USA, Japan and France, I present findings and suggestions on how the findings and aspects that are enlightened in the study can make basis for new theories. By analyzing visual observations, photographs, interviews, conversations, corporate publications, websites and relevant theory within sociology and art history, I look at how art collections and the architecture of headquarters can reflect the corporate culture and the culture in the time period and society in which they are founded, and the multiple social signals that are embedded in corporate art and architecture. In the project I have analyzed 12 corporate collections and 12 headquarters, and made comparative analysis of the included cases. By analyzing corporate collections and the architecture of headquarters established in different times and cultures, one can explore the comprehensive social signals embedded in corporate collections and the architecture of headquarters, which are often more multiple faceted than we observe at the first glance. The interesting is how all these social signals can make way for theories on issues such as; the value of symbols, the problem of gender, concepts and mantras on creativity and innovation, transparency in organizations and societies, the problem of norms and moral, territorial identity, social and environmental concern, cultural capital and the money economy of corporations and societies.

FROM PROTEST TO PROJECT? THE STATE OF ARTISTIC CRITIQUE IN NETWORK CAPITALISM.

Sighard Neckel, Monica Titton

DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF VIENNA, VIENNA, Austria

Abstract: “Life with Pop - Demonstration for Capitalist Realism” was the title of an art happening performed in October 1963 by, among others, Gerhard Richter and Sigmar Polke, in a furniture store in Düsseldorf. The art happening was meant to express an ironic distance towards the incipient consumer capitalism and to unmask the habits and clichés of the sixties.

The performance in Düsseldorf represents an aesthetic divergence from modern society, as it had been formulated time and again in the history of capitalism since Romanticism. Also today, artistic critique articulates itself in diverse manners, increasingly against the art world itself. In their work about the “New Spirit of Capitalism”, Luc Boltanski and Éve Chiapello thoroughly investigate the phenomenon of artistic criticism in this vein. They interrogate in which ways the artistic critique contributed to the justification of capitalism itself.

In our paper we want to answer the question along the analysis of the mentioned art happening “Life with Pop”. It can be demonstrated that the measures of critical activities formulated in 1963 had long since been integrated in the present network capitalism. Values like autonomy, creativity, self-realization, individuality, and flexibility are part of the new capitalism’s value system and have been transformed into expectations that capitalism itself aims at the individuals. Thus we question which reflexive potential can today still be attributed to the artistic critique. Particularly we want to investigate whether elements of artistic critique on network capitalism still exist that withdraw from integration of protest.

INTERACTION ART? HOW „ACTING TOGETHER” MAY HAVE BECOME AN ART FORM

Dagmar Danko

Sociology, Albert-Ludwigs-Universität Freiburg, Freiburg, Germany

Abstract: In my presentation, I would like to speak about what I want to call "Interaction Art". During the past decades, there has been a predominant focus on the notion of "performance" in specific forms of contemporary art. Happenings, body art etc. were analysed from this perspective which goes with particular theoretical concepts. I want to propose to look at these art forms anew, from a sociological vista which puts the emphasis on interaction. Many well-known artworks – or rather art projects – are constituted by the concerted action of several people which may or may not include the artist. This observation goes beyond Howard S. Becker’s idea of artworks as a result of collective action, because I am not referring to the impact of intermediaries on the artwork. Rather, I want to concentrate my attention on artworks which are not just produced by the interaction of several people, but whose subject is interaction. This might help gain a new understanding of works of art by artists such as Sophie Calle, Ai Weiwei, Francis Alÿs and many more.

BODY PIERCING AND INSURRENCY: THE AESTHETIC POLITICAL EXPERIENCE

Lisiunia A. Romanienko

DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF VIENNA, VIENNA, Austria

Abstract: Piercing and other forms of body modification among musicians, artists, and other aesthetic bohemians signifies membership in diverse oppositional political constituencies that resist, undermine, or are otherwise immune to inauthentic principles and practices needed to actively participate in an exploitative one world systemic economy. The analysis will demonstrate that continued alienation and disenfranchisement of creatively embodied, increasingly mobile, discursively aesthetic, migrating citizens has led to the proliferation of alternative methods of authenticating expression through the musical, visual, and performing arts. These resistant forms of cultural capital formalized through the arts upon and beyond the tactical limits of the body are fundamental in developing the fortitude and resilience necessary to resist simultaneous government-exacerbated social-political-ecological catastrophes. Organized and disorganized outrage creatively deploying the embodied arts are an important element in postmaterial contestation efforts, which are becoming a powerful vehicle to articulate outrage and usurp existing hegemonic power arrangements in unprecedented ways. Through music, performance, and related creative activism, artists in bohemian communities around the world have, over time, constructed an ideologically diverse but powerfully resistant strategic network of contemporary communities of migratory defiance; unified and driven by the desire to construct their own
sexual, political, aesthetic, and organic utopia wherever they find themselves. Intentional limitations of state power (Touraine, 1995), radical political agency (Russoinow, 1998), the aesthetic rise of oppositional transcripts in marginalized culture (Rose, 1994), the role of the arts in resisting totalitarian regime (Hamersky, 2002), and the recovery of radical aesthetic human agency (Varela, 1999) are some of the aesthetic and political factors discussed that are contributing to the widespread resurgence of anarchist thought and embodied outrage in contemporary politics to authenticate utopian projects for sensual, aesthetic, and political sabotage of the established world order.

IMPROVISING A CAREER IN MUSIC: AN EVALUATION OF THE REFLEXIVE WORKER ARTIST MODEL IN RECURRING UNCERTAIN TIMES

Allan James Sutherland

The concept reflexivity has featured prominently in theoretical and empirical sociological work on employment, the arts and culture, and is sometimes said to be an entailed condition for individuals acting within increasingly mobile, especially neo-liberal contemporary societies (e.g., Adorno, Beck, Bauman, Bourdieu, DeNo- ra, Lash). However, there is commonly an unresolved tension between reflexivity as a hermeneutics of suspicion, and reflexivity in determining daily and irregular activities, and future practices. Improvising musicians are found among the growing number of self-employed workers, also in the expanding arts, cultural employment sectors within contemporary economies. With few exceptions, improvising musicians’ performance incomes are volatile, partly as they have historically depended upon venues such as night clubs, bars, restaurants, etc., prone to instability due to operating within the highly competitive entertainment sector, subject to amplified demand fluctuations within economic cycles because dependent on discretionary expenditures. They have intermittently appealed to major recording companies, who have ambitiously signed and subsequently dropped improvising musicians from their rosters in response to low sales, inability to know how to package the musicians, and seeking higher short-term returns. This paper examines case studies of musicians’ responses to the difficulty of sustaining a career in repetitively variable contexts, especially to advancing technologies, seeking to assess the degree each form of reflexivity manifests in their musical and career strategies, and explains their creative trajectories. This is done with specific reference to the career strategies, music, writings and interviews of Miles Davis, Dave Douglas, Brad Mehldau, Evan Parker, Tim Berne, Matthew Shipp, and Satoko Fujii, examining their responses to turbulent times.

Keywords: Career, improvisation, reflexivity, network links

A VOCATION FOR A MIDDLE-BROW ART? SOCIAL TRAJECTORIES TOWARDS PHOTOGRAPHY SCHOOL

Lisa Marx

Abstract: Photography is both a widely practiced hobby, a way of recording social life, and an art form, at least to some extent. This tension leads Bourdieu to call it a "middle-brow art". Photography’s status as an art, and as a profession, is still questioned despite its growing institutionalization, and needs to be continually reaffirmed. This relative uncertainty is not without incidence on the social recruitment of photography and photography schools.

The choice to pursue a career in the arts is often explained by «vocation», a higher calling, not unlike the one invoked for religion. However, the conditions of possibility for this calling are located in social space and can be investigated. This paper will draw on fieldwork carried out for my master’s thesis at a local photography school, combining statistical analysis of data concerning all former students and in-depth interviews with current students, in order to pinpoint the social conditions and the different trajectories leading students to photography school.

Two different groups of students, with different social trajectories and representations of photography, can be identified. A first group, to which most students belong, contains offspring of upper- and middle-class families. Struggling to maintain their status, not having been able to attain their parents’ level of education, they are very technically inclined. Photography school is a "discipline of refuge", a gateway to a profession allowing them to maintain an uncertainty concerning their social status, because it is incommensurable with their origins. A second, smaller group of students hail from working-class families. They are better students than their peers and consider photography to be art. Photography school is their gateway into the arts scene, permitting social ascension outside of the traditional paths without requiring them to break with their origins.

Going to photography school does not equal becoming a photographer: one can be a photographer without following this path, and not all graduates will end up working in photography. My research shows the impact of the relatively unstable position of photography among the arts, as it attracts students for whom it provides a way of hiding their falling social trajectories or for accessing the arts through a door yet to be fully legitimated.

LE « BON TRAVAIL » AUX FRONTIÈRES DES MONDES DE L’ART : LE RAPPORT AU TRAVAIL ET À L’EMPLOI DES CÉRAMISTES ET ARTISANS CRÉATEURS

Marc Perrenoud ¹, Flora Bajard ²

¹UNIVERSITE DE LAUSANNE, Lausanne, Switzerland, ²Université Pierre Mendès France, Grenoble, France

Abstract: Nous proposons ici d’exposer les principaux résultats d’une enquête engagée avec le DEPS (Ministère de la Culture en France), portant sur la qualité de l’emploi dans les métiers artistiques. Dans une démarche comparatiste, nous avons mis en regard des activités professionnelles et des populations aux marges des mondes de l’art, renvoyant à des identités au travail et à des inscriptions (symboliques et économiques) "entre l’art et le métier". En l’occurrence, cette communication s’ancre autour de de terrains enquêtés : les céramistes et les "artisans créateurs" (on verra que l’expression mérite d’être discutée).

Ces métiers indépendants mettent en jeu une économie symbolique dont les éléments ne recoupent que très imparfaitement les indicateurs objectifs de la qualité de l’emploi - construit essentiellement pour le modèle du salariat, et ne sont pas non plus en- tièrement justiciables du modèle mengerien d’analyse socio-économique du travail artistique - se préoccupant peu de la subjec- tivité du travailleur, de sa satisfaction, du sens qu’il donne à son
activity. Au-delà des spécificités du travail artistique, nous avons donc pris en compte le "rapport au travail" dans son sens le plus anthropologique, autant que le "rapport à l’emploi". Ainsi, nous montrerons que la représentation d’un « bon travail » repose aussi bien sur le processus (l’activité de travail) que le résultat (les objets et oeuvres fabriqués). En ce sens, la qualité et la valeur éthique et axiologique du travail, sa valeur marchande, la trajectoire biographique (travail et hors travail), ou encore les processus d’inscription professionnelle individuelle (professionnalité) et collective (professionnalisation) constituent autant d’éléments qui permettent de comprendre le sens que les acteurs donnent à leur rapport à l’emploi.

Après un an d’enquête en France, nous avons au final pu approcher de manière peut-être inattendue les points de vue de la théorie critique (reconnaissance, statut émancipateur du travail social) et ceux de la tradition interactionniste, pour mettre en avant cette dimension capitale des résultats de l’enquête : la qualité des emplois dans les espaces professionnels enquêtés semble se construire dans le temps et l’espace sur le rapport à autrui (publics et pairs).

SHAPING VIRTUOSO: ‘SCHOOLED’ ROCK MUSIC IN TAIWAN
Chi-Chung Wang

Abstract: What kind of rockers would be produced in an authoritative learning context? Contrary to classical music, popular music has always been perceived as lacking formal learning mechanisms.

As studies have shown that the way popular musicians learn could be best characterized as ‘self-learning’, this article aims to problematize this thesis through addressing ‘schoolled’ rock music in Taiwan. During the last twenty years, rock music has grown in popularity in Taiwan, there are two characteristics of this recent phenomenon worth the attention of the sociology of music. First, the main population is composed of students, and second, the student societies in high schools (aged 16-18) have become central places where most musicians embark on their music journey. During this phase of learning, students engage in competition with each other in terms of their playing techniques. Whilst favoring virtuosic genres such as heavy metal and hard rock, music genres that do not contain virtuoso element are recognized as technically incompetent. This paper draws upon semi-structured interviews with musicians from school rock societies to investigate the reproduction of virtuoso-oriented rock practice. Drawing upon the current development of Sociology of Scientific Knowledge (SSK) in terms of learning/training, it can be argued that while there is a tradition of a hierarchical relationship between students who are in different grade-levels, especially in academically prestigious high schools, ultimately senior students play the role of authoritative figures that pass on the virtuosic skills within the societies. By being taught to listen and play in an appropriate manner with reference to classic rock tunes that contain virtuosic elements, junior members are oriented to prefer and be able to manipulate a virtuosic style of rock music, and the reputation of the society and the school are thus maintained and sustained.

DISCOURSE ANALYSIS OF THE NATIONAL ART IN IRAN: A SOCIOLOGICAL ANALYSIS OF THREE ERAS OF NATIONAL ART IN CONTEMPORARY IRAN
Mohammad Reza Moridi, masoomeh taghizadegan

Abstract: National art cannot be considered a specific genre or style of art because various themes can be construed from it; for example, historical, folklore and official art of a country. Due to different social and political reasons, in different eras, each of these themes becomes the centre of attention. It is obvious that national art is more than other forms of art associated with official power institutions, therefore, one can use discourse analysis in order to discover its semantic and ideological layers. However, the goal of the art discourse analysis is not merely the analysis of the meaning of the text (artistic work), it is rather the analysis of the circumstances within which this meaning is produced. Hence, in art discourse analysis, the institutions which produce meaning and reproduce discourse are dealt with. This departure from text to discourse producing institutions indicates the ultimate goal of art discourse analysis which is to reveal the relation between text, power, and ideology in the visual culture.

In this article, applying Michael Foucault’s discourse analysis method, we analyse four discourse rules in the Iranian national art: 1) unity of subject, 2) unity of expressive styles, 3) unity of concepts system, and 4) unity of strategy. Iranian national art will be discussed in three historical periods: the first one is during the rule of Reza Shah Pahlavi (1920 – 1941), through which a nationalistic, pre-Islam ancient-oriented discourse prevails Iranian art; the second one is during the rule of Mohammad Reza Pahlavi (1941 – 1978), through which an identity discourse referring to the domestic culture prevails Iranian art; and the third one is the post-revolutionary period (up to the present time) during which an Islamic discourse with anti-imperialistic, revolutionary discourse has prevailed the Iranian national art.

The discourse analysis of the Iranian national art deals with sociological analysis of the creation of the political and religious power institutions which produce meaning on one hand, and reveals the social grounds of reproduction of power in the meaning of the artistic works, on the other hand. This approach will provide us with new understanding in sociological examination of the modern Iranian art.

Key word: national art, art discourse, Iranian contemporary painting.

ROMANIAN CONTEMPORARY VISUAL ARTS WORLD AFTER 1989: TENSION AND FRAGMENTATION
Mara Victoria Ratiu

Abstract: This paper addresses the issue of the contemporary visual arts world in post-communist Romania, with focus on its institutions. The reason for such an endeavor is the finding that, more than twenty years after the fall of the Communist regimes, the Romanian contemporary visual arts world is still a highly tense and
fragmented one, comparing to other Central-Eastern European contemporary visual arts worlds. My hypothesis is that this state of affairs is rooted in the institutional shifts generated by the transition from a totalitarian regime to a democratic one. Therefore, the reconfiguration of the institutional system of contemporary visual arts after 1989 and its impact on the artistic practices, as well as its reception among art professionals, stand out as a crucial object of analysis. The aim is to highlight the structural features of the Romanian contemporary visual arts world that lead to the present-day fragmentation, as well as to explain the acute tension that characterizes the relationships among its actors. From a methodological point of view I combine conceptual analysis of the topic-related literature with empirical investigation, i.e. personal observation and interviews with artists and art professionals. Additionally, I propose a brief comparison with the Hungarian contemporary visual arts world in order to emphasize the specificity of the Romanian one.

Key words: art world, art institutions, Romania, Hungary, visual arts

EMBLEMS OF FREEDOM: INSIGHTS INTO THE TUNISIAN REVOLUTION

Valerie Hayaert 1, Valerie Hayaert 2
1English and Language Studies, CANTERBURY CHRIST CHURCH UNIVERSITY, Canterbury, Kent, United Kingdom
2Institute of Sociology, UNIVERSITY OF RZESZÓW, Rzeszów, Poland

Abstract: This contribution to the conference will present part of an ongoing research project consisting of an exploration of emblematic structures relating to the theme of liberation. These range from the scenes of manumissio per vindicta, a ritual essential in Roman law to the use of iconic or vexillographic profiles used by young Tunisians in the events of January and February 2011.

We shall identify the element of continuity in the gestures accompanying each of these “dispositifs” and show the comparative value of symbols, so as to the broad epistemological and chronological framework employed. A representation of liberation needs to deploy above all a theory of “affects”. A flag motivates and represents the essence of action; a new symbol of recently acquired freedom functions according to modalities which we shall identify.

This paper involves analysis of several iconotexts, trying to grasp the roots of certain iconic schemes and their interplay with the tunisian current political and mediatical contexts, reflecting on the ways and means in which they are used in social networks (Facebook and Tweetter).

FANTASY ROLE-PLAYING GAMES AS THE EXAMPLE OF SOCIAL AESTHETICS AND COMPENSATING ACTIVITY

Dominik Porczyński 1
1Institute of Sociology, UNIVERSITY OF RZESZÓW, Rzeszów, Poland

Abstract: Media convergence (Jenkins 2006) could be treated not only as the process of combination of different kinds of media, but also as combination of cultural phenomena, that so far were treated as separate. An example of this can be role-playing games and massively multiplayer online role-playing games (here treated as the next step of development of genre), which both contains ludic quality, however, by researchers (Mackay 2001) are also considered in terms of aesthetic. Being various types of virtual worlds, they make, according to Peter Berger and Thomas Luckmann’s work (1966) a social constructed reality par excellence. This constructivistism can be portrayed as a process consisting of two phases: objectivation, which is literally creating a world, apperance of which is the result of work of many people – designers, graphic artists, developers, etc. – and “existing in action” (Blumer 1969) what means maintaining and transforming that world by players involved who are creating this way a kind of aesthetic community (Maffesoli 2008). The latter aspect was called by Robert Bootstrom (2008) “the social construction of virtual reality”.

As an aesthetic phenomenon role playing games seem to reflect the thesis of Zygmunt Bauman (2000) that art compensates for the shortcomings of reality, reveals the truth which is difficult to see in the thicket of social interaction, and the universe created by it is understandable and subjected to an unequivocal interpretation. This paper aims to show the game universe as an example and effect of social artistic creativity, a construction of understandable world with clearly defined social roles and goals to be achieved, which could be the balance to the obscure, fragmented reality of everyday life. An analysis of two stages of this process was conducted. The first of these was examined on the basis of documents such as manuals, instructions, and websites, and the other on the basis of content analysis of forums, interviews with players and participant observation.

THE DIGITAL TURN IN EUROPEAN VISUAL ARTS: CHANGES IN THE MEDIA, CHANGES IN THE CREATIVE PROCESS?

Dafne Muntyanola 1
1Sociology, UNIVERSIDAD AUTONOMA MADRID, Madrid, Spain

Abstract: The goal of this paper is to make apparent the centrality of interaction in the creative process, moving away from excessive abstraction or empiricist reductionism. Specifically, we look at the changes brought about by the digital turn in Visual Arts departments in Europe. Given the many social factors in decision-making, the existing relationship between artists and its instruments must take into account both the discursive and structural dimensions of the creative process. Thus speech, gesture, and tool manipulation, first mostly analog and currently digital, constitute background practices for visual artists. Our theoretical stance allows us to escape the phenomenological determinism of husserlian bracketing (Cicourel, 2010). We define artistic creativity as a process of distribution (Hollan et al, 2000), multimodal (Alac, 2005) and embodied cognition (Clark, 2008). Our working hypothesis is that the digital turn has triggered a conceptual transformation of intermediate products: diagrams, models and other epistemic objects (Knorr-Cetina, 1999). The ethnographical observation of actual work allows for an empirical model that compares artists’ choices. Interviews with 45 visual artists are taking place in academic centers in Spain, France and United Kingdom. Through the application of Critical Discourse Analysis (CDA) with ELAN software we are putting together a vocabulary of tools and processes. Preliminary findings show that digitalization defines the modality of intermediate products, and modifies the conceptualization, execution and evaluation phases from the creative workflow.

KAFKA’S TURBULENT SOCIETY IN THE TRIAL: A DURKHEIMEAN INVESTIGATION

Cagatay Topal 1, Fatma Umut Beşpinar 1
1Department of Sociology, ANKARA UNIVERSITY, Ankara, Turkey
1DEPARTMENT OF SOCIOLOGY, MIDDLE EAST TECHNICAL UNIVERSITY, ANKARA, Turkey

Abstract: This paper attempts to co-read two important figures from the turbulent times of Europe during the late nineteenth and the early twentieth century: Durkheim (1858–1917) and Kafka (1883–1924). Both experienced the World War I and its consequences during their last years. Both were Jewish suffering from the implications of their minority backgrounds. Both were subject to alienating, anomie, and bizarre conditions and reflected these in their works. And both were searching for existential meanings for their life and their environment. To our knowledge, almost no literature has been developed towards a systematic appreciation of the relation between Durkheim and Kafka.

In the example of Kafka’s work, The Trial, this paper examines how Kafka conceives power, consciousness, society and the individual in a turbulent context. The paper asks what kind of legitimacy that society generates in the consciousness of individuals in The Trial and where this legitimacy comes from. For this investigation, the paper draws upon Durkheim’s methodological and sociological analysis. The main Durkheimian themes that are used in the paper are collective conscience, the external and coercive character of society, morality, law, and finally collective effervescence.

The paper argues that an inherent and powerful morality imposes itself throughout The Trial. Similarly, the court that represents the law has an intrinsic and coercive legitimacy. The key character, K., seems to be truly internalized of this legitimacy even though he does not understand its proper nature. In fact, Kafka never reveals the “true” nature of the court. In this sense, the court – and law – remains an external constraining force. The process of the trial appears as the reflection of a collective conscience against the individual consciousness of K. The trial is an ongoing ritual; and, moreover, this ritual is the story of K(afka) itself. Finally, the trial gives way for the moments of collective effervescence. K. experiences the concrete effects of the law during these moments as well as in his daily life outside the court. In summary, law is the main theme in the text and it represents the character of society in Kafka’s perspective. Consequently, following a Durkheimian methodology, this paper asserts that the turbulent nature of society in The Trial can be understood through the analysis of the turbulent nature of law in The Trial again.

Florent GAUDEZ

1EMC2 - Laboratoire de Sociologie de Grenoble, UNIVERSITÉ PIERRE-MENDÈS-FRANCE (GRENOBLE 2), GRENOBLE, France

Abstract: Visual sociology is a new branch of sociology that seeks to use the image as a particular mode of investigation. This poses several preliminary methodological and epistemological problems. Indeed sociology, is, above all, a matter of vision, of a point of view, of lighting, of angle, of depth of field, and, of course, of focus. Don’t we speak frequently of « sociological perspective » ?

Therefore, sociological understanding is, first and foremost, a fictional construction of reality (itself a fictional construction of the « real ») as an intersubjective, empathic and heuristic process. To speak of a sociology of the gaze requires us to view both the gaze and the « sociological perspective » through the prism of sociological understanding. Moreover, to posit the possibility of this meta-gaze equally forces us to question our own methodological and epistemological points of view. Can visual sociology avoid the question of the production of the gaze? And what vision does it have of itself?

ART AS UNCONVENTIONAL SOURCE OF THE SOCIOLOGICAL SCIENCE

Angela Maria Zocchi

1Department of Communication Studies, UNIVERSITY OF TERAMO, Teramo, Italy

Abstract: The paper is a theoretical reflection about the relationship between art and sociology, starting from Sociology as an Art Form of Robert Nisbett. First of all, the paper analyses the text of Nisbett, examined in its challenges for the sociology today. Then it focuses on the problematic knots of the sociology of the art, advancing the proposal to consider the art as unconventional source of the sociological science. In other terms, not a sociology of the art, but a sociology in the art, such as claimed in philosophical field by Reinhard Brandt. Can a work of art be considered a sociological text? What are the implications of this perspective for the sociological theory? The essay intends to answer to these questions considering, at the same time, the possible consequences for the future of the sociology.

HOW DIFFERENT SOCIAL ACTORS AND THE ART WORLD HAVE REACTED TO THE MARKET-BASED TURN IN CULTURAL POLICY? THE CASE OF FINLAND - DESCRIPTION OF A RESEARCH PROJECT

Erkki Tapio Sevänen 1, Simo Häyrynen 1, Kalle Lampela 2, Anne Logrén 1

1Department of the Humanities, University of Eastern Finland, Joensuu, 2Department of the Arts, University of Lapland, Rovaniem, Finland

Abstract: In the 1980s and 1990s, the era of the expansive Western welfare state and the East European state socialism came to a close and these societies were opened-up to market forces on a more global scale. These societies have, therefore, been ruled by a neoliberalist policy that treats the whole of society and the rest of the world as capitalist markets. This shift has affected the art world profoundly, for phenomena of creative economics and commercialized art are typical of this new phase.

In Finland, the state has followed the market-based policy; for example, at the beginning of this year all of the Finnish universities were privatized. Yet, the Finnish state has not been able to apply this policy to the art life on the same scale. In Finland and in other Nordic countries (Denmark, Norway, Sweden), the art life is largely dependent on the state. In these countries, the national art markets are quite limited in seize; their art worlds cannot, therefore, function properly without the expansive support of the state. Although the Finnish state and the Finnish economic life more and more often see artists and art institutions as co-actors in economic action, the Finnish state also nowadays finances art institutions (theatres, orchestras, museums) - even to the extent that 70-80% of their incomes might come from the public sector.
The Nordic countries clearly differ from the Anglo-American countries (Great Britain, the United States) that underline the importance of markets, private sponsorship and donations in the art life. Likewise, Finland differs from the post-socialist countries (Estonia, Russia) in which the state is not rich enough to give expansive financial support to the art life, nor is their private section capable of effectively acting in a role like this. In part, Finland resembles France, in which politicians and ordinary citizens still think that it is the duty of the state and the public section to protect the sphere of art against pure market forces and private interests.

In our project, we consider what kind of attitudes different social actors (the state, political parties, economic life, artists, art institutions) take up towards the market-based turn in social and cultural policy. At the same time we compare the Finnish art world with other art worlds in Western societies.

**MASTER PIECES AND CREATIVE DESTRUCTION. THE DESTABILIZATION OF TWENTIETH CNTURY ART**

Feiwel Kuperberg¹

¹Culture, Media and Language, MALMO UNIVERSITY, Malmo, Sweden

Abstract: When art historians in the future will look back upon the twentieth century,. the first thing they will ask is what actually happened here. Why was art destabilized to the degree where it almost vanished? Art sociologists will add the question of what social forces were at work here, resulting in the destabilization of twentieth century art. In this paper I will suggest that we do not need to look into the future but can firmly place ourselves in the present and compare it with the past in order to present an analytical account of what happened. In order to account for the destabilization of twentieth century art, a good strategy would be to start with the Austrian economist Joseph Schumpeter who coined the phrase “creative destruction” as the main driving principle of modern, entrepreneurial capitalism. The basic principle of creative destruction is the opposite of traditional art, it devaluates all previous innovations or creativity, replacing it with the latest innovation. Novelty becomes the prime value in its own right. This can be contrasted with traditional art which, as already Marx noted, aimed at master pieces rather than novelty, that is art works with perennial (or even increasing) value. The history of twentieth century art can be conceptualized as the constant oscillation between the traditional model of artistic creativity aiming at master pieces and the entrepreneurial model of creative destruction. The import of the latter model into the art world originated with the impressionists but its corrosive effect only became visible around the turn of the twentieth century. In both cases the pressure of technological inventions (photography and movies) seem to have been the prime causes, as suggested already by Benjamin and not merely different career patterns as asserted in Bourdieu’s over-socialized model.

**MUSEUMS IN TURBULENT TIMES. THE CASE OF SAADFIYAT CULTURAL DISTRICT IN ABU DHABI.**

Anna Gruszka¹

¹Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY POZNAŃ, POLAND, Poznań, Poland

Abstract: If it is true that culture is directly linked to the notion of power (Bourdieu et al.) and constitutes an expression of forms of social domination, then undoubtedly museums are still one of the best arenas to examine those relations. Museums have always demonstrated power: of the state, of the private collectors etc. (Duncan 1995) Still nowadays, in the late capitalism, museums are inscribed in the mechanism of co-dependency of culture and economy, often referred to as ‘museum industry’ (Krauss 1990) and linked to the cultural economy of cities (Scott 2000). Also, the current shift of the ‘museum boom’ from the West to the East goes along with the crisis of the Euro-American economic and symbolic domination as well as the economic growth of such countries as China, the latter’s ‘museum fever’ being the most spectacular illustration of this process so far. (Economist, Jun 14, 2007) Yet, the spectrum of sociological causes and consequenc- es of the Eastern ‘museum boom’ is much more complex.

In this paper I will examine the case of Saadiyat Cultural District in Abu Dhabi that comes in the middle of all those processes. By the end of 2018 it will comprise Louvre Abu Dhabi, Guggenheim Abu Dhabi, Zayed National Museum, Performing Arts Centre and other. These institutions will be designed by the world’s leading “Western” architects (Gehry, Nouvel, Foster, Hadid) and often labeled with iconic brands of Western culture (Louvre, Guggenheim). I will try to answer the question posed in this context by Peter Aspden: “[…] what can it tell us about the power of culture?” (FT Weekend Magazine, Feb 19/20, 2011)

Analysing the current plans, concepts and interviews with people involved, I will examine whether this creation of a new “capital of culture” is a symptom of the geopolitical shift in Wallersteinian world-systems sense or is it rather a mere illusion of a voluntary colonialism and Bhabhaesque reversed self-orientalisation. To what extent will those institutions enhance the local identity and heritage and bridge the Eastern and Western art and to what extent will they obey the rules of the art world market and exhibit the Western art that sells best? Finally, who is the target public of these museums and how will they respond to the needs of their communities?

**RETICENT OBJECTS, BOUNDARIES, AND FIELD DYNAMICS AT MUSEUM OF MODERN ART OF NEW YORK (MOMA)**

Fernando Dominguez Rubio¹,²

¹Centre for Research on Socio-Cultural Change, Open University, Milton Keynes, United Kingdom, ²Sociology, NYU, New York, United States

Abstract: Over the last decades, the study of the dynamics of the ‘artworld’ has motivated a great deal of sociological interest. This interest has been very productive in detailing the processes of negotiation, cooperation and struggle between the different actors involved in this field. However, there has been very little consideration of the role that artworks themselves play in mediating these dynamics. In this paper I explore how artworks intervene in these processes both re-producing divisions within the field of contemporary art and re-drawing boundaries between agents and fields. The study is based on ethnographic evidence from the Conservation Laboratory of the Museum of Modern Art of New York (MoMA). It shows how some artworks operate as ‘reticent objects’ challenging and redrawing internal boundaries and established hierarchies as well as the institutional boundaries that separate the museum from other institutions and related fields. Tracing the trajectories of some of these reticent objects as they travel through various de-
partments will allow us to explore the dynamics of change as the different actors in the museum adapt to the challenges posed by these objects. As I shall show, these reticent objects demand the institution of a novel process of judgement that redistributes competences and expertise among different actors and creates, in so doing, a new cartography of power within the museum. I will conclude by exploring the role of these ‘reticent objects’ as vectors of transformation and change in the field of contemporary art.

BEAUTY AND THE EYE OF THE BEHOLDER: SEGMENTATION OF MUSEUM AUDIENCES USING GEOMETRIC DATA ANALYSIS

Henk Roose 1, Laurie Hanquinet 2, Mike Savage 2
1Department of Sociology, GHENT UNIVERSITY, Gent, Belgium, 2Department of Sociology, The University of York, York, United Kingdom

Abstract: Views on what the fine arts are/should be and how they should be appropriated have changed during the last century—in line with Bourdieu’s conception of the emergence and development of a field. The ‘traditional’ view grounded in 19th century bourgeois society with its emphasis on beauty, elegance, balance, and emotional aesthetics has been challenged by the emergence of artistic movements based on transgression, experimentation, conceptual forms, sensuousness. At present—anno 2011—these different forms of art and ditto forms of reception coexist and are more or less similarly institutionalized. One of the key findings of La Distinction is exactly showing that aesthetic judgment and taste are socially anchored. In this paper we want to contribute two things using Multiple Correspondence Analysis (MCA):

(1) we use an item battery specifically designed to measure the different aesthetic dispositions and conceptions. We want to construct the space of aesthetic perception by means of about twenty items describing how/what art should be or incorporate: e.g. ‘Art should be beautiful’ versus ‘One colour or one line are enough to create a piece of art’;

(2) we analyze the relationship between these different aesthetic conceptions and the social origin and environment of spectators, i.e. besides including the traditional socio-demographic variables, we insert items that indicate perceptions of someone’s social position, and perceptions of what members of his/her social network prefer.

The use of MCA has a number of advantages. First, it allows for the inclusion of a lot of variables simultaneously. Second, it explicitly visualizes a space in terms of a relational logic. Third, it enables the inclusion of a number of structuring—supplementary—factors showing the homology or association between aesthetic perception and their social embeddedness. We rely on an audience survey of about 1,000 visitors from two art museums in Ghent (Belgium), namely the Museum of Fine Arts and the City Museum for Contemporary Art (also known as S.M.A.K.).

OPENING UP MUSEUMS TO SOCIETY. A TYPOLOGY OF PUBLIC ORIENTATION

Volker Kirchberg

POPULAR MUSIC AND CULTURAL MEMORY

Andy Bennett
1
1Griffith Centre for Cultural Research, GRIFFITH UNIVERSITY, Nathan, Australia

Abstract: In sociological research on popular music, there is an emerging focus on the generational impact of popular music and the extent to which questions of value, authenticity and transcendence, as these coalesce around musical practices and resources, are becoming tied to collective articulations of cultural memory. As research across a variety of popular music genres in specific local and national contexts is beginning to reveal, ageing and biography, together with associated processes of remembering and critical reflection, must now be considered key elements in an analysis and interpretation of popular music’s social and cultural meaning. Long-term cultural investment in particular musical genres by ageing audiences, together with their re-presentation via the lens of cultural memory, is now articulated in a variety of ways, manifesting itself at both the institutional level of the cultural industries and in mundane, everyday practice. Drawing on the preliminary findings of an Australian Research Council (ARC) funded, three-year, five-country project, this paper outlines an approach to the sociological study of popular music applying the conceptual framework of cultural memory and considers the value of such an approach in mapping forms of musical attachment grounded in generationally embedded practices of remembering.

TELLING SOUNDS: POPULAR MUSIC IN MUSEUMS

Amanda Maria Caterina Brandellero 1, Susanne Janssen 1
1Department of Media and Communication, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: The ways popular music and related material culture are used in cultural heritage narratives and representations are ex-
explored through an analysis of Dutch local and national historical museums. This paper specifically addresses how local popular music histories are mobilised and displayed in these institutions. Beyond the role of music in the construction of personal identities, the paper explores the extent to which popular music provides not simply a background soundtrack to local histories, but rather plays an active role in shaping a place’s cultural heritage and a shared sense of belonging and identity formation. On the one hand, the paper reflects on the nexus between aesthetic and artistic materials and the circumstances and contexts of their use. On the other, the paper asks how popular music is mobilised as part of the museums’ strategies for greater public engagement. The data is collected through in-depth interviews with museum curators and a review of (archival material on) collections and temporary exhibitions, as well as policy and strategy documents. The analysis draws out insights into the extent to which popular music participates increasingly to conceptualization of cultural heritage and finds a place within the aims and objectives of heritage institutions. In doing so, the paper teases out how institutional narratives around popular music are constructed and the prominent music cultures and moments that emerge. In conclusion, the paper reflects upon the contribution of popular music to the construction and framing of collective memories and their connection to place.

POPULAR MUSIC HERITAGE, CULTURAL MEMORY AND CULTURAL IDENTITY

Susanne Janssen 1, Amanda Brandellero 1, Arno van der Hoeven 1

1Dept. of Media and Communication, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: In this paper we provide an outline of our current international collaborative research project (POPID), in which we explore the relationship between popular music and contemporary renderings of cultural identity and local and national cultural heritage in a pan-European context. Furthermore, it explores how these articulations are negotiated in the business practices of the global popular music industry. The overall aim of the project is twofold: (i) to assess the role played by local popular music in the negotiation of cultural identity in a local, national, and European context; and (ii) to specify how the European music industry can feed into Europeans audiences’ ongoing connections to local popular music heritage in a way that continues to be meaningful for local audiences.

The paper presents the initial findings from extensive research among cultural heritage institutions and archivists, music industry workers and audience members. It also interrogates the situated articulation of popular music heritage in a combination of localities, some of which have rich musical histories and have made a contribution to the national and global music industries, and others which are less readily recognized as having strong local popular music heritage. Finally, it reflects on popular music’s contribution to the narratives of cultural identity and representations of cultural memories.

DIVISIONS IN ART ACTIVITIES BASED ON GENDER

Azam - Ravadan 1

1communications, UNIVERSITY OF TEHRAN, Tehran, Iran, Islamic Republic Of

Abstract: In this article artists are studied in terms of their appearance in different artistic fields. The main factor important in this appearance is regarded to be gender. It shows how rare are women artists in some fields and how common they are in other fields. Moreover it shows that even in those fields which are presenting more women, famous artists appear to be mostly men.

Data is collected from case of Iran using documentary method and shows that population of women directors in film industry and in theater is much smaller than population of men directors. On the other hand population of women painters, musicians and writers is bigger in comparison to women in film and theatre.

The question that raises here is whether there are social factors which influence men and women doing different artistic activities with different degree of competence? This article is aimed to give an analytical answer to this question.

YOUTHFUL CREATIVITY AND ARTISTIC PRODUCTION IN NAPLES

Enza Maria Paolino 1

1Department of Sociology, UNIVERSITÀ DEGLI STUDI DI NAPOLI FEDERICO II, Napoli, Italy

Abstract: The paper presents the empirical work carried out for the PhD in Sociology and Social Research and as part of the last research by Osservatorio Territoriale sui Giovani di Naples (OTG, 2009-2011). The research focuses on the processes of youthful artistic production in Naples, questioning the ways in which new generations of Neapolitan artists articulate their relationship with the territory. Art contributes to the process of construction of reality and, at the same time, any practice is inseparable from the dynamics of context (Grossberg 2002). The relationships of young artists with their city, with institutions and cultural organizations, with the circuits of production are some questions underlying the research on the field. The city is a privileged place for observation of the “cultural complexity” theorized by Hannrerz (1992) and the study of creativity and analysis of the interplay between the system and the cultural act, therefore, can provide a good indicator of change (Crespi 2006). Following Melucci’s studies (1994), the empirical research – qualitative, based on the semi-structured interview and the content analysis – is articulated around three main levels of investigation: the subject, including social extraction, education (cultural capital), system of relations in which the subject is embedded (social capital), motivations and expectations; the contexts, in which actions and creative experiences are generated; the discourses, which bring to the content and to creative forms of expression adopted by the subjects. The study of cultural practices draws attention also to the communication process and, specifically, to the analysis of the role of media - both traditional and virtual - in the dynamics of cultural and artistic production. Digital media, in particular, produce substantial changes in the forms of perception, cognition and communication (de Kerckhove 1991), but also provide, in terms of resource, new spaces and new ways of distribution of knowledge and skills (Levy 1999). In addition, new media and Internet offer new ways of managing social networks, also acting as a resource in the processes of production of social and cultural capital. Finally, encouraging the movement of global cultural flows in a continuous exchange between the local level and the global one, Internet contributes to contaminations and cultural hybridizations, leading to creativity and cultural vitality (Thompson 1998).
“CRACOW”: “CITY”: “ISLAND”. BIOGRAPHICAL MYTH OF PLACE AS A PERFORMATIVE “FICTION” IN A LOCH CAMELOT CABARET

Anna Kapusta
Jagiellonian University, Cracow, Poland

Abstract: The main issue of exploration is the contempopray process of transformation the mythical narration into performative municipal “fiction”. That is social mechanisms of “biographical myth of place” materialising in polish, cracovian artistic biographies. The case study is based on data from the Loch Camelot Cabaret in Cracow. “Biographical myth of place” analysed in cognitive categories and autodefinitions of the cabaret artists as well as symbolic structures present in the culture texts was reconstructed in the language analysis of unrestrained and profound interviews, author’s observations and compiled audial documentation (municipal cracovian song, in peculiarity entitled “On the Cracow Isle”). The effect of research is constatation that late-modernity forms of mythical thinking establish new spiritual phenomena of places, among them function of aesthetic communication sacrum mediated by the cabaret sender-recipient act. One of the dimensions of mythical thinking constitute also occurrence of aestheticization of biographies and symbolic social ties, which are integral feature of processual work of art, whose example undoubtedly is the recital program “On the Cracow Isle.”

HOW TO CHARACTERIZE POLISH DESIGN WORLD? THEORETICAL AND METHODOLOGICAL SUPPOSITIONS

Monika Katarzyna Rosinska
Department of Sociology, ADAM MICKIEWICZ UNIVERSITY, Poznań, Poland

Abstract: The paper aims at both presenting the possible theoretical framework for the analysis of the contemporary young Polish design field and adducing some methodological issues when it comes to inquiring such a manifold and hybrid phenomenon. Drawing on research (13 Individual Depth Interviews) I conducted in 2009 in Poland and by briefly invoking the context I would like to present and sociologically characterize the very peculiar designers’ discourse(s). What do designers say about their role in the modern world? What is their task? How do they perceive and define the (Polish) Design World? Who is playing the most profound and influential roles? How the power relations are explicated and reaffirmed? Agreeing that the very nature of definitions lies in their changeability may serve in the presented theme not only to understand the dynamics of peculiar discourses but more importantly to acknowledge that they reflect historical, socio-cultural context in which they occur and epitomize social relations which “produce” and ideologically legitimate particular ones. Keeping this in mind may help to discover and analyse the specificity of contemporary young Polish field of design, its culture, practices, status, and expanding popularity.
RN 03 Biographical Perspectives on European Societies

BIOGRAPHY, IDENTITY AND THE CONCEPT OF BIOGRAPHICAL RESOURCES

Anne Juhasz Liebermann¹

¹Fakultät für Sozialwissenschaft, RUHR-UNIVERSITÄT BOCHUM, Bochum, Germany

Abstract: The relationship between biography and identity is a very prominent and contested topic of biographical research. For example, biography has been described as a ‘resource’ in every day life, which confirms ourselves as persons and provides us with sense and self-assurance. Hence, biography is seen as a resource, which helps dealing with life experiences, which forms and restores oneself. In other words, biography is conceptualized as a resource for giving identity, which is summed up in the term ‘biographical resource’. The notion of ‘biographical resources’ is widely used in biographical research but seldom defined and conceptualized. However, a closer look on its use in biographical research reveals very different understandings and meanings. Given this background, this paper addresses the following issues: How can the term ‘biographical resource’ be defined and conceptualised? What is the relationship between biography, biographical resources and identity? How can the notion of biographical resource be theoretically framed? It will be argued that an understanding of biography, identity and biographical resources in terms of processes of education, crisis and the emergence of the new helps to sharpen the comprehension of the named notions and to better understand their interrelation.

COPING WITH LIFE: THE ROLE OF PERSONAL REFLEXIVITY ON INDIVIDUAL BIOGRAPHIES

Ana Caetano¹

¹CIEN-JUL, ISCTE - LISBON UNIVERSITY INSTITUTE, Lisbon, Portugal

Abstract: Throughout their lives, individuals face the need to make choices and to reflect upon what they should or shouldn’t do in diverse social circumstances. Pondering, deliberating and making a decision may occur on a daily basis, but it’s even more prominent in crises situations, as well as in transitions between phases and spheres of life. That’s why it’s so important to take into account reflexivity in the analysis of individual biographies. This paper is part of a PhD research that reflects precisely upon the role of social mechanisms of personal reflexivity on the configuration of biographical pathways. The focus is placed on the processes through which people confer meaning to their actions and how they choose to act in certain ways in different moments and social contexts. Special attention is given to the connections between societal structures of constraint and opportunity, and the social contexts that frame the everyday and long-term experiences of individuals. Multi-session biographical interviews were carried out in order to understand (i) how the ability to think about oneself is developed throughout the life-course, (ii) how can these reflexive processes be characterized, (iii) and what effects can they have on the definition of specific courses of action. The analysis of the empirical material allows us to understand how people cope with social circumstances (such as social change, economic crisis, social inequalities, instability), as well as with personal events and situations (such as individual crisis, spatial and social mobility, relationships, emotions), and how they define themselves and their biographies in the process.

FROM BIOGRAPHY TO THEORY: CSO WORK AND EUROPEAN MENTAL SPACE

Markieta Domecka¹, Anja Schröder-Wildhagen ²

¹School of Sociology, Social Policy and Social Work, Queen’s University, Belfast, United Kingdom, ²Institute of Sociology, Otto-Von-Guericke-Universität, Magdeburg, Germany

Abstract: Whereas much of the biographical research tends to end up at the descriptive level, we’ll demonstrate the analytical process leading from biography to theory building. Through the means of ‘pragmatic refraction’ (Schütze, 2008), which consists of text sort differentiation and sequential structural description, and thus provides the basis for a systematic comparison of autobiographical self-theorizing of the informant and the biographical unfolding with its specific sequence of experiences, we can look closely at the process of identity formation and its social (and biographical) conditions. With it, we are able to reach a level of generalization (theoretical representation) without losing sight of individual cases.

The empirical basis of our analysis are the autobiographical narrative interviews with workers in civil society organizations, collected within the 7FP project ‘Euroidentities’. We focus on two groups of CSO activists: those originally coming from Europe and those born on other continents, who started their CSO work in their countries of origin and then continued it after moving to Europe.

The CSO work encompasses here reconciliation, environmental protection and the rights of ethnic minorities and undocumented migrants in Europe. Through comparative analysis of these two groups we will show how and under which conditions Europe becomes a frame of reference orienting CSO workers. In particular, we will stress the role of personal experiences with (conflicting) collectivities in shaping the biographical identities of CSO workers and further, in supporting their commitment to the CSO work in Europe.

With it, we will present the inductively developed concept of European mental space of reference (Schütze et al., 2009; 2010) and the role it plays for the unfolding of biographies of CSO workers, their biographical decision making and the shaping of their biographical work. We will reconstruct the process, in which Europe becomes biographically relevant with special attention to the process of becoming sensitized to incisive experiences with collectivities in one’s own life, of one’s belonging to and of one’s distancing from these collectivities and of becoming oriented to a new collective phenomenon, the European mental space. In other words, we will reveal the process by which Europe becomes embodied and then is accomplished by practical action.
PATCHWORK IDENTITIES? BIOGRAPHICAL PERSPECTIVES ON TURBULENT TIMES

Daniela Schiek

1INSTITUTE FOR SOCIAL WORK AND SOCIAL POLICY, UNIVERSITÄT DUISBURG-ESSEN, Essen, Germany

Abstract: Since the 1980s it has been said to be a sociological commonplace, that constant securing and ‘calming down’ of life has lost its importance for the functioning of both: labour society and the individual. Supposedly, patchwork identity compensates the vanished tripartite structure of the life course and even appreciates turbulent times. “In place of life course structured by expectable phases patchwork biography occurs. Consequently, the actor’s perspective on life has now begun to change. Successful (and happy) are these individuals, which have developed into ‘surfers’ of life. If there is an opportunity they are willing to throw away their plans and ‘jump’” (Rosa 2009, pp. 34-35).[1]

There is hardly any ‘grounded theoretical’ credit for the insistently recurring thesis about individual’s appreciation of turbulent biographies and their social integration. What about the social and individual relevance of the ability to plan or even ‘think’ lifetime and its disappearance? The most exemplary cases for testing this are individuals’ responses to the increasing of precarity. The empirical underpinning of this paper is a qualitative study about employees’ biographical perspectives on uncertain (e. g. temporary) jobs and their social positioning. The study is based on sequential analyses of narrative biographical interviews and their contrastive generalisation in terms of types. A major result is that the biographical perspective is the most common view for employees in an enduring uncertain job situation. The reasoning is that the biographical perspective is the one access to individual’s self – or rather: it is individual’s self – and now it is threatened in its entirety: the ability to plan or even ‘think’ lifetime depends on its constant securing and means life, the only one individuals know. Reversely, the disability to plan or even think lifetime is located outside of the society, not as ‘good life’ or even life at all.

Hence, contrary to the mainstream discussion the present paper argues for an ethnomethodological approach: In turbulent times the importance of constant securing and ‘calming down’ of life for the functioning of both: labour society and the individual does not disappear but even comes to light because of its failure.

RESEARCHING CAREER AND LIFE-WORLD SELF-UNDERSTANDINGS: A DISCUSSION ON THE MERITS OF BIOGRAPHICAL INTERVIEWING AND ANALYSIS

Kathryn Breda Feehan

1Sociology, TRINITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: Based on a series of biographical narrative interviews on business graduate careers, this paper presents both a methodological and theoretical discussion on the ‘how of interviewing’, and the ‘how of analysing’ biographic data.

This paper is situated within the larger context of my doctoral research that compares and contrasts biographical data from four cohorts of business graduates from the 1970’s, 1980’s, 1990’s and 2000’s. At the core of this research are questions that ask whether careers have changed and if we can speak of career changes occurring at different points in the life course or at different points in time. Its overarching concern is to examine the extent to which we can speak of identities being made up by aspects of work, lifestyle, place and mobility.

By presenting a case for the use of a ‘biographical narrative interpretative method’, this paper explores to what extent it is a useful tool capable of examining different levels of analysis, such as: individual self-understandings of careers and to what extent careers make up identities; how decisions regarding careers routes are made, with whom, and at what points in the life course, and how all this is situated within the large-scale historical and social contexts.

Therefore, with investigating such questions, this paper opens a discussion on what an analysis of biographical data using ‘biographical narrative interpretative method’ can accomplish.

VICTOR F. PETRENKO IS A RUSSIAN FOUNDER OF PSYCHOSEMANTIC APPROACH IN SCIENCE

Choduraa Mongush

1Psychology, TUVAN STATE UNIVERSITY, Kyzyl, Russian Federation

Abstract: Victor F. Petrenko is a Russian psychologist, an expert on Psychology of Consciousness and Psychosemantics and a founder of a new approach in Psychology named Experimental Psychosemantics. He was born in Leningrad in 1948. In 1968 he entered Psychology Department at Lomonosov Moscow State University. Being a student he took an active part in Summer Schools and conferences. His teachers and early colleagues Alexander Luria, Pyotr Galperin, Vladimir Zinchenko, and Alexei Leontiev shaped his character of a man and scientist. In 1974 and 1988 he defended his master’s and doctoral thesis respectively. His doctoral thesis was researched on Psychosemantics of Consciousness under the supervision of Alexei Leontiev. After graduation he remained at Psychology Department of Moscow State University to do teaching and continue researching. He is currently the head of a Laboratory of Communication Psychology and Psychosemantics at Moscow State University. In 1993 he got a position of a professor and four years later he became a member of Russian Academy of Science. A big number of diploma works and doctoral thesis were successfully researched and defended under his supervision. He is the first to broadly use Experimental Paradigm of Psychosemantics based on Personal Construct Theory of George Kelly and Semantic Differential Method of Charles Osgood. Psychosemantics investigates various forms of existence of meanings in individual, ethnic and social consciousness (images, symbols, colors, symbolical actions, signs, and verbal units). It analyses the influence of motivators and emotional conditions of the individual and collective subject on meaning’s systems which he or she or they have. It studies the individual’s representation in the fields of Politics, Economics, Law, Art, his ideas about himself, other people and his model of the world. Using this approach Victor Petrenko created a new principle of individual typology based on his world view. He is also an author of a big number of research papers on ethnic stereotypes, on the content of consciousness and its altered forms, cross-cultural comparisons, the reconstruction of ethnic, political, aesthetic mentality of the various groups and communities. In times of turbulence Psychosemantic approach is essential being widely used in different fields of science and having aspects of Philosophy, Culturology, Linguistics, Sociology and Computer science.
THEORY, BIOGRAPHY AND THE OTHER. RESEARCHING SCIENTIFIC BIOGRAPHIES

Feiwel Kupferberg

1Culture, Media and Language, MALMO UNIVERSITY, Malmo, Sweden

Abstract: Most biographical research so far has been mainly methodological and its prime knowledge interests or theoretical ambitions have stayed within the discipline in which the researcher has been trained (sociology). The potentials of the biographical approach as a research programme or strategy is much wider in scope though. In this paper I will explore how researching scientific biographies can add to our knowledge of the “Other” which has always been the prime aim of sociological biography research. Although science itself is oriented towards a paradigmatic or logically consistent, transparent, simplifying and conciliatory mode of presentation (“the scientific argument”), personal as well as collective processes of scientific discovery itself seem to be driven by a different logic “in vivo”, which can best be captured empirically by the narrative language game (biographical projects, turning points, self-presentations and genres) before moving on to the logic of “in vitro” where the usual conceptual apparatus of scientific paradigmatic thinking takes over and assumes control over the emerging academic text. My renumberations on this topic will use Charles Darwin’s scientific biography as an exemplary case.

EUROPEANNESS AND OTHERNESS: DIFFERENT TYPES OF “OTHERS” AND DIFFERENT WAYS OF DEALING WITH DIVERSITY

Antonella Spano1, Elisabetta Perone1, 2, Pasquale Musella1

1Department of sociology, UNIVERSITY OF NAPLES, Naples, Italy

Abstract: Identity formation process always implies both self-identification and self-differentiation from other(s). In this perspective, also the development of European identity has necessarily to deal with the “otherness”.

On the basis of Euroidentities project results, the paper aims to explore different meanings of “otherness” and different ways of dealing with the “other”. In particular, differences will be highlighted between “others” inside Europe (i.e. other European nations) and outside Europe; where Europe, following our interviewees perspective, is meant as an imagined space rather than a geographical or political entity. Indeed, Europe’s boundaries, those that separate us-ness and otherness, seem to be “mobile” and connected to people’s vision of the “other”.

The paper takes as a basis one of the main results of the Euroidentities project, that is the existence of an European shared space of reference, which constitutes a fundamental platform for comparing nations, ethnicities, value systems, institutional procedures, political cultures, social habits etc. In particular, the contribution will reflect upon the different ways of doing comparison (more or less driven by stereotyped categorizations) when comparison concerns contexts perceived as different but at the same time belonging to a common imaged space, or when it regards a reality/culture perceived as completely extraneous.

The contribution identifies different ways of relating to otherness and reflects on both personal characteristics and biographical experiences and processes which on the one hand effect the extension of the imaged Europe, and on the other hand seem to result in a different capacity to deal with what is perceived as being different. Unexpectedly, cultural capital, high level of education, openness, prolonged and meaningful cross-cultural and or cross-national experiences do not prevent from getting caught in stereotyped visions: these, in fact, can be in action though often masked by “politically correct” discourses and hidden by a declared acceptance of diversity.

THE AMBIVALENT VIEWS OF EUROPE IN FARMERS BIOGRAPHICAL NARRATIVES

Mariana Draganova1, Rumiana Jeleva

1INSTITUTE FOR THE STUDY OF SOCIETIES AND KNOWLEDGE, Sofia, Bulgaria

Abstract: The paper focuses on the results of the EUROIDENTITIES project. In particular it presents the findings about the farmers as a group ‘sensitized’ by Europe on the base of biographical interviews collected in Bulgaria, Poland, Germany and Wales.

Compared to the other groups studied in the project that of farmers is not an “ordinary” sensitized group. Farmers are settled, mobile and bound to many features of their material surrounding environment like land, family, locality and nature. In the current paper we trace out this embeddedness of farmers’ existence and work into the material and natural surrounding world as well as its impact on the farmers’ biographical development and transformation in the four countries studied. Our intention is to present the whole variety of ambivalent views of farmers, when referring to Europe in their explanations, interpretations and argumentations. Significant for the farmers’ narratives are the figurations (Elias). Along to the most evident figuration “old member states versus new member states” we try to elaborate on other significant inter-relations like “farmers versus other market actors” (food chains, environmentalists, state and national bureaucracy, etc) in order to embrace both – the variety of the perceptions about the significant “others” in the farmers’ social world as well as the ambivalent views about Europe in the farmers’ group.

THINKING THE EDUCATIONAL OTHER: COMPARATIVE DIMENSIONS OF BIOGRAPHICAL EXPERIENCE OF TRANSNATIONAL MOBILITY IN THE EUROPEAN HIGHER EDUCATION AREA

Howard Davis

1School of Social Sciences, BANGOR UNIVERSITY, Bangor, United Kingdom

Abstract: Policies on education and mobility in the European Higher Education Area have promoted the structural convergence of qualifications frameworks, cooperation between institutions and student mobility. The Euroidentities project (2008-11) collected autobiographical narrative interview data which can be used to interpret the themes of education, mobility and Europe in comparative perspective. The research allows mobility experiences to be compared across a range of European countries: north and south, east and west. Taking individuals who had previously experienced study abroad in higher education, the project examines the biographical data for evidence of how the available opportunities for mobility are used as well as the evidence of changes which are reported at the level of everyday life. Personal experience broadens through
mobility but the analysis suggests that students encounter the educational ‘other’ through strategies and frameworks of reference which are embedded in the various educational cultures which can be found in Europe. Students from contrasting educational backgrounds, with different levels of commitment and skills, gravitate towards different types of student mobility. At the same time, every type of mobility develops new skills and stimulates further aspirations. Some are transnational and others may qualify as ‘European’. The paper considers a number of questions. What are the limits of observation and experience in the life stories? Which comparisons do narrators use? Where does the category ‘Europe’ emerge in argumentation and reflective commentary? How do pathways through education influence life trajectories in periods of social turbulence and at different stages of the life course? The narratives provide insights into the longer-term impact of experiences in the European educational mobility arena: the integration of new learning opportunities for cultural contact and self-development into other life experiences.

**TRANSGATIONAL WORK IN TURBULENT TIMES**

Kaja Kazmerska

1UNIVERSITY OF LODZ, Lodz, Poland

Abstract: Working abroad in Europe becomes more and more common way of designing one’s professional biography. This considers both short term projects related to goal oriented mobility as well as the project of transnational professional career. From the perspective of Eastern Europe mobility connected with temporal work to save the money or survive crisis on labour market appeared to be an effective strategy for individual biography as well as in the context of such social problems as unemployment. Especially that differences in wages seem to keep their attractiveness. Yet this kind of mobility is also connected with biographical costs related to a transnational worker situation of Shützian homecomer who at the same time has to reestablish relationships in his local environment and remains a stranger in host society. I will comment on this problem by relating to biographical materials collected in Euroidentity project.

**"I'M BUILDING MY OWN 'EUROPEAN' IDENTITY": ASPIRATION TO EUROPEAN CULTURE IN THE BIOGRAPHICAL NARRATIVES OF THE RUSSIAN-SPEAKING YOUTH IN ESTONIA**

Aida Hachaturyan

1Centre for Contemporary Cultural Studies, TALLINN UNIVERSITY, Tallinn, Estonia

Abstract: In the focus of current research is a question how the younger generation of Russian-speaking community in Estonia represents and identifies itself after the year 2000, when began the second decade after the collapse of Soviet Union and Estonia’s ‘returning to the West’. We deal with a peculiar group of young people who do not represent Russian-speaking youth of Estonia in whole, but who have their own interesting paths and messages: leaders and members of different voluntary organizations.

Estonia’s joining the European Union has ultimately eliminated the border with the West. At the same time young respondents feel their remoteness from their cultural mother country, from its mentality, Russia becomes even incomprehensible and stranger to them. Obviously, the whole complexity of the issue of identity of young respondents is that the question “who we are?” they respond while watching the East and the West simultaneously. The purpose of the paper is to show a ‘picture’ of represented identities of young Russian-speaking intellectuals.

The narratives shows the tendency of cosmopolitan attitude in self-representations of the respondents – border as a geopolitical phenomenon narrows, bounds the space of their cultural identity. In this case respondent refuse to identify himself as a citizen of current state. Is it possible in case of current study group to talk about a ‘traces’ of such phenomena as a hybrid identity, transcultural identity? From this point of view it is possible to consider represented desire of young people to go beyond the boundaries of a particular state, to move to another space, where the issue of boundaries between ‘own’ and ‘other’ would be eliminated. According to the young respondents’ views, Europe meets these expectations, it is represented as the most suitable space for creative ideas and future prospects. Multicultural identity implies, on one hand, the maintenance of cultural differences. On the other hand, for the formation of multicultural identity is important the existence of multicultural values. One of these can be seen in European culture as a phenomenon. European identity as a prototype of multicultural identity (Beck 2000) seems to be suitable for our respondents, who represent themselves as carriers of European culture, values, norms, traditions, mentality.

**DISCOURSE OF ETHNICITY AND NATION IN LATVIA: POLYPHONIC CHARACTER OF “SELF” AND “OTHER”**

Baiba Bela

1Institute of Philosophy and Sociology, UNIVERSITY OF LATVIA, Riga, Latvia

Abstract: In my paper I would like to focus on the construction of “self” and “other” in the discourse of ethnic and national identity in contemporary Latvia. There has been 20 years since regaining of independence – sufficient time to adjust private and collective identities to new situation. However situation is complicated – almost half of population is different minority groups and in the same time in the society dominates discourse of national identity typical for 19th century Europe and still typical for Eastern Europe which identifies ethnic and national identity. It is still not clear, who forms Latvia’s nation – Latvians or others as well, ethnicity and language is very important in everyday communication. How Latvians see themselves and other ethnic groups in Latvia? How other ethnic groups experience belonging to Latvia and how they see themselves and titular nation?

I would like to focus on discourse of national identity and place of ethnicity within it. Research is based on interviews conducted for research grant “Formation of consciousness of national identity after the reestablishing of independence in Latvia: tendencies and factors”. Discourse of national and ethnic identity is interpreted using perspectives of constructivism and postmodernism – theories of B.Anderson, A.L. Epstein, S.Hall, Z.Bauman, M. Castels.

**ETHNICITY – MIGRATION - IDENTITY. BIOGRAPHICAL CONSTRUCTIONS OF BELONGING BY POLISH EMIGRANTS IN GERMANY**

Thea D. Boldt

1
Abstract: This paper demonstrates the continuity of mobilisation between the first generation of post-colonial migrants to Britain and France and the second generation that was raised in these countries. It also explores how activists from this second generation gradually changed their self-identification from immigrants/children of immigrants to ‘Muslims’. The focus is on the political participation of second generation North Africans in France and those whose parents originated from the Indian sub-continent in Britain. In the latter case, activism in the 70s and 80s bridged the linguistic and religious divides in the South Asian community, religious identity was in fact sub-ordinate to an ‘Asian’ or ‘Black’ identity. In France too, an ‘Arab’ identity was much more prominent and religion never entered their demands. The ‘Asian Youth Movements’ in Britain and the movement beur in France were the most symbolic social movements of the second generation and some organizations still exist today as secular legacies of these movements. It was only during the 1990s in fact that these ‘Asians’ and ‘Arabs’ first started mobilising as ‘Muslims’. 1989 represented a watershed with the Rushdie affair in Britain and the first headscarf affair in France, and in both countries a ‘Muslim’ identity became more prominent. The paper argues that despite both sets of activists moving towards an Islamic identity, in France there was much more continuity with the past. French Muslim activists of the second generation went on to form their own organisations which later regrouped under the umbrella of the Collectif des Musulmans de France (CMF). These groups mobilised on Muslim issues but also wider questions connected to global justice (police brutality, social and welfare issues, asylum seekers). There was no such development in the UK. Indeed the groups that later established themselves were founded by first generation migrants and were almost exclusively concerned with religious issues. This helps to explain why today Muslims in France are much more likely to get involved in broader social movements and why identities in Britain have become much more rigid and conservative.

FAITH AND RELIGION IN THE FORMATION OF IDENTITIES OF THE ETHNIC MINORITIES IN EASTERN EUROPEAN COUNTRIES

Lyudmila A. Nurse 1

1OXFORD XXI, Thame, Oxfordshire, United Kingdom

Abstract: The paper addresses the place and role of faith in the formation and reproduction of ethnic identities based on analysis of biographical accounts of ethnic minorities in Lithuania and Latvia (ethnic Russian and Polish minorities) that were studied in the FP7 ENRI-EAST project: European, National and Regional Identities. Faith and religious belief have been sidelined in studies of the formation of identities in Eastern European countries. The fall of Communism in Eastern European countries was followed by a revival of religion where it had been banned or significantly oppressed by regimes. Religious practices are analysed in the context of ethnic self-identification. Religious beliefs are traditionally maintained in families and can be passed from generation to generation whereas in the Socialist atheist states this pattern of belief transfer became “withdrawn from public eye” due to the official atheist doctrine of the state and society and people’s fear of being discriminated against on the account of religious beliefs and practices. The states’ position on religion transformed the way people expressed their religious beliefs. This is reflected in the ethnic minorities’ life stories collected in biographical interviews.

FROM ‘IMMIGRANTS’ TO ‘MUSLIMS’: THE POLITICAL MOBILISATION AND SHIFTING IDENTITIES OF THE SECOND GENERATION IN BRITAIN AND FRANCE

Timothy Peace 1

1Department of Sociology, UNIVERSITÉ DU QUÉBEC À MONTRÉAL, Montréal, Canada

Abstract: This presentation summarizes the final results of my PhD project on biographical constructions of belonging by Polish migrants in Germany.

The central question of my thesis is how the construction of biographies of these people is related to the experience of migration and how this is changing in the process of life history. I work out which biographical concepts and plots the migrants are following as well as what sort of needs, expectations and attitudes are expressed within the biographies and related to migration.

The results of my study show, that Polish belonging in Germany is constructed as an ethnic process embedded in the collective German-Polish history as a space of recollection. In this, special focus is made on family members’ experiences during the Second World War.

My study shows how the recollection and reinterpretation of these experiences is used biographically in order to make sense of migration experience and of life in Germany, and how the meaning of being Polish is constructed in this frame.

The final results of my study will be published by Campus Verlag in Germany in October 2011.

BIOGRAPHY, COMMUNITY AND RESISTANCE IN SKID ROW

Maggie O’Neill 1, Philip Stenning 2

1Applied Social Sciences, DURHAM UNIVERSITY, Durham, United Kingdom, 2Griffith University, Brisbane, Australia

Abstract: Taking a biographical and visual ethnographic approach to analyse the politics of community and resistance in ‘skid row’ we discuss the multiple ways of seeing the spaces and places of ‘community’ through the narratives and photographs of residents in the DTES. Moreover, we reflect upon the theoretical and empirical implications for re-thinking biography, community and resistance through participatory and arts based research within socio-economic conditions of sharpening sexual and social inequalities.

FRAYED CAREERS IN TURBULENT TIMES. INDIVIDUAL CHOICES OR SITUATIONAL FORCES?

Elisabeth Schilling 1

1Social Sciences, UNIVERSITY OF APPLIED ADMINISTRATIVE SCIENCE NRW, Cologne, Germany

Abstract: Careers (as a part of a biography) were originally understood as a linear individual development within one stable employing organization. This conjunction began to disintegrate with the
environmental changes and turbulences. In my research project I analyse if the linear career no longer has its normative power, if the individuals freely choose to pursue non-linear career patterns or if they are forced by their circumstances to this path.

The manifold barriers in women’s careers produce not only the obstacles to reach the career goal, respected position or acceptance in the working world. They also cause interruptions, downtimes or career breaks in the career development. Women in highly qualified professions are very often forced not to pursue the standard linear and cumulative working lives but to search for unknown and unusual side ways in order to reach the professional goal.

Using the framework developed by Reiter (2010) I analyse the individual strategies which help profession-oriented women to deal with the uncertainty of their frayed biographies. I use this framework in order to analyse the biographical work of older professionals. They discover strategies to cope with insecurity, organizational injustice or life course stereotypes such as networking, additional qualification, change over to a self-employed position or working in an interdisciplinary field.

In my presentation I would like to compare the biographical narratives of three older female professionals. I aim to bring together empirical data about different biographical models and the patterns of women’s mental handling of their own biographies. My special attention is further directed towards the subjective notion of personal success.

The success of their strategies is equivocal since they are highly individualistic, create additional transitional moments and hence additional risk in the life course. It can be stated that individual effort and individual ability are not as powerful as organizational form and organizational policy in order to resolve female career obstacles.

PHOTOGRAPHIC PORTRAITS AND MEMORY

Brian Roberts1
1PSYCHOSOCIAL RESEARCH UNIT, UNIVERSITY OF CENTRAL LANCASHIRE, PRESTON, United Kingdom

Abstract: The paper seeks to add to the increasing interest and development of visual materials in narrative and biographical research by exploring, through a particular interpretive approach - the photographic portrait - "self-images" taken of us by ourselves (self-portraits) or taken by others (portraits gained informally or by professionals), alone or as part of a group. The paper has a strong auto/biographical focus: it explores how we "look" at (and experience according to our "senses") personal photographs and associate them with memories of our past, our current experience, and future. It takes as examples two school photographs (1956-8) of me aged 6-8 years old and uses the idea of "time perspectives" and a range of associated concepts. Two connected narratives are outlined - firstly, a commentary on the two school photographs and my childhood development (e.g. sensual, intellectual) between 6-8 years old, and second, my current outlook and activities and how the relate to memories raised by the photographs.

“CRACOW”: “CITY”: “ISLAND”. BIOGRAPHICAL MYTH OF PLACE AS A PERFORMATIVE “FICTION” IN A LOCH CAMELOT CABARET

Anna Kapusta1
1Sociology, JAGIELLONIAN UNIVERSITY, Cracow, Poland

Abstract: The main issue of exploration is the process of transformation the mythical narration into performative municipal “fiction”. That is social mechanisms of “biographical myth of place” materialising in polish, cracovian artistic biographies. The case study is based on data from the Loch Camelot Cabaret in Cracow. “Biographical myth of place” analysed in cognitive categories and autodefinitions of the cabaret artists as well as symbolic structures present in the culture texts was reconstructed in the language analysis of unrestrained and profound interviews, author’s observations and compiled audial documentation (municipal cracovian song, in peculiarity entitled “On the Cracow Isle”). The effect of research is constatation that late-modernity forms of mythical thinking establish new spiritual phenomena of places, among them function of aesthetic communication sacram mediated by the cabaret sender-receipient act. One of the dimensions of mythical thinking constitute also occurrence of aestheticiziation of biographies and symbolic social ties, which are integral feature of processual work of art, whose example undoubtedly is the recital program “On the Cracow Isle”.

QUEERING VEGANISM- ADVENTURES IN BIOGRAPHY AND REFLEXIVITY

Nathan David Stephens Griffin1
1School of Applied Social Sciences, DURHAM UNIVERSITY, Durham, United Kingdom

Abstract: This paper (and my broader research) reconceptualizes veganism in Queer terms, taking the vegan as its Queer subject. Biographical research is a methodologically diverse field, but generally its methods seek to understand the experiences and outlooks of individual subjects in their broader social and political context. Principles such as respect, reciprocity, trust as well as a sensitivity to the importance of narrative, are central to many of these methods. My research expands upon these principles, combining conventional biographical interviews with the use of comics. Comics are a narrative medium utilizing visual and/or textual modes of communication. Comics are visually engaging in a way that traditional prose is not and rather than being a hindrance to complexity, comics can convey nuanced ideas in a multi-dimensional way. People from wider social and educational backgrounds can engage with and respond to comics. Hopefully this means that my research can reach beyond the traditionally insular boundaries of the academy.

TOWARDS A PRAGMATIC APPROACH: A STRATEGY TO THE ANALYSIS OF BIOGRAPHICAL DATA

Trine Lund Thomsen1, Rasmus Antoft2
1Department of Culture and Global Studies, 2Department of Sociology, AALBORG UNIVERSITY, Aalborg, Denmark

Abstract: The main purpose of this paper is to develop on the idea of a “pragmatic” approach to the biographical method. In this perspective the biographical research method can be divided into four main approaches and in short they are characterized by; 1) the agent-oriented approach which main focus is that the lives of individuals are characterized by biographical projects that are constantly revised; 2) the institutional approach where the point of depar-
turing is that institutions have a significant influence on the lives of individuals in terms of self-understanding and placing oneself into a broader context and that this influence can be traced in the biographical stories; 3) the narrative approach is based on the application of the narration from the life story as statements which are transformed into text and that the text has its own reality as a meaning formatting construction; 4) the cognitive approach assumes that there exists a fundamental homology between the told story and the lived life. These four main approaches are analytical constructions that rarely are used in a “straight” version, but rather that elements from some of the approaches are brought together in order to fit with a specific study at hand.

The introduction of this kind of pragmatic approach depending largely on the social relations and processes explored in the investigation is based on that they are comprehended better in terms of context and interaction and consequently biography. In this paper we seek to elaborate on the four approaches and explore how a pragmatic approach may be an appropriate strategy to apply when conducting biographical research.

INDIVIDUAL MEMORY AND COLLECTIVE FORGETTING: BETWEEN GRAND NARRATIVES IN LATVIA

Edmunds Supulis

LATVIA UNIVERSITY, riga, Latvia

Abstract: Restoration of independence and liberalization of repressed historical memory forged new Grand narrative on Latvia’s past to replace the representations made under Soviet regime. New memory regimes in former Soviet states (and countries of Warsaw pact) on one hand liberated repressed recollections (of independence, occupation, deportations etc.), on other hand each country are experiencing its own kind of amnesia regarding particular questions of Soviet experience. In my country it is seen from turning to both public discourses and analyzing various life story interviews from the Latvia National Oral history collection. People in Latvia still have very personal memories of Soviet time and certain problems to adjust them with present biographical narratives. Can those “Soviet memories” and “Latvian identity” be reconciled? The paper touches upon aspects of memory studies where power operated within politics of memory is eliminating some recollections and supporting the others. What kind of Latvian historical vision and national identity is offered to people who are divided both by linguistic and mnemonic practices? Current politics of memory in Latvia raises my attention to the ways how to deal with contestable past and to the possibility to converge opposite communities of memory.

MAKING SOVIET PAST USABLE: NARRATIONS OF THE THREE ESTONIAN GENERATIONS

Aili Aarelaid-Tart

Centre for Contemporary Cultural Studies, TALLINN UNIVERSITY, Tallinn, Estonia

Abstract: I compare the narrations on Soviet period by three different generations: 1) born in 1920s or Republican youth (RG); 2) born in 1945-1950s or after-war children (AG); 3) born 1985-1991 or Kids of Singing Revolution (SG). All these generations use these memories as identity-building tools for more convenient interpretations their social positions in rapidly changing value-reality in Estonia.

The life stories of RG are full of comparisons of two independent periods cut by triple occupation years. Unpleasant memories on long Soviet times are contrasted to very trusty pre-war childhood/youth what was interrupted by deportations, violence and horror in 1940. The restoration of independent statehood in 1991 is taken as a happiest event in their lives. One part from RG demanded revenge for the lost youth, the large part asks for understanding of their double-minded behaviour in the coercive circumstances. The members of RG (who are over 80 years old) are the experienced survivors in historical whirlpool. AG had not their own memories on pre-war state in their formative years, that period revealed for them as something strongly forbidden but desirable. The “red” ideology, double mental standards and deficit for everyday goods were them as taken for granted framing of life. The collapse of the Soviet system captures them in the middle of their working career demanding strong revisiting of previous values. They do not narrate this rapid change as huge event in their lives but estimate it as something very normal. Even the loosing of high (nomenclature) positions they narrate now as a becoming of right time to make some changes in their working career. SG remembering of Soviet time is very fragmentary or absent at all. Their knowledge on Soviets is intermediated by school text-books or listened from relatives. The essence of Soviet ideology and repressive state-machinery is quite alien for them, pure facts from history only. They are interested in the Soviet everyday life full of queues for sausage, butter, milk, tights, underwear, etc. They are children of rising consumer society where things are more important than ideas. Told at homes fantastic stories on deficit economy (no bananas, no jeans, no fibre pens – incredible!) they take as an adventure, as a fun. The archaeology of Soviet past opens to SG a new framing to understand their position in the latest years of restricted consumerism.

THE NEGATION OF BIOGRAPHICAL PAST. THE IDENTITY WORK OF ADULTS GROWING UP IN CHILDREN’S INSTITUTIONS

Agnieszka Golczyńska-Grondas

Institute of Sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: The paper treats about the identity work undertaken by interviewees in the project “Institutionalized identity? Life stories of adults who grew up in state children’s homes” (2010-2011). The narrators come from poor, socially deprived families and - due to the family dysfunctions - were placed in institutions. It has been proved that the economic poverty and low social status are very often connected with “biographical paucity” (e.g. Polska H., Bieda i Dostatek. O nowych stylach życia w Polsce lat dziewięćdziesiątych, Warszawa 2002). In the case of narrators in the project, the phenomenon of biographical “rooting out” regards hardly perceptible resources of biographical memory about past and older generations and primary social environment of biography incumbents. These resources are limited also due to the lack or institutionally restricted interactions with parents and other family members. The possibilities of developing individual’s identity and benefiting from the resources of biographical memory are confined not only because of the lack of information about the personal past, but also on account of suffering and traumatic experiences experienced by narrators in childhood and adolescence. Moreover the interviewees have had to face stigmatizing practices of (significant) others ascribing them intergenerationally “inherited” negative attributes. Narrators’ attitudes towards past, biographical roots and assigned characteristics
seem to be crucial for their identity and biographical work and subsequent life course.

THE RUSSIAN MUSEUMS OF AFGHAN WAR AND COLLECTIVE REMEMBRANCE STRATEGIES

Elena Rozhdestvenskaya, Irina Tartakovskaya

Abstract: The museums of Soviet War in Afghanistan have been organized by the survived veterans and relatives of the perished soldiers. Most important motivation was to commemorate their comrades killed in this war. That means the necessity for two things (or objectives): mourning and grief but also giving sense to their deaths as well as to the War in Afghanistan. The second objective transforms into the "mission" of younger generation patriotic breeding.

The Museum fails to answer the question of what was the reason of war. This is the museum made for the remembrance of people who performed their duty participating in a tragic event. That event had no personal meaning for them and their state didn’t care to create any clear frame of explanation. So the task of giving sense is performed as the formation of the sequence of participation in the wars and with the help of the emotional rituals.

What is important for setting the intra-museum space of Afghan theme are the things which represent the – discursive somatizations, which localize, describe and personify military experience. These representations find their expression in the images of individual or collective body.

T.Bennett in his work ‘Birth of the Museum’ describes museum as the disciplinary machine embodying the general standards of social behavior via the enlightenment tasks. This dimension of visual culture development serves executes the power of interpretation of very certain way of development and selection of significant landmarks (of knowledge). But on top of the task of pathos transmission, a contemporary museum must be attractive, entertaining. When we balance these tasks, we also can trace the interplay between different politics of memorization and representation.

The museums of war in Afghanistan are neither militarist, aiming to support the military spirit, nor pacifistic, blaming somebody for the fact of war and daring to say this ‘never again’. Actually, there are museums of fatalism, telling their story about the inevitability of war which harvest souls and bodies young and innocent victims, who should be ready to participate in significant role of memory in society consists of the fact that the past is never the past.

The present paper will analyze the mindscape as a space of memory, the facticity of memory and the politics of memory, the so called “hot memories”, the narrative ethics...

Memory is creative. It forms the scene of thinking and presupposes the so-called “memories to be filled-up”, the spheres of common decisions and the logic of communication. Then the necessity of the harmonization of experiences as formation of a certain capital arises when narratives serve for people for practicing to act.

The life-story texts were created developed and they functions as a dialogue (in the broad sense of the word) within the communicative network (N. Luhman). It is a communication with a nation in the situation of the many-sided, plural society, it is a communication with politicians, with communities (in different regions, in ethnoses ... ).

The power of memory encompasses different structures: the mental, traditional, national, political ones, especially when the collective memory is in action opening the “doors” to the space of identity of the human being. It is speak about the narrative aspect of unfolding the memory and the thematization of experience in narratives. In everyday praxis we speak about the harmonization of experienced and, so to say, about the harmonization of history, where history is biographed. We found it in the “reconciliation” of people’s experiences. A person’s experience obtains its meaning and plausibility in relation with the experience of others.

The “agent” of habitus is memory. Values without memory are nothing, likewise values without memory. It becomes especially actual in social relations during turbulent times.

The questions of the present topic correlate with social processes in the contemporary Latvia: memory as ideology and memory as a channel of communication in the development of people and communities and different ethnic communities. The materials for biographical research are gathered in the expeditions in Latvia these results are stored in the Oral History Archives in the University of Latvia (Riga).

BIOGRAPHICAL CONSEQUENCES OF CHILDHOOD MOBILITY. THIRD CULTURE KIDS’ CASE

Agnieszka Ewa Trąbka

Abstract: I would like to analyze consequences of mobility in childhood (because of parents’ work) for further biography and identity. In seems that such mobility (involuntary and in early stages of life) differs significantly from other types of migrations.

That is why I decided to devote my research to Third Culture Kids, i.e. people “who have spent a significant part of his or her developmental years outside his/her parents’ culture. The third culture kid builds relationships to all the cultures, while not having full ownership in any (Pollock 2009). TCKs are usually children of businessmen, diplomats, scholars or missionaries and, in a way, they seem to be privileged group, but very often they experience serious problems in adapting to their passport country and have difficulties in constructing cohesive and integral identity.

In the frames of my research I conduct biographical interviews with TCKs, or, to be precise with adult TCKs. I am strongly inspired by
narrative interview method of Fritz Schutze. Its main advantage in the context or my subject is processual attitude towards one’s identity: Following experiences gradually make an individual change his or her self-definitions. Changes can be marked by turning points constituted by critical incidents [...] The deeper the change the more elaborated the biographical work that has to be done in order to integrate one’s experiences into a more or less coherent wholeness. (Kaźmierska, 2003: 5). As I shall try to show TCKs’ biographies are marked by such turning points – moving from one country to another – and all the time previous experiences are interpreted.

Moving in childhood they have contact with different people, different cultures, very often they attend international schools which results in cosmopolitan identity and multicultural competences. They easily adapt in new environments, but often have problems with identifying their home. They have sense of temporality in every place they live in – after some time they cannot imagine themselves living too long in one place and very often finally they choose for themselves similar mobile lifestyle. Some TCKs suffer however from deep crisis because of this sense of “homelessness”.

In this paper I would like to present some preliminary result from biographical interviews I have conducted.

BRAZILIAN IMMIGRANTS IN PORTUGAL, LIVING BETWEEN EQUALS AND DIFFERENTS: LIFE STORIES AND THE CONSTRUCTION OF THE THIRD PERSON

Cristóvão Ribeiro Margarido 1, Ricardo Neves Vieira 2

1 cid - Centro Investigação Identidades e Diversida, IPL - INSTITUTO POLÍTECNICO DE LEIRIA, Leiria, Portugal

Abstract: We will present a biographical study about Brazilians immigrants in Portugal, in order to understand the process of (re)creating the personal identity in people who pass social and cultural frontiers.

The people who live with a cultural stability and have few interactions with alterations, tend to have more monocultural attitudes which are closer to the type of behaviour belonging to the culture in which they are originally integrated with their peers and family. Those that, for various reasons undergo a process of social mobility whether ascending or descending, are subject to a cultural metamorphosis and therefore recreate their personal identities: they recreate the image that they have of themselves and the one they show others. The immigrant seeks to create their new me amid their culture of origin and their newly found culture by separating the two worlds, joining them or creating a third identity dimension, in an attempt to find the most secure way in an ontological perspective.

Contrary to what is normally assumed in cultural studies about immigrants which tend to explain social and mental pathologies as a result of emigration, especially amongst children of immigrants, allegedly tormented because of living divided between different cultures, we believe that these individuals have the capacity to live comfortably in different worlds without any type of pathology.

In sum, this communication departs from the general idea that immigrant’s integration strategies oscillate between an attitude of commitment and an attitude of intercultural evasion. The first case refers to the immigrants who integrate their culture of origin into the emerging cultural identity both implicitly and explicitly. The latter denies the culture of origin and idealizes the target culture, leading to the monocultural immigrant. Another strategy could be the development of a transnational identity that consists in living regularly in ‘two worlds’.

TRANSMATIONAL MOBILES AND THE QUESTION OF BELONGING. HOW OTHERNESS, TRANSCULTURALITY AND COSMOPOLITANISM ARE TAKEN PART IN BIOGRAPHY AND IDENTITY WORK

Claudia Vorhauer 1

1 Institut of Sociology, University of Zurich, Zurich, Switzerland, Switzerland

Abstract: Migration and mobility, transnationalisation and transculturality, become - in different ways direct or indirect - part of the individual and collective experiences and challenges of society members. From the biographical research point of view they can be passed by individuals as an institutional schedule model or followed intentional, they can initiate processes of biographical transformations or trajectories of suffering. On one hand border and boundary crossing, extend options of action and widen the experience realm and social universe of individuals. On the other hand plurality and heterogeneity as well as uncertainty and unsteadiness, otherness and ambivalence are prominent challenges and difficulties. Against this background we need to ask what kind of social capacities subjects provide to construct a transnational social reality, which social dispositions and competences are required and what kind of socialization and learning processes are involved.

As prototypes for current transnational socialization processes we centre on the group so called Transnational Mobiles, who were long-term living and working in several different countries and who’s social and occupational worlds are often characterized by a combination of frequently traveling and periodical moving. Based on autobiographical narrative interviews we reconstruct the patterns of their life courses and transnational careers. Thereby the research interest and talk focus on the coherence of objective and subjective transnationalisation processes. How transnational mobiles handle socio-cultural diversity and experiences of otherness on the cognitive, interactional and emotional level? What kind of specific patterns of perception and action like for example cosmopolitan perspectives and orientations can be seen? How the self and own nationality and the people from other countries and cultures are represented and reflected? In which ways transnational life courses and career paths stimulate new forms of biographical and identity work? What kind of post-national or post-traditional or other reflexive forms of identity formation transnational mobiles develop?

TRANSMATIONALISATION AND MIGRANT BIOGRAPHIES

Barbara Theresia Schröttnner 1, Angela Pilch-Ortega Hernandez 1

1 Department of Education, UNIVERSITY OF GRAZ, Graz, Austria

Abstract: Transnational spaces should not be understood as locations on a map but instead as relational social areas. Contemporary societies are increasingly heterogeneous, less limited by physical boundaries and more spatially and socially spread out. Through migration, streams of people incorporate social connections into their daily lives which go beyond national borders. It is for this reason that transnational spaces can in no way be regarded as a ho-
mogeneous phenomenon and thus, they cannot be conceived of as sealed containers. They are relational structures which are composed of various relationships arising from global mobility and having different coverage. Transnationalisation can therefore be analysed as the increasing liberation and/or emancipation from place because the bond of social relations to the local environment is opened up. However place does not lose its relevance as an organizing and structural principle – instead it gains relevance because social relations as well as all other interactions still have a territorial reference. Due to these developments new ‘transit spaces’, ‘asylum-seeker spaces’, ‘migration spaces’, ‘refugee spaces’, ‘tourist spaces’, ‘intercultural spaces’ and also ‘integration spaces’ emerge. Biographies of global actors and migrants reference transnational spaces; within these spaces, experiences of transnational acting and interacting are biographically gathered and developed. Migrants establish relationships in different geographical locations and maintain these relationships despite the physical divide. New technologies facilitate communication and allow for the continuation of these social connections; the overlapping social areas bring new challenges which have to be mastered in the everyday organisation of life. The aim of the paper is to focus on transnational social relationships and the related challenges such as diversity, contradictoriness, inconsistency, virtual distance and the proximity in daily life. This leaves the question: How do humans create their own transcultural references in their everyday lives and how do these support the transformation of regionally embodied structures and practices? By taking this question into consideration, it can be concluded that the “irritating potential” which occurs through the confrontation within and among transnational spaces can be analysed and dealt with in learning processes.

NEW MATERIAL OBJECTS AND CHANGE OF SOCIAL PRACTICES DURING THE LIFE COURSE OF THE ELDERLY IN POLAND

Joanna Marta Zalewska1

1Institute of Philosophy and Sociology, Academy of Special Pedagogics, Warsaw, Poland

Abstract: The aim of the presentation is to discuss the perception of turbulent changes of social practices in everyday life, which have taken place during the life course of the generations of elderly in Poland. The ethnographic research was inspired by multi-sited ethnography and life course approach. It was conducted in Warsaw with eleven interlocutors born between 1918 and 1940. The analyzed materials come from ten biographical narrative interviews, eleven in-depth interviews on perception of changes and eleven in-depth interviews on social ties. The interlocutors were differentiated on their social characteristics (family background, education, profession, income, moment of moving to Warsaw).

The most important change for the interlocutors was the appearance of huge amount of new material objects with new features in their everyday lives as a result of technological development. It was experienced as intense change after the II world war, and it was perceived as gradual change in the next decades. The appearance of new objects in everyday life was connected with the change of ways of satisfying needs, ways of sharing duties in families, change in structure of time and in social ties.

Thus the appearance of new objects in everyday life was connected with the development of new social practices. It can be interpreted with the concept of ‘maintenance regimes’ of M. Krajewski. ‘Maintenance regimes’ are social practices that enable continuation and recreation of everyday life through operations on material objects. They developed as a result of changing organization of consumption (consumption outside family, new forms of services offered by market and state, new technologies in everyday life).

Before the development of ‘maintenance regimes’ the rules of behavior in everyday life were rooted in customs and norms of respective communities. During the life course of the generations of elderly in Poland social practices in everyday life became more driven by features of material objects and less by customs and norms. The exteriorization of rules of behavior has taken place. Development of ‘maintenance regimes’ enabled the change in social ties in families. In patriarchal families the everyday duties of family members were assigned according to age, gender and position in family. ‘Maintenance regimes’ - rooted in material objects provided by market - allow individuals independently satisfy their everyday needs.

DISCOURSE OF THE POWER AS A TOOL FOR THE COLLECTIVE CRIMINAL BIOGRAPHY CONSTRUCTION

Alexandra Dmitrieva

1ST. PETERSBURG STATE UNIVERSITY, St. Petersburg, Russian Federation

Abstract: The process of attributing social value to the different kinds of drugs promotes changes of representations about social norms. It is especially appreciable in the modern society where in the major countries is taking place the process of reconsideration consequences of certain drugs consumption. In Russia at the same time we can find out the opposite process: till 2020 is “painted” actually new policy of not differentiated “toughening” of the social exclusion of drugs consumers. The danger of such policy is that it promotes criminalization of the social group and creates a compulsion situation of criminal relations between authorities and citizens, if we are taking into account corrupted militia. For example, considering the Note 1 article 228 of the criminal code of Russian Federation, Russian law welcomes for calls for “unmasking” drug users by the other users to avoid punishment, but in fact also by any other people that have similar information. That is basically logical, but not in case of taking into account specificity of the further content which is lead absolutely different cases to a common outcome. For example, it is possible to imagine that in one house on the one floor lives peaceful marijuana smoker growing up for his private use a couple of bushes, and in the cellar there is an equipped “kitchen” for synthetic drugs manufacture. In case of any of other inhabitants of this house will guess a smell of marijuana from the neighbor’s door and will call to militia, punishment level in this case and in the second case will be approximately the same. It will occur because marijuana smoker will hardly prove that this couple of bushes isn’t «illegal manufacture with a sales objective» for which in the criminal code of Russian Federation suppose to punish by imprisonment for the term from 4 till 8 years and it doesn’t depend on a drug kind.

Thus drug use in Russia’s representation will remain a symbol of belonging to the socially excluded and criminalized groups despite of changing orientations in European societies. While the dialogue between Russian state and Russian society will continue to remind
the theater of the absurd where the director of the Russian Federal Service for control over drug trafficking Viktor Ivanov will openly ask the readers of his blog a hypocritical question: "How can we change the high tolerance of our citizens to a drug use?"

IDENTITY IN THE CROSSROADS OF MIGRATIONS

Maruta Pranka

1Institute of Philosophy and Sociology, LATVIA UNIVERSITY, Riga, Latvia

Abstract: The paper presents analysis of materials of longitudinal biographical case study, dealing with experience in researching migration processes. Life stories and other biographical data (photos, personal documents) have been collected from the inhabitants of a single apartment building (38 life story interviews from 20 apartment’s dwellers) in Riga. The data analysis of the case study using biographical research methodology allows examining migration processes in the period from 1936 – when the house was built - till the present with focusing on actual migration.

The specifics of the research methodology lie in the fact that the house as the research object gives the opportunity to organize relative borders of the space and time and thereby opportunity to talk about common experience of a definite group. The research deals with analysis of different kinds of the house dwellers’ migration experience focusing on personal experiences’ contextualization with the particular historical phases and social context.

Migration being always a biographical break in individual life is connected with different risks, including the risk of shaping and keeping identity. Migration also includes the risk of stigmatization of individual or group. Especially it is attributed to the forced migration. – realized against individual will and choice. The paper points out also voluntary migration caused both by pull and push factors – economical, political, kinship etc.

The research project is realized by the researchers of Latvian Oral History Project in the Institute of Philosophy and Sociology of Latvia University.

WOMEN ENGINEERS’ PROFESSIONAL IDENTITY AND MIGRATION

Yves Jeanrenaud, Susanne Ihlsen

1Gender Studies in Science and Engineering, Technische Universität München, Munich, Germany

Abstract: Following G. H. Mead’s concept of identity, where identity itself consist of a self image incorporating the spontaneous “I”, which not able to react mindfully, and multiple instances of “Me”, reflect the individual’s beliefs of what idea others have about him or her by construing their reactions to the individual’s own actions, we must conceive the professional identity as part of the “self” and therefore crucial for one’s identity as a whole. Hence we would like to point out empirical findings about the professional identity of women engineers and effects of migration on this.

Our study, funded by the Economics Ministry of Baden-Württemberg, analysed the reasons and causes for women engineers to drop out of employment corresponding to their technical education. It was carried out by Gender Studies in Engineering at the TU Munich from mid 2008 to mid 2009 and longed to answer the questions as to why these women dropped out and how to win them back into technological fields. Hence, the study primarily consisted of 40 biographical telephone interviews conducted among women who possess engineering degrees (and comparable ones for the control group) but are no longer or have never been employed in the professions their education led towards.

Besides the interesting results on women’s employment factors in engineering professions, migration was not specifically in the primary focus of the study, but nevertheless not neglected. Some of the women interviewed had a migration background, varying in their country of origin, circumstances, reasons and motives for leaving it. But all of them share one common detail: ever since they left their home country they were not working as engineers anymore. However they responded to our call looking for women engineers not working in their jobs anymore. This is particularly curious because it is pointing out that their construction of their own identity as an engineer is still faultless, even after decades of leaving the job and home country.

Hence we would like to show empirically how migrated women construct their (professional) identity in their biographies and how this may be seen in comparison to the identities of other former women engineers and scientists we interviewed.

CONSTRUCTING IDENTITIES IN IMMIGRANT LIFE STORIES

Sirkku Varjonen

1Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: How are identities and belonging constructed in the context of personal life stories narrated by immigrants? In this qualitative study autobiographical immigrant narratives are approached from a social constructionist point of view. The analysis focuses on the immigrant identities constructed as well as on the changes that take place in the life stories over the years the narrators spend in Finland, their new country of residence.

The unique longitudinal research data consists of 46 autobiographical narratives by 23 immigrants. The study is discursively oriented and the data is analysed from "narrative constructionist" and "storyed resource perspective". This means looking at narratives as social and discursive actions. It also involves looking at the cultural narrative resources which the narrators draw on and resist when constructing their life stories and identities.

The immigrant narrators construct various types of identities to position themselves and other immigrants in relation to Finns. Examples of identity positions constructed include: dependent child, underdog, victim, outsider and participant. These constructions are used as discursive tools when creating a functional space for the narrators as individual actors, and also for immigrants in general, within the Finnish society. Immigration is discussed most typically in relation to themes of otherness, belonging and discrimination. With their life stories the narrators actively participate in the public discussion regarding immigration and resist the marginal position often reserved for immigrants.

LIFE STORY TELLING IN CHICAGO'S IMMIGRANT RIGHTS MOVEMENT: A SENSE-MAKING, LEGITIMIZING AND MOVEMENT-BUILDING PRACTICE

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Thomas Swerts

Abstract: Over the last decade, the immigrant rights movement has increasingly mobilized immigrants in the US. Regardless of legal status, immigrants have organized themselves collectively to claim their civil rights. In this context, people often share their everyday life experiences in diverging social settings. Yet, the relative importance of life story telling is largely ignored by sociological studies of immigrant activism.

Mobilizing immigrants does not happen overnight. In this respect, the literature on social movements emphasizes the importance of framing efforts as a basic mechanism for mobilization (Snow et al. 1986, Snow and Benford 1994, McAdam 1996). However, the focus on organizational discourses in framing studies overlooks the deeper significance and meaning that people attach to their biographies. Recently, several scholars have begun to recognize the relevance of life stories for social movements (Jasper 1999, Davis 2002, Polletta 2006). In order to gain a better insight in the social mechanisms accounting for immigrant mobilization, I argue that life story telling needs to be studied as an essential social movement practice.

As a case study, this research investigates life story telling in SMOs in Chicago: the Illinois Coalition for Immigrant and Refugee Rights, a coalition of 120 immigrant organizations, and the Immigrant Youth Justice League, a self-organization of undocumented youth. Qualitative data were gathered by organizational ethnographies, participant observation and content analysis of primary documents.

Based on this empirical research, I show that life stories are carefully constructed to suit diverging purposes in different social contexts. From an individual perspective, life story telling can be seen as a motivational practice accounting for the storyteller’s political involvement. From a collective perspective, life story telling is not only a means of self-reflection, but also a political strategy. Consequently, I argue that life story telling fulfills different functions depending upon the structural level of communication wherein life stories are told, the types of interactions that characterize this communication and the actors involved in those interactions. Hence, I identify sense-making, movement-building and legitimizing as the three major functions of life story telling as a social movement practice.

**POWER OF BIOGRAPHY AS ECOLOGY OF IDENTITY: LATVIAN LIFE STORIES IN GERMANY**

Dace Bormane

Abstract: Narrative identity, creativity, exile, structure of communication, sociotopos, habitus, and power are conceptual key words in this research topic.

The nation as subject, which gathers thousands of epistles, in this context, we can speak about memory work. People who became emigrants as a result of World War II have practised this for decades, and the concept is also familiar to 21st-century migrants from Latvia. Locality and regionality are a communicative structure in the context of globalisation. The following question therefore arose: what are the paradigms and practices of individual and community identity? This is a question of commune and autonomy, of solidarity, of paradoxes and the history of attitudes....
COMPANY-LEVEL TRADE UNION ACTIVISTS IN POLAND AND ROMANIA

Adam Mrozowicki 1, Réka Geambașu 2

1Institute of Sociology, University of Wrocław, Wrocław, Poland,
2Faculty of Sociology and Social Work, Babeș-Bolyai University, Cluj-Napoca, Romania

Abstract: This paper explores the relationship between workers’ collective memory of the socialist past and the emergent types of trade union activism in the automotive sector and the retail sector in Poland and Romania. While in both countries labour movements underwent erosion after 1989, research carried out in the last decade documented how new and reformed company-level union leaders had strived for halting and reversing this negative trend. This research adopts the actor-centred approach to explore the local practices of ‘trade union revitalisation’ through the biographies of company-level union leaders. Considering culture as a toolkit of ‘symbols, stories, rituals, and world-views’ that actors use to construct their life strategies (Swidler), we explore the role of the available stocks of cultural motives, including the memories about the socialist past and the discourses of capitalist transition, in fostering and/or hindering the formulation of a new pro-active trade union agenda by union activists. Based on the exploratory analysis of over 20 biographical narrative interviews with company-level trade union activists (collected in 2010-2011), tentative conclusions are formulated. Except for the long-standing leaders of the Solidarity union in Poland, ‘grand’ historical events, such as Revolution in 1989 in Romania or Solidarity resistance in the 1980s in Poland, rarely appear as the core frames of life stories. Although the silencing of the ‘grand history’ is a widespread biographical process, it is especially apparent in the biographies of newcomers to trade unions, who joined or co-established union organisations in the last decade of transformation (regardless of their age). While the biographies of long-standing trade union leaders tend to be framed by rich references to the histories of their work milieus and unions, the life stories of newcomers are predominantly constructed in the context of their individual and family experiences. This ‘neutralisation of grand union history’ provides more space to experiment with new meanings of trade unionism in the context of radical social change. However, the lack of coherent and collectively shared cultural frames of reference for trade union activity is also an obstacle for trade union development in a long run as it reflects a very fragmented cultural basis for workers’ solidarity.

CONSTRUCTING MEMORISING INDENTITY: THE CASE OF LOCAL WAR

Victoria Vladimirovna Semenova

1INSTITUTE OF SOCIOLOGY, ACADEMY OF SCIENCES, Moscow, Russian Federation

Abstract: The paper is devoted to the problem of identity construction process choosing between time dimension: past/present orientation in situation of past trauma experience. The object of the research are former soldiers who went through the experience of local war -Soviet/Afghan in war in 1979-1989. According to their attitude towards memory and towards past suffering they choose different strategies of remembering and different types of identity construction process.

The author discusses the problem of a set of individual factors that predominate their biographical strategies as well as their collective memory work that connected their past with present. The main aspect to be discussed here is if memory work in present is a part of present indentification or is a link between present and past.

Joaquim Mealha Silva

1Departamento Sociologia - ACTAE-NICPRI.UÉ, UNIVERSIDADE DE EVORA, Évora, Portugal

Abstract: In recent years we have seen great progresses in the field of the preservation of the historical memory and of individual/collective experiences, namely about the period of the Spanish Civil War (1936/1939). This renewed interest concerning that turbulent period in the recent history of Spain, is explained by the necessity of knowing better the traumatic migrations imposed by war to communities who lived near border areas and tried to save their lives. Against the will of the countries involved (Portugal and Spain), people used the pre-existing social linkages and the border networks, created by old border smugglers, to escape from war and Nationalist (and Republican?) persecution. The memory of these episodes is still traumatic for many residents near the river Guadiana’s border, and so we often deal with a strange and bizarre kind of amnesia and silence. The Spanish refugees came into Portuguese homes, trying to escape and to save their lives, and many of them were hidden in attics and animal shelters, but great numbers were captured by Portuguese authorities and sent back to the Spanish side of the border, where the Franquist troops executed them.

The Spanish Civil War and these border flows changed Guadiana’s river border and the lives of Portuguese and Spanish communities in these areas, which were invaded by many thousands of Spanish refugees in a very short time, many of them invoking a “right to escape” from death. All these activities had very important implications in everyday life, creating significant levels of risk, instability and insecurity, changing perspectives on identities and social structures, challenging the constellations of power, in the South of Alentejo and Algarve, and in the Spanish Andalucia as well. In this presentation we will approach the process of construction and preservation of memories, both collective and individual, researching the forced migration flows of that period, analyzing the social actors’ roles and the strategies used by them, the cycles and reasons used by the new generations to forget or to remember this past.

The methodological approach adopted is qualitative, crossing documentary research and deep biographic semi-directive interviews. We shall try to enhance the complex relations, the belonging feelings, the identities, the contestation and the opposition, which made remarkable the biographical life stories of the social actors of those turbulent times.
IMPLIED AND EXPLICIT THEORIES OF ACTION IN THE FIELD OF CHILD PARTICIPATION. A RESEARCH OUTLINE

Daniel Stoecklin¹
¹Children’s Rights Unit, UNIVERSITY INSTITUTE KURT BOESCH, 1950 Sion 4, Switzerland

Abstract: The paper explores child participation from the perspectives of the sociology of action. “Participation rights” contained in UN Convention on the Rights of the Child convey a new legal status to children viewed as subjects of rights with evolving capacities. Despite the important literature on child participation in the two decades following adoption of the UNCRC, a theory of child participation is still missing. Many authors use concepts like “social actor” and “agency” as taken for granted, which are also widely used by activists mostly unaware of the hidden frameworks lying behind different and conflicting paradigms. Specifying these concepts is possible only when theories of action are made explicit. Our research outline highlights the importance of addressing the different theories of action, whether implied or explicit, used in the literature on child participation. Instead of relying primarily on dimensions linked to intervention agendas, there is a need for a theory of action that would acknowledge the cumulative and systemic nature of action, therefore contributing to better understand the link between reflexivity and capability, a central question regarding actors with evolving capacities.

INFORMAL CHILDHOODS: STREET CHILDREN WORKING IN ACCRA’S INFORMAL SECTOR

Philip Mizen¹
¹sociology, UNIVERSITY OF WARWICK, Coventry, United Kingdom

Abstract: This paper explores children’s work within the urban informal sector. It does so by drawing upon research examining the lives of children looking to make a living on the streets of central Accra, Ghana. The paper considers these children’s work through addressing two inter-related themes. First, it considers the children’s work within a broader understanding of the work practices and employment relations of other comparable groups of workers occupying the lower echelons of a heterogeneous urban informal economy; and the strategies of ‘informal survivalism’ that they develop in response. A second and related theme is the consideration of these workers as children. It is often acknowledged that children comprise a significant and visible category of worker within the urban informal economy, but there is little understanding of how children are integrated into (or excluded from) its competitive practices. By considering how these children’s work and employment is regulated through ‘institutions of identity’ (Harriss-White 2010), like age, gender or ethno-cultural identity – forms of social regulation that have their basis outside of the informal economy but which constitute important relations of authority within it – the paper will explore more fully the nature of these children’s participation in informal economic processes.

IS WORK ENNOBLING AND EDUCATION A SILVER BULLET? CONTRADICTIONS AND TENSIONS WITHIN THE GERMAN CHILD POVERTY DISCOURSE

Maksim Hübenthal¹
¹FACULTY OF PHILOSOPHY III - Educational Science, MARTIN-LUTHER-UNIVERSITY, Halle, Germany

Abstract: For more than one decade child poverty is understood as a relevant social problem in Germany and since the end of the conservative-liberal era in 1998 the German Federal Government explicitly identifies the fight against the poverty of children and families as a central political goal in the field of child and family policy. However, despite this high attention for years children form the population group in Germany that is affected the most by poverty. As a consequence there are public debates between the Federal Government, childhood and poverty researchers, non-profit organisations, etc. about how, for what reasons and with what goal child poverty in Germany has to be abolished.

At present time, the state of the art of child poverty research allows us to structure the German discourse about child poverty alongside two poles: a children’s rights perspective which criticizes that poverty is violating the child’s rights on a decent standard of living in the present and demands more state intervention in several political areas on the one side and on the other side a social investment perspective which emphasizes that poverty of children is producing economic losses in the future and is primarily linked to investments in in-kind-transfers and in the educational system. These two ideal typical poles can be understood as the expression and symbol of a diverted discourse on child poverty in Germany.

Against this backdrop, it is the aim of this presentation to deliver first insights into the specific social constructions of child poverty behind these two poles. Based upon this, it is intended to discuss major contradictions within and central tensions between the social constructions of child poverty in Germany. For this purpose I analyse the current debate on reforming the German social assistance system via a discourse-analytic setting of qualitative methods from a child-oriented perspective in the sense of the “new childhood studies”.

CHILD-FRIENDLY CITY, DISTRICT AND STREET

Maria Sibireva¹
¹SAINT-PETERSBURG STATE UNIVERSITY, Saint-Petersburg, Russian Federation

Abstract: When we study social problems of city, it is necessary to answer how can the city become comfortable and safe for its small inhabitants. The decision is to ask children by themselves what problems do they face in everyday life in the city. The research which was conducted by the author in 2008 – 2009 in nine kindergartens in six districts of St. Petersburg showed that 5 – 7 years children can become co-researchers when we use adequate techniques of the collection and interpreting data. Methods of the research included:
• projective technique “The Person in the City”. The analysis of the received 224 pictures (the pictures were used as questionnaires) and interviews allowed to define the features of perception of socio-spatial characteristics of the city;

• interviews with children according to cards with the images of the city. The pictures were shown to 137 children and contained the description of the most typical social situations of city life which can provoke children to make a decision.

According to the received results of the research it was possible to define how many children have potential to overcome difficulties and what must adults do to make child - friendly city, districts and streets.

CHILDREN’S SOCIAL-SPATIAL INCLUSION IN DISADVANTAGED AND COMPARISON AREAS

Malcolm Hill1,1

1UNIVERSITY OF STRATHCLYDE, Glasgow, United Kingdom

Abstract: The presentation will discuss processes of children’s inclusion and exclusion with regard to informal spaces and formal services. It is based on two studies carried out in Scotland with overlapping themes and mutually supportive findings. The first focused on how children aged 8-14 cope with being brought up in areas with high levels of income deprivation and neighbourhood hazards. Both children’s and parents’ viewpoints were included in the study, which was based on four different areas, all poor. The second study examined children’s perspectives on services and how they accessed them. Data was obtained in three contrasting areas, so that the analysis was able to take account of relative affluence and the rural-urban spectrum.

The studies highlighted the many hazards faced by children in negotiating their local environments, especially when these were disadvantaged areas. Children displayed wisdom about the spatial and temporal dimensions of risk and safety. The studies revealed a range of techniques deployed by parents and children to minimise risk and facilitate children’s movements and activities, but even so fears and threats often resulted in exclusion from desired places or restricted use. Children living in higher income households in more favourable environments had much more access to safe private spaces and to organised services. In addition to safety considerations and availability of formal services, children’s access to recreational and educational resources were much affected by direct and indirect costs of services and transport.

Please note that with small modifications, this presentation could go equally well in the section on Poverty and Children.

MORE RELATIONAL CHILDREN AND YOUNG PEOPLE’S PARTICIPATION TO IMPROVE WELLBEING: HOW IN CHANGING CONTEXTS DO WE ENCOURAGE DIALOGUE AND MORE COLLABORATIVE APPROACHES?

Vicky Johnson1

1Social Work, UNIVERSITY OF CENTRAL LANCASHIRE, Preston, United Kingdom

Abstract: Exploring the links between process and context through case studies in Nepal and the UK showed that decision-makers responded to children’s evidence in participatory processes depending on significant features of context. Within this analysis different mechanisms encouraged positive outcomes for improving children’s wellbeing. External drivers, such as political economy, cultural beliefs and practices, and institutional setting were considered alongside internal processes including capacity, commitment and whether there were champions for children. This paper argues that children and young people should be made more visible in broader social development processes, and that in order to do this, power dynamics need to be addressed. Recent participation discourses suggest more relational approaches to participatory processes with children, mirroring some of the discourses in gender mainstreaming. This fits with both the concept of improving children’s wellbeing, but also with the kinds of mechanisms that, in varying contexts in the research, led to more meaningful participation and transformation at individual, institutional and broader societal levels. Mechanisms included different forms of collaboration and communication, including dialogue between different stakeholders. The challenge then remains how, in such changing contexts, to convince those in positions of power to build on dialogical approaches and encourage innovative and flexible participatory processes with children and young people.

POVERTY AND WELL-BEING OF CHILDREN LIVING IN THE POVERTY POCKETS IN LODZ IN POLAND

Marta Petelewic2

1Department of general sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: Living conditions of children, child poverty and well-being have gained recently increasing recognition of the European Union. Underprivileged children became the target group for the EU policy. National (Warzywoda-Kruszynaś, Węcycka) and comparative (UNICEF, EC) reports indicates that Poland face severe problem of child poverty. Child poverty cannot be treated as an isolated problem, there is a growing body of evidence that childhood disadvantage has negative effects on development, well-being and future life-chances. Nevertheless, there is lack of in-depth data and analysis, especially those incorporating children’s, perspective concerning the state of the youngest Poles. The current study is an attempt to address this gap. Life situation is a complex issue, multi-dimensional perspective should be included, that is why in the taken approach poverty and well-being are regarded as the reverse sides of the same coin. Both concepts are to be explored on the basis of the empirical data, that were gathered among 12-13 year old children living in the areas of concentrated poverty in Lodz in Poland. Self-completed questionnaires were conducted in the elementary schools placed in the most and least deprived parts of city. In the schools, where the field study was conducted there is an overrepresentation of children coming from families supported by the welfare. Several domains of the life situation of the youngsters will be examined, contrasted and compared: family and peer relations, living conditions, available resources, health, neighborhood, education and self-perception. Indexes of well-being - deprivation will be created for three clusters representing: having, loving, being dimensions, taken from E. Allardt’s concept of the quality of life.

RESEARCHING CHILD POVERTY IN RELATION TO THE FAMILY: UNCOVERING DYNAMICS IN THE BLACK BOX

Griet Roets1, Elisabetta Ruspini2, Rudi Roose1,3

1, 3Department of general sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: The presentation will discuss processes of children’s inclusion and exclusion with regard to informal spaces and formal services. It is based on two studies carried out in Scotland with overlapping themes and mutually supportive findings. The first focused on how children aged 8-14 cope with being brought up in areas with high levels of income deprivation and neighbourhood hazards. Both children’s and parents’ viewpoints were included in the study, which was based on four different areas, all poor. The second study examined children’s perspectives on services and how they accessed them. Data was obtained in three contrasting areas, so that the analysis was able to take account of relative affluence and the rural-urban spectrum.

The studies highlighted the many hazards faced by children in negotiating their local environments, especially when these were disadvantaged areas. Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

1Department of Social Welfare Studies, GHENT UNIVERSITY, Gent, Belgium, 2Department of Sociology and Social Research, University of Milano-Bicocca, Melano, Italy, 3Department of Criminology, Free University Brussels, Brussels, Belgium

Abstract: Internationally, child poverty is a persistent social problem and constitutes an important issue in social policy and social work research. In Western welfare states, social policy predominantly perceives the role of social work as essential in order to “activate” the family, and mothers in particular, in the realisation of child welfare and in the protection of children’s rights in poverty situations. This gives cause for action strategies oriented towards parents, and towards mothers in particular. Recent research findings indicate that mothers are activated into employment to take their responsibility in heightening the family income, and are simultaneously activated to take their responsibility for child care. Nevertheless there is a lack of insight into the implications of these activation strategies on families, particularly on individual family members such as both mothers and children. This contributes to what we name as a “black box” approach to the family in poverty situations which may have implications for the way we are researching, and therefore tackling, child poverty. Without any knowledge of its internal workings and of the intra-household strategies used to distribute individual and social resources, the family can easily be governed as a self-sufficient system. We tease out which research approaches and methods may be useful to uncover these dynamics and strategies in the family. We argue that, in order to unpack the black box approach, quantitative as well as qualitative research is necessary. Quantitative research is needed to measure both intra-household financial management and resource allocation, as well as inter-household structural (re)distribution of resources; this in order to consider the likelihood that variations in child-specific consumption are determined by variations in total household consumption and variations by household type. Qualitative research is needed to examine which strategies are developed by mothers, fathers and children to make use of social resources; this is a key element if we want to reveal the complex relationship between adult (men’s and women’s) poverty and child poverty. In relation to social work activation strategies, the conditions under which interventions are interpreted as being supportive for mothers, fathers and children need to be identified.

SILENT AND INVISIBLE IN THE MIDST OF CRISIS. THE SWISS PEASANT CHILDHOODS BETWEEN MYTHS AND REALITIES

Michele Poretti

1Children’s Rights Unit, UNIVERSITY INSTITUTE KURT BÖSCH (IUKB), Sion 4, Switzerland

Abstract: While the peasantry has been at the forefront of the Swiss social and political debates during centuries, peasant childhood has remained largely silent and invisible. The slow disappearance of family farms, accelerated by the liberalisation of agriculture of the past two decades, has not changed this pattern. Peasant children continue to be subsumed into the patriarchal family – perceived as the guardian of traditions and national identity – and trapped into intertwined dualist representations of social reality such as peasant/non-peasant, rural/urban, traditional/modern, backwardness/progress.

The paper will summarize the findings of a recent empirical research situated at the crossroads of peasant, rural and childhood studies. It is based on field observations and semi-structured interviews with key stakeholders representing peasant unions, governmental bodies and non-governmental organizations. The research highlights how different conceptions of childhood intersect with dominant myths associating the peasants with an idyllic alpine Arcadia and with the origins of the Swiss Confederation. In particular, it shows how discourses which idealize peasant childhood serve to excise regional, class, age and gender differentiations and to depoliticise the slow disappearance of peasant family farms and childhoods.

CHILDHOOD AT LATITUDE ZERO – THE GAMES OF THE AFRICAN ‘GLOBAL’ CHILD

Sandra Barra

1Instituto de Educação, UNIVERSIDADE DO MINHO, Braga, Portugal

Abstract: This study aims to dip into the daily playful lives of African children born in Sao Tome and Principe, in order to scan into one of the social and cultural worlds of childhood and reveal it in the voice of children themselves.

Through observation and analysis of the practices and meanings associated with the game and toy in the life contexts of children in Sao Tome and Principe, will seek to clarify how the cultures of children in its genesis and structure are intertwined on the broad context of an ongoing globalization.

That is, investigate how are reflected in the games and toys that use African children the premises of a globalized world or a “global child” is the main cut of the project to be undertaken.

The main objectives of this study are:

Contribute to enrich the studies of childhood, giving voice to African children in the natural context of their existence, explaining the concepts and social practices of a childhood outside the western standard, but in the context of a globalized world.

Competing for the analysis of the impact of globalisation in the contemporary childhoods, researching the ways they relate global and local in childhood cultures through the processes of production and reception of culture by the children and their expression on peer cultures in daily playful activities.

Deepen knowledge about the childhood cultures, extending the analysis of the play and toys, examining how and whether the games and toys from the children in the study express, accept, or reject the global culture and the ‘global child’.

‘IT’S ABOUT CHANGING SERVICES AND BUILDING RELATIONSHIPS’: THE DEVELOPMENT OF CHILDREN IN CARE COUNCILS

Nigel Thomas 1, Barry Percy-Smith 2

1School of Social Work, University of Central Lancashire, Preston, 2Faculty of Health and Life Sciences, University of the West of England, Bristol, United Kingdom

Abstract: Within a context of economic austerity and the pressure on local authorities to ensure efficient and cost effective services, resources to support the participation of children and young people are at risk of being cut. Yet, it could also be argued that participation is even more important to ensure that services deliver what is
needed. More importantly, ensuring the right of the most vulnerable to have a say is imperative in ensuring the well-being of children during public sector cuts. This paper reports on a recent evaluation of Children in Care Councils (CICCs) in London, England. It maps out the extent and nature of such developments, but also documents experiences and challenges which are at the heart of the search for ‘meaningful’ participation. The paper discusses how the purpose and operation of CICCs are understood before going on to consider some of the complexity at play with respect to how CICCs have sought to change processes and relationships at the heart of governance. The paper considers the impacts of CICCs as well as the barriers to their future development. The paper concludes by reflecting on the significance of Children in Care Councils in relation to wider understandings of participation.

RECOGNISING THE POTENTIAL FOR JUSTICE IN THE (MIS)BEHAVIOUR OF YOUNG CITIZENS

Cath Sarah Ann Larkins

1SOCIAL WORK, UNIVERSITY OF CENTRAL LANCASHIRE, PRESTON, United Kingdom

Abstract: Children are citizens, holding rights and responsibilities and participating as members of local and global spaces. Children’s status as citizens is claimed in order to recognise children’s social contributions and to link their aspirations to demands for justice from institutions that affect their lives. Despite claims for citizenship, however, institutions do not always provide justice for children, as the 2011 EU Agenda on Children’s Rights illustrates. To advance children’s achievement of the citizenship to which they aspire a clearer understanding is needed of children’s perspectives on justice and how this can be enacted.

This paper presents the understanding of justice and action developed in research by groups of children aged 5-13 in Wales and France. I outline the groups’ expressions of justice in attitudes, limits and inclusions associated with citizenship. I then draw on this understanding to show how some children enact justice in ways that transgress the boundaries of dominant conceptions of appropriate citizenship. These actions can be described as (mis)behaviour or as ‘acts of citizenship’ (Ilsin and Nielsen 2008). In these turbulent times, where governmental responses to financial crisis fail to provide citizenship justice, recognizing and enabling children’s citizenship in (mis)behaviour has potential for widening understandings of participation.

REPRESENTING THE RELATIONAL IN THE PARTICIPATORY PROCESS: A NEW THEORETICAL FRAMEWORK

Victoria Jupp Kina

1School of Health Sciences and Social Care, BRUNEL UNIVERSITY, Uxbridge, United Kingdom

Abstract: When reviewing recent debates on children and young people’s participation there appears to be two distinctive contradictions. First, despite the acknowledgement of the positive impact that participation can have on children and young people these impacts are rarely absorbed back into the various definitions and categorisations. While participation is regarded as a process the dominant theoretical frameworks remain fairly static. Second, of the many barriers to participation that have and continue to be identified adults are viewed as the biggest challenge. While it is largely accepted that the practice, perceptions and preconceptions of adults constitute one of the primary barriers within children and young people’s participation theoretical frameworks focus on defining the act between adult and child through categorising the level or ‘degree’ of participation. This fails to incorporate the relational aspect of the act as the focus is on the final result of the action rather than the interrelationships that led there. This paper will attempt to address these two contradictions through proposing a new two-dimensional theoretical framework that recognises the fluidity and continual learning processes of all and explicitly challenges current dualisms by placing the adult alongside the child as a subject of the participatory process.

BETRAYAL OF TRUST: VICTIMS OF MATERNAL INCEST

Jackie Turton

1Department of Sociology, UNIVERSITY OF ESSEX, Colchester, United Kingdom

Abstract: The sexual abuse of children has traditionally been viewed as a male crime (Grubin, 1998; Cawson et al., 2000; Bunting, 2005). Children have few, if any, strategies of coping with sexual abuse and such a betrayal of trust by an adult may well affect their relationships with all adults, particularly if the perpetrator is a familiar figure. The difficulties are exacerbated for child victims when the offender is female and even more so in cases of maternal incest (Elliott, 1993; Turton, 2008). In this paper I intend to focus on the problems victims of maternal incest have in disclosing their abuse and work towards understanding the dilemmas these children face when considering who to trust.

The data for this paper comes from a wider study investigating female perpetrators. The interviewees included professionals, offenders and adult survivors of female perpetrators. This discussion will focus on the survivor sample most of whom were abused by their mother or mother--figure.

The analysis of the data suggests that even after the sexual abuse has been exposed and as adults the survivors had considerable difficulty in coming to terms with their experiences. I argue that the mother figure is so pivotal that victims of maternal incest deny and minimise their abuse to overcome the gross betrayal of trust.

MAPPING INDEPENDENT CHILDREN’S RIGHTS INSTITUTIONS

Karl Hanson, Brian Gran, Nigel Thomas
URBAN CHILDHOODS/URBAN PLAYGROUNDS: BETWEEN SURVEILLANCE, INVISIBILITY AND PARTICIPATION

Maja Brzozowska-Brycwożyńska

Abstract: Taking the material culture of urban childhood as envisioned in design of playgrounds and other children’s spaces within the city as its starting point and inspired by Colin Ward’s assumption that: “The failure of an urban environment can be measured in direct proportion to the number of >>playgrounds<<” (Child in the City, 1977:73) I would like to discuss the complexities of children’s (negotiating) autonomy in the urban space. The discipline and safety embedded in typical 4S (see-saw, swing, slide, sand-box) playgrounds, the “invisibility” of children’s Temporary Autonomous Zones (Hakim Bey) within the otherwise monomorphic (Owain Jones) urban spaces and the potential of children’s participation in designing their own >>playspaces<< (resp. junk/adventure playgrounds) all provide a basis for linking the play (and the definition of play, childhood and childhood assumed by each of the above playground “models”) with the problem of children’s “ownership” of their cities and, consequently, the issue of city-as-Lebenswelt’s possibility and quality. The presentation will be supported by photographic data from the ongoing research project “The Invisible City” (dedicated to analysing different forms of everyday urbanism in major Polish cities) I am involved in.

WHAT’S ‘NORMAL’, WHAT’S A ‘CRIME’ AND WHAT’S ‘ABUSE’? POSITIONING EXPERIENCES OF MALTREATMENT AND VICTIMISATION IN

CHILDHOOD. FINDINGS FROM A UK WIDE STUDY OF CHILD MALTREATMENT AND VICTIMISATION

Lorraine Radford, Debbie Allnock

Abstract: Children’s experiences of violence and abuse in the home are frequently described as ‘hidden’. This paper will draw on findings from UK wide research into the prevalence and impact of child maltreatment and victimisation in the UK, to explore developmental aspects in naming victimisation experiences as ‘abuse’. Interviews were collected from 6196 caregivers, children and young adults, identified from the post code address files using random probability sampling methods. CASI and A CASI were conducted asking caregivers of children under the age of 11 years, children aged 11 to 17 years and young adults aged 18 to 24 years about childhood experiences of maltreatment and victimisation and the impact on wellbeing and behavior. Up to 39 different types of victimisation were assessed, using measures from the Juvenile Victimization Questionnaire (Hamby, Finkelhor, Ormrod & Turner). Follow up and in depth interviews were also conducted with over 60 young adult survivors of child maltreatment to explore the processes of naming experiences as ‘abuse’ and finding safety.

CHILDREN’S RESOURCES IN ACTION – A BOURDIEUSIAN FIELD IN PRESCHOOL

Mari Vuorisalo

Abstract: In this study, children’s activities in the preschool are conceptualized as a social practice within a Bourdieuian frame. This means to study children’s everyday interaction as their active construction. The starting point for a Bourdieuian analysis of social spaces (fields) is the understanding of the social world as being both structured and structured. In this study the volume and the composition of the resources that children bring into preschool are seen to give their interaction its objective structure as they determine the inter-related, reciprocal positions. The empirical base of the study is ethnography in a Finnish preschool.

A Bourdieuian field is a dynamic space of positions taken and struggle for by agents in the field, within its existing power relations and with resources that are recognized in the field as valid and valued capitals. Therefore, to be accepted as an active participant (agent) to the game in the field requires that children know how to do play i.e. they have a ‘feel for the game’. This paper focuses on the ‘game’ children play in the field of kindergarten and the utilization of resources in these games. The paper is part of a PhD study in early childhood education.

IS ANYONE LISTENING? CHILDREN’ PARTICIPATION IN PUBLIC DECISION-MAKING, TURNING ‘VOICE’ INTO ‘INFLUENCE’

Anne Catherine Crowley

Abstract: Taking the material culture of urban childhood as envisioned in design of playgrounds and other children’s spaces within the city as its starting point and inspired by Colin Ward’s assumption that: “The failure of an urban environment can be measured in direct proportion to the number of >>playgrounds<<” (Child in the City, 1977:73) I would like to discuss the complexities of children’s (negotiating) autonomy in the urban space. The discipline and safety embedded in typical 4S (see-saw, swing, slide, sand-box) playgrounds, the “invisibility” of children’s Temporary Autonomous Zones (Hakim Bey) within the otherwise monomorphic (Owain Jones) urban spaces and the potential of children’s participation in designing their own >>playspaces<< (resp. junk/adventure playgrounds) all provide a basis for linking the play (and the definition of play, childhood and childhood assumed by each of the above playground “models”) with the problem of children’s “ownership” of their cities and, consequently, the issue of city-as-Lebenswelt’s possibility and quality. The presentation will be supported by photographic data from the ongoing research project “The Invisible City” (dedicated to analysing different forms of everyday urbanism in major Polish cities) I am involved in.
Abstract: This paper examines the impact of children’s participation on public services in four formal governance structures - a local authority youth forum and primary school council in Wales, UK; a children’s advisory group of an large international Non-Governmental Organisation and neighbourhood children’s parliaments in Tamil Nadu, India. A critical review of the processes involved in turning children’s ‘voice’ in to ‘influence’ in these case studies, suggests that traditional constructions of childhood are alive and well and work to ensure that formal participation structures and mechanisms established as a result of policy drivers in the UK, have been much more about providing opportunities for children to practice ‘good’ citizenship, develop a responsible attitude, and to learn about the complexity of public decision-making than about user involvement in shaping public services or holding service providers or policy makers to account.

Drawing on broader theories in political science relating to citizen engagement and new governance as well as the sociology of childhood, the paper concludes with a summary of the factors that show promise as ‘enablers’ in turning children’s ‘voice’ into influence in formal participatory structures and deliberative forums.

'Star of the Week' and Other Forms of Governance: Constructing Normative Childhood in Day-care

Anna Laura Elina Siippainen

Abstract: Generational relations between children and adults are going through changes (Alanen 2009). This has sparked off a vivid debate on children’s agency and need for adult-provided protection. In my ongoing dissertation research I examine intergenerational relationships in a Finnish day-care center and try to answer to the following research questions: What kind of position do children take in intergenerational relationships in day-care? How do children shape these relationships? How do the relations between children and adults affect children’s agency and well-being?

Theoretical ideas are adopted mainly from governmentality research (Foucault, Rose, Dean). The data are collected by ethno-graphic methods in one kindergarten group (children aged 3-5 years old) by observing and interviewing the children and the personnel during the spring 2011. In this presentation I will take a closer look at some empirical cases from the point of view of governance and discuss the kind of normative childhood and ideal child that the practices of the day-care center help to construct?

My research builds on my master’s thesis and is part of the project “Intergenerational partnerships: emergent forms for promoting children’s well-being”. The project is funded by the Academy of Finland (2010-2013).

The Social Importance of Things: Inclusion and Exclusion Among Children in a Multi-Ethnic Suburb of Oslo

Mari Rysst

Abstract: Since the Second World War, nation building in Norway has focused on welfare, equity and equality. From the same period, immigrants from non-Western countries arrived in great numbers. As a consequence, egalitarian values regarding gender, race and ethnicity are highly prioritized in kindergarten, schools and elsewhere. Children learn from an early age that "people look different, but are similar inside", and that inner qualities count more than appearance, which include physiology and clothes. The field site is in an ethnically heterogeneous suburb of Oslo populated by immigrants from all over the world. Based on more than six months of ethnographic fieldwork in a primary school consisting of 95% pupils with immigrant backgrounds, the paper discusses inclusion and exclusion in the light of children's social networks and social capital. The paper discusses the following questions: How are children's friendship networks to be understood in the light of gender, ethnicity and different proficiencies? Which "things", including activities, seem important for children's inclusion? How do children and their family's social networks relate to their overall inclusion and exclusion in this particular place?

Lars Alberth, Ingo Bode, Doris Bühler-Niederberger, Steffen Eisenraut

Abstract: Internationally, maltreatment of small children is increasingly viewed as a severe challenge to social professionalism. Concern is widespread about imperfections of existing patterns of intervention, regarding the use of organisational resources and resistance to interprofessional collaboration. However, this debate has shortcomings concerning the way it addresses professional divides in the societal response to child maltreatment. Firstly, greater awareness is needed concerning the profession’s intrusion in the families’ life world as this intrusion is subject to a bargaining between parents and professions. A crucial problem here seems to be the invisibility of the child in the process of professional intervention, with children ranging from a mere ‘bearer of symptoms’ to being an active participant in the intervention process. Secondly, professional interventions are embedded in institutional and organisational regulations, with a simultaneous involvement of different professions and organizations, each following a distinctive approach of how to intervene. In this configuration, particular trajectories of professional interference emerge which entail case-specific (chains of) reactions.

The paper is based on a research project funded by the German Research Council (DFG). It explores professional interventions in the field of child maltreatment and neglect. On the basis of in-depth interviews with different professions (social workers, physicians, midwives etc.) as well as reported cases, an analysis of the triage process (the process leading to a decision if the case is to be seen as maltreatment, neglect etc. or not) is presented. The hypothesis developed in this paper is that professional interventions are subject to as distinctive social embeddedness and, among other things, contingent on a) the processing of professional knowledge and b) prevailing organisational structures, with both impacting specifically on the situational interaction with the family under treatment.
Thus, intervention against child maltreatment risks being only loosely coupled to what the needs of children or their families actually may require. At least, idiosyncracies rooted in the knowledge processing of professions and organizational constraints colour the process of intervention makedly.

SEgregation and MixinG in belFasT: Teenagers’ percepTions of the post conflicT city

Madeleine Leonard

1sociology, QUEEN’S UNIVERSITY BELFAST, Belfast, United Kingdom

Abstract: Until recently, studies of modern cities and their impact on the daily lives of occupants focused largely on adult spatial patterns. This focus often rendered young people as invisible inhabitants of urban landscapes and by failing to incorporate their own ‘ways of seeing’ they were positioned as outsider groups (Matthews 1995). In attempting to redress this balance, research on young people’s micro-geographies has revealed the myriad ways in which they utilise street corners, shopping centres, vacant spaces, parks and playgrounds as places where they can meet and create their own identities (Matthews et al 1998). Young people often access public spaces as members of groups and this often results in young people making territorial claims over the spaces they commonly use. In cities such as Belfast which have historically been ethno-nationally divided into parallel landscapes whereby one group claims control over space and defends that space against others, one would expect that young people growing up alongside pre-defined boundaries and barriers would be territorial in their daily practices. However, as the paper will demonstrate, while there are some continuities between adults’ and children’s perspectives on divided spaces there are also likely to be differences.

Thus, while young people’s ‘ways of seeing’ may support adult perspectives regarding traditional patterns of segregation they may also dilute, challenge and contest them. Reflecting O’Brien et al’s (2000: 257) assertion that debates about children’s place in the city need to move away from ‘the unitary public child’, this paper explores the heterogeneity of young people’s attitudes to growing up in Belfast and the extent to which they view Belfast as a divided or shared city. By focusing on the contradictory narratives produced by young people, the research aims to demonstrate the diversity of their experiences of growing up in a city divided by physical and symbolic boundaries and the ways in which they make sense of and challenge segregated urban landscapes.

the experienCes of the asylum seaKing children in flight and exile

Minna Mari Lähteenmäki

1Institute of Behavioural Sciences, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: The number of asylum seekers is rising sharply in the European Union. This means the growth of the child victims of human smuggling and it also resulting in the growth of the number of those children who have experiences of war and flight. The own stories the children and their mothers who seek asylum in Finland tell about the fear of being killed, the longing; about the silence and being silenced; the submission; the negligence; the witnessing of the violence and the seeking of protection from it; the helplessness; the hiding; the hunger; the coldness; the pain and the fear. They also tell about the sense of relief the children have felt after the flight. From these narratives can be found experiences of different kinds of exercise of power and the possibilities of agency, but also the lack of such possibilities.

In addition to the age and gender of the child, the length and heaviness of the journey, the used vehicles, the need of being hidden and it’s duration and the parent’s condition and ability to help her child, affected how the child felt during the flight. Although the child may apparently appear to have managed the journey without great difficulties, it is however both mentally and physically hard time for all children. The flight stories of asylum seeking children and their mothers will help us to understand the backgrounds of the silence and malaise of those children living in exile. These backgrounds are largely similar to what the Finnish evacuated children experienced during the Second World War and immediately after it. Silence and to be silenced appear to be common to families wounded by war, regardless of the geographical location and the period of time we are examining.

The flight stories of the asylum seeking children and mothers are part of an extensive research data. In this doctoral thesis I propose to address the day-to-day life of children who seek asylum in Finland together with their families in the context of the Finnish refugee reception centers and schools. I shall consider the significance of the family, the reception center and the preparatory education in a situation where the children are trying to cope with their difficult conditions. Another strain of the study will concentrate on the support provided by various networks and the own experiences of the children in the midst of asylum seeking process.

Daily life in a romanian prison for youth and minors

Petronel Mirel Dobrica

1Faculty of Sociology and Social Work, UNIVERSITY OF BUCHAREST, Bucharest, Romania

Abstract: Daily life in a Romanian prison for minors and youth

The aim of this paper is to describe and explain some aspects of everyday lives in a prison for youths and minors. The paper shows the results of a field research, “Deculturation as effect of detention. Resocialization in the context of the progressive and regressive regime of prison sentence execution”, financed by CNCSIS – UEFISCDI (project IDEI PCE 2008, ID-1977).

The universe of young inmates exists as a separated and in many ways as a contrary world to the official depiction of the institution of prison. What are the attributes of this world? What kind of representations of the prison and the outside world are elaborated by the young inmates? What is the inner social hierarchy in this environment and what are the elements that determine the individual’s inclusion into this world? My research analyses the inmate’s strategy of adaptability to the official rules, on the one hand, and to the informal rules of prisoners, on the other.

One of the most salient aspects of my research refers to the evaluation of the consequences of the penal system for youth and minors, which dramatically diminish the social reintegration of former young inmates.

Changing childhood, shifting priorities. International children’s rights advocacy
**SINCE THE ADOPTION OF THE CONVENTION ON THE RIGHTS OF THE CHILD**

Karl Hanson 1, Michele Poretti 1

1Children’s Rights Unit, UNIVERSITY INSTITUTE KURT BÖSCH (IUKB), Sion 4, Switzerland

Abstract: In spite of the comprehensiveness of the UN Convention on the Rights of the Child (CRC), limited resources and time inevitably lead duty bearers to prioritize some issues over others. The international children’s rights agenda can therefore be conceived as a process of meaning-negotiation between antagonistic ideas of children’s rights and related priorities.

The paper will present the findings of an ongoing interdisciplinary research project which aims to gain better insights into the processes of prioritization in international children’s rights advocacy. The project explores, in particular, the extent to which there is space for translating children’s own conceptions of their rights (understood as ‘living rights’), especially when these do not correspond to dominant children’s rights discourses.

The project findings are based on data from semi-structured interviews with key informants and from quantitative analysis of more than 300 documents produced by the United Nations system and international NGOs between 1989 and 2009. The paper will highlight how competing understandings of children’s rights intersect with changing conceptions of childhood, unequal power relations, established institutions and transnational advocacy networks to include childhood-related themes in – or exclude them from – the global agenda.

**CHILDREN’S CITIZENSHIP IN EUROPE: THEORISING CURRENT PRACTICES**

Tom Cockburn 1

1Social Science and Criminal Justice Studies, UNIVERSITY OF BRADFORD, Bradford, United Kingdom

Abstract: Children’s citizenship has been the subject of considerable action and debate across Europe in the last 10 years or so. These debates have been occurring inside and between nation states and within the Council of Europe itself. The debates are extremely wide ranging: covering as diverse issues as the protection of children, the participation of children, children’s migrations, citizenship education, numerous strategies around ‘youth’ following the Lisbon Agenda, and so on. Furthermore, the nature and condition of children’s citizenship is heterogeneous if we consider the contrasting nature of citizenship between nation states (e.g. UK subjects and French citizens; or the welfare citizens of Sweden and Bulgaria).

Despite this there are common issues around children’s citizenship when viewed through social and political theory. All member states have ideologies of citizenship shaped by the enlightenment and it is these enlightenment ideologies that have placed, or more accurately excluded, children from nineteenth and twentieth century citizenship. However, children’s rights and children’s citizenship have been re-evaluated in the twentieth century and now all member states are influenced by a growing children’s rights movement that have challenged many of the assumptions of children that have excluded them from conventional notions of citizenship.

**THE CHILD AND THE CITY: CHILDREN’S CITIZENSHIP, PARTICIPATION AND THE RIGHT TO URBAN LIFE**

Gabriela Pina Trevisan 1, Manuel Jacinto Sarmento 1

1Institute of Education, MINHO UNIVERSITY, braga, Portugal

Abstract: Contemporary citizenship debates explore its subjective meanings, new spheres of action and identities by rejecting a mere and formal definition of citizenship as a simple set of rights and duties. Children’s citizenship implies a more complex discussion since their political status (at least until they’re 16 years old) is not previewed or consecrated. Yet, on the agency plan children are political agents, intervening in the life of cities and institutions, suffering and influencing collective decisions, being the beginning but also the agents (invisible and marginal but, nevertheless, real) of political action. Matters of exclusion and inclusion also contribute to the struggles of the idea of children as citizens, since they remain nowadays as the main excluded group of political participation. Participation in formal structures of public decision making – such as the city - is seen as a fundamental tool for this recognition. Children’s competences and adults perspectives on their status as citizenship help to shape and define their opportunities on participation structures and the impact of those experiences in children’s everyday life settings. Sociological analysis of children’s participation challenges common notions of citizenship and questions interpretative frameworks proposed by sociology on social and political participation. New ways and meanings of citizens participation in political have been questioned and rebuilt. This questioning will be built from a research in a Portuguese city – through the Child Friendly Cities Unicef Program – focusing particularly on its constraints and inhibitions but also the possibilities of children’s action on the organisation of public space, looking at children’s and city council decisions perspectives.

**OF INNOCENCE AND GUILT: YOUNG CHILDREN NEGOTIATING ‘RACE’ AND BELONGING IN IRISH PRIMARY SCHOOLS**

Susan Mcdonnell 1

1Applied Social Science, UNIVERSITY COLLEGE CORK, Cork, Ireland

Abstract: This paper presents some of the findings from research with young children (age 6 to 7) focusing on identity constructions and specifically the area of racialised identities. According to Toni Morrison, we live in a ‘wholly racialised world’ (1992:4). Emphasising the production of inclusion and exclusion as dynamic processes situated in particular cultures and contexts, the paper refutes the dichotomies of childhood ‘innocence’ or (implied) ‘guilt’ sometimes associated with inquiry into areas considered sensitive with younger children. The research engages with children’s narratives and embodied peer interactions within the ‘mainly white’ and governmentally Catholic spaces of Irish schooling. In the context of depoliticised official discourses emphasising equality and belonging and eliding difference, the research demonstrates children’s capacities to actively reiterate, negotiate and resist discursive hierarchies of belonging, as well as their knowledge of what may and may not legitimately be said. The paper suggests that ‘colour-blind’ and ‘colour mute’ educational policies, while endeavouring perhaps to protect children’s ‘innocence’ and ensure their inclusion, do so at the expense of engaging in an effective manner with issues that have real resonance and consequence in children’s everyday lives.
WHAT AFFECTS CHILD AGENCY AND WELL-BEING IN KYRGYZSTAN?

Saltanat Rasulova

1Social Policy and Intervention, OXFORD UNIVERSITY, Oxford, United Kingdom

Abstract: What affects child agency and well-being in Kyrgyzstan?

The concept of agency and how it relates to wellbeing are rarely defined by children themselves. And studies of agency often lack an awareness of children's connections with materiality and how their role changes within a specific society. This paper explores the nature of child agency and the factors which affect it in a specific economic, social and cultural locality. In doing so, it investigates children's own understandings of child agency and how it relates to wellbeing. It identifies the commonalities and differences within the wider social-economic environment shared by Kyrgyz children across differences in age and sex between them and in material position between their families. It will draw on the author's qualitative fieldwork carried out in Bishkek, Kyrgyzstan in 2010/2011. 40 semi-structured qualitative interviews were conducted with children aged 12 and 16 at state and private schools and group discussions were held with both parents and children.

The research objective was to study how agency functions under specific life circumstances and forms of social involvement of children and the personal meanings of agency for children given the economic conditions and cultural demands of childhood in contemporary Kyrgyzstan. Based on the fieldwork data, the paper will explore two main issues: first, the importance of the subjective views of children in understanding what the concept of child agency means and how it is exerted in Kyrgyz society; and second, the importance of love and care for children's lives and the effects of culture, materiality and the socio-economic circumstances in which they live. This study raises issues central to the consideration of appropriate policies to enable children to lead satisfying lives and contributes to the quantity and quality of research engaging with children's subjective views, in particular about child agency.

CHILDREN’S AND TEENAGERS’ SOCIAL ROLES IN FAMILIES WITH IMPRISONED MOTHERS

Dan Octavian Rusu, Andrea Muller-Fabian, Maria Roth

1Faculty of Sociology and Social Work, Babes-Bolyai University, Cluj-Napoca, Romania

Abstract: The objective of our research is to highlight the practice of children’s rights in families with imprisoned mothers, and the differences between them and children with parents not involved with the justice system in respect to the way they can take advantage of their rights, decision making in social problems, and involvement in family tasks, as well as the involvement in religious organizations. The participation of children in social life depends on their family situation and support. Families shape the moral responsibilities and practical duties of children, according to their own values and social situation. Involvement of children in religious organizations can also depend, among other factors, on the needs of children and on the response of religious organizations to these needs. Differences also depend on the degree of autonomy and control of children, due to their psycho-social status within a family that lack the presence of the mother because of imprisonment.

Methodology. The study involved 50 children and adolescent with imprisoned mothers and a sample of 50 children and adolescents living in families not involved with justice. As instruments we used a semi-structured individual interview. The objectives are: 1. to evaluate the way children with imprisoned mothers can put into practice their rights regarding participation in social life, and the evaluation of the frequency the children and teenagers participate to the family decisions about the main tasks and problems in the family; 2. the evaluation of the involvement in religious organizations and activities.

Conclusions. Our results highlight differences between the 2 groups, but we found a large diversity also within both groups. The absence of the mothers from children’s family environment impacts children’s rights, increasing the vulnerability to discrimination, by the risk of reducing their personal networks, pressuring on the development of autonomy and their independence in decision making and involvement in religious organizations and activities. We demonstrate that the absence of mothers puts a high pressure on children’s social roles, who prematurely overtake adult roles, which are experienced as heavy burden by several children. Mothers’ imprisonment might have for children the meaning of a punishment that frames the space and the quality of their children’s rights.

AMBIVALENT EXPERIENCES IN THE PSYCHOSEXUAL DEVELOPMENT OF CHILDREN FOR PARENTS AND PROFESSIONALS CHILDREN’S EXPERIENCES WITH THEIR BODILY IMAGES IN THE FAMILY AND EARLY CHILDCARE INSTITUTIONS

Inés Brock

1Magdeburger Ausbildungsinstitut für Psychotherapeu, University of Applied Science Magdeburg-Stendal, Hal-le(Saale), Germany

Abstract: In the presentation I will discuss the actual status of my scientific work about psychosexual development in the early childhood. The sexual education in the family and in early childhood institutions can be seen as occupied by ambivalent emotions. Especially in the first years, children discover their bodies in an uncommitted fashion. Attention to children’s bodies, and how these function, are experienced and constructed by each child individually. This is an important presupposition in understanding children as social actors. We have to bear in mind that some effects are influenced by the relationships in which the children are involved. Infants and very young children are reliant on the habits of their parents, the behavior of their peers and the rules of professionals. My theoretical interest concerns the social practice and emotional circumstances under which children’s physical personification arise. The body and childhood can be comprehended as complex entities in which a mixture of cultural and natural factors influence the possibilities.

A child’s body is seen as one characterized by change and growth – a process of biological and emotional development dependent on the quality and behavior of closely related peers and adults. Children experience themselves simultaneously in and as their bodies. In the early part of an individual’s life course, personal and social...
relations are very important in accepting the physical changes and in finding the appropriate balance of personal well-being and the acceptance of social norms.

This theory is based on childhood sociology and emotional sociology, keeping in mind that adjoining disciplines such as psychology and anthropology are incorporated. Children are limited by the conditions of their social lives, but also find ways of creatively managing, negotiating and extending their possibilities. The paper will introduce the implications of the development of sexual identity in the family and early child education, whilst focusing on the ambivalent aspects these processes. The pilot study with expert interviews has been finished and some nonverbal data of children’s inner notions were collected. Theoretical approach to interpret the empirical material is the Grounded Theory.

TRUST AND FACILITATION IN ADULT-CHILDREN EDUCATIONAL INTERACTIONS
Claudio Baraldi ¹, Federico Farini ¹
¹Scienze del linguaggio e della cultura, UNIVERSITÀ DI MODENA E REGGIO EMILIA, Modena, Italy

Abstract: According to Giddens, in modern societies trust can be enhanced in two ways: a. through expertise and technological systems, b. through interpersonal affective relationships. In the education system, expertise is generally considered the main source of trust since adults are held to be the experts (educators), those who must be trusted for their knowledge and competence. Recent studies in sociology of childhood suggest that expertise can become risky for children’s trust in educational activities and that the lack of trust may cause children’s marginalization and self-marginalization. Therefore, educators should facilitate interpersonal affective relationships with children, supporting their agency. Following these studies, children should trust primarily adults who show sensitivity towards their personal expressions; therefore, it seems important to understand if facilitation of personal expressions can create trust effectively. This can be understood through an analysis that highlights those types of actions that can promote trust in a way which is visible in communication processes involving adults and children. This presentation analyses interactions that are taken from research on activities of peace education in international groups of adolescents and the purpose is to highlight the cues for the social construction of trust that are made evident in the organisation of the interaction.

TRUST RELATIONSHIPS BETWEEN CHILDREN, YOUNG PEOPLE AND SOCIAL WELFARE PROFESSIONALS
sharon pinkney ¹
¹social sciences, OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: This paper explores the dynamics of trust between children and social welfare professionals. Participation and children’s rights literatures tell us that trust takes time to develop between a child and professional. The conditions of increased managerialism and administration in social welfare mean that time is a scarce commodity for welfare professionals charged with advocating, representing and assessing ‘the best interests’ of children and young people.

The importance of the development of trust is evident in all kinds of professional relationships but with children who are involved with welfare services it takes on an elevated level of significance. These children often have reasons to be particularly cautious about trusting adults because of experiences of abuse and violations of trust. This makes it particularly important that professionals have the time and skills to build and develop trust with them.

The paper assesses some of the constraints in the process of development of trust by using examples from social policy and consultation with groups of children. The task is for individual professionals as well as institutions of child welfare to recognise the significance of the process and relations of trust within this often fraught and contested arena of social welfare work with children.

CHILDHOOD NORMS: BALANCING BETWEEN VULNERABILITY AND SUCCESS
Nele Van Den Cruyce ¹
¹Vrije Universiteit Brussel, Etterbeek, Belgium

Abstract: Childhood is part of social life, it is a social and cultural concept. Within social life, believes and ideas are shaped into norms. In Western culture many forms of behavior are evaluated on the basis of these norms rather than on the direct observation of an actual fact. Cultural preferences and practices are the basis on which one elaborates individual and collective identities. This is the same with children and child behavior. Ideas about what a child should look like and what a childhood consists of are part of societal norms. It is exactly the possibility of experiencing childhoods different to these norms which forms the basis of this paper.

The main focus lies on contemporary societal representations of childhood and on how Belgian children in different socio-economic and cultural positions deal with these childhood norms. Which norms do they encounter and how do they experience them? Do they reflect upon social norms when positioning themselves in relation to other children? Which information sources do they rely on when positioning themselves and others? Do children experience different socio-economical or cultural status positions among their peers and how do they act upon these differences? To what extent do children consider childhood norms and their positions in relation to these norms to be determinants of their future?

Using creative methods (cf scrapbooks) Belgian children are actively involved in this research whereby they themselves reflect upon the childhood norms which they experience in their daily lives, and their own future considering their position related to these norms.

CHILDREN’S TIME AND PARENTS’ CLOCK. A SOCIOLOGICAL LOOK BEYOND CHILDREN’S BEDTIME
Rosalina Pisco Costa ¹
¹Department of Sociology/School of Social Sciences, UNIVERSIDADE DE ÉVORA, Évora, Portugal

Abstract: Bedtime is socially constructed as a children’s time. As children become more and more central in contemporary families, bedtime is idealized as a (the?) moment where, in a kind of ‘stopping’ everyday life, parents can ‘recover’ their children after a day where they stood apart. The parent-child relationship can then be constructed and enhanced, namely by means of providing comfort, reliability and safety messages. But bedtime rituals are strongly
shaped by parents’ clock. Participation in labor market, relations between paid and unpaid work, including gender inequalities inside family, as well as family structure, are central in shaping what bedtime is, beyond what it should be.

In this paper we specifically address bedtime rituals for young children as “family rituals” (Wolin e Bennett, 1984; Imber-Black & Roberts, 1992; Gillis, 1996; Pleck, 2000). Methodological anchored upon empirical data from qualitative in-depth interviews carried out to both nuclear and single-parent families, this paper purpose is to discuss bedtime rituals as a way of constructing contemporary family. Through an empiric and theoretical analysis of collected data we hope to critically highlight the sociological knowledge on relations between family, time and children, with a special focus into different family structures. Sharing of space, time and meaning are strongly valued by parents, especially in single-parent families, where the presence of only one adult turns this seeming commonplace into a ‘special’ moment in both adults and children’s everyday life.

EDUCATIONAL CHOICES OF THE ÉLITES

Stefania Fucci1, Giulia Maria Cavaletto1
1department of social science, UNIVERSITY OF TURIN, Turin, Italy

Abstract: Inside a national research project, a study focused on the educational choices for children 9 and 12 years old (pupils of the fourth class of primary school and the first class of middle lower school) of the élites (upper classes) in the Turintown had been realised. The school observed is equipped of some characteristics: high level courses, extracurricular activities (sports, music, chess), disciplines in foreign languages. A school attending by working class families formed the control group.

The theoretical framework of sociology of childhood (James, Jenks, Prout, 1998; Qvortrup, 2004; Alanen, Mayall, 2001; Hengst, H., Zeiher H., 2004) was connected to the topic of the educational practices of the families according to the social class (Kellerhals J.M., Montandon C., 1991; Kellerhals J.M., Montandon C., Ritschard G., Sardi Mr., 1992, C. Perregaux, 2002; P. Deubel, J. - M. Huart, Mr. Montousse, 2007). The research question was articulated in two analytical axes. The first one inquired the relations between parents and children, with special attention at school performance, the saturation of time with additional formative activities, and the role of the peers groups for social capital. The second one explored the relationship between school and family, observing alliances or contrasts in the educational methods and practices and the rules system.

The aim of the research is the the reconstruction of meanings of educational practices adopted by parents, involved in an educational project which produces a child in which you can already see the adult of the future.

The school choices of excellence can be interpreted like status maintenance and distinction practices in order to offer to children educational and professional chances over the average of the children of the same age, attending other schools.

Interviews with parents and children (20 upper class and 20 working class families involved), and focus groups with teachers (4) are realised, and then analysed through analytical dimensions and Alcesti software. In particular, different dimensions emerge from the analysis such as parenting models (permissive, negotiating, authoritarian), positions with respect to extracurricular activities (perfectionism/experimentation), socialization to parent expectations towards the social evaluation of school and peers context.

EVERYDAY ANTSOCIAL: CHILDREN’S EXPERIENCES OF ANTSOCIAL BEHAVIOUR

Emma Clare Davidson1
1Centre for Research on Families and Relationships, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: Over the last two decades, UK governments have given attention to antisocial behaviour (ASB) as a contemporary social problem. Children have been a particular focus of this discourse. While ‘youth’ are symbolic of a declining social order, children are innocent victims.

This paper argues that this dual conceptualisation of children – as victims or perpetrators – fails to take account of the social context in which ASB takes place. Using data from an ethnography of children’s spaces in a Scottish housing estate, it is suggested that children’s everyday experiences of ASB, and policies designed to tackle the problem, are mismatched.

The study found that for children growing up in a ‘poor’ place, ASB is a daily, and often unusual, occurrence. Normalised within their surroundings, ‘antisocial’ became an established part of children’s walks to school, friendships, leisure activities and family life. Children’s experiences of ASB, as a victim, perpetrator or observer, is thus rationalised as part of everyday life.

The paper concludes by stating that while social policies define ASB as a collective concern, solutions are individualistic. There is a need to move to a relational approach to tackling ASB, which connects the problem to the social spaces where it occurs.

WHEN THERE IS LITTLE KNOWN ABOUT THE RULES AND RIGHTS: YOUTH RESEARCH IN THE CZECH REPUBLIC

Michaela Bartosova1, Beatrice Elena Chromková Manea1, Beatrice Elena Chromková Manea1
1IVRIS, FACULTY OF SOCIAL STUDIES, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: The position of children as independent actors and therefore individually conscious research subjects and co-researchers is more and more acknowledged by the research practice. Scholars point out that younger members of society are not exempt from the general requirement of post-modern discourse for individual reflection on their own biography (Moxnes 2003, Greene, Hogan 2005, James et al. 1999). Simultaneously, it is necessary to protect their rights as they are still minors.

Researchers who conduct research with children must negotiate with parents or teachers. At the same time, they must not neglect the real subjects of the research – children. Mostly the teenagers have a certain degree of independence (from parents) and life experience, and the approval of a parent or teacher for the research to take place does not necessarily mean that the adolescent agrees with participating in the research.

In the Czech context, there are no official ethical rules or recommendations for conducting research with children and adolescents, a fact associated with the lack of recognition and enforcement of
rights for children and adolescents in general. Researchers must individually find their way and the rules for conducting a research that meets certain ethical requirements. Their position is complicated by the tradition of authoritarian approach of institutions and parents towards children and teenagers, who are primarily seen as inferior, subordinated subjects without own opinion. The effort to work with juveniles as independent subjects in the research, while protecting their rights, can obscure the negotiations with the key actors.

In our paper, we intend to tackle the issue of research experience based on our own experience in conducting research with children of two age groups (8–10, 12-14 years) in the sociology of family and the experience of other scholars from various disciplines. We want to find out what importance is assigned by each researcher to ethical values in such a research and which common ethical principles researchers agree with. We want to understand how they defined the most fundamental barriers to ethical research with children in the Czech Republic and how they dealt with them in their research.

AGING OUT AS SEPARATED MINORS IN SWITZERLAND: PERSPECTIVES OF A TRANSITION

Manuela Scelsi

Abstract: Due to increasing migration flows, separated minors (SM), which are considered a particular vulnerable minority group among migrants, have become a permanent reality in most European countries. The presence of SM in Switzerland poses several challenges not only for the receiving population and institutions, but also for the youth and SM themselves. Our research aims at better understanding the transition period for SM from childhood to adulthood, phrased as ‘aging out’, whereby young people leave a structure of formal care because they have reached the upper age limit. The transition to legal majority not only forces SM to leave institutional and welfare structures that provided special support but also takes away special protection rights contained in the CRC; neither do they obtain, in most cases, a valid residence permit.

The proposed paper/poster will explore how separated minors in Switzerland manage to face new situations and challenges linked to their recently acquired legal status (majority) in the absence of institutional networks that previously supported them. What resources do they use? Besides presenting the initial findings of our qualitative study into the ageing out of SM, we will also discuss the significance of visual research methods and field interviews for obtaining our results.

CHILDREN IN TEMPORARY INSTITUTIONAL CARE. A LOOK INTO THE DECISION MAKING PROCESS.

Clara F. M. Oliveira

Abstract: According to Portuguese official records, there are about ninety thousand children who are considered to be at risk every year. Also yearly, the number of children who are currently not living with their family of origin due to child services intervention is about ten thousand. These numbers are considered too high by the authorities, who have implemented measures to reduce it by, for example, promoting adoption or improving the quality of the social work amongst the families of origin. Still, many of these children linger in an institutional environment, many of them transitioning from year to year and some of them without certainties about their future. What are the reasons for this to happen? With our PhD research, supervised by Prof. Anâlia Cardoso Torres, we propose to find explanations amongst the adults who are in charge of deciding, from families of origin who are primary decision makers on the lives of children, to judges, ultimate decision makers, and also with the technical staff of temporary placement facilities. In the present text we take a look at a first stage of the research, in which we intend to study the situation of children at risk within the context of a temporary placement facility (Centro de acolhimento temporário – CAT). This kind of institution represents the first moment where the state substitutes the parents in deciding what the child’s best interest is. By analyzing the documents underlying the decision, we want to comprehend the paths of these children and young people in a route marked by legal and formal instances, mandatory and time consuming. Our main goal is to understand what reasons led the families of origin to have a child removed, how long were the children institutionalized until a decision was made and what were those decisions. Thus, this text gives an account of the results of the first data collected in a Portuguese CAT, based on the documental study of 171 individual files of children who entered the institution, from 1996 to 2009, its analysis and a few preliminary conclusions. Amongst other findings, we showthathigherchildrenremaininstitu tionalized for periods of time superior to one year, well beyond the scope of the temporary character of the facility; and that half the children, independent of the reason of removal from their family, went back either to the family of origin or the care of another family member.

THE VIOLENCE OF PUPILS IN SCHOOLS AND THE EMERGENCY OF A SOCIAL REGULATION PLAN: THE CASE OF GENEVA

Arnaud Frauenfelder, Geneviève Mottet

Abstract: How, during the last two decades, has the violence of pupils in school become a public issue in Geneva? This contribution aims at describing the main stages of such a construction. For this purpose, a documentary analysis of various sources (parliamentary debates, print media articles, scientific reports, institutional discourses, and intervention protocols) has been conducted. Whereas the existence of “youth violence” has been debated since the early 1990’s, we will see how this question led gradually to a certain moral and political consensus. We will also see that the suspicion of youth dangerousness has been emphasized to a level of risk by school policies. In a context that denies the social matter, it is necessary to know and to regulate such a risk.

ROAMING SAN SALVADOR. CAUSES AND EFFECTS OF THE PHENOMENON OF STREET CHILDREN IN CENTRAL AMERICA

Raúl Ruiz-Callado

Abstract Book
Sociology I, University of Alicante, Alicante, Spain, 2Chair de recherche en immigration, ethnicité et citoyenneté (CRIEC), Université du Québec à Montréal (UQAM), Montréal, Canada

Abstract: The paper presented here is the result of the BEST/2010/075 research project carried out at the Latin American Faculty of Social Sciences-El Salvador Programme, funded by means of a public call by the Regional Government of Valencia (Spain) during the months of July, August and September, 2010.

It involves a detailed analysis, which is not merely descriptive, of the theoretical approaches to knowledge of the variables explaining the processes by which too many Central American minors come to join the group of homeless street children. It makes a diagnosis which compares Central America-European Union-North America in order to understand and contextualise strategic actions as regards policies for the integration of children. Furthermore, the development of the concept of the family within the Central American context has been studied, analysing local, regional and state policies for the social inclusion and integration of minors at risk of social exclusion. It also identifies the social changes that link citizens, group identity and social integration with the exclusion of young people in migrant societies, specifically in El Salvador, keeping in mind the comparative viewpoint with respect to Europe and, specifically, Spain.

This research project involves the analysis of street children as a social phenomenon, that is to say, with social causes and consequences, based on some of the most important sociological explanations regarding deviance, starting from the idea that not all street children show deviant behaviour. The interpretations of social deviance by the modern sociological theories essentially, with some exceptions, deal with seeking the causes, the aetiology, of deviant behaviour (Aptekar, 1988). What are the precipitating factors that cause adolescents to leave their homes and stay a number of days away from their families, spending time on activities that are marginal or which are not characteristic of that age-group? What is the cause of their behaviour? These are some of the questions that, based on qualitative and quantitative sociological research carried out in Central America in recent months, are answered here.

SCHOOL BULLYING AND OTHER VIOLENCE: TRAPS OF THE CURRICULUM MODEL CONTRARY TO THE "BODY OF CHILDHOOD"

Rosana Coronetti Farenzena 1, Maria Beatriz Pereira 1

1Instituto de Educação, UNIVERSIDADE DO MINHO, Braga, Portugal

Abstract: The universalisation of children’s formal education is an unchallenged societal advance. It guarantees the right of active citizenship to a non dominant generation in areas of participation and power. However, the massive and early influx of children in schools can contain paradoxical functions, if not considered the specific features of this generation group and the increasing differentiation of the curriculum subjects. The playful body language of a child still raises eyebrows considering the current model of school organization. Little-known processes derive from the body jettison and its various manifestations in the schooling of children. The playing has a structuring function, which extends beyond childhood. It must be regarded, from the public policies to the educational practices, in all dimensions that it can involve. The appropriate play culture, produced by children in the formal education process, determinant patterns of the interactions within and between generations emerge. The violence made present in this territory, and therefore bullying, found in almost all contexts where it is searched, is linked to this model of social coexistence, which must be understood. The school’s educational project needs this understanding of children so that it can follow the perspective of a single and decontextualized curriculum. It might be different, but it has not been this way. It is important to recognize that it is possible, from and through school to give childhood back to every child.

Keywords: childhood - school - curriculum model - play culture - violence - social coexistence

CHILDREN’S FATE. THE WELL-BEING OF INMATE MOTHERS AND THEIR CHILDREN

Andrea Müller-Fabian 1, Dan Rusu 1

1Sociology and Social Work, BABEŞ-BOLYAI UNIVERSITY, Cluj-Napoca, Romania

Abstract: The phenomenon of imprisonment implies more than just the prison (institution). It includes the effects of imprisonment on society and society’s interpretation about prisons, the way in which criminals think about prisons, their role and effect. Women offenders and their children represent a severely disadvantaged and marginalized population.

Based on these general considerations, the present study takes as object of analysis the well-being of inmate mothers and their children.

Based on the results of our empirical researches, we have approached the problem from two points of view: on the one hand, from the point of view of inmate mothers (based on the results of semi-structured individual interviews made with a sample of 120 persons, as well as standardized questionnaire), on the other hand from the point of view of children, which was revealed during a group activity with 50 children.

The definite conclusion of the research is that we cannot speak about a “protected age” regarding this loss, because children are in all cases negatively affected – irrespective of their age – by the imprisonment of their mother, which is leading to a situation in which children are partially or fully losing their parent. However, in most cases the loss is not an individual one, but a series of losses: father is backing out of child rearing, as well, because is imprisoned together with the mother or is simply not undertaking the role, entrusting the child to a member of the wider family (mostly grandparents) or various institutions, while himself is founding a new family. The breakup of the family is not meaning only a change of the structure, but is leading to several psychosocial modifications. These modifications eventuating on multiple levels is generating for most children the vulnerability inherited through generations. This vulnerability can provoke different types of deviances or eventually delinquency.

OUTCOMES OF TAKING CHILDREN INTO CARE

Heidi Pohjanpalo 1

1Department of Social Sciences, UNIVERSITY OF EASTERN FINLAND, KUOPIO, Finland

Abstract: The main objective of my research is to analyse and explain whether we get all those good things that we aim to, when we take children into society’s care. Other objectives are, what kind of
outcomes are attained by child protection measures with used resources, what are the child protection processes like, which factors affect success and what are the preconditions for effective placements. The research emphasizes the child’s perspective. A random sample of 40 cases (and additional 4 pairs of twins) of 261 children in all taken into care in 1990-1998 in a Finnish town are going to be examined. Child protection processes, the course of life from the beginning of the custom in child welfare till the time of the research and outcome of taking the child into care are studied from documents as a doctoral thesis. The data collection from the documents (social workers’ journals, final acts and different kind of resolutions, letters, etc.) is now completed. The collected data is going to be analyzed by e.g. qualitative and quantitative content analysis. Doctoral thesis will be a beginning of a follow-up study as a post doc – research made by e.g. interviews and Critical Incident Technique.

CHILDREN’S RIGHTS AND PARENTAL RIGHTS

Marta Almeida Carreira

Abstract: The rights of children are now in the spotlight of adults. In a world designed by and for adults, in recent years alert voices for the need to respect and guarantee the children’s rights began to emerge. Yet, every day we hear about situations disregarding those rights, both inside and outside the family. After presenting a new perspective on childhood, brought by Sociology, we focus on the rising of children’s rights and in the constitution of the child protection system in Portugal, especially the Commissions for Protection of Children and Youth (CPCY). Let’s look at the speeches of those children’s parents whose rights have been challenged on the needs and rights of children, about the importance of the CPCY and how they evaluate the contribution of this institution in their family, trying to discern whether children’s rights and parent’s rights collide or coincide.

DYNAMICS OF REPRODUCTION OF TRADITIONAL AND DISSEMINATION OF INNOVATIVE PRACTICES OF CHILDREN’S READING

Elena Kolosova

Abstract: Kolosova E.
Dynamics of reproduction of traditional and dissemination of innovative practices of children’s reading
Children’s reading in the past was one of the most important channels of education of morality, inculcating values of patriotism and internationalism to the younger generation. Nowadays there is a serious evolution of the content of literature for children, and also of the actual practices of reading.
All-Russia research “Young Reader 2010” was carried out at the beginning of 2010 year, which was attended by 1100 primary school children aged 7-11 years from eight federal districts.

The major goal was to identify the genre and thematic preferences of contemporary Russian readers, pupil’s involvement in the process of “reading for the soul”, the consideration of channels and ways to get information about books for modern children and to outline the dynamics of innovation practices of reading (in this case among children), such as reading online, reading from the screen, reading from the special devices and so on.

The study gave some insight into what today is children’s reading, whether it is a school program or for pleasure, whether today’s children are recording their thoughts about books they’ve read, how well they know the preferences of their parents in childhood.

So, the conflict of modern children with the book culture, of course, in no small measure due to the abrupt change in civilization and technological conditions of their lives. However, a considerable burden lies with the society in which the child is brought up. Gradual but steady destruction of the social environment that encourages reading, predetermined mass rejection of books and reading in the generation of the twenty-first century. But the dynamics of reproduction of traditional practices suggests that the situation is not critical (at least for primary school age), and use of new technologies designed to quickly improve, supplement and to some extent, facilitate the process of reading, but not replace it for entertainment in its purest form.

FREE TIME AS A TIME OF SOCIAL LEARNING FOR CHILDREN

Lourdes Gaitán

Abstract: The coexistence of “modern” and “postmodern” models in the understanding of childhood produce contradictions in pedagogical discourse on children. On one hand the emphasis on preparing them for the future leads to the strengthening of conventional formulas of protection and control. On the other hand, recognition of children’s right to autonomy, to “agency”, comes to consider them responsible for their own learning and their use of time and space. Children are no longer “objects” of protection to be recognized as “subjects” with capacities.

Currently, new informal learning environments are competing with the school in time spent and value conceded by children. The terms “learning” and “education” have been expanded to include new forms of knowledge acquisition. Learning can take place almost anywhere and in connection with very different kinds of activities. Furthermore it is something that we all engage, regardless of age, which “education” no longer seen as an exclusive field for children. Be involved in this common process of continuous learning, modifies intergenerational relationships.

We present the results of a study conducted in the region of Madrid with the objective of knowing: the concept that children have the free time, how they use and who decides what is done.

GENERATIONAL PORTRAIT AS A METHOD OF STUDYING OF THE CHILDHOOD

Pavel Makeev

Abstract: Makeev P.

Currently, new informal learning environments are competing with the school in time spent and value conceded by children. The terms “learning” and “education” have been expanded to include new forms of knowledge acquisition. Learning can take place almost anywhere and in connection with very different kinds of activities. Furthermore it is something that we all engage, regardless of age, which “education” no longer seen as an exclusive field for children. Be involved in this common process of continuous learning, modifies intergenerational relationships.

We present the results of a study conducted in the region of Madrid with the objective of knowing: the concept that children have the free time, how they use and who decides what is done.
Abstract: The interrelation of generations passes stages from an inequality, the representative form (an imperious vertical of generations) - to an equal dialogue in rights as the higher form, peculiar to characteristic of a society of the XXI-st century.

We determine intergenerational dialogue as a process of interaction equal in rights between representatives of two or more generational groups, directed on transfer, critical comprehension and reproduction of social experience, on its development and modernization. Thus the rising generation is the occurrence accelerator in life of new information technologies, that is why as a whole new technological and culturological processes because it comes under influence of inerterness of former forms less. The second aspect of intergenerational interaction is connected with influence of generational features of the childhood and a youth on the further course of life at transition from one stage to another.

At the approach to rising generation as to the subject of intergenerational dialogue equal in rights it needs a proper studying of it, on the one hand, as an integrity, and on the other hand - as variabilities of courses of life of representatives of one generation (biographic generations).

For structurization, the description, forecasting of rising generation we together with the philospher and psychologist S.Tsymbalenko develop a model of “a generational portrait” which includes statistical (quantitative) characteristics of generation and individually-biographic (qualitative) characteristics. The model represents the structural layers considering age and generational features, vital biographies which can be studied in their dynamics by means of target groups. Inclusion of children and youth in the self-studying mechanism. Model generational portrait will allow interpretations that are important for assessing the qualitative features of the younger generation, analysis of social problems through the prism of generational portrait forecast the influence of generational specificity in the development of society.

MOBILITY AND MOBILE COMMUNICATION IN THE MAKING OF PLACE

Harriet Anita Strandell

1Department of Social Research, UNIVERSITY OF HELSINKI, 00014 Helsinki, Finland

Abstract: Children’s play parks have emerged as an important institution supplying after-school care and activities for 7-9 year old children in the Helsinki region, Finland. The play park is in the paper analyzed from a spatial perspective. Conceiving of childhood places as "islands" clearly bounded, spatially separated from the rest of society and surrounded by ideologies of protection has been in the core of modern childhood. The social geography of play parks, however, is different. It is characterized by openness, mobility, both internally and across its borders, and by the frequent use of mobile phones in the organizing of children’s times and spaces across borders.

The children’s and the leaders’ recurrent mobile communication with parents and other instances and places involved in the organizing of children’s after-school time, such as hobby clubs, is in the paper conceptualized as a fundamental spatial quality of the play park. Mobile communication is used by children, parents and leaders for coordinating children’s leaving for home or other engagements. By contacting their parents by phone in situations in which they need support, company or comfort, for example in conflicts with other children in the park, the children create momentarily a family space inside the park, which they can use as a means of extending their own activity space. Theoretically the paper draws on mobile sociology (John Urry) and the anthropology of place (Doreen Massey). The data consist of ethnographic observation and interviews.

THE “RELATIONAL TURN” IN SOCIAL SCIENCES AND THE DIFFERENCE IT MAKES TO THE SOCIOLOGY OF CHILDHOOD

Leena Alonen

1Department of Education, UNIVERSITY OF JYVÄSKYLÄ, Jyväskylä, Finland

Abstract: The “long march of relational sociology” (Vautier 2008) started with Weber, Durkheim and Simmel; they all were participants in the debate on where sociology should start: from individuals in order to understand the social structure, or from structures in order to understand individuals’ logic of action. The debate has stayed on, also in the sociology of childhood (cf. micro- vs. macro-sociologies; interactionist vs. structural paradigms).

Simmel was the first to propose a relational solution to the (ontological) problem. Since then the march of relational sociology has not been too vigorous until the last 2-3 decades. While Pierre Bourdieu was developing his theory of practice – undoubtedly the best-known relational sociology today – also several other relational ‘schools’ have been building up: a “relational turn” is taking place across social sciences.

The core idea in relational thinking is that “in the beginning is the relation” (Bachelard), and therefore discrete, pregiven units (such as the individual or society) cannot be posited as ultimate starting points of sociological analysis; instead, attention needs to be shifted towards relational structures and processes.

The paper will present a range of relational approaches and discuss their benefits for theoretically and conceptually advancing the sociology of childhood.

CONCEPTUAL, METHODOLOGICAL AND ETHICAL ISSUES IN CHILDREN’S RESEARCH IN PORTUGAL

Catarina Tomás, Natália Fernandes

1Escola Superior de Educação de Lisboa, Instituto Politécnico de Lisboa, Lisboa, 2Instituto de Educação, Universidade do Minho, Braga, Portugal

Abstract: Methodological issues in research with children have sparked a growing interest by the Sociology of Childhood since the last decades. In Portugal, this interest is more recent, but it has had a significant increase.

Considering several researches, namely master thesis, oriented by the authors on the framework of Sociology of Childhood, this proposal intends to characterize some methodological complexities in research with children in Portugal, when we consider their voice and agency in the knowledge producing about them.
The goal of this paper is to contribute to the methodological discussion on research with children through the identification of a set of challenges related with: (i) the diversity of methodologies uses in children’s research, (ii) ethical concerns and (iii) the role of the researcher.

Keywords: Methodological and Ethical complexities, sociology of childhood, academic research in Portugal

MOBILISING TRUST IN CHILDREN’S LIVES: CHALLENGES AND OPPORTUNITIES
Jo Moran-Ellis 1, Heinz Suenker 2
1Department of Sociology, UNIVERSITY OF SURREY, Guildford, United Kingdom, 2Department of Educational and Social Sciences, University of Wuppertal, Wuppertal, Germany

Abstract: This paper examines the concept of trust within intergenerational relations and institutional orderings in children’s lives. Starting first with an attempt to distinguish trust from confidence, we note the role of cultural semantics and discourses in these distinctions. We then develop a consideration of how adult (and institutional) perceptions of risk in relation to children interact differently with ideologies of childhood and constructs of children’s capabilities in differing contexts. These contexts range from the educational setting, to formal welfare provision, across to research encounters in the social sciences. Applying these considerations to the example of the role of trust in research with children, and based on examples of such research, we explore how trust is crucial to the project of involving children in the production of knowledge about their lives, but, how at the same time, anxieties about children’s vulnerability in inter-generational relationships can undermine the capacity for trust to be enacted. The paper concludes with a reflection on the implications of how trust can be enacted and mobilised in the range of institutional contexts in which children’s lives are located.

TO BE OR NOT TO BE A POWERFUL AGENT TRUST AS A CRUCIAL DYNAMIC IN THE SHAPING OF CHILDREN’S PARTICIPATION AND CITIZENSHIP IN COMPLEX GLOBALIZED SOCIETIES
Hanne Warming 1
1Society and Globalization, ROSKILDE, Roskilde, Denmark

Abstract: This paper explores how sociological trust theorizing can contribute to a dynamic and critical understanding of children’s (differentiated) participation and citizenship. The point of departure is the theoretical identification of trust as crucial to social life and agency in complex globalized societies (Luhmann, 2005). The paper introduces different approaches to trust, exploring how these in various ways can contribute to a dynamic understanding of the shaping of different aspects of children’s participation and citizenship. These aspects include the children’s influence on decision making, other rights aspects, access to (cultural, social and economic) capital and citizen identity.

WHAT KIND OF TRUST IN WHAT KIND OF CONTEXT? THE (LACK OF) CONCEPTUALIZATION OF TRUST IN CHILDHOOD RESEARCH
Michael Christensen 1
1Department of Society and Globalisation, ROSKILDE UNIVERSITY, Roskilde, Denmark

Abstract: If there is one thing researchers dealing with the concept of trust in general agree upon it is that the concept is confusing, contested, multi-faced and quite elusive to get a hold on. Few scholars agree upon what to make of the concept with conceptual confusion about trust as a result. An often stated argument about trust is that trust is a subjective matter by which concrete trust formations, what constitutes trust and how trust can be recognised should be empirically elaborated and acknowledged. On behalf of a literature-review of 1008 selected articles focusing on children and trust (and mistrust) the argument of the paper is that though trust is considered to be of particular importance, trust/distrust and trustworthiness in childhood research is vaguely defined and is often not conceptualized explicitly. The paper thus advocates an awareness of the many faces of trust and a more meticulous conceptualization of trust and its associated concepts with the aim of reducing potential conceptual uncertainty and thereby strengthens explanatory force in childhood research dealing with trust.

GOVERNMENTAL MODES OF INCORPORATION AND EDUCATIONAL OPPORTUNITIES OF IMMIGRANT CHILDREN: THE GERMAN CASE
Janina Soehn 1
1SOCIAL SCIENCE RESEARCH CENTER BERLIN (WZB), Berlin, Germany

Abstract: In the last two decades, Germany experienced a large influx of immigrants. These new immigrant cohorts not only came from a wide range of countries, but their legal-political situation in Germany was very diverse as well. Thus, the German case provides us with an ideal case for an examination of the more general question of how the assignment of immigrants to different legal-status categories and the treatment following from that affect their structural integration and the educational opportunities of immigrant children in particular. The presentation will present a theoretical framework of the mechanisms linking legal status and educational attainment and will apply this framework to the German case. The politically privileged ethnic German “repatriates” (Aussiedler) are compared to other immigrants with less favourable modes of incorporation by the government, with refugees being confronted by the most exclusive form of reception. The hypotheses derived from the institutional analysis of group-specific rights and policies will be tested with data from the German sample census 2005 – the first representative data set suitable for this intergroup comparison. I will demonstrate the effect of legal status on the educational attainment of immigrant children (1.5 generation) and its interplay with other social determinants of educational opportunities.

My proposal is based on a recently finished PhD thesis which analyses major groups among the immigrants cohorts arriving in Germany from the end of the 1980s to the beginning of the 2000s.

PRACTICES OF GLOBAL AND GENERATIONAL RELATIONS IN AN EARLY EDUCATION AND CARE INSTITUTION IN NORWAY
Randi Dyblie Nilsen 1
1Department of Education and Social Sciences, UNIVERSITY OF WUPPERTAL, Wuppertal, Germany

Abstract: This paper explores how sociological trust theorizing can contribute to a dynamic and critical understanding of children’s (differentiated) participation and citizenship. The point of departure is the theoretical identification of trust as crucial to social life and agency in complex globalized societies (Luhmann, 2005). The paper introduces different approaches to trust, exploring how these in various ways can contribute to a dynamic understanding of the shaping of different aspects of children’s participation and citizenship. These aspects include the children’s influence on decision making, other rights aspects, access to (cultural, social and economic) capital and citizen identity.
THE SIGNIFICANCE OF CHILDREN UNDER SCHOOL-AGE IN THE PROCESS OF SOCIAL INTEGRATION
Ullamaija Seppälä

Abstract: About three percent of Finland’s population consists of immigrants. The biggest ethnic groups are Russian and Estonian people. A big share of them are families and children. I’m particularly interested in how children before school-age (in Finland under 7-year-old) are integrating to society and what is the significance - and even stake - of small children in the process of social integration of the whole family. Social integration is here defined as a process, where the immigrants take up their position and start participating in their new environment. I study the integration of children from the both sites, the immigrants and the basic population in Finland.

Researching small children has many challenges. The extra challenge in this study is that the researcher doesn’t have a common language with the children she communicates with. For this reason I must give a lot of attention in selecting and developing the research methods. In my presentation I’m going to open the process of building the research positions. I’m going to tell how the children with immigrant backgrounds have been researched earlier and what kind of results have got. I also tell how I’m going to study the children in this specific case. In autumn-time this study will be in the position of pre-study.

GENDER DIFFERENCES IN ECONOMIC SOCIALIZATION: DO FINANCIAL EDUCATION PROJECTS HELP FILLING THE GAP?
Lorenzo Todesco 1, Emanuela Rinaldi 2

Abstract: Moving from Blood and Wolf (1960) pioneering study, some scholars (e.g. Pahl, 1989; 1995; 2004; Gambardella, 1998, 2004) show that a fruitful framework to study gender inequalities within the household is pointing the attention on the gender differences in the control and allocation of money and in important financial decisions. Other studies (Rabow, Rodríguez, 1993; Rabow, Newcomb, 1999) also maintain that sons and daughters receive different economic socialization patterns, with the result of developing gendered attitudes towards money and financial behavior that in turn reproduce and maintain an unbalanced distribution of power. This study has two main purposes. The first is to shed light on the gender dynamics shaping the attitudes towards money, the financial behavior and the degree of information on economic issues among Italian preadolescents. The second is to analyze the role played by financial education in minimizing such dynamics. The survey used in this study was conducted in 2010 by an interdisciplinary team of scholars (sociologists, economists, statisticians and psychologists) and consisted of a self-completion questionnaire on a sample of 2.103 students aged 12-14 years attending lower secondary school. The survey collected information on a range of aspects that can be grouped in five main sections: family life and progress at school, interest in economy and sources of information on the issues related, an evaluation test of economic knowledge, attitudes towards money and economy, values and personality. A sub-sample of 1.476 respondents has participated to a financial education project, while a group of control consisting of 627 respondents has not. The effect of gender dynamics and of financial education is estimated using some multivariate statistical techniques. Results are discussed with some indications for policy-makers in designing future financial education projects.

QUELLE JUSTICE JUVÉNILE DANS UN CONTEXTE DE PLURALISME JURIDIQUE ? L’ENFANT LIBANAIS ENTRE ORDRE ÉTATIQUE ET ORDRES COMMUNAUTAIRES
Samer Ghamroun 1

SAFEGUARDING YOUNG PEOPLE IN THE UK: RESPONDING TO YOUNG PEOPLE AGED 11 TO 17 WHO ARE MALTREATED
Alison Jobe 1, Sarah Gorin 1
1Child Protection Research Department, NSPCC, London, United Kingdom

Abstract: A large number of young people aged 11-17 are affected by abuse and neglect. Research in other countries has highlighted the importance of acknowledging the different maltreatment experiences and needs of young people, as compared with younger children. Yet, in the UK, the issue has received very little attention. This paper presents research findings from the first large scale research study to explore these issues in the UK context. The study focused upon young people (age 11-17) who have been maltreated and explored their access to appropriate safeguarding services in the UK. The research was conducted by the National Society for the Prevention of Cruelty to Children (NSPCC), in partnership with The Children’s Society and the University of York, with funding from the Big Lottery Research Grants Programme.

Drawing from these research findings, this paper focuses upon young people’s (11-17 years) accounts of maltreatment, help seeking and experiences of being referred to Children’s Social Care Services in the UK. The paper will outline some key contextual factors concerning young people’s maltreatment experiences, which make young people’s case histories distinct from younger children. The paper also presents key themes concerning young people’s experiences of seeking help and receiving help. Throughout the paper professional and system responses to this age group in the UK context will also be explored.

SEXUALIZED TECHNOLOGY – PORTUGUESE YOUNGSTERS AND THE NEW MEDIA
Daniel Santos Cardoso 1, Cristina Ponte 1
1Communication Sciences, FCSH - UNL, Lisbon, Portugal

Abstract: In 2010, aiming to understanding how children use the internet assessing both risks and opportunities and how risk can be fought while at the same time increasing opportunities and digital literacy, the EU Kids Online project interviewed 25 thousand children (ages 9-16) in 25 European countries, as well as one of their caretakers, using a representative sample of each country’s population (see Livingstone, Haddon and Gorzig, 2011). Amongst other risks, children were asked several questions that related to sexualized uses of new technologies, from sexting to the (accidental or willful) viewing of pornographic material, its source and context, and how they coped with that experience.

This paper is focused on the Portuguese results of this survey, and attempts to see how Portuguese youngsters incur in a sexualized use of new media. In this aspect, Portugal comes out as average in comparison with the other countries when it comes to the consumption of sexualized images but Portuguese parents are also the most prone to deny that their children have ever seen sexual images online. Aiming to analyze more closely what is seemingly a very residual practice (the usage of new media in a sexualized manner), this paper tries to trace the different kinds of sexualized usages of the new technologies and how they are linked to different sociodemographic profiles and to different attitudes by parents in their role as mediators. These results are analyzed in light of the effects of a conservative and religious culture, with a deep generational gap in terms of education and media literacy, and a paradox between an “unfinished modernity” (Machado & Costa, 1998) and an ever-growing bedroom culture, fueled by the fact that Portugal has a very high penetration rate of both mobile phones and laptop computers, creating a unique combination of possibilities and lack of cognitive and contextual resources to deal with those possibilities. This approach will attempt to see the possible risks and harm that come from these practices, but also the opportunities they open up, as youngsters come to grips with their changing bodies and seek autonomy over the usage of their own desires and intimacy.

CARE HOME CHILDREN’S PERSPECTIVES ON THEIR BIOLOGICAL FAMILIES IN BRAZIL
Fernanda Müller 1
1Faculty of Education, University of Brasilia, Brasilia, Brazil

Abstract: The work explores care home children’s conception on their biological families. Eight children from care homes located in deprived areas in Sao Paulo/Brazil who keep ties with their biological families participated in the research. Based on the argument of family’s negligence, these children were separated from their families and taken to a care home. The ethnographic method was used in combination with others which were produced with the children, such as photographs, video recordings, drawings and conversations. The data collection took place in the children care homes and lasted one year. Doing research on diverse familial dynamics through care home children’s points of view could help with: 1) presenting a barely explored research object; 2) deconstructing the negative idea about poor people’s familial dynamics. Also the study aims to contribute for the consolidation of childhood studies in Brazil, preferably with children and not just about them. The work presents results that aim to improve Brazilian public policies in order to guarantee quality in children’s care homes and in families’ support. The research shows that children present alternative familial dynamics, different from the nuclear and middle class models. Although these familial dynamics are taken as hazardous by public policies, children are hopeful to go back to their family homes. On one hand obviously it is not acceptable that children live in precarious conditions such as misery, parent’s alcoholism, aggression, and insecure homes, on the other, the current social policies for vulnerable children are a failure. They do not solve the source of poor families’ problems and usually blame the parents. There is urgency of integrated public policies (transport, health, education, home), which could support families and children in order to avoid situations related to negligence.

‘CHILDREN WITH (DIS)ABILITIES’ – PRACTICE AND VALUES IN DAY-CARE CENTERS.
Karianne Franck 1
1Norwegian Centre for Child Research, NORWEGIAN UNIVERSITY OF SCIENCE AND TECHNOLOGY, Trondheim, Norway

Abstract: Title: ‘Children with (dis)abilities’ – practice and values in day-care centers.

In this paper I will present some preliminary analysis from my PhD project, which focuses on practices and values among staff members (teachers and assistants) in Norwegian daycare centers in rela-
tion to categorization processes and early intervention discussions of children with possibly indistinct and debatable (dis)abilities. The project addresses issues such as: how is the category children with disabilities constructed? Which child-identities are used by the staff in daycare centers and how do they carry out and reflect on practices in relation to create borders between ‘children with disabilities’ and ‘children without disabilities’ – between so called ‘normal children’ and ‘different children’? What kind of normativity and perspectives are explicitly or implicitly interwoven in practices and values among the staff regarding children with (dis)abilities? The project is grounded in Sociology of childhood in combination with disability research. Qualitative interviews of staff members in four day-care centers and short term participant observation are carried out.

OUT-OF-HOME CHILDREN AND YOUTHS CARE SERVICES: TOWARDS A “RELATIONAL QUALITY” EVALUATION

Elisabetta Carrà

1 Atheneum Centre for Family Research and Studies, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: THEORETICAL FRAMING

In Italy, over the last decade the percentage of out-of-home children and youths is growing, and this makes increasingly urgent to assess the quality of services meeting this important social problem. Foster care is spreading rapidly, but there are still many children housed in residential facilities. Recently, reflection on residential care quality has greatly developed, at national and international level.

This intervention presents the results of a research-assessment on residential care facilities for children and youths in a region of Northern Italy (Lombardy), taking into account four dimensions: efficiency, effectiveness, participation in planning and intervention, empowerment of children and youths and their family relationships. Their emerging effect is defined as “relational quality”.

HYPOTHESIS

A broad examination of international literature shows that the response to children’s needs is as much more effective as children themselves and their families take an active role in the intervention, with a network approach that connects all services having competence over the cases. The purpose of this research is to verify the effectiveness of such a network, which in Italy involves residential care facilities and social services, with the latter in charge of referring the minors to residential care facilities and follow their families.

METHODOLOGY

We carried out 187 online self-report interviews to coordinators of residential care facilities; 30 face-to-face semi-structured interviews to social workers; 97 self-report questionnaires to minors above 10 yrs living in children homes.

RESULTS

A) efficiency: residential care facilities are generally good, while social services resources often appear insufficient to ensure an adequate work with birth families;

B) effectiveness: children and youths’ wellbeing in residential care facilities is high, but generally they move from one facility to another never returning to their birth family;

C) participative approach: rather lacking in terms of the involvement of children and their families at different path stages;

D) empowerment: the most critical element is the lack of attention devoted to working with birth families.

The application of the assessment frame of relational quality enabled to highlight strengths and weaknesses of the network responding to the needs of out-of-home children and youths.

THE TYRANNY OF FORMS IN PARENT-PRACTITIONER INTERACTION

Maarit Alasuutari

1 Education, UNIVERISTY OF JYVÄSKYLÄ, University of Jyväskylä, Finland

Abstract: The paper studies parent-practitioner meetings in Finnish early childhood education and care (ECEC). In them an individual educational plan (IEP) is drafted for each child. The plan aims at taking account of the child’s individuality in ECEC. The meetings are carried out by using a form that is partly filled in by the parent(s) before the discussion with the practitioner. Besides providing the themes of the parent-practitioner discussion, the form is also supposed to function as the child’s IEP.

The paper examines how the use of the form structures the parent-practitioner interaction and especially, the talk about the child. It studies how the child is constructed and portrayed in the form-framed talk and what the function of this talk is in parent-practitioner interaction. Theoretically, the paper applies a social constructionist approach. It approaches childhood as a thoroughly social phenomenon that is historically and culturally produced, determined and negotiated. In addition, it assumes that also the forms have constructive functions. They pose various descriptive and interactional demands on their users and hence, act as agents in the human interface they are part of.

The data of the paper consist of recordings and IEP documents originating from 21 parent-teacher meetings in ECEC. The data are analysed by using discourse analysis and categorized according to the discursive positioning of the child and the interactional function of the positioning.

The findings show that the forms easily invite a pattern of interaction which comprises reading of the question and the answer on the form, justification of the answer and/or confirmation of its factuality. Consequently, the talk is very much adult oriented. The child is typically constructed as an object and the child’s viewpoint and perspective are only seldom taken under consideration. The demand to take account of the child’s viewpoint when drawing up an IEP in ECEC will be discussed.
BETWEEN NETWORKS AND MOVEMENTS: CONSUMPTION COLLECTIVES AS DYNAMIC PHENOMENA
Kai-Uwe Hellmann
1
1Institut für Soziologie, Technische Universität Berlin, Berlin, Germany

Abstract: Since the publication of the article "Brand Community" by Albert M. Muñiz, Jr., and Thomas C. O’Guinn in the year of 2001 this kind of research object got a lot of attention manifested in an avalanche of subsequent publications in many different journals and books. Salient is examining this bunch of articles that at least the decision of Muñiz and O’Guinn to define their object of scientific interest as a “community” related with the three properties “shared consciousness, rituals and traditions, and a sense of moral responsibility” was more or less fully accepted by all other colleagues without further scrutiny. Obviously this approach fulfilled the need of offering some fundamental terms and concepts which relieve from the duty to start always again from the scratch quite perfectly. Thomas S. Kuhn called this effect the career of doing normal science implementing a paradigm which serves as a frame of reference which becomes more and more immune against criticism from the outside as well as from the inside.

Starting with this consideration the intention of my presentation will be to go back to the roots of this “brand community” paradigm and reflecting the conceptual and empirical evidence of the definition of the term “brand community” and its three properties under sociological circumstances. The scientific grounded suspicion is that the term “community” doesn’t match the empirical phenomenon in a sufficient way if we compare the three properties not only in relation to the state of the art of the community research since more than 100 years but moreover if we check the empirical basis which is shown in the articles. To say it in a different way the empirical material presented in the articles often does not suffice what the three properties shared consciousness, rituals and traditions, and a sense of moral responsibility require taking them seriously. This doesn’t mean that there is not all shared consciousness, rituals and traditions, and a sense of moral responsibility in any of these cases but that whatever presented it lacks the evidence to label the described phenomena as “communities” whether brand related or whatever. Alternatively we observe instead of communities often only social networks or groups which set less ambitious conditions for their confirmation compared to communities.

LOCATING THE SENSES IN THE SOCIOLOGY OF CONSUMPTION
Lydia Martens
1
1Sociology and Criminology, KEELE UNIVERSITY, Keele, Staffordshire, United Kingdom

Abstract: The sociology of consumption has to date been little concerned with the senses and the multi-sensory nature of experience. Considering first of all in what ways the senses play a crucial role in consumption, I think through how recent developments in the phenomenological anthropology of the senses and experience may be brought into conversation with the sociology of consumption. At first glance, anthropological debate seems to have something to offer in the sense that it conceives of the senses as culturally and environmentally ‘trained’ and by locating them broadly within a conception of practice that interconnects learning, habit formation, the body, memory and that emphasises the fundamental salience of tools (and thus objects) in the mediation of action. Moreover, rather than locating the senses on the ‘sideline’ (as we e.g. did in our eating out research, se Warde & Martens 2000), we here find an analysis that starts ‘from’ the senses (see e.g. Grasseni 2007, 2008 on looking) and where sensory attention is integrated in methodology and knowledge development in central and interesting ways (Pink 2007; Harris 2007). In this paper, I will reflect on how and in what manner these theoretical insights may be of use to reflect on consumption; defined broadly as “a process whereby agents engage in appropriation and appreciation... of goods, services, performances, information or ambience, whether purchased or not, over which the agent has some degree of discretion” (Warde, 2005), and on ‘ways of knowing’ about consumption.

THE FUTURE OF CONSUMPTION: DECREASING OR POST-GROWTH?
Paolo Corvo
1
1UNIVERSITY OF GASTRONOMIC SCIENCES, Bra-Pollenzo (Cuneo), Italy

Abstract: The current global financial and economic crisis is causing profound transformations in consumption patterns and lifestyles of many Europeans. Even sociologists who study the concept of risk they are trying to understand those changes and to provide plausible interpretations. In this perspective, play a significant role the theories, as the ‘serene decreasing’ of Serge Latouche, that propose as a possible solution to systemic problems an alternative model of development and consumption in relation to the environment, energy, transport, food, pointing to a qualitative and not quantitative dimension of social life.

Other theories prefer use the concept of post-growth and observe the worldwide spread of movements and associations that seek to change the approach to the consumption of natural resources according to a vision of economic, social and environmental sustainability. It’s possible to prevent the risk of environmental disaster, exhaustion of energy sources, global food crisis, with the dematerialization of economy and a lower use of energy and resources, based on a changed view of the relationship with nature and society.

Public policy could take the opportunity of the crisis to determine and implement new strategies, involving citizens more directly, promoting a qualitative lifestyle, with attention to territorial development, exploitation of local natural resources, in food, transport, energy sources. It’s important to dedicate more time to sociability and community life. It’s a delicate and complex challenge, which could lead to a positive and renewed equilibrium of ecosystem.

WHAT IS A PRACTICE: SPATIO-TEMPORAL, ABSTRACT OR THEORETICAL?
Ruth Rettie
1
1Business School, KINGSTON UNIVERSITY, Kingston, United Kingdom

Abstract: The paper aims to elucidate the concept of a practice by comparing the ways in which various authors (Schatzki, Reckwitz, Warde, Shove, Halkier, Gram- Hanssen, Ropke) theorize the con-
A MISE-EN- SCÈNE OF THE SHATTERED HABITUS THE EFFECT OF SOCIAL MOBILITY ON AESTHETIC DISPOSITIONS TOWARDS FILMS
Stijn Daenekindt¹, Henk Roose¹
¹Department Sociology, GHENT UNIVERSITY, Ghent, Belgium

Abstract: This paper focuses on the effect of social mobility on aesthetic dispositions towards films. Central query is whether Bourdieu’s idea of a rather static, class-based habitus—and its associated way of appreciating art as voiced in La Distinction—holds anno 2010. Or is his idea of the habitus as a more permeable, malleable entity, as argued in his later work and recently voiced by Lahire, more accurate?

Research on the link between individual’s social position and their taste uses a variety of measures for taste—usually someone’s actual cultural participation. In this study we want to grasp the habitus dispositionally by focusing on aesthetic dispositions—i.e. in terms of attitudes towards the arts; expectations people have when being confronted with art. By measuring taste this way, we try to minimize the bias associated with using actual cultural praxis as an indicator—certainly public participation is inherently conspicuous and therefore it may not only reflect sheer taste.

Strategy is to investigate whether socially mobile individuals adhere to the dispositions acquired from their social context of origin, of whether they adapt to attitudes and dispositions viable in their new social environment. Building on a large-scale survey representative for the Flemish population (n = 2,849), we consider innovative, emotional and action dispositions towards films. Results show that the effects of social mobility are a complex matter and differ according to highbrow or lowbrow orientation of the dispositions at hand. Implications for the conceptualization of the habitus are discussed.

FROM RELIGIOUS TO CONSUMPTION-RELATED SOCIAL ACTIVITIES: A LONGITUDINAL ANALYSIS OF THE IMPACT OF INCREASING SOCIOCULTURAL CONSUMPTION ON CHURCH ATTENDANCE AMONG GERMAN CATHOLICS
Jochen Hirschle¹
¹Department of Sociology, FERNUNIVERSITÄT IN HAGEN, Hagen, Germany

Abstract: This paper treats the relation between economic modernization and religious change. Following John K. Galbraith I argue that in order to realize economic growth, companies in Western societies mainly have to solve the problem of marketing consumer goods under conditions where original needs are already satisfied. In order to do this, consumer products are charged with imaginary values by means of marketing measures. Moreover, companies incrementally supply commodified social practices and social infrastructures like holiday resorts, theme parks, shopping malls, clubs, restaurant chains, gyms etc., in order to make consumption a routine sociocultural practice.

Next, I argue, that this process incrementally puts consumption in competition to traditional religious practices and imageries. This argument follows Émile Durkheim’s conception of religion as ‘something eminently social’. Durkheim defines religion as an inventory of symbols, practices and beliefs that enable individuals to socially connect. Consumption, however, provides a range of products and services that equally work as ‘intermediaries’ for social activities and, therefore, in the long run, can supplant the social functions of traditional religion.

In the empirical part of the paper I test this hypothesis by analyzing the development of income, consumption-related leisure activities and church attendance of a sample of young Catholics from Germany. Analyses are conducted via bivariate and multilevel regressions and rely on the longitudinal data of the German Socioeconomic panel (1984-2009).

OPERATIONALIZATION OF ETHNICITY AND DIFFERENCES IN READING CLIMATE DETECTED
Mia Stokmans¹, Peter Broeder¹, Carel van Wijk¹
¹cultural studies, TILBURG UNIVERSITY, Tilburg, Netherlands

Abstract: It is common knowledge that adult, female, native Dutch read more fiction as a leisure activity than adolescent, male, migrant Dutch. Results about differences between ethnic groups in reading practices or cultural participation in general, are of course predetermined by the way ethnicity is operationalized. At this moment, objective criteria such as country of birth are used next to more subjective criteria focusing on language use or self-identification. Since some ethnic groups have stayed for generations in the Netherlands, while others move quite quickly, the correlation between the objective criteria and the subjective criteria is deteriorating. In this study we explore the idea that the usefulness of an operationalization of ethnicity can be derived by linking it to cultural behaviour such as reading practices of fiction. Since, in the cultural sociological perspective, it is believed that differences in stratification go along with differences in socio-demographic characteristics as well as differences in modes of conduct in cultural domains.

Data for this study originate from a questionnaire presented at a stratified sample (310 native adolescents, 310 migrant adolescents, 310 native adults, and 310 migrant adults). In this questionnaire, ethnicity is asked for by objective (country of birth, first of second generation) as well as subjective criteria (dominant language used, self-identification). Regarding reading practices, the indicators used are based on the theory of planned behavior and encompass: reading frequency, reading attitude, social norms of important reference groups about reading, and perceived opportunities to read.

Preliminary analyses on ethnic groups defined by only one indicator showed that there are differences in reading climate however they
go together with differences in sex and age (adult versus adolescents) and less with differences in ethnicity. Moreover, analyses show that the indicators of ethnicity for native Dutch have a 100% correspondence, while those for migrants show a smaller concordance which is not straightforward to describe. So it is unclear what differences in reading climate go together with ethnicity when the objective and subjective indicators of ethnicity are combined to unravel differences in reading climate. Additional multivariate analyses will provide more insight into this issue.

A VISIT TO THE MEMORY SITE ESTABLISHED ON THE FORMER DEATH AND CONCENTRATION CAMP AS A CONSUMPTION OF THE PAST FOR THE YOUNG GENERATION

Karolina Keler 1, Katarzyna Stec 1

1JAGIELLONIAN UNIVERSITY, Kraków, Poland

Abstract: The meaning and significance of the visit to the memorial sites established on the former death and concentration camps is becoming an inherent part of a discussion about the relation of the contemporary young generation to the consumption of the history and memory of the past. The past, according to some researchers, is becoming an attractive tourist commodity (e.g. Seaton 1996, Sharpley and Stone 2009, Urry 2007). However, there is a lack of complex empirical studies which explore both visitor’s motivation and influence of the visit to the Holocaust sites. The aim of the paper is to explore the experiences, motivations and views of young people connected with their visit to the memorial sites from the perspective of the process of consumption of memory and the discussion of commercialization of the past. In order to explore this issue the survey study (before and immediately after the visit) was carried out in 2009-2010 among young visitors (14+, N=2355) to the memorial sites (Auschwitz-Birkenau, Majdanek, Treblinka in Poland). Additionally, the photographic observation of young visitors during visit, the focus group interviews with guides, personal interviews with teachers and follow up qualitative study with survey respondents were made. In the paper, the phenomenon of dark tourism (thanatourism) is explored in context of the motivations and needs of contemporary young visitors to the memorial sites and how these aspects correlates to the perception of the memorial site as a tourist attraction.

CHILDREN SPEND, CHILDREN SAVE: THE CASE OF A PRIMARY SCHOOL IN LISBON

Raquel Ribeiro 1

1CAPP, SUPERIOR INSTITUTE OF SOCIAL AND POLITICAL SCIENCE, Lisboa, Portugal

Abstract: This article examines consumption and saving representations and practices of children aged 8-11 years, attending a primary school in Lisbon, Portugal. This school is adhering to a Program of Financial Education by Montepio Bank and our purpose is to identify and understand perceptions, behaviours and cognitive outcomes of the children under consideration, before and after the implementation of the program. Research has demonstrated the relationship between the development of the concepts of money and saving among children and their subsequent use in adulthood, as well as the importance of factors such as education and social networks in the construction of these notions. But the mental dialogue that contextualizes the decision of whether to spend or save, from the children’ viewpoint, is yet to be further explored. While children have been increasingly regarded as active and influential consumption actors, they are also taught (again) on how to refrain and save money, especially during recessive economic periods. It is therefore important to identify and understand the representations and practices that shape consumption and financial management of children and what is the contribution of parents, school, peers, media and other agents for this process. The research is qualitative; focus groups, individual interviews questionnaires will be applied to approximately 60 children and to their parents and teachers. Gender and socio-economic effects will be analysed. The results will serve to define pedagogical practices and to build a financial education program tailored to the needs of children.

PRE-SCHOOLERS AND SUPERMARKETS: LEARNING AND TEACHING TO CONSUME.

Margit Keller 1, Riina Ruus 1

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

Abstract: The current consumer literacy debate gaining momentum in Estonia increasingly stresses the need to teach “sensible consumption” at a pre-school age. The main responsibility lies with parents. Earlier research shows that Estonian parents are relatively protectionist in their attitudes, at the same time lacking resources – mostly knowledge and time, sometimes willingness - to systematically educate their offspring in consumption matters. The present study draws on focus groups, interviews and participant observations with pre-schoolers (aged 3-6) and their parents conducted in 2008-2009. The paper is inspired by practice theory (Reckwitz, 2002; Warde 2005) as well as various recent practice-based studies of consumption. The objective is to track how routine grocery shopping with small children is built of sub-practices of shopping and good parenting. Interview and focus group data highlight mainly how practices are articulated as entities and participant observation provides material to analyse how they are enacted as performances. The main foci are cases of teaching, i.e. parental attempts to either explicitly or tacitly induce their children to adopt certain routines and ways of shopping deemed by them as “sensible”, “rational” and “appropriate”. We also look at how problematic situations, where children’s and parents’ wishes clash, challenge the existing practices. The practice theory inspired approach helps to study not only the discursive and reflexive side of “teaching to consume” but also the bodily and material arrangements and moves used both by children and parents to achieve their particular ends in a situation of shopping.

CONSUMER BEHAVIOUR, BODY AND POWER

Arne Dulsrud 1

1NATIONAL INSTITUTE OF CONSUMER RESEARCH, OSLO, Norway

Abstract: The idea of modern shopping spaces and supermarkets as the key arenas of the sovereign and empowered consumer is not only disputed by sociologists, but also by behavioural economists. Whereas economists argue that “behavioural biases” stem from individual and cognitive limitations, we argue that consumer and purchasing behaviour is embedded in power. Inspired by Foucault’s general thesis that the emergence of individual freedom coincides with new techniques of discipline, this paper explores consumer
routines as an outcome of governance structures embedded in modern retail marketing techniques. First, the term embodiment of consumer choice is introduced to describe how shopping in modern supermarkets hinges on various techniques of bodily discipline. Second, by relying on a study of in-store marketing in retailing, these promotional activities are examined as techniques of normalizing purchasing behaviour. We conclude by saying that power and discipline are underestimated as explanations to the formation of shopping behaviour and consumer routines. Our findings partly supplement, but also challenge basic assumptions within behavioural economics.

**CONSUMPTION, FETISHISM AND TRANSGRESSION - EXPERIENCING DEATH, SEX, AND INTIMACY THROUGH LADY GAGA’S BODY**

Swen Seebach1, NATÀLIA CANTÒ-MILÀ1

1ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain

Abstract: In his book Eroticism Georges Bataille showed that two of the most elementary social taboos in religious societies concern sexuality and death and that the moment of the sacred festivals gave the possibility to experience these socially and morally forbidden zones in moments of ‘liminality’ wherein the taboo was lifted and the impossible became possible. These liminal moments of social disorder, these moments of transgression have been crucial for the weaving of religious society.

In modernity, related with the secularization of society and with the disenchancing character of capitalism these moments have changed their expression and meaning: We experience these liminal moments mediated through one or some of the various forms of consumption. We experience liminal moments with our partners by joined consumption, we experience death and sex in movies and TV and we experience it mediated by and projected on the body of our chosen others. Lady Gaga is one example for those helping us to transgress social moral boundaries and making us consumptively experiencing the most important social taboos.

An analysis of Lady Gaga and her performance of Sex, Death and Intimacy will help us to understand what these taboos mean in late modern society and whether a liminal experience might still be possible.

"IT’S ALL ABOUT YOU": APOTHEOSIS OF THE BODY IN ADVERTISEMENTS FOR HYGIENE PRODUCTS

Sigal Barak-Brandes 1, Amit Kama2

1The School of Media Studies, COLLEGE OF MANAGEMENT ACADEMIC STUDIES, Rishon Lezion, 2Communication Dept., Academic College of Emek Yezerel, Emek Yezerel, Israel

Abstract: Despite the recent burgeoning of sociological interest in the body as a culturally constructed project, little research attention has been paid to bodily excretions (sweat, urine, feces, menstrual blood, saliva, rhinorrhea, and skin fat) and their social implications. Furthermore, studies of the roles played by advertisements in the regulation of body waste are even scarcer. The present study therefore addresses this lacuna. Since advertising for hygiene products can be assumed to reflect prevailing hegemonic ideas regarding the body and the regulation of its excretions and smell, this research focused on two major questions: What messages are conveyed by advertisements for products that are intended to regulate bodily excretions? How is shame constructed and constituted in the ads?

One hundred and fifty nine ads that appeared in Israeli newspapers between 2005-2010 were qualitatively analyzed. Semiotic analyses were performed by the authors and were also based on categories developed in a pilot study of five random ads.

Several common themes emerged from the analysis: pampering hedonism, return to Nature, pseudo-scientific, and concealment of the actual purpose of the product. Ads were also found to constitute mechanisms of identity formation and dissociation of the corporeal body from the self.

The results indicate that shame, discipline and regulation of the body’s orifices and waste do not constitute the overarching frame for promoting hygiene products. On the contrary, the issue of cleaning one’s body for hygienic purposes is covert, at best. Rather, the ads reflect a hedonistic cult of the self. This apotheosis of the body implies that pampering oneself requires constant investment, including the purchase of products that only incidentally take care of unwanted waste.

‘MASS PRODUCTION’ IN THE MASS CONSUMPTION SOCIETIES: THE CASE OF MALE BODYBUILDING

Guillaume Vallet1

1GENEVE/EHESS/GRENOBLE, TALLOIRES, France

Abstract: ‘Mass Production’ in the Mass Consumption Societies: the Case of Male Bodybuilding

Nowadays, the body seems to be the perfect object of consumption. People use it to define themselves but also as a vehicle that can send signs to others in the hope that their body will be a factor of social integration and social recognition. That would explain why people have turned to their body, as a support of intimacy and differentiation. Hence we can observe the development of practices of body transformations which go along the contemporary philosophy in which everything seems possible for everybody, with no limits whatsoever. The practice of bodybuilding sustains efforts in that direction: historically born and developed along with the consumption society, it came to embody its values. Particularly, a muscular body symbolizes for the persons who practice this sport a high-performance body that is highly valued. And as they think this body is nicer and stronger than the others, they can exhibit it to attract people’s glance. The present research assumes that this is a relevant strategy for those men who have principally their body as capital to value, in particular to be more “attractive” and “competitive” in a gender problematic. The analysis is based on observations in 2 bodybuilding settings and 30 interviews with bodybuilders conducted in France. Results will show how bodybuilding reflects the consumption society’s norms, that is a practice in which the body is in tension between imitation and distinction, hence showing the will to be ‘like others but better’ thanks to the production of a nice and ‘massive’ body.

EXPLAINING CONSUMPTION BEHAVIOUR: THE CASE OF HIGHTBROW CULTURAL CONSUMPTION IN EUROPE

Sebastian Eduard Weingartner1
NEW GENERATIONS DO NOT CONTRADICT RETIREES

Luc Champarnaud 1, Trine Bille 2, Sophie Dabo 2

1Equipe, EQUIPPE UNIVERSITY LILLE/UNIVERSITY ARTOIS, Ville-neuve d’Ascq cedex, France. 2Copenhagen Business School, Copenhagen, Denmark

Abstract: We look for effective generations, in the spirit of Karl Manheim’s work, i.e. that differ according to the nature of their cultural expenditure, not only according to the birth dates. Thus datation of the length of the periods of generations is given by structural changes in average behaviors, and not by an abstract cutting of periods. Our methodology is two folds. First we found evidences of key behaviors for identifying generations living in France between 1979 and 2006. We showed that on the basis of the cultural spending declared by 62247 households in six surveys extracted from the family budget survey from the INSEE (1979, 1984, 1989, 1995, 2001, and 2006). The amounts spent are detailed by nature that differs according to nine items: books, performing art/cinema, television plan, museum, gambling, travels forfeit, newspaper, image or sound supports, and stationery. We considered the age of reference person in the household. We were lucky because the first dimension of a CA (Correspondence Analysis) on the cultural spending displays a good ordering considering the generations. Once the CA has been done, a hierarchical ascendant classification (or clusterization) allows us to assess each household his effective generation. Thus, we decomposed then age and generations components in a tobit regression of the spending coefficients in each item. We observed that when spendings are negatively correlated with ages –for museum or books, for instance–, successive generations tend to consume less and vice versa –for newspapers, for instance-. We explain that by a model of diffusion of the quality where the quality of cultural products is assumed to improve the “productivity” of the household in producing culture. For instance, we can think that the quality of programs on TV has been improved such that, for the same money spent on these programs, the contents is more efficient in producing culture over new periods. We showed that changes in quality of goods can very well explain why if spending of elders are higher than younger’s, then spending of successive generations increases, and vice versa .

THE HOMOLOGY HYPOTHESIS IN FRANCE, GERMANY, SWITZERLAND, UNITED KINGDOM AND THE USA

Amal Tawfik 1, Dominique Joye 2, Julien Chevillard 3

1Department of Political Science, University of Geneva, Geneva, Research Center on Methodology Inequalities and Social Change, 2Laboratory for life course studies, University of Lausanne, Lausanne, Switzerland

Abstract: The model proposed by Bourdieu in La Distinction received a large echo, largely due to the fact that it reflects a fruitful interaction between systematic theoretical reflection and empirical analysis. Though some scholars consider that this model reflects the specificity of the French society in the sixties and, therefore, is not applicable to other national contexts, this model still remains, thirty years after its elaboration, at the heart of a heated debate in the field of the sociology of cultural consumption and social stratification. But changes of tastes and cultural hierarchies, and, inter alia, the rise of omnivorism, coupled to a large extent with changes...
in lifestyles, seem to contradict the homology link established by Bourdieu between social space and lifestyle space.

This presentation aims at testing systematically the homology hypothesis in five countries: France, Germany, Switzerland, United Kingdom and the USA. The comparison between these countries is based on an analysis of the data from the 2007 ISSP «Leisure, Time and Sports».

This comparative approach allows to determine whether the modalities and forms of the relationship between the social space and the lifestyle space are similar in the five countries under consideration, or whether they differ in function of national specificities. In the latter case, the various forms of homology should be able to shed light on the social and cultural divisions within each of these countries. The microclass scheme will be used to measure social position.

**DOES MADE-IN-ITALY STILL MATTER FOR ITALIAN CONSUMERS?**

Ariela Mortara

1IULM UNIVERSITY, Milan, Italy

**Abstract:** The topic of country-of-origin effect (COO) gained the attention of marketing scholars in the early '60s (Schooler, 1965) and is well documented in the literature on consumer’s evaluation of products since the '70 (Bilkey, Nes 1982). In recent years some authors (Pharr, 2005) have argued on the saliency of this concept in an era in which products and brands are progressively more global, and multinational corporations prefer not to emphasize the origin of goods since they routinely delocalize production in countries with weaker quality image. Moreover, nowadays many consumers seem to be unaware of the made-in of the products they buy and, if they are aware of it, merge these information with other clues as price, brand, point of sales. But a large body of research literature still deals with this topic (Usunier, 2006) and points out that, in addition to its role as a quality signal, COO has symbolic and emotional meaning to consumers, relating a product to national identity (Fournier, 1998).

Although some studies explore the role of socio-demographics characteristics, like profession, on COO (Chao, Rajendran, 1993), most research uses convenience sample, often groups of students, to study the phenomenon. The aim of this paper is to present some results of an exploratory research on the perception of Italian consumer of the concept of Made in Italy based on a more reliable sample: 800 individuals, representative of the Italian population, questioned through computer assisted telephone interviews (CATI).

**HOW TO IMPRESS - CUSTOMER COMPLAINT MANAGEMENT**

Paul Eisewicht

1Departement of Sociology, KARLSRUHE INSTITUTE OF TECHNOLOGY, Karlsruhe, Germany

**Abstract:** Considering the relation between customer and provider the sociology of consumption normally centres on the purchase situation and the related services. This presentation in contrast focuses on situations occurring after the purchase where the customer is disappointed in his expectations of the product and seeks to express this disappointment with the formulation of a claim towards the provider.

For the presentation the strategies of customer complaints are analyzed along the dimensions of the i) expression of emotionality, ii) anticipation of the modes of communication and iii) attitude towards the provider organization. Second the course of complaint interaction based on the customer-performed impression management is examined. On this foundation consequences of complaints for consumer behaviour in general can be derived from the evaluation of the complaint interaction in regard to the causing problem, the provider (personal) and the consumer himself.

The research findings are reflected and embodied in the context of the discourses about i) complaining as a distinctive communicative practice, ii) the recent acceleration of mediatization processes as a radical change in the scope of action of the actors and the course of action and iii) the role of the consumer in relation to the provider and other consumers.

The presentation builds on an empirical research project about barriers of social action in customer complaints due to online shopping funded by the German Research Foundation since April 2008. The empirical basis of the research consists of focus interviews, documents, self-reports and protocols of participant observations.

**PURCHASING ATTITUDES OF ETHICAL CONSUMERS IN POLAND**

Agata Kinga Neale

1Sociology, Jagiellonian University, Kraków, Poland

**Abstract:** Purchasing attitudes of ethical consumers in Poland

Ethical consumption is a well known and researched practice in Western European countries but in the case of Poland it is still not a popular mean of purchasing. The reasons for that are among others: materialistically oriented mentality of the Poles, absence of ethical and sustainable consumption related subjects in school curriculum, dearth of eco-friendly laws and regulations. Despite this the amount of consumers dedicated to buying sustainably and ethically is slowly growing in number. The purpose of this paper is to relate issues of ethical consumption in Poland (such as availability and accessibility of goods, sources of knowledge, the lack of a positive attitude to the problem in the Polish society) to a theory of attitudes, situate ethical consumption in the specific economic and political context of Poland and show how such consumption is being viewed and practiced.

Attitude will be understood as a model with three components: cognitive, emotional, and behavioral. Ethical consumption will be defined as ecologically and socially sustainable shopping practices in using the Earth’s resources.

The empirical data of the study were collected in two qualitative research projects done in 2008 and 2011 among respondents who claimed to be exclusively responsible buyers. This paper presents the results of the study of the projects investigating the relations among the three components of attitude. The study mapped relations among the emotion people show towards the general idea of sustainability, ecological and ethical consumption, producers and products accessible on the stores’ shelves, the expert knowledge such consumers tend to have, and their willingness to act in ethical ways while in the market for goods. The studies have shown a great will of ethical Polish consumers to purchase ethically and a great
inability to do so on a large scale due to a lack of ecological and ethical awareness of the Polish society which explains lack of a desired variety of products. This paper will answer the questions of how consumers in Poland manage to continue ethical shopping while encountering many difficulties and how the three components of the attitude model interact with each other during shopping.

THE CONCEPT OF WELLNESS IN MARKETING, RETAILING, TOURISM, AND LEISURE - A REVIEW OF MAJOR JOURNALS

Miia Katariina Grénman, Juulia Räikkönen, Heli Marjanen

Abstract: Wellness is seen as one of the key drivers of consumer behavior as consumers pursue health, well-being, and a better quality of life. As people are putting more emphasis on health and well-being, the commercial wellness market is growing rapidly (cf. wellness revolution), and the wellness ideology is emphasized in various studies concerning future society.

Besides wellness consumption, consumption of experiences is increasing as individuals function in multiple social worlds creating identities, seeking new ways to enjoy life, and taking care of themselves. Wellness consumption is considered as a conscious and active pursuit of well-being, whereas a wellness consumer can be viewed upon as an active, youthful, and healthy individual who takes responsibility for his own well-being, while making consumption choices. In the wellness market, consumers construct their identities by purchasing images of healthy, beautiful, youthful, and trendy selves.

Although health and well-being are increasingly significant motivators in consumer behavior, wellness consumption is an under theorized and researched domain in academic research. The purpose of this study is to examine wellness-related research within the fields of marketing, retailing, tourism, and leisure. In short, this article identifies the research themes related to wellness, published in major journals of each discipline. Due to the commercial nature of previous wellness studies, this article focuses on mapping the scientific knowledge of the phenomenon. Based on a literature review of 108 articles, 14 research themes were identified. The results provide an overview of past scientific research, explore research gaps, and suggest directions for future research.

ESCAPING PRACTICES: THE SCHEDULING OF 'LEISURE' PRACTICES IN EVERYDAY LIFE.

Stanley Webster

Abstract: This paper uses social theories of materiality and practice to help understand the socio-temporal rhythm of everyday life and to characterise that space in routine which is often denoted as 'leisure' time. I begin by asking how different 'leisure' practices come to be scheduled and organised within various routines. Do so-called 'leisure practices', often regarded as a means of escaping the busyness of everyday life, have distinctive temporalities of their own?

With this question in mind I discuss the experiences of people engaged in yoga and computer gaming and analyse the various materials, skills and temporalities associated with each practice. Although material aspects are important in both cases, it is evident that practices are not simply "scripted" by the material requirements of participation. Rather, routines are established and changed through dynamic processes of interaction between the material and the embodied skill of the practitioner. These interactions are important for how participation structures daily schedules.

As I go on to show, the experience of doing yoga and computer gaming and their 'leisurely' status also depends on how these practices are synchronised and coordinated with other 'non-leisure' activities and with how they fit into more comprehensive systems of practice.

Discussion of these contrasting cases leads me to question the utility of understanding either practice as an inherently 'leisurely' pursuit. In addition, comparison between them allows me to develop a more thorough understanding of the relation between materiality and embodied skill, and to demonstrate the importance of this relation in establishing and maintaining the multiple rhythms and routines of which daily lives are made.

FAMILY (AND) CULTURE: THE EFFECT OF EMBODIED, INSTITUTIONALIZED AND OBJECTIFIED CULTURAL CAPITAL WITHIN THE FAMILY ON CULTURAL PARTICIPATION OF ADOLESCENTS

Mart Willekens

Abstract: Bourdieu’s theory of social reproduction states that cultural capital is passed down from generation to generation through the habitus that is formed within the family of origin. This cultural capital presents itself in three different states. An embodied state (dispositions and practices), an institutionalized state (educational qualifications) and an objectified state (cultural goods). In this scheme, the presence of all three forms of cultural capital in the family should have a great impact on the educational careers and cultural participation patterns of adolescents in those families. This paper will focus on cultural participation patterns of adolescents. Using data collected at the household level, we construct a multi-level structural equation model with the presence of the three forms of cultural capital in the family as “family level effects” (with cultural participation patterns and education level of both parents and cultural goods in the household as indicators of embodied, institutionalized and objectified cultural capital) and educational position of the adolescents as a “mediating effect” at the individual level. This way it is possible to test the direct effects of cultural capital in the household and the indirect effects through educational position on cultural participation. Other individual and family level variables, like gender, age, socio-economic position and family composition will also be included in the model as control variables. We use data from the “Cultural Participation Survey 2003-2004”, a large-scale representative population survey (3.144 face-to-face interviews supplemented with 3.757 paper questionnaires of family members) in Flanders (Belgium).

GOVERNMENT FUNDING OF CULTURE: DOES IT SERVE CONSUMERS OF CULTURE?

Tally Katz-Gerro
Abstract: The literature offers two main ways to think about the relationship between public funding of culture and social inequality. One approach sees the state as responsible for providing arts and culture as merit goods that are considered a basic right for citizens, and posits public funding as an equalizing force. The other approach emphasizes the way public funding of culture can reproduce the social hierarchy by preserving or even strengthening inequality between social groups.

We maintain that public funding of arts and culture is, at least to a certain extent, responsive to societal demographic, economic, and political characteristics. Therefore, analysis of the way change over time in public funding of culture is associated with change in demographic, economic, or political characteristics may provide insight into the two cultural policy approaches described above.

To adjudicate between the two approaches, we collected data on public funding of art bodies in Israel over the period 1960-2009. We employed time series analysis to model the GDP per capita, mean income, mean age, percent of individuals with higher education, ethnic heterogeneity, and political affiliation of the minister of culture, are associated with trends in public funding of classical orchestras, theaters, opera, and dance companies.

We find that change over time in funding for the theater, classical orchestras, and dance companies is positively associated with level of education and with size of the underprivileged ethnic group in Israel (Mizrahi Jews), negatively associated with income level, and has an insignificant association with the size of the Ashkenazi group. We interpret these findings in the context of the merit good and the hegemony theories.

VEBLEN WAS SO RIGHT! ANALYZING ADVERTIZING CAMPAIGNS OF THE CONTEMPORARY LUXURY SECTOR IN THE LIGHT OF THE THEORY OF THE LEISURE CLASS.

Alain Philippe Quemin

Department of sociology, UNIVERSITÉ PARIS-EST, Paris, France

Abstract: Although Veblen published his Theory of the Leisure Class in 1899, we would like to show in this presentation that the analysis and concepts that he developed in his brilliant essay are still most relevant to understand advertising campaigns of the luxury sector. Through a wide selection of advertisements published mostly in recent French luxury and fashion magazines or other titles advertising luxury brands such as Dior, Chanel, Yves Saint Laurent, Vuitton, Hermès, Prada, Gucci, Boss, Michael Kors and many others, we will show that, although advertising and marketing are essential for creating the social value that is attributed to upscale brands and to push consumers to accept high prices, the imagination of advertising agencies seems very limited in the luxury field and mostly refers to a very limited number of codes that express strong social norms. Besides, even today, these norms make it possible to sell luxury goods are very close to some concepts that were central in Thorstein Veblen’s Theory of the Leisure Class.

Ostentatious leisure is massively expressed by the archetype of extremely thin women wearing stilettos (very high heal shoes) in front on swimming pools or by the sea (when the swimming pools are not located by the sea...), doing nothing and expressing obvious bore. Ostentatious spoil is also expressed in diverse ways. Second-

CLASS-CULTURAL DISTINCTIONS ON THE DRESSED BODY: A CASE STUDY ON THE CONSUMPTION AND EMBODIMENT PRACTICES OF TURKISH MIDDLE CLASS WOMEN

Irmak Karademir Hazır

Sociology, UNIVERSITY OF MANCHESTER, MANCHESTER, United Kingdom

Abstract: This research intends to analyze whether social class and cultural capital structure taste patterns and consumption practices in the area of the “dressed body” in Turkey. While exploring the consumption patterns in relation to body and clothing, the research focuses not only to the point of purchase but to the consumption practice as a process including the formations of taste, judgment of tastes, transmissions of tastes from family and their symbolic power in daily life. The analysis draws on the in-depth interviews held with 43 women living in three socioculturally diverse middle class neighbourhoods in Ankara/Turkey. The limited number of consumption and class studies in Turkey mostly focuses on the secular upper middle class and very recently on the religious upper middle classes. However unlike them, the snowball sample of this study reflects both the vertical (upper-lower) and the horizontal (conservative/covered and secular/uncovered) divisions. On theoretical grounds, the research reveals that, contrary to reflexive embodiment and individualization thesis suggest, the impact of cultural capital and class still persists in the patterning of tastes and consumption practices on the domain of body and clothing. The narratives of the women prove that ‘unreflexive’ embodiments do have symbolic power and do create cultural exclusions and inequalities on other fields of daily life. On the other hand, contextual conclusion of the research contrasts to a widely accepted argument in Turkey which suggests the religious/secularist divide as the main patterning of cultural divisions and differential embodiments in Turkey. The analysis of the themes identified regarding the judgments of tastes; such as modern vs. traditional, necessity vs. aesthetic, ordinaries vs. originality, proposes that, although intertwined at certain points with secular-religious divide, class is a salient crosscutting category that shapes the cultural stratification and divisions on the dressed body which continues to be one of the most visible and symbolically value laden domain of consumption.

COMPENSATED DATING IN RUSSIA: THE COMMODIFICATION OF INTIMACY?

Christopher Scott Swader

Department of sociology, UNIVERSITY OF HAIFA, Haifa, Israel

Abstract: The literature offers two main ways to think about the relationship between public funding of culture and social inequality. One approach sees the state as responsible for providing arts and culture as merit goods that are considered a basic right for citizens, and posits public funding as an equalizing force. The other approach emphasizes the way public funding of culture can reproduce the social hierarchy by preserving or even strengthening inequality between social groups.

We maintain that public funding of arts and culture is, at least to a certain extent, responsive to societal demographic, economic, and political characteristics. Therefore, analysis of the way change over time in public funding of culture is associated with change in demographic, economic, or political characteristics may provide insight into the two cultural policy approaches described above.

To adjudicate between the two approaches, we collected data on public funding of art bodies in Israel over the period 1960-2009. We employed time series analysis to model the GDP per capita, mean income, mean age, percent of individuals with higher education, ethnic heterogeneity, and political affiliation of the minister of culture, are associated with trends in public funding of classical orchestras, theaters, opera, and dance companies.

We find that change over time in funding for the theater, classical orchestras, and dance companies is positively associated with level of education and with size of the underprivileged ethnic group in Israel (Mizrahi Jews), negatively associated with income level, and has an insignificant association with the size of the Ashkenazi group. We interpret these findings in the context of the merit good and the hegemony theories.
**MANAGING OVERWEIGHT: CLASS AND GENDER PERSPECTIVES ON EMBODIED EXPERIENCE AND EVERYDAY PRACTICES**

Lotte Holm 1, Louise Hardman Smith 2

1Institute of Food and Resource Economics, COPENHAGEN UNIVERSITY, Frederiksberg C, 2National centre for research in the work life, Copenhagen, Denmark

Abstract: Based on life history interviews with twenty men and women who have experienced overweight or obesity, this paper will discuss how the experience, the conceptualization and the managing of overweight is differentiated according to gender and class (in terms of educational background). The data stems from a Danish explorative study, which was part of a project addressing social inequality of overweight and obesity. The analysis is inspired by Watson’s dimensions of embodiment and it highlights how the experience and normative conceptualization of such dimensions vary between different individuals. The study also underlines how material and social resources influence if and how bodily overweight is considered a problem to be addressed by the individual.

**CLASS, CULTURE AND EXCLUSION IN A WORKING CLASS NEIGHBOURHOOD IN TURKEY**

Meltem Karadag 1

1Sociology, UNIVERSITY OF GAZIANTEP, Gaziantep, Turkey

Abstract: This paper is on the working class and culture. It will be based on interviews with working class members in the working class neighbourhood of Gunes in Gaziantep, Turkey. It has been an on going project, and in-depth interviews were used to capture information on the organisation of everyday life, engagement with legitimate culture, cultural activities and taste. As there are different ethnic groups living in this neighbourhood, the role of ethnicity on the organisation of the cultural field is considered. Similarly, there are ethnographic studies that highlights Islamism among working classes in Turkey (White: 2002; Tugal 2009). Hence, the role of religion on cultural practices of working class is also considered. Furthermore, while the cultural practices of working class is identified, the production of subjectivity in relation to class will be considered. Indeed, as class is central to how these people live their lives, the study considers not just locating their everyday practices, but ‘the emotional politics of class’ (Skeggs 2001:75). Drawing on the ethnography, the paper will show the ways in which class operates subjectively within daily practices of the working class.

Key Words: working class, culture, subjectivity, ethnicity and religion.

**CONSUMING COMPETENTLY IN POST-SOCIALIST SPACES: THE MORAL ECONOMIES OF SOCIAL REPRODUCTION**

Jeremy Bryan Morris 1, Kathryn Cassidy 2

1Centre for Russian and East European Studies, UNIVERSITY OF BIRMINGHAM, Birmingham, 2School of Geography, Queen Mary, University of London, London, United Kingdom

Abstract: This paper adds to the growing body of literature on consumption in post-socialist Europe. By drawing on ethnographic material from Russia and Ukraine it describes the processes by which everyday practices of consumption, initially developed as a result of constrained economic circumstances, have been imbued with cultural and moral meanings. We argue that clear notions of what it is to be a ‘competent’ consumer have emerged in these contexts and are produced and re-produced through specific performances in both public and private spheres.

We adopt the term ‘moral economy’ (after Scott 1976, and Thompson 1991) to highlight a variety of social and cultural values relating to consumption. After Graeber (2002), the research attempts to tie together different meanings of ‘value’ for social actors: ‘values’ as social and cultural dispositions about what is ‘good’ or ‘fitting’ consumption, its exchange- and use- conceptions, and ‘value’ in terms of performing sameness and difference through consumption.

We explore the ways in which the values linked to consumption are shared and in a sense ‘enforced’ in both of the fieldwork sites; through ‘performance’ of consumption, both as an act itself in spaces of consumption, but also in other public and private spheres as a social discourse. In doing so, we draw on Judith Butler’s work on the creation of gender norms, (1990).

‘Competent consumption’ is understood as a set of interrelated routines and dispositions structuring a ‘moral economy’ that people take part in through choices and attitudes towards producing/consuming and the meaning of goods.
THE MORALISATION OF CONSUMPTION: CONTINUITIES AND DISCONTINUITIES

Jens Hälterlein

Abstract: In my paper I want to address the relation between morality and consumption from the perspectives of social theory and social history. In public discourses as well as in scientific discourses (Michele Michelletti, Paul Cloke, Ulrich Beck, Nico Stehr etc.) a currently occurring moralisation of consumption is stated. In doing so, it is often assumed, implicitly or explicitly, that so far consumption has been an amoral practice aiming at the pacification of needs or the symbolic expression of identity. Only now, due to the ecological crisis and other “arousing” events of our turbulent times, consumption has become a question of morality. However, this diagnosis is ignoring that consumption has been ever since the objective of social policy and its corresponding risk perceptions and has experienced specific forms of moralisation.

A reconstruction of these moral codes, focusing on continuities and discontinuities, can contribute to the understanding of our present (consumption). Thus, for example, the discourse of sustainable consumption can be understood as an attempt to do both initiating a transformation of patterns of consumption according to new risk perceptions and continuing the politics of social integration through mass consumption.

The theoretical background of my paper is based on the conceptual tools, methods and analytical distinctions of governmentality studies. The empirical evidence of my paper is based on a discourse analysis focussing on liberalism, the welfare state and neoliberalism (already carried out in the course of my PhD thesis) and findings of the history of consumption.

THE USE OF FOOD BANKS AND THE EXCLUSION FROM THE CONSUMPTION SOCIETY

Stephan Lorenz

Abstract: Food banks and similar organizations have been becoming an increasing social reality in most European countries in recent years. They are working at the edge of the consumption societies. On the one hand, they collect the food excess that systematically emerges from production, retail and consumption processes. Therefore and contrary to their claim of fighting food waste and the ‘throwaway society’, they are dependent on the affluent society. On the other hand, they distribute the collected goods to people who are excluded from (work and) consumption to a large extent. The presentation will discuss the work of the “Tafel” initiatives I have researched over the last years. The “Tafel” is the biggest organization in Germany that works on food bank principles. The initiatives normally use a market communication, e.g. speaking about “Tafel” users as customers or referring to their redistribution outlets as shops. However, no one would use the “Tafel” if he or she did not have problems accessing the market as a customer. Rather, using the “Tafel” shows that one is excluded from that. I will argue that “Tafel” initiatives, while trying to be helpful, to some extent carry the exclusion from the consumption society. Their market communication demonstrates the relevance of consumption especially where it is hardly attainable. However, it just neglects the disruption of real market access as a customer, and their charity work doesn’t bring people nearer to an autonomous consumer status.

CULTURAL CAPITAL IN ACTION

Joerg Roessel

Abstract: Cultural Capital in Action

There is a twofold perspective on cultural consumption in sociology. On the one hand sociologists focus on specific social determinants of various forms of cultural participation and taste, e.g. class, gender, age or education. On the other hand, there is an emphasis on the relevance and the consequences of cultural consumption and taste, insofar as it has an impact on educational success, labor market position, marital choice or network formation. In these fields cultural participation and taste are used as cultural capital to send signs of high status and to draw symbolic boundaries against groups with a lower status. A huge array of survey-based empirical studies has shown the relevance of cultural capital in the aforementioned fields. However, there is a dearth of research that analyzes the impact of cultural capital on the level of micro-interactions and thereby elucidates the causal mechanisms that link cultural capital on the one hand and interactional outcomes on the other hand. This study presents results from group discussions about movie preferences with more than 90 apprentices and college students. On this empirical basis it analyzes the interactional outcomes of different levels of cultural capital: conversational dominance, group satisfaction and individual mood after participation in the conversation. This study insofar offers exploratory results on the relevance of cultural capital for micro-level outcomes that might also shed some light on the findings of more meso- and macro-level studies on cultural capital.

CULTURAL CONSUMPTION OF POP MUSIC: FANS’ PLEASURE IN TEXT OR CONTEXT?

Massimiliano Nuccio, Anna Sgrina D’Augusta

Abstract: Fandom, after being negatively depicted as pathology, has been reconsidered and emerged as a complex emotional, participative and productive experience. However, relevant spaces and gaps still remain to be analyzed: although what fans do has been investigated in-depth, still the role of those practices in relation to fans’ pleasure is not completely clear. If a limited view of fandom as an excessive consumption of popular texts has been challenged, even a limited idea of fans’ pleasure as mainly aroused by the core consumption of a text, must be challenged. This work aimed at investigating this aspect, specifically in reference to pop music fans: does the source of pleasure lie in text, that is in music, or in context, in the practices of fandom? A qualitative analysis has been conducted on a Madonna fans virtual community, through netnography, in-depth interviews and a focus group. A quantitative research followed, structured on the basis of the material collected through the qualitative analysis: two samples have been confronted, one to 153 fans, community members, and one to 80 non-fans, pop music consumers. The analysis of the data has involved descriptive and inferential statistics and revealed important differences between fans and non-fans’ behavior and motivations. In particular, the hypothesis that fans’ pleasure is mainly excited by the context of fan-
dom, rather than by text (music), has been accepted, contrarily to non-fans, who consider text as the most important element for their pleasure and satisfaction, with important implications on how to deal with these two groups of consumers.

“HIGH CULTURE IS AN ARROGANT NAME” UNEASE WITH CULTURAL HIERARCHIES IN THE NETHERLANDS

Marcel van den Haak

Abstract: In my PhD project ‘Perceptions of cultural hierarchies’ I researched to what extent present-day Dutch people rank cultural objects in a hierarchical way, i.e. in terms of ‘high’ and ‘low culture’. How do the hierarchies people perceive relate to their personal tastes? Do people look down on other one’s taste (distinction, Bourdieu), do they look up to it (cultural goodwill, Bourdieu), or do they perceive tastes as equal (which would be a logical but not necessary consequence of the rise of ‘cultural omnivores’, e.g. Peterson)? And how do these perceptions and attitudes vary along education level, parents’ background, age, and sex? Starting point is that a cultural hierarchy is no objective fact, but a social construction.

In 2009 and 2010 I conducted semi-structured interviews with ninety, mostly randomly selected, people from the Netherlands (Amsterdam and surroundings). These interviews dealt with people’s likes and dislikes (in five cultural disciplines: music, film & TV fiction, theater, visual arts), their knowledge of and opinion on other people’s tastes, and concrete concepts such as ‘high’ and ‘low culture’ and ‘good’ and ‘bad taste’. All interviews ended with the ranking of thirty cards with names from the field of music (such as composers and singers), according to (1) people’s own taste, and (2) their hierarchical perception.

The quantitative analysis of this card ranking shows that most people – regardless of education or age – recognize a cultural hierarchy, and that there is much consensus on the nature of this hierarchy. In broad strokes: classical music is generally perceived as high culture; Dutch language music as low culture. This hierarchy is very much similar to the taste ranking of older higher educated people, and opposite to the taste of younger lower educated people.

Qualitative analysis of the interviews however shows that many people are ambivalent about this. On the one hand they recognize a hierarchy and they often openly distinguish themselves from (or look up to) other people, but on the other hand many downplay their own statements, resist the high/low distinction, and hold a relativistic view instead. This ambivalence and unease with hierarchies might be typical for a more egalitarian society such as the Netherlands (cf. Wouters, Hjellbrekke).

THE ‘CULTURAL’ AND THE ‘ECONOMIC’ DIMENSIONS OF POSITIONAL GOODS: SUPPLEMENTING BOURDIEU WITH SEN

Dean Curran

Abstract: There has been a growing tendency to subsume the ‘economic’ within the ‘cultural’ in all fields of economic sociology. This paper argues that, unless the (relative) autonomy of the economic from the cultural is preserved, certain key dimensions of power relations in contemporary neo-liberal societies will be neglected. This general, theoretical point may be substantiated through a field of study which has primarily applied a cultural approach, that of consumption. Through building upon Amartya Sen’s insight that consumption is also ‘productive’ – and Sen’s replacement of the view that commodities simply yield “utility” – with an account of what are some of the specific roles that material goods play in fulfilling one’s key ends, this paper outlines a renewed account of positional goods. By exploring the central theme of Bourdieu’s Social Structures of the Economy, namely the question of housing, through the ‘economic’ lens, and doing so specifically with regard to how both the “exchange entitlement” of one’s resources and the adequacy of one’s commodities to one’s purposes are fundamentally socially contingent, key dimensions of the scope of positional goods, and hence power relations, can be identified that are not accounted for by cultural approaches such as Veblen’s and Bourdieu’s. Consequently, in affirming the dual importance and relative autonomy of the economic and the cultural, this paper suggests that only an approach that retains the full contribution that both the ‘cultural’ and the ‘economic’ makes to contemporary consumption can illuminate the relation between consumption, stratification, and power in contemporary societies.

DO ETHICAL MOTIVATIONS FOSTER ETHICAL FASHION CONSUMPTION? AN EXPLORATIVE RESEARCH

Ariela Mortara; Simona Ironic

Abstract: Fair trade fashion, second hand, vintage, eco-fashion, and swapping represent different facets of ethical fashion. According to a previous study carried out by the authors, ethical fashion consumers are driven by different motivations (hedonic, utilitarian and ethical) often coexisting in the same person. The relevance of each of these motivations is different according to the different kinds of ethical fashion, so that it is not easy to evaluate to what extent they influence consumer behavior and the purchase decision.

This contribution presents the preliminary results of an explorative quantitative research aimed at understanding the reciprocal importance of utilitarian, hedonic and ethical motivations in the different forms of ethical fashion consumption.
The survey has been conducted on a convenience sample of ethical fashion consumers using an on-line questionnaire developed according to the findings of the previous qualitative research’s phase.

THE CONSUMER BOYCOTT IN EUROPE: AN EMPIRICAL ANALYSIS FOCUSED IN SOME EUROPEAN COUNTRIES

Ramón Llopis-Goig

1Department of Sociology, UNIVERSITY OF VALENCIA, Valencia, Spain

Abstract: In the past, the job provided the worker with the central axis of the formation of his/her identity, as well as the ability to act as a counterforce by withdrawing the work effort through the organized strike. But this role played by work as the basic element in the formation of the individual’s identity has been replaced to a large degree by consumption, as the previous dialectic is being increasingly impaired by the lost centrality of work, but also by the new trans-border mobility of capital. Thus, the role of counterforce corresponds more and more to the global civil society, and especially to the figure of the political consumer, whose power stems from the fact that s/he can refuse to purchase at any place and time. This possibility of refusing to buy constitutes a form of political consumerism whose presence has begun to grow in European societies in the past few years.

This communication is divided into three main sections, although previously, a review is carried out of the main theoretical proposals based on which the study of the consumer boycott can be approached: as a form of political protest; as an expression of reflectivity, as a means of increasing the feeling of consumer sovereignty; and as an exercise in self-expression and a challenge to the characteristic elite in a post-industrial society. After these theoretical considerations, we present the results of an empirical research based on the last wave of the World Value Survey which provides data for the majority of the countries of the world. First, we quantify the share of consumer boycotts that people carry out in the different countries of Europe. Second, we explore the social profile of people who is involved in such behaviours, analysing the influence of several socio-demographic and ideological variables. Third, we present several statistical analysis which test the hypothesis and assumptions introduced in the theoretical frame. We use various multivariate statistical techniques to achieve the aforementioned objectives.

UNITED WE BUY: NEW CONSUMER ORGANIZATIONS FOR A SUSTAINABLE FUTURE. THE CASE OF THE GAS – GRUPPI DI ACQUISTO SOLIDALI (SOLIDARITY-BASED PURCHASE GROUPS).

Francesca Forno 1, Cristina Grasseni 2, Silvana Signori 3

1Department of Language, Communication and Cultural, 2Department of Human Sciences, 3Department of Business Administration, UNIVERSITY OF BERGAMO, Bergamo, Italy

Abstract: More and more often consumers are considered as both a cause and a possible solution to consumption-related problems. Within this line of reasoning the growth of so-called “critical consumption” in recent years has generated considerable interest (and hope). Many of the studies on the subject, however, have analyzed this phenomenon by focusing mainly on the individual consumer and on his/her motivations. Little attention has instead been placed on organized forms of “political consumerism” – such as groups of citizens that promote consumption as a critical means of achieving greater social and environmental justice.

The paper will focus on some new grassroots initiatives promoting alternative forms of consumption as a way to protect the environment and the right of workers, which have been very successful in Italy in the latest decade. Born in 1994, according to the census of the National GAS network, “SOLIDARITY-BASED PURCHASE GROUPS” (or “Gruppi di Acquisto Solidale”, GAS), count today more than 700 groups. Their estimate is that about 75,000 people buy food and other environmentally friendly products collectively privileging fair trade goods and organic and local foods which they buy directly from farmers, pursuing the goal of responsibly collaborating with the producers and managing the financial and logistic aspects of bulk-buying on a voluntary basis. Their criteria for selecting producers flag up respect for the environment and solidarity, both amongst group members and with the producers. Nevertheless, such criteria are interpreted and appropriated on a strictly local basis.

From many points of view, GAS are an important case study for understanding the mechanisms and decisional processes through which citizens can enter into a cooperative relationship amongst themselves and with individual producers or networks of producers, aiming for reciprocal benefit on a concrete basis, namely modifying the production processes towards a higher sustainability. GAS’s purchase preferences are sometimes determinant in providing a survival opportunity to small businesses or farms.

The paper will present the results of the first step of a more comprehensive multi- and inter-disciplinary project. In particular it will focus on a quantitative study aimed at “mapping” the GAS and their members.

VOLUNTARY SIMPLICITY AS A RESPONSE TO SOCIAL-ENVIRONMENTAL CRISIS IN AN ERA OF CAPITALISM AND CONSPICUOUS CONSUMPTION

Einat Zamweli

1Sociology and Anthropology, BAR ILAN UNIVERSITY, Ramat Gan, Israel

Abstract: This study examines the choice of simple living and abstinence from consumption as a new type of political consumption and as a mechanism of social change and expression of opinion. By studying Israelis that have chosen a lifestyle of voluntary simplicity, the paper asks what social, political and personal implications these consumers attribute to their abstinence from consumption. This is a work in progress whose initial findings are presented here.

Voluntary simplicity is a way of life that offers an alternative to capitalist consumption culture, whose basic tenet is to minimize consumer activity as much as possible. This is a personal practice, done in the private sphere; however, it belongs to a wider phenomenon of alternative consumption whose increased prominence is attributed to consumers’ response to environmental, social and economic crises of the past two decades, as well as to individual crises stemming from enslavement to capitalist lifestyle.

This paper is based on interpretive analysis of interviews with thirty alternative consumers that have chosen different degrees of reduced consumption.

The findings show that these consumers employ a universal-environmental, thus political rhetoric, while the immediate consid-
erations for this choice of this lifestyle are mainly individualistic. My main claim is that their consumption patterns attest to creativity and change compared to conventional consumption patterns. However, while the literature refers to the choice of voluntary simplicity as a means to financial, social and environmental change, the consumers focus on the change itself and see it as an end in and of itself.

FOOD IN THE FAMILY: BRINGING YOUNG PEOPLE BACK IN

Geoffrey Hunt1

1INSTITUTE FOR SCIENTIFIC ANALYSIS, alameda, United States

Abstract: This paper examines the practices and beliefs about eating within the family in the narratives of 30 “at-risk” adolescent girls in the San Francisco Bay Area. We examine traditional notions of the family meal and question the literature’s tendency to portray the family as a single unit of consumption. In examining our respondents’ households, we identify a diversity of structures, few of which conform to traditional notions of the nuclear family. Household food purchasing and consumption activities are varied, and frequently rely upon extended family members and non-kin relations for support. We identify two sets of practices and meanings associated with eating: eating alone, and eating with others. For the first group, eating alone is symbolic of independence from one’s family of origin, serves as an opportunity to satisfy individual tastes and preferences, or can be the result of familial conflict at the dinner table. For the second group, although eating with the entire nuclear family rarely occurs, we see that these young girls and women value eating with family when it happens, and make attempts to incorporate family meals into their daily lives. This active agency represents an involvement that has been ignored in much of available literature.

POLARIZING APPETITES? STABILITY AND CHANGE IN THE CULINARY CULTURES IN FINLAND, 1995-2007

Semi Purhonen 1, Jukka Gronow1

1Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: This paper analyzes trends in culinary cultures in Finland since the mid-1990s. Because the period is characterized by a rapid socio-cultural change of Finnish society that includes important changes also in the area of food and eating, it is reasonable to suppose that changes have taken place in culinary cultures and taste patterns related to food. What kind of culinary cultures - if any - can be detected in Finland? How these culinary cultures are differentiated according to socio-demographic characteristics? Have the shape of culinary cultures and the way they are socially structured changed in recent years? Drawing upon two nationally representative survey data from 1995 (N=2,540) and 2007 (N=1,388), this paper aims to answer these questions by operationalizing culinary cultures through favourite foods and most typically consumed table beverages. Both data included identical questions on favourite foods: liking/disliking for a list of different dishes, ranging from global and ethnic items (Chateaubriand, Chinese food, Greek salad, pizza, Wiener schnitzel) to the traditional Finnish dishes made of meat ("Karelian hot pot") or fish ("fried sander"). In addition, both surveys asked about the most often consumed beverage, separate-ly for a "normal" weekday main meal and for a Sunday main meal. The identified culinary cultures are analyzed according to socio-demographic variables: age, gender, education, income, marital status and residential area. Finally, the main findings, reflecting the tensions between light and heavy, global/ethnic and local/national, modern and traditional, are illustrated by excerpts from qualitative follow-up interviews collected among selected respondents of the 2007 survey (N=28).

THE MORALITY OF FOOD CONSUMPTION

Jonas Grauel1

1Faculty of Philosophy, Sociology, UNIVERSITY OF SIEGEN, Siegen, Germany

Abstract: In recent years, the thesis has become widespread that everyday consumption is more and more structured by moral or ethical decisions. However, sociology has mostly studied splinter groups of self-appointed “ethical consumers” until now (e.g. FairTrade-activists), neglecting the broad majority of consumers. My paper deals with the morality of consumption in two ways: First, which forms of moralization in relation to buying and consuming food can be found? Second, can types of consumption moralities be identified and how are they grounded in social structure?

The empirical results presented can be fruitfully linked to Bourdieu’s theory of distinction: While morality is highly fragmented, ambivalent and context-specific, moral orientations towards food consumption can be found for all cases examined across different social milieus. On the one hand it is shown that moralizations of others’ consumption patterns can be understood on the background of social position and capital structure, suggesting that even in the private area of food consumption social distinction is at work. On the other hand, collective forms of moral consumption seem also to be negotiated within households. These results suggest that Bourdieu was wrong to neglect the role of morality within class struggles. Results also imply that approaches which see ethical consumption primarily as a search for personal authentic self-expression underestimate the social embeddedness both of morality and of everyday consumption.

Evidence is based on a series of semi-standardized in-depth interviews with consumers from a medium-sized town in Germany.

CONSUMPTION PRACTICES AND SOCIAL MEDIA: BARBIE CONSUMERS’ RITUALS AND RESISTANCE TACTICS IN FLICKR

Roberta Bartoletti1

1Department of Communication Sciences, UNIVERSITY OF URBINO CARLO BO, Urbino, Italy

Abstract: In the debate regarding prosumerism, we should recognize that social media play a very important role. A prosumer (Toffler, Ritzer) is a consumer who self produces – symbolically and/or materially - the products that he consumes. In this paper our starting point is de Certeau’s concept (1980) of “consumer’ tactics”, in order to evaluate if social media can be considered as new social places where consumers can act as prosumers, in different ways. According to de Certeau, a tactic is an invisible and irreverent use by consumer that cannot be capitalized. Are social media new social places where consumers can capitalize and share with other
consumers meanings, relationship styles, skills and tricks, cultural and also political forms of resistance? We attempted an answer to this research question observing the practices of Flickr users, especially regarding those who produced images of their Barbie dolls, that is to say consumers publishing and sharing them in the social network site. We analyzed images and comments in order to reflect upon prosumerism practices in a digital environment.

GENDER IN THE KITCHEN: FOOD PRACTICES IN THE LIGHT OF ECONOMIC SOCIOLOGY

Livia Barbosa 1, John Wilkinson 2
1Center Advanced Studies: Marketing / Consumption, ESCOLA SUPERIOR DE PROPAGANDA E MARKETING, 2CPDA /Graduate Center, Federal Rural University, Rio de Janeiro, Brazil

Abstract: Paper Proposal: Summary
Gender in the Kitchen: Cooking Practices in the Light of economic Sociology
John Wilkinson
Livia Barbosa

Economic sociology has identified two apparently opposed but in practice interdependent dynamics to the construction of markets. On the one hand, much research has shown the extent to which markets are anchored in wider practices, often identified with social networks and the notion of embeddedness. On the other, markets are argued to be actively formed in a process of social construction based on the interests, values and theories of engaged actors making them relatively immune to social pressures. We would argue that it is the mutual interplay of these two processes which best explains market dynamics. In this paper we look at the changing gender profile of cooking practices and show how both these processes are at work in redefining gender partnerships in the kitchen. The analysis is based on a nationwide questionnaire on food practices carried out in Brazil covering ten of its principal cities and a series of in-depth interviews with chefs also in Brazil. Our research suggests that specific strategies of market construction are continually redefined by broader social practices and that these latter in the case of cooking practices point to the greater importance of more egalitarian gender relations in the domestic kitchen. A similar tendency can be identified in the increasing challenge to the male appropriation of the image of the chef as artist and star.

UNDERSTANDING THE INTERSECTION BETWEEN CARE WORK AND CONSUMER SOCIETY, AS SHAPING LOW-INCOME MOTHER’S PERCEPTIONS ABOUT THEIR CHILDREN’S NEEDS

Eina Lavee 1
1sociology, bar Ilan University, Ramat Gan, Israel

Abstract: Capitalist Western society is a consumer society. Individuals living in poverty that are unable to participate in the consumer culture suffer not only from real material depravity but from social ostracism as well, and are considered ‘disposable’ in Bauman’s terms. This study focuses on how single parent, low-income mothers perceive their role as being obligated to provide for their children’s needs, as a combination between an obligation to provide material support, and care at the social emotional level. The essay examines how in consumer society, low-income mothers also perceive their children’s non-basic needs as essential, and what they do to fulfill these needs. The study’s findings are based on 35 in-depth interviews with low-income mothers. The findings show that these women’s perceptions of their children’s needs are derived from the concurrent directives of consumer society and the maternal discourse, which requires her to devote her entire being. The attempt to provide for the children’s emotional and social needs often entails the attainment of financial resources that will secure their children’s place as equal and worthy. In order to attain the resources that will enable this equality, the women “stretch the limits” – attempt to gain financial resources in various different ways, which appear to be difficult and detrimental to them. The study elaborates on the phenomenon of latent poverty, presented by Ruth Lister, and examines how the discourses that dictate what motherhood provides in a consumer society exacerbate the women’s personal poverty, and how gender patterns of livelihood and care in such a society are reshaped.

WHAT IS CLEAN? ENACTING CLEANLINESS IN KITCHENS AND CLOSETS

Eivind Jacobsen 1, Ingun G. Klepp 1
1NATIONAL INSTITUTE FOR CONSUMER RESEARCH (SIFO), Oslo, Norway

Abstract: How is cleanliness defined and enacted by ordinary people with regard to food related activities in kitchens and to clothes and their cleaning in washrooms and inspection in wardrobes. How are standards set and enacted in these settings? Are there sharp defining lines between categories of cleanliness, and if so, how are they managed in practice? How is gender enacted, and what roles and tasks are assigned to non-humans of different kinds? For instance, are bacteria enacted in these processes, and if so, in what ways?

These questions will be discussed taking on two sets of qualitative data, one related to food hygiene practices in private Norwegian kitchens and one related to Norwegians’ private management and cleaning of clothes. Both the kitchen and the wardrobe data consists of interviews and a broad set of handbooks, surveys, and guides on how to take care of food hygiene as well as how to wash clothes. Though the discussions are explorative in their intent they are heavily inspired by literature on dirt and social order (Douglas 1966), on rituals of cleanliness (Shove 2003) related to ordinary consumption (Schatzki and Warde 2001) within everyday practices (Shove 1996; Shove et al. 2007), and on the role of artifacts and their enactment as discussed in the tradition of ANT and material semiotics (Akrich 1992; Law 2004). We discuss women’s roles in domestic standard setting within households (cf. Bianchi et al. 2000). Besides, in line with Halkier (2001) we look for moral ambiguities within everyday consumption practices.

ENJOYMENT IN AN AGE OF AUSTERITY: GUILT, CONSUMPTION AND THE END OF AFFLUENCE

Colin Cremin 1
1Sociology, UNIVERSITY OF AUCKLAND, Auckland, New Zealand
Abstract: The commodity, once celebrated, has now lost something of its shine. Instead of the mantra ‘greed is good’ there are numerous ‘talking heads’ or what Antonio Gramsci called organic intellectuals raising concerns about the material effects of the system on people and planet. The evident concerns of prominent sociologists about climate change, inequality or even state violence is part of a wider media discourse that we see in television documentaries such as Blood, Sweat and Tee-Shirts about child labour in India, high profile campaigns of NGOs and news coverage on anything from poverty in Africa to the devastation wrought by natural phenomena increasingly linked to climate change. Freidric Jameson once said that ‘the underside of culture is blood, death, torture and horror.’ Today, the hidden relations of the commodity are themselves highlighted by the very agents who prosper from the unsustainable and unconscionable exploitation of nature and labour power.

Slavoj Žižek speaks of ‘liberal communists’ such as Bill Gates who disavow their role in perpetuating inequality through small acts of generosity towards those deemed worthy victims of capitalism. But it is not only CEOs who appear to feel guilty about their relationship to capital. Consumers too are increasingly made to feel guilty for their habits. Apart from being self-centred, superficial and narcissistic, the consumer is held responsible for global warming, poverty and now, by ‘binging on easy credit’, economic crisis. A straw man has many uses, including being ‘part of the solution’ by reducing ‘carbon footprints’, consuming ‘more ethically’ and tightening the proverbial belt. ‘Desire’, Deleuze and Guattari said, ‘is ashamed, stupefied... it is easily persuaded to deny “itself” in the name of more important interests of civilisation’. Developing arguments from my 2011 book Capitalism’s New Clothes, the paper defends the ‘consumer’ against the charge that it must take responsibility for its own excessive desires.

ORGANIZED CONSUMPTION: BUYING FAIR AND THE “FAIR TRADE” MOVEMENTS IN WESTERN EUROPE

Sebastian Koos1
1Universität Mannheim, Mannheim, Germany

Abstract: Fair trade commodifies normative standards, by setting a "just" price above the market average to support deprived producer groups. Explanations of why consumers are willing to pay such a premium have mostly focused on individual consumer motives, like consumers’ ethical identity or post materialist value orientations (e.g. De Pelsmacker and Janssens, 2007; Shaw 2005). This paper employs a different perspective in highlighting the organizational embeddedness of fair buying. Fair Trade consumption is conceived as an organizational phenomenon, where social movement organizations provide opportunities for fair buying and try to shape consumers’ understandings of fair market exchange. Fair trade movements in Western Europe differ in the way they organize and market fair traded goods. Drawing on social movement theories of economic opportunity structures and framing, it is elaborated how organizations and ways of organizing shape consumption patterns. Hypotheses are empirically tested using a quantitative multilevel design. Organizational data on national fair trade movements compiled from an organizational survey of the European Fair Trade Association is combined with individual level survey data of the 1997 Eurobarometer for 14 European countries. Logistic hierarchical regression models reveal the crucial importance of the organizational communication efforts as well as the importance of the distribution channels for individual fair trade consumption. A complementing second analysis using aggregate measures of per capita

Fair Trade consumption for the year 2007 provides evidence for the persistent effect of organizational determinants.

THE PLACE OF ANIMALS IN POLITICAL CONSUMPTION:
EXPLOREING CITIZEN-CONSUMER POSITIONS IN FARM ANIMAL ISSUES

Saara Kupsala1, Pekka Jokinen2, Markus Vinnari3
1Department of Geographical and Historical Studies, UNIVERSITY OF EASTERN FINLAND, Helsinki, 2Department of Geographical and Historical Studies, UNIVERSITY OF EASTERN FINLAND, Joensuu, 3Department of Geographical and Historical Studies, UNIVERSITY OF EASTERN FINLAND, Tampere, Finland

Abstract: Consumption has become increasingly an arena for political participation, in which everyday lifestyle choices appear as a form of protest and public engagement. At the same time, the moral standing of animals has been subjected to societal contestation and re-evaluation, and the importance of animal ethics in consumption politics has increased.

In the scholarly discussion on sustainable or ethical consumption much attention has been given to identifying and characterising the green, ethical or political consumer. However, more research attention is required to investigate what kinds of consumer orientations or segments can be found related to political consumption in representative population level data. In this paper we explore this issue based on an extensive nationwide survey. We focus on farm animal welfare questions, analysing which kinds of citizen-consumer orientations people take as regards to animal ethics and livestock production.

Our research material consists of survey data carried out in Finland in 2010. The survey was based upon a random sample of 18-75-year-old Finns, with a response rate of 47.9 percent (n=1,893). Our results indicate that the majority of Finns do not define consumptions as an active political arena through which to influence farm animal conditions, but we also identified a noticeable proportion of active consumers taking a more political role. We identified several citizen-consumer orientations that differed from each other with their expression of trust in regulative institutions, with their attitudes to knowledge uncertainties, with their expression of consumer empowerment and with their attitudes to animal welfare standards. We conclude the paper by discussing the challenges involved in integrating farm animal concerns into everyday consumption choices among the different identified consumer groups.

THEUTOPIAS OF POLITICAL CONSUMPTION: THE SEARCH OF ALTERNATIVES TO MASS CONSUMPTION

Sophie Bossy1
1Political and Social Sciences, European University Institute, Florence, Italy

Abstract: This paper is a study of political consumerism understood as a social movement in which a network of individual and collective actors criticize and try to differentiate themselves from traditional consumerism by politicizing the act of buying in order to search and promote other types of consumption. The use of consumption as a political tool has been increasingly investigated recently. However this study offers an original angle: utopia. Utopia is defined here as both a form of discourse and a set of particular
practices. To be called utopian, a discourse has to include, first, a rejection of the existing society, and second, if not a clear conception of what another world might look like, at least the idea that another society is possible and desirable. And, to be called utopian, practices need to be an attempt to create here and now at least some of the features of this utopian discourse, in the hope of a spread in the rest of society. Therefore, the goal is to identify the utopian elements that can be found within political consumerism and to see what their impact is on collective action.

The answers given by political consumerism to the global economic downturn in terms of anti-consumerism (that states that de-growth is something that is both necessary and desirable) or alter-consumerism (that promotes solutions through a more responsible consumption) will be the focus of attention. Indeed, viewing political consumerism with the lenses of utopia helps to understand how actors view consumption and how they related their acts of (non-)consuming to ideals and dreams of a better world. Utopia also helps to show that the particular choices of consumption, of lifestyle or the choices collectively made within the groups they belong to are only really understandable if one looks at the logics behind them and their articulation to the ideals and hopes actors have. Finally, the lenses of utopia allow the researcher to see how actors articulate the individual and collective levels of action since it helps understand that for the actors their everyday choices of living are also done in order to achieve some necessary changes within society. In order to illustrate this theory, this paper will be based on a comparison of four case studies done in France and in the United Kingdom with two local groups of the Slow Food organization, a group of de-growth promoters and an intentional community belonging to the ecovillage network.

BEYOND OMNIVOROUSNESS: USING A SOCIAL SPACE APPROACH TO ANALYZE THE SOCIAL STRUCTURING OF LIFESTYLES

Henk Roose¹, Koen van Eijck², John Lievens¹
¹Department of Sociology, GHENT UNIVERSITY, Gent, Belgium, ²Department of Arts and Culture Studies, Erasmus University Rotterdam, Rotterdam, Netherlands

Abstract: By using Bourdieus’ social space approach, this analysis maps the structure of cultural lifestyles in Flanders, Belgium. Information on a broad range of cultural behaviors (participation) and dispositions (what is important in cultural activities) from 2,849 respondents is analyzed and linked to a set of indicators of social position. By means of Multiple Correspondence Analysis (MCA) three structuring dimensions are found. The first is an engagement-disengagement axis, distinguishing an active, and open-minded lifestyle versus a more passive, home-bound way of living. The second dimension contrasts a preference for contemplation and legitimate arts with a preference for adventure and action. The third dimension adds an opposition between a pronounced, reflexive openness to new things and a more unreflexive taste. Cultural and economic capital are primarily associated with axis one, age with axis two. The third dimension is linked to different combinations of social categories. The findings show that respondents have distinct ways of showing the underlying trait of openness depending on their position in the social space—omnivorousness is only one of its expressions linked to younger people with a lot of cultural capital. Our analysis demonstrates the power of MCA to reveal additional insights in the social structuring of lifestyles, insights that complement results obtained via traditional correlational techniques.

IT TAKES TWO TO TANGO: THE IMPORTANCE OF SOCIAL NETWORKS FOR EXPLAINING CULTURAL PARTICIPATION

Jef Vleegels 1, John Lievens¹
¹Ghent University, Gent, Belgium

Abstract: The social stratification of cultural participation is a well studied topic in sociology. Often still inspired by Bourdieu’s classical work: ‘La Distinction’, researchers try to understand the ‘field’ in which cultural taste and participation preferences are formed an internalized. The conversion between different forms of capital, and more specific the relative importance of economic and cultural capital to explain cultural praxis still gets a lot of attention in the sociology of culture. In recent literature, sociologists challenge the deterministic class-model by exploring the effect of more individualistic characteristics. Research on cultural mobility, personal capital accumulation, ethnicity, gender, etc. put Bourdieu’s traditional class-model in a new perspective.

In this paper, we build on these recent insights and focus on the role of an individual’s social network for explaining cultural participation. We test the relative importance of personal social capital - besides the more traditional class-effects- to predict participation in a broad range of cultural domains (‘highbrow’ as well as ‘lowbrow’ activities). We expect that personal social network structures offer important resources (or constraints) that can influence participation in cultural activities in a substantial way. More specific, we focus on social integration (tie strength), network heterogeneity (in terms of gender, role and age composition) and network size as explanatory variables for cultural participation. Furthermore, we pay special attention to the causal direction of the effect by using a two-stage least squares regression analysis to encounter potential feedback effects.

DATA: We use data from the ‘Cultural Participation in Flanders 2003-2004’ survey. This is a representative (weighted) sample of the Dutch speaking part of Belgium, with 2849 randomly selected respondents between 14 and 85 year old. They were questioned with a computer-assisted face-to-face interview about their cultural behavior and attitudes and we used a name generator to construct the ego-centric cultural participation network of each respondent.

PROFILING CULTURAL OMNIVORES IN KOREA: QUANTITY AND BREADTH OF CULTURAL CONSUMPTION

Eun-mee Kim¹, Sae-rom SUH¹
¹Communication, SEOUL NATIONAL UNIVERSITY, Seoul, Korea, Republic Of

Abstract: Bourdieu’s theory stirred up debates over its applicability to contexts other than the 1960s French society and the omnivore hypothesis was posed as one of the complementary explanation on how cultural capital functions.

Previous research on cultural omnivores in the U.S and Europe suggests that the concept of cultural capital and omnivore should be explicated within a specific context. What it means to do cultural consumption and its social utility differ in each society, especially in Asian countries such as Korea where most of high cultural forms are western and class mobility is high. Regardless of forms and genres, cultural participation is significant as a marker for higher social sta-
WHAT IS “GOOD TASTE” IN POPULAR MUSIC? OPENNESS AS A RESOURCE IN THE PURSUIT OF SUPERIORITY

Michael Parzer
1

1Department of Sociology, UNIVERSITY OF VIENNA, Vienna, Austria

Abstract: The declining importance of social and aesthetic hierarchies is a great challenge for cultural sociology. It is not clear whether this tendency indicates an erosion of claims for social and cultural superiority or whether new ways of expressing distinction are emerging instead. While the fragility of boundaries between high and low culture has been subject of extensive research, similar changes within popular culture have been largely neglected so far.

Drawing on discussions on musical preferences in online-fora it will be shown how and to what extent tastes in the field of popular music are used as a resource in the pursuit of superiority.

While the distinction between “authentic” and “commercial” music still serves as an important symbolic boundary and hence as the base for defining “good” taste in popular culture, there is evidence that concepts of “authenticity” are increasingly put into question. Empirical findings suggest that rhetorics of authenticity conflict with a new pattern of interpretation: “Openness” is promoted as a key concept of musical taste in popular culture. This concept is not only characterized by crossing boundaries between “authentic” and “commercial” ostentatiously, but also by being open towards a broad range of different musical worlds. Consequently, a clear separation from consumers of music with a rather limited taste is called for. Not what is liked or disliked, but how consumers deal with the diversity of musical genres has become the criterion for symbolic and possibly also social distinction within popular culture.

LOOKING FOR CREATIVITY AND INNOVATION IN CONSUMPTION PATTERNS. THE DEMOCRATIZATION OF COMPUTER HACKING AND THE EMERGING OF NEW CONSUMER PRACTICES.

Paolo Magaudda
1

1Dep. Sociology - CIGA, UNIVERSITY OF PADOVA, Padova, Italy

Abstract: This contribution aims to show how hacking practices, and their recent evolutions, are becoming increasingly relevant for consumer studies. In the last decade, the term “hacker” has lost their unique association with digital criminals or countercultural heroes and “hacking practices” have started to increasingly involve more ordinary young people and their everyday lives and leisure. When we consider hacking practices in a broader sense, we can see that these practices are frequently appearing in the realm of ordinary consumption patterns and therefore they became related to understanding the stability and the innovation of consumer culture and practices.

In this presentation I will show one of the possible ways to conceptualize and analyze empirically the relationship between hacking practices and consumption practices, by showing few examples concerning consumers’ modifications and transformations of Apple’s hardware. More specifically, I will focus on the examples regarding the appropriation of two kind of digital Apple devices: the well-known iPhone and the “Hackintosh” (a computer based on non-Apple hardware, but running Apple software). In both cases, people’s modifications of Apple hardware does not represent only...
individual activity or the result of esoteric knowledge, but they rather represent the outcome of a reconfiguration of consumer practices, in which issues connected with «craft consumption», «cultural jamming» and new consumers’ skills and material tools are involved.

In conclusion, grounding on a “theory of practice” framework, I will argue that the complex set of competences and knowledge originality required in hacking practices is today being translated into cultural, practical and material terms to fit into contemporary consumer patterns. The interaction between socio-material elements from hacking practices and from ordinary consumer behaviors helps us to highlight on of the sources of creativity and innovation in contemporary consumption patterns.

THE CRISIS OF INTANGIBLE IDENTITIES: FASHION BRANDS AND SEMIOTIC SATURATION

Emanuela Mora1

1dipartimento sociologia, UNIVERSITÀ CATTOLICA SACRO CUORE, Milano, Italy

Abstract: In the first ages of modern fashion, the difference between fashion and clothing was rooted in the creative content of the former, produced by fashion designer and couturier and emphasised by advertisers and communication professionals. Afterwards, during the Nineties, the difference between fashion and clothing has progressively evanesced, as the latter doesn’t exist almost anymore, due to the catching on of brands even at the mass market level. The role of materiality had been highly underestimated during this phase, but materiality seems to be going to revenge itself, because of the progressive thickness’s lost of the intangible contents.

The paper presents and discusses the main findings of a research program that explores a phenomenon we call “semiotic saturation”, according to the process Simmel identified at the beginning of the 20th century as typical in the diffusion of fashion among social classes. What makes different the present occurrence of the phenomenon is that it doesn’t imply in principle the abandoning of the saturated images by the luxury brands. On the contrary it contributes to the stabilization of the mainstream fashion’s visual mood of a certain period. The result seems however to be the lost of thickness (meaningful uniqueness and exclusiveness) of communicated images of brands. The research program had been carried out with a convenient (60 people) sample of respondents balanced as far as regarding gender and age, and showed that people feel disoriented when asked to recognize the brands associated with blind submitted images. More than a half of the interviewed couldn’t accomplish the job. As a conclusion it will be argued that the visual content of brands isn’t enough to communicate the identity of the brand itself and that semiotic saturation represents the final stage of a culture of fashion mostly based on a pure commercial imagery.

UPCOMING CHANGE IN URBAN LIFESTYLES IN 2050: TOWARDS A POST CONSUMPTION SOCIETY?

Michelle Dobré1,2

1Département de Sociologie/Cerrev, UNIVERSITE DE CAEN, 2Centre d’études et Recherches sur les risques et les vulnérabilités, Université de Caen, Caen, France

Abstract: An important today’s concern with changing social practice is the anticipation of changes in lifestyles confronted to carbon constraints related to climate change politics. Is the ecological transition leading us to post consumption societies? Our approach is based on an ongoing empirical research (PROMOV), funded by the CNRS and the Prospective Board of the French Ministry of Development from 2009 to 2011. While a wide literature exists on economic or general social changes (EEA 2009), very few if none deal with lifestyles as driving forces for change. Lifestyles and consumption are more often seen as the “black box” in other, over determinant dimensions. On the other hand, contributions in sociology of consumption (Lipovetsky 2006; Galland & Lemel 2006; Dobré & Juan 2009) have a potential to be employed in the field of sociological prospective on lifestyles.

Based on the state of the art on statistical sources, social theories, prospective literature and a review of science fiction literature, this paper discusses the ways of engaging sociological diagnosis and knowledge of cultural trends, material consumption, urban life changes, in order to build lifestyles scenarios for future. The six scenarios here presented are the outcome of an interdisciplinary collective discussion on relevant dimensions for change in future lifestyles: individualism Vs.community, religious renewal Vs. laicization, simplicity Vs. growing consumption are some examples. Three main dimensions bound to change in the future delimit the contrasting scenarios: relation to others (sociability); new technologies; public space (political participation). The relation to material Consumption is the common cross variable which structures the architecture of the 6 scenarios.

EEA 2009, N. 3, Looking back on looking forward: a review on evaluative scenario literature.

BETWEEN INDIVIDUALIZATION AND HOMOLOGY: YOUNG ITALIANS READING BEHAVIOR FROM 1983 TO 2004

Ferruccio Biolcati-Rinaldi1

1Department of Social and Political Studies, UNIVERSITY OF MILAN, Milan, Italy

Abstract: According to some globalization and individualization theorists (Pakulski and Waters), changes that are redefining contemporary societies eventually replace production with consumption as the ordering principle of social systems. Lifestyles and consumption patterns would then be independent from traditional factors such as stratification of social classes, creating complex social positions and more permeable boundaries. This position is opposed to the homology theory of Bourdieu, according to which lifestyles vary depending on to different combinations of economic capital and social capital that distinguish individuals.

Linked to this debate are those analyses that give an account of recent changes in the media diets. One example can be found in the theory of omnivorism of Peterson and Kern that holds that individuals who occupy top social positions do not distinguish themselves for the choice of activities and sophisticated cultural genres
but for the ability of mixing different consumptions, from the most popular to the most exclusive.

All these and other theories address two interrelated issues: the first is the change in the ways people mix different media and media genres; the second is the change in strength of the relationship between the traditional stratification variables and media consumption. The presentation deals with these research questions focusing on Italian young people reading behavior (newspapers, magazines, comics, books). Multivariate analysis techniques are applied to data from IARD survey on Italian youth that covers the period from 1983 to 2004.

BUYING TO DRESS, DRESSING TO MEAN - CONSUMPTION IN THE SARTORIAL FIELD AS AN INDICATOR OF LATE MODERNITY AND POSTMODERNITY IN CULTURE

Gabriela Zuchowska

Abstract: Contemporary individuals are now perfectly aware that goods are, as Mary Douglas suggests, ... a system of communication.” They tap into various narrations within the market, media or popular culture incorporated by commercial objects. One of the hallmarks of late modern culture is a coercion of constant choice between goods, with which social actors are to compose a coherent, stable image of themselves Contrary, the type of identity(ies) that postmodern actors are encouraged to incorporate or diagnosed to have incorporated is heterogeneous, eclectic and inconsistent. As opposed to modern “designers” of solid, original characters, postmodern individuals are apparently role-players that have as many contradictory identities as there are social encounters in which they participate. Theoretical background for these ideas was provided by works of Giddens and Bourdieu (questions of late modern identity and taste), Bauman (on postmodernity or fluid modernity) and followers. The paper will challenge Malcolm Barnard’s claim that communication emerging from the use of clothes may not be voluntary exchange of meanings, but is merely a product of pre-existing set of values and ideas of people involved in the process. Questioning results obtained by Thomas and Hayko (that sartorial purchases of consumers express their modern but not postmodern values) another aim will be to show, basing on two tours of small-scale qualitative observations (survey for 50 participants in 2008 and a few in-depth interviews in 2011 that are to serve as a pilot for large PhD project), that consumers in fact do express attitudes that indicate postmodernity in culture.

FRENCH TEACHERS’ CULTURAL PRACTICES AT THE TEST OF TIME

Géraldine Farges

Abstract: In our presentation, we propose to analyse French teachers’ cultural consumption on a long-term period, as regards cinema, theatre and reading habits. We formulate the hypothesis that teacher’s cultural consumption has changed through time. Highbrow culture is traditionally associated with teachers’ behaviours. For instance, according to Pierre Bourdieu’s Distinction: a social critique of the judgement of taste (1979), cultural practices and tastes of French secondary-education teachers display a “sense of distinction”, in compliance with the dominant class, even though teachers are more “scholastics” than “mondains”. However, within a few decades, the teaching population has experienced several changes, regarding recruitment procedures, the desirability of their social position, or within schools’ public, which is more socially diverse. As a matter of fact, in a recent publication, Philippe Coulangeon has pointed out the cultural effects of the massification of education. Considering reading and television habits, he observes that highest diplomas are no more automatically associated with highbrow culture. Our research program consists in a comparison of data from a survey realised in 1970 on a sample of French secondary-education teachers with new data provided by a survey we carried out in 2008 during our doctoral research. Thanks to our methodological procedure, we provide demonstration of quantitative changes within teachers’ cultural consumption from 1970 to 2008, giving evidence of generational effects.

“NOT FOR SOMEONE LIKE ME.” PERCEPTIONS OF FOUR CULTURAL ACTIVITIES.

Astrid Van Steen, John Lievens

Abstract: Cultural sociology merely focuses on cultural practices and tastes to understand social and cultural stratification. However, culture functions also in a less tangible way. Culture is for example an important identity marker used for the creation of symbolic boundaries; it establishes social relations and as a social phenomenon, culture encompasses a wide variety of social meanings and connotations. These meanings and connotations, attributed by individuals, are based on experiences and practical knowledge and strongly depend on someone’s social and cultural position (Bourdieu, 1984).

In order to study this wide variety of connotations, we use data from the ‘Participation Survey 2009’, a large-scale population survey (N=3144) in Flanders (Belgium). By means of a newly designed semantic differential scale, we examine the connotations, or more general, the perceptions of four cultural activities. This allows us to understand how individuals perceive and experience culture and how they position themselves and others in cultural settings. We define perceptions as the complex of meanings, connotations, associations, prejudices and stereotypes. First, differences in perceptions of non-attendees, occasional and frequent attendees are described. According to the theoretical assumptions, we mainly expect differences for perceptions concerning the relation between the activity and the individual, not between the activity and its societal aspects. Second, we assess what determinants are associated with positive or negative perceptions. Results will show a puzzling effect of young age on negative perceptions. We end the presentation with some theoretical remarks and discuss the advantages and limits of a quantitative approach of perceptions.

THE DISSECTION OF THE AMATEUR. AN EMPIRICAL ANALYSIS OF THE DETERMINANTS OF ACTIVE CULTURAL PARTICIPATION

Dries Vanherwegen, John Lievens

Abstract: In our presentation, we propose to analyse French teachers’ cultural consumption on a long-term period, as regards cinema, theatre and reading habits. We formulate the hypothesis that teacher’s cultural consumption has changed through time. Highbrow culture is traditionally associated with teachers’ behaviours. For instance, according to Pierre Bourdieu’s Distinction: a social critique of the judgement of taste (1979), cultural practices and tastes of French secondary-education teachers display a “sense of distinction”, in compliance with the dominant class, even though teachers are more “scholastics” than “mondains”. However, within a few decades, the teaching population has experienced several changes, regarding recruitment procedures, the desirability of their social position, or within schools’ public, which is more socially diverse. As a matter of fact, in a recent publication, Philippe Coulangeon has pointed out the cultural effects of the massification of education. Considering reading and television habits, he observes that highest diplomas are no more automatically associated with highbrow culture. Our research program consists in a comparison of data from a survey realised in 1970 on a sample of French secondary-education teachers with new data provided by a survey we carried out in 2008 during our doctoral research. Thanks to our methodological procedure, we provide demonstration of quantitative changes within teachers’ cultural consumption from 1970 to 2008, giving evidence of generational effects.
PUBLIC PRIVATE PARTNERSHIPS (PPP) AND THE DIFFERENT PRECONDITIONS FOR FIGHTING OBESITY IN EUROPEAN COUNTRIES

Anita Borch 1, Gun Roos 1

1NATIONAL INSTITUTE FOR CONSUMER RESEARCH (SIFO), Oslo, Norway

Abstract: According to the report ‘Health at a Glance: Europe 2010’, more than half of the adult population in EU is regarded as overweight or obese, and the rate of obesity has more than doubled over the past 20 years. Drawing on Esping-Andersen’s (1990) theory of ‘The Three World of Welfare Capitalism’ and some of its criticism, this paper aims to explore the rates and forms of Public Private Partnerships (PPPs) related to weight issues in European countries, and discusses the structural preconditions for implementing PPPs to fight obesity in Europe. The European countries are clustered in four categories representing the ‘liberal’, the ‘corporatist-conservative’, the ‘Mediterranean’, the ‘social democratic’ regimes respectively, as well as one category representing the East European Countries (EEC).

Questions are: What are the rates and forms of PPPs fighting obesity in European countries? What social groups are the PPPs targeting? The analysis is based on reports from 28 European countries (27 EU and Norway) collected in 2010 as part of the EU-founded project ‘Obesity Governance’ headed by National Institute for Consumer Research, Norway. One thesis is that PPP rates are highest in liberal regimes and lowest in EECs. Another is that private businesses are more involved in PPPs in liberal countries and less involved in EECs. A third is that most PPPs target social groups at risk for developing obesity.

"YOU'RE NOT JUST BUYING COFFEE": THE PROMISE & CONTRADICTIONS OF ETHICAL CONSUMPTION

Nicki Lisa Cole 1

1Sociology, University of California, Santa Barbara, Santa Barbara, CA, United States

Abstract: Ethical capitalism and consumption have become mainstream in Western societies. Today, market places abound with ethically branded and certified goods that appeal to a host of consumer values, desires, and identities. The history of the coffee market, and consumer awareness of the struggles faced by producers make ethically coded coffee particularly attractive and successful. In the United States, its product design communicates a message of a happy farmer set amongst a lush landscape in rural communities that are positioned as in need of both economic and ecological preservation. Drawing on research of the coffee industry and with consumers of ethical coffee conducted along the west coast of the U.S., I present an analysis and critique of these phenomena. The findings, based on a survey of 180 participants and 30 in-depth interviews, reveal that the narrative presented by the industry via product packaging, marketing materials, and baristas succeeds in interpellating consumers as saviors of the world’s poor. Consumers of ethical coffee express articulate moral subjectivities in relation to the product and its representation of producers, and thus affirm the concept of consumer-driven social change. I argue that despite critical consumer concerns, the ideology and discourse of ethical capitalism ultimately quell concern over labor and environmental exploitation, fuel mass consumption, and reproduce the dominant system of global capitalism. Far from a move toward social change, ethical consumption benefits privileged consumers and further binds laborers around the world to a system that offers them limited options for survival.

YOUTH, CONSUMPTION AND CITIZENSHIP: THE BRAZILIAN CASE

Fatima Portilho 1, Livia Barbosa 2*, John Wilkinson 1, Veranise Dubeux 1

1CPDA - Social Science Graduate Program, RURAL FEDERAL UNIVERSITY OF RIO DE JANEIRO, Rio de Janeiro/RJ, 2CAEPM, ESPM, São Paulo/SP, Brazil

Abstract: There is evidence that points to a possible politisation of consumption in Brazil, similar to what has been occurring in other countries. In this process, consumption attitudes, behaviors, and practices are perceived and used as a way of participation and political action. Theories of post-materialism and hypotheses of mistrust in relation to political institutions have been used as an explanation for this phenomenon. However, little is known about the use of these actions by young adults in Brazil. To explore this question we developed a quantitative survey to analyze the perceptions, interests, forms of engagement, personal and institutional trust, and political practices, including political consumption, of 457 Brazilian young adults. Respondents were aged 16 to 25, lived in the cities of Rio de Janeiro and São Paulo, and were part of the three highest economic classes in the country – A, B, and C. The results obtained show that, in Brazil, involvement in activities of political consumption are low, with little variation regarding social and economic class, age and school level. This can be explained by the important role of the family in Brazilian culture and by the presence of numerous, active social organizations that seem to be the main actors.
of social changes, making individual action secondary. Our data do not confirm theories of post-materialism or lack of trust in political institutions as the explanation of political consumption phenomenon.

CONTESTED SCHOOL FOOD: FROM CHILDREN’S NEEDS TO CHILDREN’S RIGHT TO CHOOSE
Minna Ruckenstein

Social and Cultural Anthropology, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Since the 1940s Finnish children have been offered a daily lunch at school. The aim of the emerging welfare state was to create public services accessible to all citizens. Many everyday tasks and responsibilities were outsourced to the state, including social and health-related activities, such as providing nourishing food to pupils. Today this state-designed mechanism for maintaining children’s wellbeing is constantly debated in the public discourse. However, in most debates, the voice of children and young people is not heard; it is the experts on nutrition and childhood who define the needs and the ‘best interests of children’. This research approaches the school meal as a prism through which everyday interests and orientations of children and young people (mainly 13- to 15-year olds) are expressed and manifested. The ethnographic pilot-study took advantage of a variety of methods, including data gathering by children. The data demonstrate how school lunch is consumed and not-consumed, how it relates to conflicting ideas of childhood. The school meal represents the adult order and it is an object of evaluation by children. For instance, youngsters skip school meals, because they have money that gives them the right to choose other offerings from the food market. Thus conceptions of and practices around school food open for scrutiny current tensions and contradictions between adults and children and bring to the fore the cultural underpinnings of publicly served food.

CONVENIENT MEDIA FOOD? NETWORKING AND CONTESTED FOOD CONSUMPTION
Bente Halkier

CBIT, ROSKILDE UNIVERSITY, Roskilde, Denmark

Abstract: Convenient media food? Networking and contested food consumption

Abstract for paper to be presented at the RN on Sociology of consumption, ESA Conference, Geneva, 2011

By Bente Halkier, Roskilde University, Denmark

Convenience food is a fast-growing and differentiating consumption style. At the same time, convenience food is a contested category in society due to its normative connotations with fast food and industrialized food. Hence, public information and behavior change campaigns on food quality, nutrition and health tend to question the appropriateness of convenience food. However, the existing empirical studies of food practices and understandings of “proper food” do not take into account that food practitioners are also skilled social networkers and media practitioners who use differentiated types of convenience food and negotiate a multiplicity of cross-genre mediated constructions of convenience food in their social network interactions while shopping, cooking and eating in everyday life. Rather, understandings and uses of convenience food are seen as results of life-historical experiences, individual choice-making or socio-material conditions.

This paper forms part of producing a theoretical framework for an empirical qualitative investigation of how food consumers use different material and mediated genres of convenience food for navigating and negotiating normatively appropriate food practicing in their social networks. On the basis of my previous research on contested food consumption types, I suggest to combine the following theoretical elements: A practice theoretical perspective, interaction analysis, positioning theory and qualitative social network analysis. In the research field of contested food consumption, there is a long-standing critique of the deficit-approach to public food communication, and an approach that includes socio-practical complexities and networking is seen as a potential analytical improvement. Existing practice theoretical approaches to consumption as well as existing network communication approaches both fail to address explicitly conceptually the micro-level of social interaction and interpersonal communication. The purpose of the paper is to unfold a first attempt to make this theoretical combination, and to discuss it in relation to the planned empirical study, “Easy eating? Negotiating convenience food in media food practices”.

exploring weight management from a practice theoretical point of view
Mari Niva, Mikko Jauho, Johanna Mäkelä

National Consumer Research Centre, Helsinki, Finland

Abstract: Our paper has the dual objective of i) examining the methodological challenges of analysing weight management from a practice theoretical perspective, and ii) presenting empirical findings from practices of weight management. The paper draws on the recent line of practice theory developed for empirical analyses in sociology of consumption particularly by Bente Halkier and Alan Warde. In this version of practice theory, understandings, procedures and engagements are conceptualised as the constitutive elements of a practice.

The paper is based on an analysis of eight focus group discussions in which 68 people (47 women, 21 men, average age 55) participated in Helsinki in autumn 2009. In six groups, the participants were trying to lose weight at the time of the recruitment and in two groups they were not.

In the paper, we first discuss our methodological solutions relating to the challenges of analytically distinguishing the three constituent elements of a practice in the data. We present our categorisation scheme developed based on a detailed analysis of a verbatim transcript of one focus group discussion and discuss the difficulties that we faced in the analysis. Second, we focus on our findings on weight management from the perspective of the three elements. Our preliminary analysis suggests that the understandings, procedures and engagements of weight management include a variety of ideals, activities and negotiations relating to why and how to control weight. Third, we discuss the nature of weight management as either an integrative, complex practice with its own dynamics and socially recognisable features, or a dispersed practice forming a part of other practices, such as eating and/or exercise.
SCHOOL MEALS AND BIOPEDAGOGIES: A CRITICAL EXAMINATION OF THEIR EFFECTS ON CHILDREN’S FOOD PRACTICES

Monica Truninger 1, Ana Horta 1, Silvia Alexandre 2, Vanda Aparecida 3, Mara Miele 3, José Teixeira 3

1Institute of Social Sciences, University of Lisbon, 2SOCIIUS, ISEG, Lisbon, 3CRIA, ISCTE-IUL, Lisbon, Portugal, 4CPLAN, Cardiff University, Cardiff, United Kingdom

Abstract: Nowadays socio-political discourse is mobilized to fight a ‘war on obesity’ in schools (Leahey, 2010). The way this war is fought makes use of devices, or biopedagogies (Wright and Harwood, 2009), such as initiatives to improve eating practices amongst school children (changing menus contents, food education, BMI monitoring, and more). In this paper we talk about a myriad of initiatives and programmes that have been recently put forward by the Portuguese health and education governing bodies, private and voluntary sectors in order to encourage school meal changes and healthier children’s eating practices. By adopting an a-humanist perspective (Allport, 1955), inspired by a material semiotic sensibility, we focus on a critical examination of the various effects that these biopedagogies (assembled through a hybrid assortment of human and non human elements) may have on children’s consumption seen as a moment in most practices (Warde, 2005), on food taste acquisition, on children’s social networks, and, ultimately, on becoming ‘person’ (Allport, 1955). Some of the questions that guide this examination are: Are children becoming consumers or citizens? Do children participate and have a voice in assembling school meals? How do these initiatives affect parents-children relationshios, namely regarding food control, choice and care? The empirical material is based on a thematic documentary analysis of healthier school meals initiatives in Portugal and on the findings of a British project on children and parents’ focus groups on school meals in the UK and Italy. It is concluded that the British and the Italian cases illustrate children becoming consumers and citizens respectively. In Portugal, the implementation of some of these biopedagogies may contribute to lessening what should be a broader understanding of food consumption in everyday life, and also to promoting a view of children and their families as mere vessels of information. That is, voiceless non-participants in the process of constructing healthier and happier school food cultures.

PERSONAL NORMS AS PREDICTORS OF SUSTAINABLE CONSUMPTION: EXTENSION OF THE TPB FRAMEWORK

Jan Urban 1, Iva Zverinova 1, Milan Scasny 1

1Environment Center, CHARLES UNIVERSITY, Praha 6, Czech Republic

Abstract: The main purpose of this study is to examine the role of personal norms and environmentally-related beliefs in motivating organic food consumption. The study uses data from a survey of general population (N=600) and of the subpopulation of organic food consumers (N=600) in the Czech Republic in 2010. Theory of planned behavior (Ajzen 1991), previously used is several empirical studies of organic food consumption (Kauffmann, Stagl, and Franks 2009; Arvola et al. 2008), is used as a theoretical framework. Further, we seek to extend the framework of the TPB by including personal norms related to organic food consumption. Personal norms have been found in previous meta-analytical studies to be an important predictor of proenvironmental behavior, explaining as much as 52% of variation in proenvironmental behavior (Bamberg and Möser 2007) and several have attempted to include personal norms in TPB framework (see e.g. Bamberg and Schmidt 2003, Wall, Devine-Wright and Mill 2007).

Based on the literature review, we propose and empirically test 5 models, using latent variable structural equation modeling with categorical data (due to Muthén 1983). M1 is a standard TPB model. M2 is M1 extended with personal norms (PN) and with all effects of PN on TPB variables being constrained to zero. M3 is similar M2 except that we relax the zero constraint on the effect of PN on attitudes. M4 is, again, similar to M2, except that we allow PN to influence behavioral intention. Finally, in M5 we modify M2 by relaxing the constraint on the effect of PN on reported behavior, i.e. organic food consumption.

Our results suggest that conventional TPB model (M1) performs decently well in explanation of organic food consumption. Interestingly, self-related beliefs and altruistic beliefs seem to play much more prominent role as indirect factors of organic food consumption than environmentally-related beliefs. Further, personal norms seem to have no direct effect on organic food consumption but rather, their effect seems to be mediated by attitudes.

SUSTAINABLE CONSUMPTION: THE DILEMMAS OF THE RELATIONSHIP BETWEEN INDIVIDUAL CHOICE AND THE SOCIAL, CULTURAL, AND POLITICAL CONTEXT

Isabel Maria Fernandes Silva Cruz 1

1Institute of Sociology, UNIVERSITY OF PORTO, Matosinhos, Portugal

Abstract: The theoretical and methodological approach that we propose in order to understand sustainable consumption practices requires: i) the analysis of the relationship between consumer choice and welfare, ii) the analysis of constrains resulting from government policies and actions, undertaken by various associations on the internalization of environmentalists’ dispositions. The analysis will take place at both the individual psychological and social level as well as at the environment level. Thus, the analysis focuses on the concepts of habitus, reflexivity, secondary socialization, and consumer welfare, which we consider central in order to understand these practices.

As Illich (1977), Bauman (2008) and Kasser (2002) we also sustain that in modern society the demand for welfare is a difficult task, with damaging repercussions in terms of environmental, social and psychological individual well-being. In this sense it is considered that: i) the effects of eco-industry are insufficient to achieve sustainable development, ii) the need to meet consumer issues, such as consumption level and pattern, consumer expectations and behaviors, the nature of consumers decision-making processes and the importance of changing attitudes, behaviors and expectations in favor of clean products, reducing environmental impact, and iii) the constraints of social and cultural context in the definition and constraint of individual choice. Finally, we stress the importance of policy intervention in promoting moral and social behavior (Dawkins, 2001).

The empirical analysis aims to characterize the relationship between the government, the market and society in the definition of public policies concerning sustainable consumption in Portugal.
WHICH CONCEPTION OF SUSTAINABILITY FOR SUSTAINABLE PUBLIC PROCUREMENT?
Ronan Le Veau1
1UMR Innovation, MONTPELLIER SUPAGRO, Montpellier, France

Abstract: Sustainable consumption does not only concern individual consumers. In many countries, notably in France, “sustainable procurement” of local and central governments is also recognized as an important political task. But, to which development model does sustainable public procurement refer?

To explore the conception of sustainability that is associated to sustainable public procurement, the author has observed the content of some ninety “normative documents” drafted by various French entities (local governments, NGOs, government agencies, etc.) and international organizations (European Commission, OECD, etc.). These “normative documents” consist of regulations, guides, manuals, reports on experiences, and so on, and have all in common to present the good practices that should be followed in the name of sustainable public procurement.

The author shows that these documents envision a more or less wide range of good practices that is related to different conceptions of sustainability. Three types of justification for sustainable procurement are distinguished: “dubly winning purchasing”, “overall winning purchasing”, and “morally responsible purchasing”. What is at stake is very concrete. For example, if the first argument predominates, notably because of budgetary tensions, sustainable procurement concentrates on energy efficiency and forsakes fair trade goods or the products of organic agriculture. Then, the identification of these three justifications also strives to avoid having current thinking about sustainable public procurement refer only to the first (or first two) of them.

WHAT CAN THE LITERATURES ON WELFARE REGIMES AND VARIETIES OF CAPITALISM TELL US ABOUT THE ROOM FOR CONSUMER SELF-REGULATION AS A STRATEGY FOR SUSTAINABLE CONSUMPTION IN NORWAY AND THE UK?
Sjur Kasa1
1CICERO, UNIVERSITY OF OSLO, OSLO, Norway

Abstract: Among current efforts to spur sustainable consumption, there is a bias towards various branding and labelling efforts that aim to regulate the environmental consequences of consumption through individual choice. I perceive this turn towards individual self-regulation as a regulatory tool to make consumption more sustainable as intrinsically linked to the rise of the regulatory state. In contrast to classical liberalism, neo-liberal forms of regulation put a stronger emphasis on markets, but do not simply denote state withdrawal and “laissez-faire”. Rather, the regulatory state differs from former goal-oriented and interventionist state forms by seeking to establish new procedural routines aiming to assist markets in functioning better and thereby presumably produce superior outcomes. Modern self-regulation takes place under close state monitoring and with the deliberate use of incentives, information measures and various kinds of hands-on/hands-off network facilitation, as we can see many examples of in the field of sustainable consumption. There is a large literature on the legitimacy and efficiency of self-regulation as a tool for encouraging sustainable consumption but little research on the factors that shape policies aimed at encouraging sustainable consumption. Such regulatory policies are strongly path-dependent, attributing different responsibilities to state bureaucracies, interest groups, firms and individuals. So far, consumption practices and regulations have had a marginal position in broader typologies of welfare regimes and varieties of capitalism. In this paper, I discuss to what extent differences between the shape and ambitiousness of government policies in encouraging sustainable consumption through individual self-regulation in two different national settings – Norway and the UK – can be said to be structured by varying relationships between state and individual in the two countries roughly similar to the ideal types suggested in the literature on welfare regimes (social-democratic vs. liberal) and the production-oriented literature on varieties of capitalism (liberal vs. coordinated market economies).

CULTIVATING OPPORTUNITY IN THE SOIL OF CRISIS: NEOLIBERALISM, CONSUMPTION, AND THE LOCAL FOOD MOVEMENT
Stefanie Torlai Stauffer1
1Sociology/Global Studies, UNIVERSITY OF CALIFORNIA AT SANTA BARBARA, Santa Barbara, CA, United States

Abstract: This project is an ethnographic study of the local food movement in Michigan and California conducted through urban agriculture experiments and participant observation of farmer’s markets, urban farming non-profits, farmer’s cooperatives, community gardens, school gardens, restaurants, and local food distribution networks. Building on the work of critical globalization scholars, urban and environmental sociologists, social movement theorists, and the Frankfurt School, this project investigates how neoliberalism has altered food consumption patterns and how people have responded to those changes. A main premise here is that the adoption of neoliberal practices has encouraged states to deregulate, privatize, and thus commodify social services once provided for free (or at relatively low cost), creating a situation where people without monetary means to access these services have gone into debt or gone without. Couple this reduction in public services with rising unemployment rates and soaring fuel and food costs, and the result is a growing number of people who are subsequently unable to consume healthy, affordable food or provide for other basic needs. This project investigates how the local food movement has subsequently responded to this crisis of access by relocализing the economy and adopting more sustainable consumption practices in the face of the economic inequality, resource scarcity, and social fragmentation exacerbated by neoliberal hyper-production. We shall see explicitly that although neoliberalism has encouraged many people to consume the same cheap, mass-produced, low-quality goods available at large retail chains across the globe, it has encouraged others to do quite the opposite.

EATING BOBO IN PARIS. SOCIALLY TAGGED LIFESTYLE AND CONSUMPTION AS AN IDENTITY
Sabine Bognon1
1ENPC LATTs, Paris, France

Abstract: Created by David Brookes, the bobo phenomenon (bourgeois bohemian) holds a slightly different meaning in France than it does in the United States. Thanks to the well-established bourgeois
Abstract

The paper draws on the findings of a study of eating and drinking behaviour in contemporary Beijing. The research has a qualitative background and focuses on conventional actions during the meal, and on the study of verbal and non-verbal interaction. It took place in several dozens (mainly gastronomic) locales in Beijing between 1999 and 2004 and involved both observational materials and data derived from interviews. Some comparative data has been gathered in villages nearby Beijing as well.

The whole work has been conducted under the influence of Anselm Strauss grounded theory therefore it would be said that research generally has been aimed at creation of sets of interrelated theoretical categories, together with description of their conditional matrix and tracing conditional path between them.

The main idea of the whole project was to analyse eating and drinking interaction patterns in the context of their role in creation, maintenance and change of social bonds and hierarchy. One of findings of research is an observation that social bonds and social hierarchy are inextricably linked. Author’s aim is to defend and explain this thesis with support of gathered empirical material and with reference to some concepts which can be find in both Chinese and Western ritualistic studies just to mention:  

1. Condition of the participation situation two aspects has been distinguished: the aspect of the definition of a work of culture, and the aspect of the definition of its meaning, and then on their basis a typology of recipients – participants in the cultural activities has been created. The empirical data proves that suggested theoretical typologies help capture highly significant differences in the frequency of incidence and also in characterisations of participatory behaviour exhibited by each of the recipient types. Therefore emphasizing situational factors have a real impact on the process of the participation in culture and that they should be regarded in the study of the cultural participation.

2. Arts & Humanities, Universitat Oberta de Catalunya (UOC), Barcelona, Spain

Abstract: It is a constant in the literature that human beings are beings in need of myths, myths understood as narratives that bestow human life and experience with a meaning, ordering and regulating their everyday life practices in relation to this ‘higher’ dimension of meaning that is reminded and restored by the myth. However myths have not always worked the same way; they have not had the same structure, or told the same kind of narration in order to work, and accomplish their more constant function.

In this paper we will seek to depict the transformations (in structure and consequences) that myths have undergone in modernity; thus arguing at the end of our presentation that, at the moment, in late (or second) modernity we are facing a new form of myth which is disguised as contingent and is exercised through an act of consumption. Myths that seem to be ‘ad-hoc’, myths that seem to break that which myths are supposed to be, and exult the most individual, his (normally his) authenticity, the fluctuating moment, but which, dressed up as anti-myths, continue to exercise their very old function, and this is a rather effective way. We will use exami...
ILES FROM THE MOVIES AND ADVERTISEMENTS IN ORDER TO ILLUSTRATE OUR THESIS.

ILLEGAL DRUG- AND ALCOHOL USE IN THE NIGHT TIME ECONOMY – AN EDGECYCLE OF OVERCONSUMPTION
Jakob Demant 1
1Centre for Alcohol and Drug Research, AARHUS UNIVERSITY, Copenhagen S, Denmark

Abstract: A paradox appears in young adults’ intoxication on drug and alcohol in the Danish night time economy. On the one hand they strive for getting very intoxicated, mostly with alcohol, and on the other hand in keeping control, with drugs like cocaine and amphetamine. Stephen Lyng’s concept of edgework grasp the paradox of control vs. loss of control in the way he describes the identities gained from the skillfulness of keeping control in a self produced chaos (risk). But can the theory of edgework be used to grasp drug use in a controlled mainstream consumption site of the night club where the behavior when intoxicated on drugs is far more restructured that in the sub-cultural clubs or in street drug scene? The paper argues that edgework can be a fruitful concept in understanding this phenomenon of overconsumption if we address the social space that constitutes the setting for the edgework. The edge for the young mainstream clubbers is exactly produced in a context of the regulated consumption site where a high level of intoxication is expected. The edge is as such both social and bodily defined. Within this space mastering of over-consumption integrates one into an accepted consumption based youth society and as such produce an acceptable identity. This reflection of drug and alcohol consumption may be relevant also in order to understand other forms of overconsumption – gambling, shopaholics and compulsive-eating – that is likewise placed on the borderline of pathologic consumption within spaces where high consumption is expected.

SHOPPING WITH(OUT) CHILDREN: FAMILY AND CONSUMPTION IN THE SUPERMARKET ARENA
Rosalina Pisco Costa 1
1Department of Sociology/School of Social Sciences, UNIVERSITY OF ÉVORA, Évora, Portugal

Abstract: Sociological perspective on shopping time is usually undertaken from a gender point of view. In this presentation we prosecute a different look. Focusing specifically on shopping time with (or without) children, we conceptualize it as a “family ritual” (Wolinske Bennett; 1984; Imber-Black & Roberts; 1992; Gillis; 1996; Pleck; 2000). Family rituals are powerful tools to catch inner dynamics of both family practices and representations, namely the ones related with the central place of children in contemporary families. Sometimes invisible in consumption practices, children indeed play a major role in decision-making process of their parents. But children are also actors in context and the supermarket can be the arena where family presents itself. For the ones, to go with or without children is a question of option; for the others, there is no option at all. In this case, family faces other families whose behavior is accepted or refused, but always judged.

In this poster we specifically address shopping time involving parents and children in urban supermarkets. Methodological anchored upon empirical data from qualitative in-depth interviews carried out to parents with children within the age of 3-14 years old, this poster purpose is to present final data and concluding remarks on both practices and social representations surrounding contemporary families’ shopping times and contexts. Through an empiric and theoretical analysis of collected data we hope to critically highlight the sociological knowledge on relations between family, consumption time and children. Sociology of the family and childhood insights brought into discussion can enhance a both original and fruitful contribution to sociology of consumption debates.

THE ROLE OF THE CONSUMER IN NATIONAL MEDIA DEBATES ON ENVIRONMENTAL SUSTAINABILITY. A COMPARISON OF NORWAY AND FRANCE
Siv Elin Ånesved, Sophie Dubuisson-Quellier, Unni Kjærnes
1SIFO (NATIONAL INSTITUTE FOR CONSUMER RESEARCH), Oslo, Norway, 2Center for the Sociology of Organizations (CNRS), PARIS, France

Abstract: Sustainable consumption is receiving increasing political and academic attention in policies for environmental sustainability. There is a general call for measures aimed at promoting consumers’ voluntary engagement in sustainable development, e.g. through product labelling schemes. However, how the notion of consumer responsibilities is constructed depends on the political system, market conditions and people’s everyday practices. To better understand the role of consumers in relation to sustainability in different national contexts, we conduct a comparative analysis of the media discourse in Norway and France. In Norway the current focus on consumer involvement has developed from a tradition of steering consumption through direct regulatory intervention, whereas France would be characterized by a more recent tradition of sustainable consumption policies. Our discussion is based on a content analysis of relevant articles published in the five most important newspapers in the countries over a ten year period. We emphasise five main issues 1) how the issue of sustainable consumption is defined as a public issue, 2) the main actors involved in the debates and conflict alignments, 3) images and roles of consumers presented, 4) the main consumption areas highlighted and discussed as problematic (textiles, chemicals, meat, energy, housing, water, waste, mobility etc.) and 5) how consumers are presented in social mobilization and as agents of change. Our study allows us to assess the way these different national framings of consumers’ responsibilities arise from the interlocking between public policies, provisioning systems for various products, and national issues emerging as key subjects for a transition towards sustainability. The paper describes what is presented as unresolved issues for making consumption more sustainable, and how these are to be addressed – through direct public regulation of pricing and legislation, product labelling, education, local/community initiatives, or so-called “partnerships” between public, commercial and other social actors.

Abstract Book
125

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: In this paper our aim is to analyse the way the relationship between health and food has been changing at the same time as Spanish society itself. From the beginnings of the consumer society until the present day the modernization process has made its imprint on the guidelines public bodies have issued to the public on caring for their health and diet. Beginning in the sixties with a welfare idea of a healthy diet, very typical of the decade, and meant for a population with nutritional problems, today we have guidelines for an overfed population. The social trends dominant in each historical moment are shown throughout this transformation process and the dietary recommendations have been part of the social change. However, the perceptions of the administration itself on what constitutes a healthy diet have also made their mark on the criteria. The modernizing nature of the paternalistic administration of the sixties can be easily seen in contrast with the public bodies of the eighties competing with the messages from the food and agricultural businesses. As the 20th century drew to a close, dietary advice was in keeping with a background dominated by considerations on the nature of social change and in which both public bodies and citizens trusted in the truths of science as a reference point for correct action. At the beginning of the 21st century reflexivity and questioning of scientific power appear and also an increase in public preoccupation with food risks. Each stage is analysed relating historical background and dietary recommendations.

MEDIA, FOOD & MORAL: THE TRINITY OF GOOD COOKING
Sascha Qvortrup

Abstract: Media, food and moral.
This paper tend to investigate “good cooking” as an enactment of negotiated moral practice. Methodologically I have combined textual discourse analysis (Aakerstrøm, 1999; Foucault, 1984) of Danish food magazines published in the period 2000 till 2010 with participant observations in 10 families (Hammersley and Atkinson, 1995) The participant observation was experimental and intervening fieldwork (Marcus & Fischer 1999) through the use of cultural probes (photos, foodstuff ingredients, objects etc; Gaver, Dunne & Pacenti 1999). I have observed “good cooking” as an enactment of practical morality in relation to the level of magazines in relation to the level of users. Through the analysis, I investigated to what extent the magazines’ showed knowledge dissemination articulate values and norms and to what extent the users negotiate and accept or reject these values and norms. I have focused on two aspects: 1: How is “good cooking” articulated over the period 2000 to 2010, and how can the discursive strategies be localized. 2. How does the discursive strategies of magazines create different generalised dispositifs and how do they relate to the “good cooking” in the families. It seems as the norms are articulated in a modern version of the anti trinity of: the good, the truth and the beautiful/prettty (Platon, 1975) transformed into : the good, the healthy and the beautiful/prettty. The trinity is reflected in the concept of negotiated narratives of “good cooking” by the food responsible in the family articulated in shopping, cooking and interaction between family members, food responsibilities and Articulation from the institutions. The good cooking as a negotiated moral practice is created as a narrative the family live by.

A SUBURBAN HOUSE AS A GENDERED PATTERN OF VALUE CONSUMPTION. THE CASE OF PIERĪGA
Gunta Darbina, Agita Luse

Abstract: Before the global economic crisis, Latvian families strove for own house. During the previous decade the expansion of the Riga suburb Pierīga was facilitated by easily accessible mortgages. A life in the suburb became a way of consuming values. The middle-class in particular, strove to confirm its “elective belonging” (Savage, 2005). Belonging to a place is related to self-esteem and rais-
ing and educating the children. The orientation to these values is markedly shaped by gender.

For example, a consumption-oriented economics affected women’s identities in Britain in the 1920s-1950s when development of suburbs gave rise to a concept of the ideal house with its consumer housewife (Gile, 2007).

Within the framework of her doctoral research, 1st author took part in a study on the Pieriga inhabitants’ attitude to their place of residence (SKDS, 2009). The survey showed that satisfaction with different aspects of life there was quite low. That can be explained by the specific pattern of the suburban development, strongly influenced by an intensive land market and resulting in scattered housing schemes with no common planning, nor infrastructure.

We conclude that the new suburban zone failed to provide the middle class of Pieriga with an “elective belonging”. The high ratio of divorced families and low average income mean that women have to balance their identity of consumer housewives with efforts to preserve their homes.

DEINDUSTRIALIZATION AS MATERIAL CULTURE: FROM ABANDONED OBJECTS TO CONSUMPTION

Liviu Chelcea 1

1Sociology, University of Bucharest, Bucharest, Romania

Abstract: As other cities in many parts of the world, Bucharest underwent substantial deindustrialization during the last two decades. This has produced a large number of abandoned and unclaimed objects. Some are moveable, while other are immovable. Evacuated as an economic practice from the urban core, these ex-industrial objects gained new material and symbolic value. Underclass families, heritage protection groups, artists, ‘urban explorers’ and urban flaneurs use these objects in a variety of ways. I will describe how these groups transform these objects into items of consumption, either as material or immaterial commodities (pictures, scrap metal, art installations or blogs), heritage objects or new aesthetic forms. The research, carried out between 2008 and 2010, is based on observation of several abandoned industrial sites and participant observation among people who visit and extract objects and meaning from such sites. I engage with literature on deindustrialization as material culture (Mah, Alice, 2010, Memory, Uncertainty and Industrial Ruination, Int. Jour. of Urban and Regional Research, 34.2:398-413; Edensor, Tom, 2010, Industrial Ruins Spaces, Aesthetics and Materiality, Oxford: Berg), the social life of objects (Appadurai, Arjun ed., 1986, The Social Life of Things, Cambridge: Cambridge UP), voluntary risk-taking (Deborah Lupton and John Tulloch, 2002, Life would be pretty dull without risk, Health, Risk and Society, 4.2:113-124), sensory overstimulation and tourism (Simmel, Georg, 1906, The Metropolis and Mental Life; Urry, John, 2002, The Tourist Gaze, London: Sage). The research emphasizes the potential of abandoned, residual objects to become objects of consumption.

TASTE THE DIFFERENCE: SLOW FOODS AND THE SOCIOALITY OF THE SENSES

Dana Bentoia 1

1Sociology Department, LANCASTER UNIVERSITY, Lancaster, United Kingdom

Abstract: Taste has acquired an almost infamous status as a marker of distinction, as a determinant of hierarchical forms of inclusion and exclusion, and as a relatively stable reflection of identities. In this way, taste came to occupy an uneasy and tense position in respect to current social, political and environmental challenges posed to food production and consumption.

More recently, social scientists have come to devote a new focus to the relationship between food and taste in ways which question the solidity of the concept of taste and thus to highlight new facets and understandings of what it means to consume and be a consumer (i.e. Warde et al. 2007 on the cultural omnivore; Soper 2007 on the alternative hedonist; Mol 2009 on the normativity of good taste). Along such developments, social movements and groups such as the international Slow Food Movement provide ongoing forms of interrogating the notion of the eater in its various roles as consumer, producer, citizen, and human inhabitant of this planet.

Based on ethnographic research on the practices of the Slow Food Movement pursued in Britain, the paper explores distinctive aspects of the nature of relationship between food and taste by focusing on the embodied and situated aspects of tasting, dining, buying and crafting certain foods and dishes. It contributes to unfolding debates (mentioned above) in showing how such slow food practices reveal taste as a process of training and formation of skills and knowledge and as deeply entangled with various forms of sociality. Thus, relational and multi-sensuous dimensions of taste not only undermine beliefs regarding the difficulty of changing tastes but also uncover taste as a practice generative of creativity and difference.

VISUAL SACRIFICES - THE APPEARANCE OF THE BODY, DESIRE AND FEMININITY IN HOLLYWOOD'S LOVE STORIES

Ana Rodriguez-Granell 1, SWEN SEEBACH 1, NATÀLIA CANTÓ-MILÀ 1

1ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain

Abstract: Since the beginning of the last century society has undergone significant changes. This paper is based on the assumption that these changes are anchored in the social developments of late modernity, the change from capitalist society based on production to capitalist society based on mass consumption. In this process towards a society of mass consumption, society not just turned towards consumption as a means to satisfy needs and desires but we and our interactions with others have changed into objects of consumption. One important element shaping and channeling this transformational process has been the cinema. In watching and identifying with images on the screen and by relating the projected images back to ourselves we have slowly learned to perform the illusionary images, to speak using the forms and shapes and phrases of visual cineastic language and to see and perceive ourselves and the others like they would be mediated by a screen. This paper attempts to explore the hypothesis that the most crucial changes taking place in late modernity shaped by mass media (especially the cinema) have been related to the changed perception of our materiality (our human body) and touches especially those spheres of social life in which the body plays a crucial role. Furthermore, the imaginary play on the screen takes especially those dimensions into account that had been foremost closely related to the body, namely desires and emotions. The presentation of emo-
tions, desires and the body are therefore crucial in analysing the disciplinary regulative character of movies.

The objective of this paper is to examine the ways in which the imageries of the body, desires and emotions in movies have contributed to social developments in late modernity. This paper will present a discursive text and film analysis of 5 movies: *Revolutionary Road*, *Existenz*, *Black Heaven*, *The Pianist* and *The Matrix*.

EMBEDDED CONSUMERISM: TOBACCO, MOTORBIKE, AND PC

I-Liang Wahn

1sociology, UNIVERSITY OF ESSEX, Colchester, Essex, United Kingdom

Abstract: Rapid economic growth in East Asia brought specific consumer revolution that is seldom examined in existing sociology of consumption. Instead of assuming universal and converging consumerism, this research set out to explore how development shape East Asian consumers.

By comparing consumption patterns between Taiwan and the United Kingdom, this research attempts to characterize the difference between emerging and traditional consumer society. And by focusing on three commodities featuring different historical stage: Tobacco, motorcycle, and personal computer, this research examine developmental influence on consumer practices. Twenty semi-structured interviews are carried out with consumers from each society after online forum observations. Discourse analysis is applied on narratives thus collected, focusing on how consumption practices are learned and imitated from others.

This comparison discovered common ways consumers construct practices through institutional structures and attribute meanings to commodities through social networks in both societies. Yet memories of socio-economic transformation played a stronger role in Taiwan as consumers drew on history to understand and recreate specific practice. Personal history intersects economic history, transforming consumption as generations replace one other. Rapid transformation thus facilitated the condition for the formation of multiple consumer cultures.

HERO OR HELPER? FINNISH SOCIAL WORKERS’ ACTUANTIAL POSITION IN ALCOHOLISM TREATMENT

Michael Dieter Egerer

1Department of Social Research, UNIVERSITY OF HELSINKI, University of Helsinki, Finland

Abstract: In Finland alcoholism is considered traditionally as a social problem and handled accordingly. Recent studies suggest a convergence of drinking culture, alcohol policies and treatment approaches in the Western countries: Secondary prevention, and a consideration of alcohol consumption as an individual lifestyle issue replaces population based measures aimed at reducing total consumption.

The purpose of this study is to show how social workers, not working in institutions specialized on addiction treatment, perceive alcoholism and alcohol problems and in which position they see themselves in its treatment in the context of changing alcohol policy and treatment approaches.

Eight focus group interviews were conducted with Finnish social workers. Film clips serve as discussion stimulus. The short vignettes show incidences of alcohol problems taken from fiction movies. The three clips follow thematically loss of control, harm of loved ones, and cue-dependency. The transcribed interviews were analysed by coding them on biological, psychological and social contextualisation of alcoholism. By using a Greimasian actantial model onto this first organisation of the interview narrative it is shown where the social workers place themselves in the treatment process.

Social workers consider alcoholism as a social problem and focus on the alcoholic’s close-ones. They consider themselves as the subject of the fight against these symptoms of alcoholism. Their sender is the Welfare State and the receiver of their work the alcoholic’s family and society in general. Their opponents are the social problems connected to alcoholism, but not alcoholism itself. In alcoholism treatment they are only helpers. The “hero” of curing alcoholism instead is specialized drug service and therapy there, in which normal social workers are not involved. Therefore, social workers still follow the Finnish non-medical approach and leave treatment of alcoholism itself to specialized institutions.

MORAL BOUNDARIES AND BELONGING: ATHEISTS AND HOMOSEXUALS

Murat Ergin

1Sociology, KOC UNIVERSITY, Istanbul, Turkey

Abstract: This presentation examines the nature and limits of the acceptance of atheists and homosexuals in Turkey. Moral boundaries delineate symbolic distinctions that are based on both inclinations and exclusion. Despite the relatively lower and declining levels of prejudice against ethnic and religious minorities as well as foreigners in surveys, moral boundaries drawn concerning non-believers and homosexuals remain strong. The data come from a recent nationally representative survey collected in the project entitled “The Construction of Cultural Boundaries: Relations between Cultural, Socio-Economic and Moral Status Symbols in Turkey” (2011, N=1893). Results show that the distrust of homosexuals is significantly higher when compared with atheists, although both groups are among the least likely to be accepted. The existing literature on the way in which race, ethnicity, gender, social class, and education are implicated in drawing social and cultural boundaries against the perceived “others” in different societies is rich. Although the limits of acceptance toward both homosexuals and atheists are driven by a number of demographic predictors that are related to education, social location, gender, and class, this study also demonstrates that the hesitance to accept these groups is as much rooted in symbolic boundaries as it is in cultural and consumption patterns. The presentation offers a theoretical view to understand moral membership and exclusion in contemporary Turkish society.

PATHWAYS AND SPEEDWAYS TO GAMBLING ADDICTION

Pekka Sulkunen 1, Maija Majamäki 1, Virve Pöysti 1

1social research, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Gambling may lead to addiction. Several factors, including personality, availability of games, types of stimuli offered by the game and the social environment, have been shown to be potential...
risk factors. No coherent theory, however, currently explains how these factors are related to each other and what forms of gambling and gambling behaviour are more prone to generate dependency. This paper presents elements for such a theory derived from the IMAGES approach. Social behaviour is governed by holistic images that structure our understanding of diverse material and immaterial elements. These images make the world significant and understandable to us and influence both the way we perceive the world and how we act in it. It is likely that the structure of those images is related to the addictive potential of gambling behaviour. Using qualitative group interviews among active players in Finland and France as phenomenological evidence, we hypothesise that some images of gambling are more prone to lead to addiction than others. We argue that the insight and experience of active gamblers on the images of gambling behaviour and potential risk factors leading to gambling addiction can be utilised to construct a theory of potential pathways and speedways to addiction.

**HYBRID CONSUMPTION PRACTICE A QUALITATIVE ANALYSIS OF CONSUMPTION STYLES OF CHILDREN OF IMMIGRANTS BORN AND BRED IN ITALY**

Luisa Leonini¹, Lorenzo Domaneschi¹

¹dept. of Social and Political Studies, UNIVERSITY OF MILAN, Milan, Italy

Abstract: The paper presents the main results from two empirical researches in the urban area of Milan focused on the teenage children of immigrants consumption styles and their dealing with material culture. It claims that sociological approaches to consumption and material culture in the case of everyday life of the children of immigrants reveal themselves as essential in both an investigation of ethnic identities and a critical review of actual consumption studies. Consumption styles in Western country have, in fact, usually been considered as a typical reference of the white, bourgeois, mainstream culture (Brewer, Trentmann 2006). Hence the construction of cultural difference has been developed also through the claim of different consumption styles and the rising of so-called ethnic youth subcultures. However our research on consumption of the children of immigrants shows that the Italian culture as “the majority group”, especially in the area of consumption styles, is not an established and shared dominant model for these young people.

At the end of such a double qualitative analysis focusing on representations of taste by a sample of youngsters from different national origins, born or bred in Italy, new potential profiles of consumers emerge as well. The meaning itself of being a consumer appears in those cases rather less as a linear process of constantly approaching to a given standard of national values, than it is a practical process of “learning by doing”, as much conflicting as creative in its social effects. Finally, young children of immigrants consumption practices seem to be sociologically explained by empirical encounters between situated commodities and embodied agents. In this vein, the purpose is here to pay attention on the very ambivalent role played by material culture in structuring the relationship between consumption and identification.

**"NECESSARY" CONSUMPTION AND CONSUMPTION NORMS IN FINNISH CONSUMER CULTURE**

Terhi-Anna Wilska¹, Rikka Aro¹

¹Dept. of Social Sciences and Philosophy, UNIVERSITY OF JYVÄSKYLÄ, Jyväskylä, Finland

Abstract: Problems related to consumers’ “real” needs and “necessary” consumption have been under heavy debate both in research and media recently. The discussion is connected to larger issues of economic growth and de-growth, well-being of individuals and ecological and ethical values. In this study, we focus on the connection between economic well-being and perceived necessity of certain durable goods and leisure time services. We also aim to find out connections between the perceived necessities and consumers’ attitudes in 1999, 2004 and 2009. Our research data is derived from “Finland 1999-2009”-lifestyle surveys.

In poverty research, in particular, consuming less and thereby not leading an acceptable, conventional and “normal” lifestyle, is usually regarded as a sign of poverty and deprivation in consumerist societies. This is the case regardless of the fact that voluntary simplicity and de-growth are topics that have been widely discussed for decades. However, the perceived “normal” consumption level has kept growing and simplistic lifestyles have remained marginal. Deviations from consumption norms are typically seen as abnormal behaviour. This is why we should focus on the ways the connection between consumption and well-being in society are talked about, as well as how consumerist lifestyles are being supported and strengthened.

Previous studies have revealed that people’s perceptions of sufficient and reasonable consumption standards in relation to their own economic situation are not necessarily related to their actual income. Also experiences of reasonability and necessities are dependent on people’s social background, age and life course stage, values, attitudes and expectations.

According to our research results, almost all goods under examination were regarded as necessities more often in 2009 than in previous years under examination. The changes were particularly notable in items related to new technology. There was not much change in leisure time services, such as travelling or culture. We also noticed connections between high subjective economic well-being, high income and perceiving expensive goods, such as cars or computers as necessities. However, consumerist attitudes still seemed to have decreased between 1999 and 2009.

**THE PECULIAR FEATURES OF CONSUMER BEHAVIOR IN CONTEMPORARY RUSSIA**

Nikolaj Narbut¹

¹Sociology Chair, PEOPLE’S FRIENDSHIP UNIVERSITY OF RUSSIA, Moscow, Russian Federation

Abstract: Transformations in Russian society have given rise to the peculiar consumer patterns which can be described as inherently contradictory. On the one hand, the consumption patterns in contemporary Russia are set by the Western model typical of all the “consumer societies” which can be described by the proliferation of status consumption imposed by advertising and emerging as a cornerstone of the socioeconomic structure characterized by increased prevalence of service sector and marketing systems involving consumer behaviour patterns which are of benefit to them. However, unlike Western system which has taken shape as a result of “the general welfare society”, where the problem of access to basic consumer goods is not posed any more, the Russian one, on the first hand, emerged at the time of commodity deficiency so that the
contemporary generation, which can afford most goods at present, still remember the time of queues and is by no means always ready to develop rational choice patterns amid the contemporary abundance of goods. On the second hand, the context of Russian system development does not still involve the access of the majority of the population to many commodities due to their insufficient income.

The first of the above-mentioned factors gives rise to the unrestricted consumption, thoughtless buying of luxury goods and gadgets by the elite encouraging the “middle class” to outrageous expenditures to achieve the delusive feeling of belonging to the elite (sometimes even at the expense of basic needs satisfaction). As far as the second factor is concerned, it can entail not merely the rise of consumer inequality but also social tension escalation affecting in a specific manner the consumer patterns of low classes who are eager to “domesticate” the images of advertising by means of surrogate and counterfeit consumption and other imitations of the elite status.

The thesis is also confirmed by empirical studies results which show, for instance, that in spite of lower living standards Russian females spend more on their clothes than the French ones (with due consideration of the “climatic” parameters).

The application of the concept of reflexivity coined by Giddens seems to be of heuristic value here to develop an explanatory model of consumer behavior in contemporary Russia.

APATHY, ANGER AND AGENCY: CONSUMER RESPONSES TO GLOBALIZATION

Stefanie Torlai Stauffer 1, Nicki Lisa Cole 2
1Sociology/Global Studies, 2Sociology, UNIVERSITY OF CALIFORNIA AT SANTA BARBARA, Santa Barbara, CA, United States

Abstract: A wave of discontent is spreading today across the world in response to the economic, political and social externalities of the widespread adoption of neoliberal policy and practice. As neoliberal globalization has encouraged the automation and outsourcing of production, the downsizing of government function, and increasing rates of environmental degradation, cultural homogenization, and social fragmentation, the responses to this global system have been diverse. Some responses have been nationalist, fundamentalist, regionalist, or simply reactionary, while others have been driven by a desire to consume ethically, or to consume less altogether. Here we examine the ethical consumption of coffee and the local food movement in order to better understand what values and experiences encourage people to support such projects for sustainable social and economic change. Through analysis of these distinct cases we highlight the striking similarities and key differences among participants’ values, experiences, identities, and practices (as well as their complexities). Similarities include an ability to trace problems to the dominant system of production and consumption, a concern for environmental and economic sustainability, and a desire to enact change favoring small, independent producers, while differences include political sensibilities, economic motivation, and levels of community support. Overall, we argue that class, race, demography, individual experience and community history shape divergent responses to globalization and we conclude by offering a spectrum of consumer behavior that aims to more readily identify values and practices associated with sustainable social change (while noting which factors would challenge and stall that change).

ENERGY CONSUMPTION AND THE CONSUMERS’ POINT OF VIEW

Nina Heidenstrøm 1, Pål Strandbakken 1
1NATIONAL INSTITUTE FOR CONSUMER RESEARCH (SIFO), Oslo, Norway

Abstract: Contrary to public beliefs and media focus, consumption will not necessarily always increase. During the last 20 years, electricity consumption in Norwegian households has stabilised and even decreased. This unexpected development has so far not caused any headlines; neither in the scientific nor in the political discourse. But seem to cling to a focus on fiasco rather than on success. But in a time of potentially very serious climate change, the occurrence of a decrease in domestic energy use in a rich nation like Norway is both politically relevant and academically challenging, most notably since it has occurred during a period of strong economic growth.

The paper will focus on some of the measures consumers (or households) do or wish they could do, such as improving the insulation, installing heat pumps, recycling or lowering the indoor temperature. By using new results from a national consumer survey, we are able to investigate whether there are interesting discrepancies between the measures consumers think of as effective, and measures they think of as easy to implement. Further, we will consider questions of consumers’ expectations of how fast an investment in energy saving measures should pay off. Survey results indicate that 93 per cent expect their investments to pay off financially within 5 years. This means that some of the more advanced, and hence expensive, heat pumps are probably not competitive in the market place, without governmental price subsidies. It also indicates that consumers as house owners do not see energy motivated investments as contributing to real estate value, but are focussing solely on direct energy use.

These survey findings and questions/themes will be introduced in focus group interviews with consumers from different household types. Here, we will try to emphasise some of the challenges consumers might meet when trying to reduce their energy consumption; investment of time and money, gathering information or changing their habits.

“UNTIL IT BREAKS OR I LOSE IT, I’M NOT GOING TO CHANGE IT.” - EXPLORING TEENAGE CONSUMPTION THROUGH THE LENS OF DIVESTMENT

Rebecca Collins 1
1Geography, UNIVERSITY COLLEGE LONDON, London, United Kingdom

Abstract: Young people are widely recognised as some of the most committed consumers. At the same time, they can be vocal citizens, agents of potentially significant social change and, frequently, ready and willing to act in line with their principles. As such, they inhabit a powerful position at the nexus of consumption and sustainability. Yet research with this group, particularly older adolescents, has remained sparse and has often failed to connect with wider consumption subthemes. The research presented in this paper aims to address this gap and reports on the empirical findings of work with 26 young people aged 16-19, in UK schools.
While consumption research with teens has focused on processes of acquisition, how young people experience and enact subsequent phases of consumption has remained neglected. In this project the aim has been to explore young people’s attitudes towards the consumption of material possessions through the lens of divestment. By exploring how decisions about ridding, wasting, giving away and generally ‘getting rid’ are made and enacted, I suggest that a more nuanced picture of what consumption means and involves for young people results. Further, since the nature of divesting personal possessions necessarily locates the decisions and processes firmly within the context of the home and family, I explore the extent to which teens’ embeddedness in close social networks governs the choices they make, and the extent to which a family-based divestment habitus might be reshaped by individual experiences beyond the home.

ADVERTISING AND THE PERFORMATIVE CONSUMPTION OF THE CITIES
Stefania Antonioni
1

1Department of Communication Studies, UNIVERSITY OF URBINO CARLO BO, Urbino (PU), Italy

Abstract: Contemporary audiences can be described as more and more active or, to be more precise, performative and diffused (Abercrombie&Longhurst). Nonetheless nowadays we have to address to audiences as to networked publics (Ito), facing social, cultural and technological shifts leading us to a different amount of involvement by digital media.

So networked publics broaden their chance to create, post and share all type of contents (video, images, texts, etc.) in a new wider public space that witness the creation of a convergence culture (Jenkins). In this sense the amount of user generated contents, but also the time spent in producing them, arises the “new” character of the prosumer, an hybrid of productive consumer of material and immaterial goods (Toffler, Ritzer, Fabris).

Considering the new shape and way of feeling of these creative publics, more and more enterprises, brands, companies and corporations are taking benefits of this new frame, especially using the strategy of crowdsourcing (Brabham, Howe), but also other practices of productive engagement in advertising and promotion at large. Particularly interesting is how brands and companies use urban spaces to build this sort of connections with consumers, but also how people uses cities and in the meantime nowadays and disseminate their personal meanings on them. In fact contemporary forms of advertising based on urban spaces, such as ambient advertising, guerrilla advertising and all the so-called non conventional advertising, reflect the logic of digital media, that is to say improve engagement, creativity, self expression, connectivity. All of them are subjectively performed by city users, that can subsequently disseminate them further in social network sites, with geolocalization, etc.

So the aim of this paper is to give its contribution to the analysis and thinking on this topic, collecting several examples of these practices taken in a global scenery.

BUILDING LUDIC TERRITORIES IN BARCELONA AND LISBON: URBAN TRANSFORMATION, LEISURE, TOURISM AND CONSUMPTION

Patricia Pereira 1, Luis Baptista 1, Jordi Nofre 1
1CesNova, Faculdade de Ciências Sociais e Humanas, Universidade Nova de Lisboa, Lisboa, Portugal

Abstract: In most capitalist cities, the economy of leisure has become one of the main strategies for the renewal of their spaces. The celebration of great events transfigures urban everyday life and space by creating ludic territories. In Lisbon and Barcelona, Expo 98 and Forum das Culturas, respectively, led to the transformation of inner city waterfront areas, formerly occupied by heavy industry, storage and working class residents. These activities and inhabitants were displaced and replaced by service activities and local and global new middle classes. Focusing in both cases of Fórum (Barcelona) and Parque das Nações (Lisbon), this presentation highlights the role of urban leisure and consumption in the renewal of former marginal urban spaces. It includes a description of the main urban transformations and of some aspects of day to day life in these new territories, but also a debate on how the concepts of Bryman’s Disneyization, Ritzer’s MacDonaldization and Hannigan’s Fantasy City can be used to analyze both study cases. The presentation contributes to the debate around the path of Western postfordist cities towards becoming puzzles, divided into distinct/fragmented neighborhoods, where intrusions and disorders are minimized and a “social class”-led environment is presented through architecture and urban design, landscape, costumes, cultural practices, urban entertainment and themed stores.

Keywords: Disneyization, McDonalidization, Urban transformations, waterfronts, Lisbon, Barcelona.

KEEPING COOL: CLIMATE CHANGE POLICY AND THE TINY DETAILS OF DAILY LIFE

Elizabeth Shove

1sociology, LANCASTER UNIVERSITY, Lancaster, United Kingdom

Abstract: This paper tracks one bit of climate change policy from its formulation within government through to its consequences for the tiny details of daily life. In the process, it engages with a range of more fundamental questions about how policies have impact on what people do and on related patterns of consumption and practice. I consider the case of Cool Biz, a programme launched by the Japanese government in 2005. Under Cool Biz, the government’s
own buildings were not cooled until indoor temperatures reached 28 degrees C. Occupants were expected to adjust their clothing to suit. Various measures were taken to persuade businesses and companies to adopt the same strategy. Government ministers were, for example, shown wearing lightweight clothing. Ambassadors participated in fashion shows run by the ministry of environment, and the department stores were involved.

By any standards, this programme has significantly reduced the energy used for air-conditioning. It has also transformed social conventions of office life. In particular, male office workers no longer expect to wear a jacket and tie during the summer months. Although this might seem like a simple solution, conventions of clothing are embedded in traditions and institutions of power, respect and social status. From this point of view, adopting Cool Biz was anything but simple.

Interviews with those involved in making and responding to Cool Biz reveal the different registers across which this policy plays out and gives a sense of the many varied settings in which it is enacted and resisted for real.

In reflecting on this case I discuss the possibility that Cool Biz represents an accidentally powerful intervention that succeeded not because of the ideas around which it was designed, but because of how it became embedded in the tiny details of daily life. In conclusion I explore the wider implications of this case for social theories of behaviour, consumption and practice, and for climate change policy.

SURVEILLANCE OF MUNDANE CONSUMPTION:
LOYALTY CARDS AS A CONSTRUCTION OF CONSUMERS

Sami Coll 1, Jason Pridmore 2

1 The Graduate Center, The City University of New York, New York, United States, 2 The DigiDeas project, Zuyd University, Maastricht, Netherlands

Abstract: Over the past few decades, retailers have collected massive amounts of data on a daily basis through loyalty card programs. These serve to gather at the point-of-purchase the identity of the consumer, date and time of the transaction, and a list of products purchased. As an incentive, these programs enable consumers to collect points or miles for each purchase, which then can be converted to rewards or access to special offers only available to card owners. They are part of a relationship marketing paradigm that relies upon precise data on consumers in order to establish a personalized and long-term relationship with them.

This paper argues that loyalty programs make the mundane, everyday practices of consumption into important building blocks for the performance of economies. In this process, consumers are ‘created’ with varying levels of significance through an increasing level of surveillance. That is, with the (usually) voluntary participation in loyalty programs, consumers are deemed worthwhile or not through a “purposeful, routine, systematic and focused attention paid to personal details” that exists to control, manage, influence and entitle consumption practices (see Lyon 2001). This surveillance has both significant social and socio-economic implications as well as raises concerns about the usefulness of personal privacy in its current form.

The paper draws on two significant studies of loyalty cards, made in Canada and in Switzerland, both of which begin to demonstrate the potentials and problems of contemporary marketing practices in general and the issues and implications of loyalty card marketing in specific.
THE ASYMMETRIES OF EUROPEAN GOVERNANCE AND THE CRISIS OF PORTUGUESE CAPITALISM

João Rodrigues, José Reis

1Centre for Social Studies, 2School of Economics and Centre for Social Studies, UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: The recent turn in European integration, from a process based on cohesion to another based on competitive asymmetric relations, has deep consequences for Portuguese capitalism. The structural imbalances between central and peripheral countries, at the core of the recent eurozone crisis, and the austerity policies now being pursued with great intensity in the latter can be seen as the main expressions of the lack of resilience of the asymmetric configuration of the European integration with important consequences for Portugal. This asymmetry refers to: 1) the way the single market and monetary integration coexist with increasingly heterogeneous social, labour and tax regimes at the national level; 2) the differentiated impact of the single market on existing varieties of capitalism, particularly on the peripheral ones; 3) the absence of non-deflationary policy instruments, both at the national and European levels, which might block the transfer of the brunt of adjustment to labour, particularly in a context of pressures in financial markets and imbalances in the current account positions of European countries. The question raised by Jean Monnet in 1955 – “is it possible to have a Common Market without federal social, monetary and macro-economic policies?” – must become central in discussions about the future of European integration and the Portuguese economy therein.

This communication will analyse the Portuguese variety of capitalism in the context of the crisis of legitimacy affecting the European project as the more coordinated and egalitarian varieties of capitalism experience pressures for deregulation and peripheral countries, with more unequal capitals, experience the consequences of IMF-style policies of structural adjustment. It will be argued that these policies run the risk of perpetuating a socioeconomic regime, consolidated with the decision to join the Euro, marked by high levels of inequality, increased levels of unemployment and precarious work, very low growth rates and huge levels of external debt. A critique of the logic of austerity policies and an analysis of proposals to correct the asymmetries of European integration are needed in order to think about sustainable avenues for the Portuguese economy.

THE POLITICAL ECONOMY OF LABOUR RELATIONS IN THE EMU: IRISH NEOLIBERAL CORPORATISM IN CRISIS

Aidan Regan

1UNIVERSITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: Ireland is a critical case of embedded neo-liberalism that challenges many of the functionalist assumptions in the study of varieties of capitalism. It is said to lack the institutional preconditions for the emergence and institutionalisation of national corporatist policy making structures. The political party system is not configured on a left-right ideological basis, it has a pluralist administrative state tradition, trade unions do not encompass the majority of employees and it has a voluntarist collective bargaining regime. It has relatively high levels of income inequality, a liberal welfare state and an industrial policy premised on low tax foreign investment. However, between 1987 and 2008, ‘centralised wage bargaining’ or ‘social partnership’ became the default position of both labour relations and Irish politics. Seven national income agreements were negotiated between the representative interests of labour, capital and state. Whilst wage bargaining was central to negotiations the ‘social pacts’ covered a wide variety of public policies including fiscal, welfare and labour market policy. The nature of the bargain was not premised on a wide distributional agenda of social democracy but market competition. It was an institution of labour relations, constructed by the state, to manage the constraints of Europeanisation in a rapidly changing capitalist economy. But, despite twenty three years of ‘social partnership’, the government opted for a market led rather than a negotiated adjustment to the crisis. The paper will argue that the diminishing power resources of organised labour and the policy constraints of the EMU are central factors in explaining this shift in strategy. In this regard we need to bring power and politics back into the study of European varieties of capitalism.

"WEST EUROPEAN POLITICAL ECONOMIES IN CRISIS: WHAT HAS CHANGED SINCE THE 1970S?"

Jonas Pontusson, Damian Raess

1Political Science, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: Our paper will contrast the crisis of 2007-10 to the crisis of the mid-1970s in an effort to understand better how advanced capitalist political economies have changed. The origins and nature of the two crises were clearly different, following different phases of capitalist expansion. Triggered by sharp oil price increases, the crisis of the 1970s ended a period of energy-intensive Fordist mass production that boosted the union bargaining power. By contrast, the current crisis was triggered by bank failures and marked the end of an expansionary period characterized by the rise of finance capitalism. Notwithstanding these differences, both crises resulted in dramatic recessions of the real economy. Emphasizing trends that cut across the distinction between LMEs and CMEs, our account diverges from the “VoC approach.”

A striking feature of near-term government responses to the current crisis is the absence of many of the non-Keynesian alternatives to orthodoxy that governments relied on the 1970s, notably protectionism, nationalization, and competitive devaluations. In seeking to explain the universal but also limited reliance on fiscal stimulus, we explore the implications of European integration, the decline of manufacturing unions, and asset ownership among middle-income voters. While the Euro eliminates the use of competitive devaluation, the Single Market prevents individual member states from raising tariff barriers and prohibits payment of direct subsidies to companies. In addition, the institutional set-up of the EU creates coordination problems that explain the limited extent of fiscal stimulus. The decline of manufacturing unions represents another factor behind the absence of alternatives to Keynesianism. Unions’ loss of members and mobilizational capacity, particularly pronounced among low-income wage-earners, accounts for why unions are less likely than they were in the 1970s to pull Left parties in a more egalitarian direction. Finally, we argue that the policy pref-
erences of middle-income voters have changed to the extent that their economic well-being has come to depend increasingly on asset prices. Private insurance via asset ownership yields political opposition to publicly provided social insurance and support for tax cuts among the middle class, providing an explanation for the priority given to tax cuts (over spending increases) by many governments.

EXTENDING VARIETIES OF CAPITALISM? A CRITIQUE
Matthias Ebenau¹
¹QUEEN MARY, UNIVERSITY OF LONDON, London, United Kingdom

Abstract: Over the last decade, the Varieties of Capitalism (VoC) framework has emerged as the paradigmatic approach to comparing political economies, especially in Anglophone academia. Notwithstanding its obvious popularity, which manifests itself in the burgeoning amount of literature drawing on the framework, other scholars have developed an array of critiques. One of the most salient points concerns the inability (according to many critics) of the basic distinction between so-called ‘liberal market economies’ (USA etc.) and ‘coordinated market economies’ (Germany, Japan etc.), to account for both the existing diversity within and the fundamental characteristics of modern capitalism.

These weaknesses, the critics contend, are a result of the empirical focus of the VoC literature on the Triad and its proponents’ theoretical concern with parsimony and analytical neatness. Partly responding to these criticisms, recently some authors have begun to apply VoC’s conceptual apparatus to political economies outside the OECD-group, such as the ‘mixed market economies’ of the Mediterranean, the ‘dependent market economies’ of Central/Eastern Europe and the ‘hierarchical market economies’ of Latin America. In the light of the debates surrounding the VoC literature, this paper seeks to critically assess these extensions at a conceptual level and to illustrate the resulting criticisms by drawing on examples from the Latin American context.

It argues, first, that not only the methodological nationalism and exaggerated firm-centrism inherent in the general framework do persist and compromise its critical-analytical potentials; but also, second, that a problematic normative Eurocentrism is introduced by reversing the rationale of the VoC’s ‘core’ framework – from explaining different paths to success under conditions of globalisation to explaining why political economies fail to ‘cope’ with the challenges it poses – which is concretised in the notions of ‘negative institutional complementarities’ and ‘institutional discomplementarities’. As a result, analyses building on the VoC approach will underestimate the significance of transnational social and political-economic interconnectedness and the dynamics at a world-system scale for the development of nationally framed economies.

MEASURING THE STABILITY OF THE STRUCTURE OF THE WORLD-ECONOMY: THE CONTINUING SALIENCE OF REGION
Salvatore J Babones¹, Francisco J Morales¹
¹Department of Sociology & Social Policy, THE UNIVERSITY OF SYDNEY, Sydney, Australia

Abstract: The general contours of the global income distribution look pretty much the same today as they did a century ago: Europe and North America are rich, Latin America is in the middle, and Africa and south Asia are poor. Only east Asian countries have shown much mobility, and even then much less mobility than most people assume. The fact that the broad regional outlines of the world-economy haven’t changed in over a hundred years should provoke questioning. Just how much “should” the world be changing from decade to decade based on reasonable models of how the world-economy works?

The research reported here uses concepts from entropy theory to measure the degree of structure in the contemporary world-economy. Entropy is the concept that all structures will tend to decay over time unless energy is expended to maintain them. Left to themselves, the economies of any world region should tend to diverge over time as individual countries pursue different policies or simply experience different luck. The fact that the regional organization of the world remain coherent over time implies that strong systemic forces are continuously working to maintain the regional structure of the world-economy.

The strength of these forces can be measured (indirectly) by comparing the actual rate of decay in the regional structure of the world-economy to the rate of decay that would be expected if countries were growing at random. This null scenario of random growth is operationalized using a Brownian motion model. All countries start at their 1974 levels of income per capita. A simulation is then run in which countries grow at random every year for 25 years. The simulated salience of region in 2009 is then compared to the beginning salience of region in 1974. After hundreds of iterations it is possible to estimate the degree to which the salience of region “should” be decaying over time.

Preliminary results indicate that powerful systemic forces are continually at work maintaining the structure of the world-economy. These forces have repeatedly restored the regional structure of the world-economy after major crises (like the Latin American debt crisis, the Asian financial crisis, and the global financial crisis). This is strong (though indirect) evidence of the existence of systematic international exploitation in the contemporary world-economy.

TOP DOWN OR BOTTOM UP? A CROSS-NATIONAL STUDY OF VERTICAL OCCUPATIONAL SEX SEGREGATION IN EUROPEAN COUNTRIES
Andrea Schaefer¹, Karin Gottschall¹, Ingrid Tucci²
¹Gender Policy in the Welfare State, ZES/UNIVERSITY OF BREMEN, Bremen, ²SOEP, DIW Berlin, Berlin, Germany

Abstract: Starting with a comparative assessment of different welfare regimes and political economies from the perspective of gender awareness and “pro-women” policies, this paper identifies the determinants of cross-national variation in women’s chances of holding a high-status occupation in twelve Western European Countries. Special emphasis is given to size and structure of the service sector, including public employment and power resource-related factors such as union density.

The first level of comparison between men and women concentrates on gender representation in the higher rungs of the job hierarchy, while a second level comparing women extends the scope of analysis to the degree of occupational sex segregation between women in high-status occupations and low-status work in order to allow for a more nuanced analysis of the interrelation between gender and class.
The first-level analysis is based on European Social Survey data for the years 2002-08 using multi-level random intercept models to capture more recent trends in occupational dynamics. Results indicate that a large public sector and a high union density enhance women’s chances of holding high-status occupations, i.e., in the public sector. Furthermore, equality at the top can well be paired with inequality at the bottom, as countries with a highly polarized occupational hierarchy such as the UK show.

VARIETIES OF POLITICAL ECONOMIES AS COMBINATIONS OF DIFFERENT POWER PATTERNS SURROUNDING WORK AND LABOUR

Jeffrey Harrod¹

¹Political Science, UNIVERSITY OF AMSTERDAM, NETHERLANDS, Amsterdam, Netherlands

Abstract: The so-called variety of capitalism literature of the past decade has used market and institutional criteria to distinguish different forms of capitalist economies. Previous attempts with the same objective were varieties of corporatism, which had a focus of the role of labour organisations in the institutional arrangements, the regulation school in which the total productive systems including labour control was incorporated, and labour relations systems which saw the core importance of labour relations and labour motivation in general to any particular economy. Emerging from this literature was the argument in the late 1980s that the work and labour relations identified in these typologies should themselves be disaggregated into distinctive modes of social relations or patterns of power relations surrounding work and production. Corporatism, for example, focused on organised labour and yet in most political economies organised labour was a minority pattern in the total labour force. Other patterns of power surrounding different forms of work were also important. Thus while almost all political economies have a pattern which could be labelled “self-employment” the size of a casual or “precarious” pattern varies substantially and that variation to some extent determines both national politics and foreign policy. By identifying and naming eight different patterns and analysing them as dominate and subordinate, different combinations and sizes create different varieties of political economy with dramatically different social and political outcomes. This paper examines these combinations as they appear in currently extant models to illustrate the utility and appropriateness of this approach. For example, to unpack the imprecise and macro level notions of the models of Neo-liberal, Social Market and Asian Development models using these criteria identifies the central forms or labour control and motivation and advances the understanding of their less obvious differences. In conclusion, the paper argues that refinements and promotion of approaches considering disciplinary power surrounding work and production within modern societies are needed in the social sciences in general as a midway path between the current excessive economism and promoted individualistic well-being.

CURRENT TRENDS IN THE RUSSIAN BANKING: COMPARATIVE AND INSTITUTIONAL ANALYSIS

Svetlana Kirdina¹, Andrei Vernikov¹

¹Institute of Economics Russian Academy of Sciences, Moscow, Russian Federation

Abstract: We compare the functions performed by the banks in different types of economic systems, with regard to general and specific functions of banks within a monetary economy. Institutional matrices theory suggests that in an X-type redistributive “non-capitalist” economy the banking system has a different institutional design and follows a different model of banking than in a Y-type market “capitalist” economy, namely we see a “top-down model” instead of a “bottom-up model”. We suggest that for X-type economies private banking activity just complements the institutions of centralized finance and credit allocation. We test this hypothesis with historical and contemporary evidence from Russia as well as from China and the USA. Russia’s experiment with bank de-nationalization did not produce an efficiently-functioning system of privately owned banks. Current trends in the Russian banking are consistent with the guideline of evolution of core economic institutions in the country including state ownership of core industrial assets. The share of state-controlled banks keeps growing and may have exceeded 54 percent of total banking assets. We conclude that the complex and uncoordinated nature of the evolutionary change of Russian banks in Russia after the economic crisis represents a search for a better balance between redistributive and market instruments and an institutional model of banking that would be more natural to this country.

SOME POLITICAL CHANGES IN BRAZILIAN FINANCIAL INSTITUTIONALIZING PATH

Marcus Ianoni¹

¹DEPARTMENT OF POLITICAL SCIENCE, UNIVERSIDADE FEDERAL FLUMINENSE, NITERÓI, Brazil

Abstract: In the history of industrialization and economic modernization in Brazil, opened since the 30s, the financing of investments in major projects related to development was brought about mainly, or by the state or by foreign capital, or by the association between capital and private capital. Medium and small sized projects have had their investments financed by the reinvestment of company profits. The Brazilian banking system, especially the private sector, differently, for instance, from the German, traditionally had little involvement in the financing of capitalist investment in the country. Moreover, Brazilian banks have not been effective in incorporating the majority of the population to credit and other financial services. Bank credit in Brazil is still scarce and very expensive. These characteristics of the Brazilian banking system lead to the debate on the model of financial institutionalization existing in the country. Economics and political economy, as well as the literature on varieties of capitalism, show the importance of financial institutionalization in the development. In Brazil, one of the most important issues in the debate about development is the model of financial institutionalization. This paper proposal considers the institutionalization of the Brazilian banking system inefficient in terms of its ability to play a more active role within a framework of financial institutionalization aimed to maximize the development possibilities. Brazilian banks intermediate many businesses related to financial flows, via National Treasury bonds, and is less engaged in financial intermediation of productive activities, especially the industrial ones. The important transformations in the Brazilian banking industry since the monetary stabilization of 1994 has not changed that situation. But since 2003, with the formation of the Lula government, some changes started to happen. Although this government has maintained the macroeconomic policy of its predecessor, it starts from the assumption that, since Lula has been some incremental change
in the trajectory of relations between state and financial interests, and they were important to minimize the effects of international crisis in Brazil and to demarcate possibilities to change the institutionalization bank towards a greater state coordination of the financial market.

VARIED OF LIBERALISM: ANGLO-SAXON CAPITALISM IN CRISIS?

Gerhard Schnyder1, Sue Konzelmann2, Marc Fovargue-Davies3
1Management Department, KING’S COLLEGE LONDON, 2Management Department, 3LCCGE, Birkbeck University of London, London, United Kingdom

Abstract: The recent financial crisis has raised doubts about the conventional wisdom of economic liberalism and debate about the appropriate direction of theory and policy. However, the sharply contrasting experiences during this crisis of the four main Anglo-Saxon banking systems suggest that the crisis may not be one of liberal capitalism as such, but of the neo-classical variety that characterizes the British and American systems. We investigate the factors which ensured that Canada, and Australia, both with well-developed financial markets, emerged from the financial crisis relatively unscathed. This is in sharp contrast to the other two major liberal market economies – the US, UK – which were very badly affected by the crisis. Using the concept of ‘varieties of liberalism,’ we assess how different approaches to liberalization and different rules or a more prudent application of the same rules affect both corporate and regulatory behaviour. We find important differences in the way that economic liberalism was theorized and implemented in the four countries during the period preceding the crisis, suggesting that broad classifications of national business systems into ‘liberal market’ and other varieties of capitalism do not capture their inherent diversity. Further, liberalization of financial markets appears to be viable only if accompanied by appropriate supervision. In the current crisis, regulatory capture, political fragmentation and the financial sector’s political and economic leverage are among the most important factors contributing to national banking system vulnerability.

BRINGING THE INDIVIDUAL AND THE STATE BACK IN: VARIETIES OF CAPITALISM IN THE BRITISH AND GERMAN HOUSING MARKET

Ben Jacoby1
1Politics and International Studies, The University of Warwick, Coventry, United Kingdom

Abstract: The academic success of the wider ‘Varieties of Capitalism’ (VoC) literature has been extensive, and yet it seems that the debate is not coming to a point of maturation, the reason being that by now the critics of VoC hold at least as strong a position as their original supporters. Hence the question: is the whole VoC paradigm in crisis? The present paper takes distance from the debate and analyses its underlying assumptions and methodological foundations. From such a critical point of departure it claims that many of the VoC flaws are related to it’s neglect of the individual and the state, hence the essence of the political. Suggesting a framework that starts from an ontological position that radically puts the individual into the centre of politics, the paper builds upon constructivist accounts that have human indeterminacy as their core. At the same time, the approach opens space for state intervention upon economic agency and advances a method that moves towards the new institutionalisms debate. By integrating the individual into the ideational/discursive variant, the argument is put forward that capitalist diversity must be understood as differences in individual-state relationships in different institutional arrangements (polities). Hence, it brings back into VoC two quintessentially political concepts: the individual and the state. The paper then goes on to showcase the approach with the comparative study of British and German state interventions upon economic subjectivities in their respective housing markets. It becomes clear how specific legitimation regimes and interactive individual-state processes influence socio-economic internally consistent variance in the way that the state considers the economy, and how and why policies are enacted. Capitalist variety is thus a much broader topic than the initial contributions, but also the current critiques to VoC suggest. Finally, VoC can only be advanced when its critics are taken seriously and radically applied into an alternative perspective upon economic regimes, on that is centrally concerned with economic subjectivities, hence agency, and the state.

NEOLIBERALISM AND SOCIAL/CHRISTIAN DEMOCRACY

Ian Bruff1
1UNIVERSITY OF MANCHESTER, MANCHESTER, United Kingdom

Abstract: This paper will focus on how the last thirty years in Europe have seen a gradual unravelling of the policies, programmes and practices associated with post-1945 Christian and social democracy. This will be examined across three key examples – collective bargaining practices, welfare programmes and the system of political representation – where the rights of trade unions, the values of social solidarity and equality plus the dominance of moderate, centrist politics have been fundamentally challenged. Moreover, the current economic and legitimacy crisis facing the eurozone could well accelerate this slow-burning crisis of the political economy of Christian and social democracy. I will also consider the extent to which Europe is on the verge of a fracturing of traditional social coalitions into a radicalised social democracy on the one hand and especially a resurgent neoliberalism – recast along authoritarian (and sometimes xenophobic) lines on the other. There is a broader relevance, too, for my approach contrasts with much of the fast-growing International Political Economy (IPE) literature, which continues to adhere (even if implicitly) to a “states and markets” dichotomy. That is, when seeking to make sense of the potentially transformative developments associated with neoliberalism, an unsatisfactory “either/or” methodology is still dominant. Structures and agents tend to be defined by pre-determined capabilities and interests, which then drives analysis along “political” or “economic” lines. The more detrimental logic deemed inherent to markets rather than the more benign logic viewed as inherent to institutions leads to a concentration of “critical” analysis on the former and not the latter. IPE’s multidisciplinary and interdisciplinary potential is not realised in consequence, and it ought to be more open to insights from other disciplines when attempting to make sense of the complex, contemporary era.

SMALL NORDIC COUNTRIES AND GLOBALISATION: IS THERE STILL A SPECIFIC MODEL OF CAPITALISM?
Abstract: There has been a large range of literature on the continuing viability or inevitable demise of the Nordic model of capitalism with a specific emphasis on developments in the Swedish case. This paper will compare the Finnish and Norwegian political economies, two much less analysed case studies, through a comparison with developments in Sweden and thereby help to fill a gap in our understanding of the current development of Nordic countries.

Conceptually, the paper will critically engage with the varieties of capitalism literature and argue that its focus on institutionalist continuities and change implies that changes in the underlying social relations of production and the related power balance between capital and labour cannot be taken into account. Instead, a historical materialist approach will be put forward which makes it possible to conceptualize the relationship between changing production structures and class agency in both countries. Empirically, the paper will focus on the decision by the Finnish employers’ association EK to abandon the tripartite TUPO system in 2007 and the Norwegian Campaign for the Welfare State to mobilise trade unions and social movements against neo-liberal restructuring in the elections in 2005 and 2009. It will be argued that both the failure of EK to change the Finnish model drastically as well as the success of the Campaign for the Welfare State to block neo-liberal restructuring in Norway is partly due to the fact that the production structure in both countries is comparatively less transnationalised than in Sweden. Hence, Finnish and Norwegian capital are less powerful vis-à-vis labour than Swedish capital. Nevertheless, such developments are not automatic but crucially depend on the strategies of labour to retain their specific, more socially-oriented model of capitalism.

A POLITICAL ECONOMY ANALYSIS OF HUMAN RIGHTS: RESTRUCTURING OF STATE-EDUCATION RELATIONSHIPS AND ITS IMPLICATIONS ON THE RIGHT TO EDUCATION IN TURKEY

Funda Karapehlivan Şenel

Abstract: Consolidation of neoliberalism and expansion of capitalist relations in every aspect of life have resulted in a decline in the well-being of people throughout the world. Hence, the neoliberalisation process and increasing inequalities between and within the countries have created a deteriorating environment for the enjoyment of human rights especially for the working classes and other disadvantaged groups all around the world. This paper aims to contribute to the emerging field of sociology of human rights by analyzing the right to education from a political economy perspective. A political economy approach requires an analysis of power relations and structural inequalities in capitalist society. This paper has a critical approach to liberal-individualist theory of human rights which has emphasized civil and political rights without considering the effects of the economic, social, cultural and political inequalities of capitalist societies on the realisation of these rights. It argues that economic, social and cultural rights, on the other hand, despite their formal recognition, have been reduced to ‘consumer rights’ with the withdrawal of the state from the provision of the public services and the introduction of the market system in these services since the 1970s. I will try to disclose this gap in formal recognition and substantive enjoyment of the right to education by drawing on the case of Turkey. The paper will discuss the possibility of provision and enjoyment of the right to education within the neoliberal socio-economic structure and also asks how successful the right to education is in addressing the current social, economic and political realities as it is formulated in the international human rights instruments. Its specific concern, in this process of neoliberalisation, is the introduction of market relations into primary education and their implications on the right to education in Turkey. In this paper, it will be argued that the restructuring of state-education relationships has had implications on the right to education in Turkey by creating new forms of inequalities in education. In order to illustrate this point, I will focus on the consequences of macro polices in micro level, namely on individual schools, teachers, parents and students by drawing on the micro level qualitative research conducted in two primary schools in Ankara.

INSTITUTIONAL CHANGE AND VARIETIES OF CAPITALISM

Daniel Heinrich

Abstract: The development of capitalism in western states is not accurate classifiable in a dichotomous convergence-divergence model. The reason is that institutional complementarities, differently than in the VoC postulated, need not be coherent. Despite the overall meaningful and comprehensible classification in liberal and coordinated market economies, national institutional arrangements are justified as a social regime which is determined by historical contexts, that can contain liberal as well as coordinated elements. The affect of mega trends, such as economical globalization and the increasing importance of knowledge, are, according to national historical contexts, institutionally processed. In particular, the coordinated market economies are in a fiscal pressure condition. These economies aim to optimize their national business demography to face the effects of the mega trends. In fact, institutional change for the reinforcement of the competitiveness of business demography is influenced by national path dependency. Thus, despite of conversion, drift, exhaustion, layering and displacement, no hybrid type of market economy develops, but a new more competitive form of coordinated market economy. There are no competitive advantages for the liberal market economies. Instead, they must deal with new forms of dependence on their business demography. For example, Denmark and Ireland pursued different policies for changing their institutions to optimize their business demography. Both nations are not clearly marked by a distinct institutional trend. As a result, liberal institutional complementarities will harmonize with coordinated, if the institutional hierarchy remains clear.

COMMUNICATING THE EU SOCIAL ECONOMY AND THE WELFARE STATE AFTER THE LISBON TREATY

Mihaela Danetiu

Abstract: The main goal of this article is to analyze how are the European social economy and the social policies communicated from the institutions to the citizens. Are the EU institutions able to communicate the social responsibility? Is the European Social Econ-
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

om a communication tool itself? The current EU strategy that was adopted after the Lisbon Treaty highlights the need of constructing the European citizenship that can overcome the unilateralist dimension given by the national citizenship. The social inclusion policy and the social integration on the market labor require a communication strategy that targets the European citizens. Social economy obliges several political actors such as the EU institutions, corporations and states to take part in forging the European Citizenship. The study will analyze the social economy as a communication tool that has the ability to convert the national interests and projecting them to the European level. From the humanist philosophical principles of the social economy to the cultural patterns of each member state, responsibility and equal opportunities merge into a single dimension of an identity that can play a key role in consolidating the European public sphere. The EU Barometers, the projects that have been already implemented on employment, the social cohesion and the institutional communicational products from the EU institutions can provide useful data that can indicate the degree of implication of the citizen in the EU social policy. The social dimension of the EU 2020 strategy can point out the strengthening of the Welfare European states.

Keywords: social economy, citizenship, corporate social responsibility, Welfare, social policy.

EU CORPORATE SOCIAL RESPONSIBILITY IN A POST-LISBON CONTEXT

Laura Horn 1

1Political Science, VU UNIVERSITY AMSTERDAM, Amsterdam, Netherlands

Abstract: In its Europe 2020 strategy, the European Commission has made a strong commitment to promoting Corporate Social Responsibility (CSR) ‘as a key element in ensuring long term employee and consumer trust’. In particular in the context of the financial and economic crisis, CSR is increasingly seen as a policy instrument to address questions of corporate behaviour and societal change.

This paper puts the recent developments in CSR at the EU level in the Post-Lisbon period in the context of a broader perspective of how CSR emerged as a policy area in the European Union. CSR is often criticised as a non-committal form of social and environmental self-regulation, avoiding more concrete regulation on labour standards and environmental protection. Drawing on a neo-Gramscian approach to European integration, the paper argues thatCSR initiatives by the European Commission have constituted a moment of trasformismo, in which contestation and opposition have been incorporated into a broad and non-binding process of civil society dialogue. Institutionally, within the Commission there is a strong bifurcation of CSR and industrial/social policy on the one hand, and Internal Market and Financial Regulation on the other – while initiatives in the latter often have a binding character, discussions in the former domain tend to be programmatic rather than offering concrete outcomes. In light of the recent financial and economic crisis, the paper then examines whether the Commission’s CSR policy has changed significantly following the regulatory reactions to the immediate crisis and the recession, and how these changes reflect a general reconsideration of social policy at the EU level.

INTEGRATION IN CRISIS: A REGULATIONIST PERSPECTIVE ON THE INTERACTION OF EUROPEAN VARIETIES OF CAPITALISM

Johannes Jäger 1, Joachim Becker 2

1Economics, UNIVERSITY OF APPLIED SCIENCES BFI VIENNA, Vienna, Austria
2Economics, University of Economics and Business Vienna, Vienna, Austria

Abstract: The present crisis in Europe affects national economies in different ways. In addition, the whole pattern of European integration is in crisis and important institutional transformations are observed. It is proposed to apply a theoretical framework which allows focusing on the specific linkages between (national) regimes of accumulation in combination with a systematic analysis of institutions at different spatial levels. This is provided by a modified and expanded regulation approach which we use as framework for our paper. Based on this, we provide an empirical overview of the different regimes of accumulation and their interaction to explain the crisis and its dynamics. In addition, we analyse the reactions to the crisis and the consequences in terms of institutional transformation at different territorial levels. This allows drawing conclusions regarding the dynamics of future political-economic developments in Europe.

THE DISEMBEDDED GOVERNANCE OF THE EUROPEAN UNION

Maja Lazo Savevska 1

1Institut d’Etudes Europeennes, Universite Libre de Bruxelles, Brussels, Belgium

Abstract: I aim to provide a Polanyian critique of the incomplete neo-Gramscian interpretation of the EU governance structure, by drawing insights from the neo-Polanyian scholarship b) Constructivist critique of the pessimistic accounts of Gill and Harmes which identify neoliberal preemptive measures in every societal initiative. I am interested in applying Polanyi’s concept of disembeddedness to analyze the structural transformations of the society-economy relation. Many formulations provide a valid analysis of underlying issues within the EU, however they fail to theorize the implications of the EU integration on the society-economy relation. Thus, I propose a return to the concept of disembeddedness, which can help us assess the extent to which the economy and the policy are integrated at the EU level. Harmes used somewhat redefined version of this concept to signify the configuration of the EU. However Harmes makes two mistakes when applying this tool: a) borrows this concept from Polanyi without problematizing it, and b) proclaims that there is disembedded federalism within the EU without making a refined distinction between the different stages of disembeddedness that marked the EU integration. If he engages in any periodization he theorizes only the general transition from embedded to neo liberalism i.e. his periodization is not EU specific. I argue that we should question the direct applicability of the grand neoliberal narrative. Many critical thinkers have agreed on a common narrative of how neoliberal ideas and practices spread around the world. However, the neoliberalization of the EU did not unfold in a linear manner. Thus, we should aim at an EU specific narrative that would be more complete only if we inspect the discrete transformations within it. I propose to reintroduce the concept of disembeddedness and exhaust its explanatory potential. First, I would like to theoretically dissect the concept of disembeddedness and ex-
plain my understanding of the concept. Then I will look at the contingent structural transformations that marked the disembedding within the EU. Not to repeat Harmes mistake, I intend to engage in more precise interpretation of the extent of the asymmetric governance, by providing periodization of it. A closer look at the institutional setup of the EU would reveal a more complicated picture that disproves the thesis that the economy operates absolutely above the polity.

THE POLITICAL ECONOMY OF THE TRANSNATIONALISATION

Eva Hartmann

Abstract: The concept of varieties of capitalism has been very influential in questioning the assumption that globalisation will lead to conversion. This paper wants to challenge the methodological nationalism built into this account without, however, substituting methodological globalism for methodological nationalism. It argues that what is needed are studies that examine whether the nation state remains the main organising principle and if so why. In other words, the nation-state is no longer the explanans but the explanandum.

The point of the departure of the paper is Hall’s and Soskice’s distinction between the two basic types of capitalism, i.e. liberal market economy and coordinated market economy. The empirical study examines vocational education and training (VET) whose coordination differs significantly in market and coordinated economies. This domain thus illustrates very well the two types of market economy. By looking at the recent internationalisation of VET the paper analyses to which extend and how the nation-state as the principle level of coordination is undermined.

REGIMES OF SOCIAL COHESION: A COMPARATIVE ANALYSIS

Andy David Green

Abstract: This paper explores the different meanings of social cohesion in historical and contemporary societies and identifies some different ‘regimes of social cohesion’, and their characteristics, that can be found in western and east Asian societies. It adopts a mixed-method and interdisciplinary approach, drawing on the literatures in comparative historical sociology and comparative political economy, and using both qualitative, logical comparative methods, and quantitative statistical analysis. In the first section of the paper we analyse the constituents of social cohesion which are specified in different definitions-in-use in policy and contemporary academic writing. This leads to a definition of social cohesion which is non-normative and non-exclusive and which can be used in empirical analysis. The second section seeks to identify the major historical traditions of writings about social cohesion and the social order in western sociology and political philosophy and the logics they imply as to the forces which bind society together.

Sections three and four review some historical evidence for social origins of different traditions of social cohesion in the West, and their subsequent patterns of evolution, based on ‘longue durée’ accounts of historical development and on ‘non-absolute’ notions of path dependency. Section five uses the literature on ‘varieties of capitalism’ and ‘welfare state regimes’ to develop some provisional theories about different contemporary forms of social cohesion which may be found in particular regions – or clusters of countries - in the West and east Asia. We call these ‘regimes of social cohesion’, in the same way that Esping-Andersen (1990) refers to ‘welfare regimes’ and Michael Walzer (1997) to ‘regimes of toleration’. The last section of the paper uses international data on social attitudes and institutional characteristics to test empirically whether such regimes can be identified in terms of regions or country clusters which display particular sets of institutional characteristics and aggregate social attitudes.

VARIETIES OF CAPITALISM: POTENTIAL WELLSPRING OF THEORETICAL ROUTES IN ASIA PACIFIC-FOCUSED POLITICAL ECONOMY RESEARCH

Lisa Tilley

Abstract: This paper argues that the varieties of capitalism (VoC) approach, up to now sparsely applied in the East Asian context in particular, represents a potential wellspring of related theoretical perspectives for Asia Pacific researchers. The developmental state model may be exhausted in the sense that both developing and industrialised economies no longer conform to its most precise definition, if in fact they ever did; while convergence theories - which anticipate largely unidirectional movements towards an Anglo-American neoliberal model – have been contested by numerous empirical studies into capitalist diversity. In contrast, the VoC approach - employing essentially a firm-level analysis with particular focus on inter-firm and state-business relational aspects in order to identify core determinants of capitalist diversity - offers more conceptual density and methodological precision.

Two key examples are presented which locate the VoC approach at an early stage of its employment in the Asia Pacific rather than at an end point or in crisis. Firstly, the VoC framework is proving useful in theoretical modelling of Southeast Asia’s developing capitalisms, which may not entirely adhere to liberal (LME) or coordinated market economy (CME) models, but may show elements of each or form hybrid types combining developmental state features in addition. Secondly, application of the VoC approach to Japan has shown its use in defining post-developmental states and provided a theoretical framework through which to illustrate divergent practices of firms in these states from those based in LMEs.

Rather than expecting Asia Pacific economies to conform to the LME-CME typologies, this paper expects their boundaries to be stretched, even to a third or hybrid type of market economy. Related to this, it is anticipated that some of the region’s economies may challenge the VoC hypothesis that hybrid regimes which approximate neither the LME nor the CME pole develop less inter-firm and firm-institutional complementarity than those closer to the two ideal types - Singapore for instance, may display both hybrid-type capitalism and high levels of complementarity. On the whole, the Asia Pacific has much empirical substance to add to the testing of VoC theories, just as the VoC approach has much to add to theoretical discourse on Asia Pacific capitalism.
VARIEIES OF CAPITALISM AND THE RESTRUCTURING OF THE NORDIC LABOUR PROCESS

Markku Sippola

1UNIVERSITY OF EASTERN FINLAND, Joensuu, Finland

Abstract: The position of the worker is in a state of flux in North European societies. The Nordic countries, that is to say, Denmark, Finland, Iceland, Norway and Sweden, have been traditionally categorised as representatives of ‘the Nordic model’ or coordinated market economies. This classification does not satisfactorily take the changing situation, based on historical trajectories, into account. According to Finnish and Swedish scholars, the emergence of the universal welfare state system in Nordic countries, for example, traces back to early changes in institutional arrangements that had great implications at much later stages. Moreover, the whole capitalist accumulation is taking new shape in the aftermath of the financial crisis 2008-2009, which calls for a change of the social system of innovation and production (SSIP) from a ‘social-democratic’ SSIP toward a ‘market-based’ one. New dynamics of division of work and employment relations are emerging. The ‘high road’ to economic growth and workers’ equal prospects in the Nordic labour market are giving way to a greater variation in worker status within a country, sector, and even workplace. New forms of precarious work are gaining ground. The use of flexi-time, agency and posted workers, typically of foreign origin, is becoming more widespread. Simultaneously, certain parts of manufacturing and construction processes are being standardised and relocated to abroad. In connection with the relocation, blue-collar labour is undergoing degradation while the white-collar work is being intensified. This study draws upon empirical data collected from Finnish manufacturing and construction sites and Baltic and Russian subsidaries of Nordic manufacturing companies. The analysis reveals that the employer utilises both in situ and spatial strategies of labour control, under the all-encompassing regime of ‘hegemonic despotism’. This new regime, intertwined with international disintegration of production, relies upon the inequality of different parts of the process for ensuring “national” competitiveness and the “natural” evolution of economies. Here capitalists – the Nordic ones included – seek to maximise comparative advantage through the relocation of low-cost labour manufacturing operations that and through encouraging work-related migration. This also provides the economic rationale behind the integration of the Eastern European countries within the EU.

SELF-ORGANISATION AS A FOUNDATION OF ECONOMIC GROWTH: PAST AND CURRENT PROBLEMS OF RUSSIA

Vasiliy Skalon

1Department of Local Administration, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The World economic crisis showed once again on the example of Russia that raw-material orientation, however high raw commodity prices are, is not quite a sound foundation for the economic system. However, current economic policy in Russia doesn’t facilitate the increase of robustness of Russian economy in turbulent environment. Expansion of government intervention, greater concentration of power, populist growth of social obligations hinder the diversification of Russian economy and produce steep level of unproductive institutional costs. The main thesis of our paper is that Russia, heading towards welfare state, skipped a crucial stage: creation of a robust institutional and economic foundation. The essential factor of creation of such a foundation is a developed local governance system.

We look at the problems of Russian economy through the lens of local governance, because this element of public administration is of key importance for the functioning of extended order of human cooperation. It is the level governed by the local authorities, where the major part of economic activity not concerned with raw-materials extraction and processing happens. In search of the genesis of the considered problems we refer to the Russian history.

The high degree of concentration of power has been a distinctive feature of Russian statesmanship during last four centuries. Even today Russian policy still bears marks of some medieval institutions. We conclude that Russian economy is a prisoner of “bad” institutes, such as: defunct land market, archetypic bureaucratism, civil society deficits, etc.

Nevertheless, during the reforms of late 19th — early 20th century there has been taken a number of fundamental decisions (removal of serfdom, creation of district councils (‘zemstvo’), cooperation support), which allowed the Russian economy to perform an unprecedented breakthrough, interrupted by the First World War and bolshevik’s coming to power. In our paper we are going to show that our history provides some decisions, satisfying the requirements of Russian peculiarity better, than uncritical importation of foreign (particularly European) models.

The study is based on field research of local governance, conducted by the author during last 2,5 years, and contains conclusions, which can be of interest to anyone, concerned with condition of not raw-commodity oriented part of Russian economy and Russian local governance.

THE STATE GOVERNANCE OF CRISIS WITHIN THE CONTEXT OF A CRISIS OF STATE GOVERNANCE: TWO VERSIONS OF (POST-FORDIST) NEO-LIBERAL RESTRUCTURING IN SPAIN AND THE UK

Nagore Calvo Mendizabal 1, Tsvetana Vassileva 1, 2

1European Studies / SPLAS, King’s College London, London, 2School for Community Based Medicine, The University of Manchester, Manchester, United Kingdom

Abstract: While the main concerns surrounding the on-going global crisis have primarily focused on addressing the causes and consequences of the crisis, we argue that it offers a useful context within which to explore arguments about the on-going restructuring of the state as well as examining specific strategies of adaptation. In developing this analysis we will draw on the regulation approach and state theory and will compare Spain and the UK. More specifically, we will explore the nationally specific articulations of the global crisis as the unfolding of a set of specific economic, political and social crises in Spain and the UK. Our main focus however will be on the political system and the strategies and political rhetorics developed in response to these different crises, and the ways in which they contribute to an on-going cycle of partial resolution, displacement, and re-emergence of crisis. In developing our arguments, we will analyse official government documents and reports as well as coverage and discussion in major national newspapers in order to identify key issues, adopted policies, controversies, and alternative agendas, alliances, strategies and rhetorics. Within the context of
Spain this will include a focus on the financial crisis, the role of the saving banks in relation to the housing bubble, the expansion and contraction of the construction sector, and the effects of the crisis on employment. Related to the latter we will further discuss the political crisis associated with the handling of labour and pensions reforms and the challenges that the Spanish economy and the Spanish state are facing in relation to its participation in the EU monetary union. Within the context of the UK, we will discuss the dominance of the debates around the collapse of the financial sector, the welfare reform and the shrinking of the public sector. We will argue that Spain and the UK have adopted different strategies of adaptation with a stronger emphasis on a neo-corporatist and neoliberal policies, respectively, although framed within different rhetorics: corporatist and communitarian. This is within the broader context of the post-Fordist restructuring that is currently dominated by neo-liberal ideology, rhetorics, and policies.

RADICAL INNOVATION IN A COORDINATED MARKET ECONOMY – SOCIAL EMBEDDING AND CONCERTATION

Gerhard Fuchs¹

¹Social Sciences, UNIVERSITY OF STUTTGART, Stuttgart, Germany

Abstract: David Soskice and Peter Hall in their seminal contribution on the Varieties of Capitalism have established the distinction between coordinated market economies (CMEs) and liberal market economies (LMEs). The different types of capitalism are linked with distinctive economic strengths, specific modes of policy making and implementation. With respect to innovation Hall/Soskice claimed that the institutional framework of CMEs (like in the case of Germany) favors the development of incremental innovations, while on the other hand the institutional framework of LMEs (like in the case of the USA) would be especially suited for radical innovations. This paper does not intend to put into question the whole VoC framework. It is on the one hand rather will make the point that the two varieties of capitalisms still show stark differences with respect to the creation resp. construction of new markets, but the postulated differences between innovativeness do not hold. The paper will look at one specific case of innovation: Photovoltaics. Looking at the history of this innovation, one gets the initial impression that research and economic implementation in the USA was far ahead of its main competitors and in line with general arguments on the advantages of the US institutional framework for technologically based radical innovations. Observers in the 1980s and 1990s believed that the US-market possessed the ideal characteristics to develop into a lead market for PV and will mimic developments in other high tech areas. Meanwhile both in terms of economic viability and technology Germany (and other coordinated market economies) seem to be ahead. The proposed paper will argue that radical innovations in Coordinated Market Economies are possible and use the example of PV development in Germany. In order to make this point the paper will first try to clarify the meaning of the concept of “radical innovation”. Contributions to the Varieties of Capitalism debate have repeatedly claimed that the concept of innovation is not very well defined by Hall/Soskice. By establishing linkag-es to discussions in innovation research a more elaborate definition for radical innovations will be proposed. Based on this definition the PV-developments in a LME (USA) and a CME (Germany) will be briefly compared in order to explain under what auspices PV-development Germany as a radical innovation could be successful.

STANDING ON THE SHOULDERS OF GALBRAITH: FROM MANAGED MARKETS TO CORPORATE-GUIDED MARKETS

Brendan Michael Sheehan¹, Brendan Michael Sheehan¹

¹Economics and International Business, LEEDS METROPOLITAN UNIVERSITY, Leeds, United Kingdom

Abstract: This paper builds upon the audacious insights of J.K. Galbraith (1958; 1972) with respect to managed markets and the management of specific demand. It begins by outlining the dominant threat to the global economy, and especially the system of abundance: that of under-consumption by the people of plenty (Potter, 1973). In the system of abundance the institution of marketing spontaneously emerges to counter this threat (Sheehan, 2010). Next, the paper reviews Galbraith’s audacious analysis of managed markets. Galbraith’s approach marks a distinct break with the mainstream frame of reference of markets influenced by an invisible hand. The paper proceeds to evaluate the Galbraithian approach, highlighting some important limitations. Finally, the paper introduces Sheehan’s concept of corporate-guided markets for branded products. This is the general market form in the system of abundance. Corporate-guided markets provide the most propitious conditions for corporations increase sales of their branded products; this market form is vital to the growth dynamic of the system of abundance. The concept of corporate-guided markets refines and develops Galbraith’s analysis; most tellingly it incorporates the critical role played by the institution of marketing. Put another way, the insights contained in this paper are the result of standing on the shoulders of an economic giant – J.K. Galbraith.

DOES COORDINATED CAPITALISM STILL WORK?
LABOUR MARKET ‘DUALISATION’ AND THE GLOBAL FINANCIAL CRISIS IN GERMANY AND JAPAN

Steffen Heinrich¹

¹Institute of Sociology, UNIVERSITY DUISBURG-ESSEN, Duisburg, Germany

Abstract: Germany and Japan are both marked by comparatively strong divisions between labour market insiders (regular, non-termed workers that are covered by traditional collective bargaining practices) and outsiders (non-regular employees who are represented in collective bargaining and consultation bodies). The global financial crisis has hit the latter group particularly hard (e.g. almost two thirds of temp agency workers in Japan had lost their job at one point and more than a third in Germany), yet the main concern of governments in the aftermath of the crisis has been the stabilisation of regular employment policies. Comparatively little has been done to raise the status of non-regular employees and to permanently improve their level of social protection. While parts of this reaction can be explained with short-term pressures, this paper argues that this primarily reflects long-term institutional changes in German and Japanese labour market arrangements since the early 1990s. This paper aims to demonstrate that the scope of institutional change in so called coordinated market economies is both wider and more heterogeneous than is commonly understood. Although the Varieties of Capitalism approach (VOC) has been criticised for being overly static, the global financial crisis shows that it still is very helpful to understand current developments. VOC can be used to show how the traditional employment models and institutions have maintained an “economic functionality” even though a
large number of firms now operate outside them and a “political functionality” despite the fading structural power of organised business and labour.

Yvonne Franke1

1Otto-Suhr-Institut für Politikwissenschaft, FREIE UNIVERSITÄT BERLIN, Berlin, Germany

Abstract: Capitalist development is embedded in broader societal processes and cannot be interpreted without taking global economic and political conditions into account. In order to understand the specific formation of Argentina’s capitalism this paper analyzes the development of the dairy chain in Argentina. Field research was conducted in 2009 and 2010 based on a Grounded Theory research design, which allowed for broad insights into socio-economic processes. Thus, the paper seeks to promote qualitative field research as an innovative instrument to understand the specific historically embedded context of capitalist development and therefore going beyond a pure varieties of capitalism or global commodity chains approach.

The specific Argentine mode of capitalist development rests on three pillars:

1. Argentine capitalist development has historically been strongly connected to the world market, as it is until today. Global markets for agricultural commodities have influenced agricultural and agro-industrial production as well as the Argentine capitalist mode of production in general. In case of the dairy chain their performance depends heavily on the international market for milk powder (e.g. highly influenced by the Common Agricultural Policy of the EU) and the international exchange rate regime dominated by the US-Dollar and Euro.

2. The specific agricultural system, which is characterized by what I call the relay-principle of Argentine agricultural production, is highly responsive to international incentives. This flexibility is based on historical class formation and land ownership, and mirrored in the local, regional and national institutional and legal framework. Here the challenges that soybean production poses to the dairy chain will be examined, taking economic, societal and political aspects into account.

3. The rise of the narrative of the “granero del mundo” (granary of the world) is shaping Argentine cross-over politics until today and can be considered as a fundamental consensus in Argentine society. This narrative supports politics promoting an agro-industrial export-based capitalism, which is in the interest of the Argentine elites, but might threaten food security and sovereignty in Argentina in many ways.

My analysis of these three pillars follows the idea of Global Complexity (John Urry 2003) and outlines that national capitalist development is strongly shaped by general social parameters.

LOCAL ECONOMIC CRISES IN GLOBAL CONTEXT: AN IRISH CASE STUDY

Terrence Mcdonough1

1Economics, NATIONAL UNIVERSITY OF IRELAND GALWAY, Galway, Ireland

Abstract: The Social Structure of Accumulation (SSA) Framework argues that capitalist history is characterized by successive stages separated from one another by periods of crisis. These stages are characterized by sets of institutions, economic, political, and ideological elements which support the capital accumulation process. Thus the institutional framework of capitalism changes from period to period. These structures of accumulation as they contain political and ideological elements have also historically differed from place to place, thus sharing a conceptual affinity with the varieties of capitalism literature. Recent work has argued that globalization has created a more geographically extensive SSA with local (national) variations.

The SSA framework has also analyzed the current crisis as the crisis of the global neoliberal SSA dating from the early 1980’s. Thus the crisis is a general one but one which is likely to have specific local manifestations. This paper examines the relationship between global neoliberalism as a world-wide structure of accumulation and more local structures of accumulation nested within it. As a case study it analyzes the relationship between the global neoliberal era which followed the stagflationary crisis of the 1970s and the Celtic Tiger period in Ireland. It then compares the institutional dynamics of the current crisis in global neoliberalism and the economic crash in Ireland. It finds the Irish case to be a local instance of global neoliberalism but with significant differences in some institutions and dynamics.

THE FUTURE OF CAPITALISM: RAPPRECHENMENT OF EAST AND WESTERN VALUES

Larissa Vladimirovna Tserkasevich1

1Management Faculty, ST. PETERSBURG ACADEMY OF MANAGEMENT AND ECONOMIC, Sankt-Petersburg, Russian Federation

Abstract: The future of capitalism: rapprochement of East and Western values

There is a point of view point of view that the liberal model of social development is perfect. And this model is realized in countries of the Europe and Northern America. Moreover, the modern scientists propagandize this way as a unique possible way of development of a society. However at present time in Western countries the system of individualism is come to deep crisis for all spheres of a public life: from economy and politics to culture and demography. In this case it is very important to study the experience of modernization of some the countries of the East which give us an example of an alternative way of the social and economic development which are based on collectivistic values. It is necessary to understand that in the East the state has an active a role of initiating force of development and the state is a guarantor of the statement of market values, rates and relations in economy. It also has introduced achievements of the western technogenic civilization, but preserved basic eastern cultural values and public attitudes. The aspiration to modernization was occurred without destruction of basic traditions of a society. For example, such countries as China, Singapore, Japan achieved the symbiosis of traditional and technogenic civilization what provided fast growth of economy, qualitative improvement of conditions of a life and work, and also increase of authority of these countries in the world community. Significant emigration of the Asian population in the countries of the West can
lead to diffusion of cultural traditions of the East and the West and all paradigm of social development.

AFTER NEOLIBERALISM? BRAZIL, INDIA AND CHINA IN THE GLOBAL ECONOMIC CRISIS

Stefan Schmalz 1, Matthias Ebenau 2

1Sociology, FRIEDRICH SCHILLER-UNIVERSITY JENA, Jena, Germany, 2School of Politics & IR, Queen Mary’s University of London, London, United Kingdom

Abstract: It has becomemcommon knowledge that rising powers such as Brazil, India and China coped better with the global economic crisis 2008ff than most core countries. While China and India never entered into recession, Brazil was among the first countries to overcome economic contraction. In this paper we combine neo-Gramscian IPE and regulation-theoretical insights to identify the major reasons for these countries’ good economic performance during the crisis. We argue that before the global crisis, each country ran through a phase of neoliberal reforms that eventually led to the establishment of different transnationalized forms of capitalism. In China and Brazil, these neoliberal models already experienced crises tendencies before the global meltdown had begun. Both governments, however, tried to make use of the crisis to restructure the economy and to reshape social relations. In Brazil, the crisis reinforced the transition to a social-democratic neodevelopmentism. In China, however, it is still rather unclear whether a fundamental regime change will be accomplished. India, in turn, did not change its economic policy significantly. There, the crisis has not presented an effective challenge to neoliberal dominance. We conclude that, due to these diverging trajectories, heglocal political economy might pass through a phase characterized by different, potentially tension-laden regional hegemonic constellations.

CONTRIBUTIONS FROM FLECHA AND OLIN WRIGHT: REAL UTOPIAS IN TURBULENT TIMES. THE MONDRAGON EXPERIENCE

Ana Burgués 1, Gisela Redondo 1, Tatiana Santos 2

1University of Barcelona, Barcelona, 2University of Girona, Girona, Spain

Abstract: In the year 2006, due to the economic crisis, Ramon Flecha and other researchers decided to deepen into the study of real alternatives to the capitalist economy, with a clear emphasis in the Mondragon case. Erik O. Wright became enthusiastic with the idea and included this proposal in the “The Real Utopias Project”.

The present proposal is framed in the analysis of this experience which constitutes an economic successful action in the framework of the current crisis. This paper will analyse some of the strategies and actions that are being carried out in the Mondragon cooperatives which show sustainable employment creation policies that foster social justice. The Mondragon cooperation is the seventh enter- preneurial group in Spain and the decision-making in their cooperatives follows the premise of “one person, one vote”. Among the consequences that this functioning generates, we can highlight -on the one hand- that the managerial policies favour the totality of their workers and not an entrepreneurial elite owning the capital. On the other hand, the internationalisation of the corporation has not supposed the delocalisation of the employment, which is also an element to be stressed out. The Mondragon corporation possesses a narrow salary range compared to other companies in the sector. However, in the context of the global economic crisis, policies for wage reduction have been possible and agreed by consensus, which has prevented cooperatives from conducting policies of employment reduction.

VARIETIES OF ALTERNATIVES TO CAPITALISM IN SYSTEMIC CRISIS

Vera Vratusa 1

1sociology, BELGRADE UNIVERSITY FACULTY OF PHILOSOPHY, Belgrade, Serbia

Abstract: The paper argues that it is high time that critical scholarship goes a step further beyond description of different types of responses to the most visible financial and fiscal aspects of the present acute manifestation of systemic crisis of capitalist mode of production as such. It is demonstrated that the common feature of apparently divergent neo-Smithian or neo-Keynesian responses to present systemic crisis manifestations in all empirical varieties of national capitals, presents the implementation of policy options that equally aim to preserve the present system of contradictory capitalist production relations which reproduce social crises and imperialist war disasters.

Paper proposes that the main task of critical scholarship is to examine varieties of past, existing and possible future alternatives to the present system of exploitative, oppressive and life destructive capitalist social relations.

The main finding of the paper is that reproduction of cyclical systemic crises can be resolved only through substitution of present private ownership, menagerial decision-making, market regulation and private profit motivation institutional mechanisms, with social ownership, producer’s and consumer’s councils’ decision-making, participative planning and human capacities’ development motivation institutional mechanisms.

Key words: varieties of alternatives to capitalism, systemic crisis, institutional mechanisms, ownership, decision-making, regulation, motivation.
RN 07 Sociology of Culture

CULTURAL GLOBALIZATION AS A FIELD OF RESEARCH, 2001-2010

Diana Crane

1Sociology, UNIVERSITY OF PENNSYLVANIA, Paris, France

Abstract: What can the literature on cultural globalization contribute to the sociology of culture? How can the sociology of culture contribute to our understanding of cultural globalization? The answers to these questions will be discussed in relation to: (1) A review of major theories in the field which concern the effects of cultural globalization on national cultures, the nature of transnational networks and flows, and the emergence of world culture and global civil society; and (2) A survey of the literature on cultural globalization in the past decade, using a set of 164 articles, published between 2001 and 2010 and retrieved from two information databases (Sociological Abstracts and International Bibliography of the Social Sciences). The survey shows that researchers studying cultural globalization are based primarily in Europe and North America but the most frequent location of recent research is Asia, followed by Europe and North America. On the whole, the literature is focused on the effects of cultural globalization, usually some form of media, on national cultures rather than on global networks/flows or on world culture and civil society. Cultural and media imperialism remain important subjects of debate, particularly the role of American culture and changes in the content of media hegemony.

AFRICAN CONTEMPORARY ART - ART INSTITUTIONAL APPROACH OUTSIDE THE CONTINENT

Sara Martins

1Sociology, Goldsmiths College, London, United Kingdom

Abstract: After the consolidation of independence movements in Africa, there was a need to create a discursive dialogue between nationalism and the importance of the Arts, but it is specially since the 90’s, that the concept of “African Contemporary Art” has been acquiring more and more international attention with specific exhibitions, festivals, and dedicated areas from the Venice Biennial or in the Documenta 11.

The visibility of this new category is still controversial for some agents from the arts world – what is it to be “African”? What’s the position of the Diasporas? Why do we need to categorise origins in such global arts world system? Some artistic agents resist to it, while some others engage with it. The fact is that the number of institutions and events dedicated to “African Contemporary Art” is still increasing outside the African continent.

With this presentation I aim to rethink this process from the point of view of the Sociology of Culture. This reflection will articulate different domains: politics, economy and art worlds, in order to better identify patterns and possible explanations for this process.

As a case study, I will focus on the recent initiative from the Portuguese government to create a Centre of Contemporary African Art to be open Lisbon in 2012. On this presentation, I will then give an account from its socio-political context, and its present-future positional strategy/ies regarding other peer institutions outside Africa.

This presentation will reflect my on-going PhD research on Cultural Policies regarding African Contemporary Art in Portugal.

WORLD CULTURE – THE ‘SACRED CANOPY’ OF WORLD SOCIETY, OR JUST ITS TECHNICAL UNDERBELLY?

OUTLINE OF A MACRO-PHENOMENOLOGICAL RESEARCH PERSPECTIVE

Sebastian M. Büttnerr

1Institute of Sociology, UNIVERSTY OF ERLANGEN-NUREMBERG, Erlangen, Germany

Abstract: While the so-called ‘world-culture’ theory proposed by John W. Meyer and colleagues has been quite popular in studies of organizations and globalization, it has been largely disregarded in the sociology of culture. The reasons of this peculiar inattentance are multifaceted, but some seem to be obvious: First and foremost, cultural sociologists were mainly pre-occupied with the analysis of local particularities, distinctions and variations in the past decades. Thus, a theoretical account that asserts trans-local, or even global, similarities has been eyed with suspicion. Second, the thesis of a massive diffusion of ‘modernity’ that the world-culture school puts forward articulately has been widely perceived as a strong deterministic theory of social change and an unfortunate resurgence of orthodox modernization theory. Third, the whole notion of ‘world culture’ and the use of the term ‘culture’ in connection with aspects which are often regarded as the opposite of ‘culture’, such as rational bureaucratic practices, technical standards and procedures, relatively vague and abstract scientific models and legal documents, are also widely refused by culturalists. And from the perspective of new theories of culture the conceptual anchorage of the world-culture theory in institutionalist sociology appears somewhat outdated. This paper argues, nevertheless, that world-culture theory should be seen as vital element of the all-encompassing ‘cultural turn’ in sociology and that it is worth paying more attention to in the sociology of culture. Based on theoretical premises of phenomenological sociology (Berger/Luckmann), symbolic interactionism, and Post-Parsonsian sociology of culture (Geertz, Alexander) it is a highly constructionist, non-deterministic, empirical account of contemporary globalization society. It highlights the increasing relevance of relatively similar cultural models, standards and practices around the globe that are widely shared and enacted in by experts and professionals and increasingly shape performances and actions of such different social entities as individuals, organizations, or even states. In this way, the world-culture theory can be used to fill a missing link in contemporary sociology of culture, namely: the link between local knowledge and practice and more recent accounts of expanding expert-driven systems and the constitutive technical foundations of modern life.

GUERNICA – THE PLACE TO WHICH WE REMEMBER – BUT WHY AND TO WHAT EXACTLY?

Akos Kopper

1Social Sciences, ELTE UNIVERSITY BUDAPEST, Budapest, Hungary

Abstract: FOR RS07 ARTS CULTURE AND CULTURAL MEMORY
Our paper is interested in the question why certain events turn into places of memory not only for national communities but become also part of the global ‘memory-scape’. We elucidate this question through the example of Guernica. We suggest that Guernica’s ‘success’ is rooted in the fact that it epitomizes modernity not only in what it stands for but also how it invokes this via Picasso’s painting.

Guernica is arguably one of the few political/cultural icons, which has a truly global resonance. (Thus protesting Chinese students could use in their outrage against the US to have bombed by mistake the Chinese Embassy in Belgrade; one can find references to Guernica in protests against atrocities in the Middle-East; just as much Guernica inspired artworks remembering the terrorist attack of 9/11). Although, intuitively, there seems little to be surprised about this state of affairs – given that Picasso was one of the greatest artists of the 20th century – nevertheless we believe it deserves scrutiny why Guernica became THE historical painting of the modern world. Why is it that Guernica turned into a universal symbol through which men of different cultures can send messages to one another?

Concerning what Guernica refers to we underline that it is rare to find such an uncontroversial point of capturing the way aggression and war completely lost its human face. While there are hundreds of comparable events in modern history many of these events invite for taking sides and finding excuses – at least explanations—why there were reasons for the actual tragic unfolding of those events – Hiroshima, the bombing of Dresden etc.. What is one of the peculiarities of Guernica is the fact that it seems to lack a struggle about appropriating the past, which allows for it to have a global reach.

Furthermore, it is even more significant that Picasso’s painting provides an abstract depiction of Guernica, which makes it both particular and universal at the same time. Guernica is in a way a ‘logo’ that is not bound to an event but goes beyond it. The painting is about Guernica but it is about much more than Guernica. This is, however, we argue, a rare phenomenon. Usually when we remember, WHAT we remember is upon which the emphasis is put. In case of Guernica, however, the medium of remembering – i.e. the painting—turned out to have a much greater significance than the actual event itself.

MIGRATION AND MORALITY: A CASE OF POLISH LABOUR MIGRANTS IN OSLO AND LONDON

Elżbieta Anna Czapka

1Institute of Sociology, UNIVERSITY OF MARIE CURIE-SKŁODOWSKA IN LUBLIN, Lublin, Poland

Abstract: Migration is a multidimensional process in which an individual changes their position in geographical, social and cultural space. Migrants are replaced from an axionormative system that they are familiar with to the unknown one. Each culture has its own system of norms and values, including moral ones, and creates a specific system of internal and external sanctions that come into play when certain norms are breached. The paper analyzes migration in context of morality. The author tries to examine what happens to individuals’ morality when they emigrate. Does it change? What do migrants think about their moral attitudes abroad? Do they sanction deviant behaviour of their compatriots? Does emigration from one’s country mean emigration from one’s morality?

Paper presents the partial results of the research conducted among Polish labour migrants in Oslo. Data were collected using both qualitative (focused and in-depth interviews) and quantitative (survey) methods.

The research results show that if there is no social sanctions that regulate individuals’ behaviour abroad, migrants are more prone to break their moral norms.

THE EXPANSION OF THE SOCIO-CULTURAL SPACE. POLES VERSUS FOREIGNERS

Rafal Wiśniewski

1THE FACULTY OF HISTORY AND SOCIAL SCIENCES, CARDINAL STEFAN WYSZYŃSKI UNIVERSITY IN WARSAW, Warszawa, Poland

Abstract: Opening of national borders and labour markets affects migration processes in various degrees. For example, in Poland a change in the dynamics of migration processes has been apparent since joining the European Union and later, in the period of global economic crisis. Migrations cause not only encounters with ‘cultural differences’ but also implement this ‘difference’ into individuals’ own activity space such as work and education in the multicultural environment. Acquired competences help to understand a ‘stranger’ and co-operate in a different organisation culture.

Work and education in the multicultural environment are, in a way, a form of dialogue between various individuals and groups. Functioning in such environment may benefit later in the form of a future co-operation or gaining trust whilst working for an international company. This refers to both - foreigners immigrating to Poland and to re-emigrating Poles, who gained new experiences in the multicultural environment. There appears a question: how does a common presence of cultural diversity affect attitudes towards foreigners? Accepting one defined attitude expresses itself in one of multiple possible accultural strategies towards the strange group.

The aim of this paper is to present the outcome of research conducted as a part of the Polish Measurement of Attitudes and Values (PPPiW) project in 2009-2010 on attitudes of Poles towards foreigners. One of the concepts referred in this paper to, is the Bourdieu Social Distance Scale. It was used in order to describe the social distance between Poles and foreigners. Acquired data is compared in the local and national scale and allow depicting two different perspectives towards strangers.

ETRE UN DES NOTRES, UN DES LEURS

Laura Ferilli

1Institut of Social Sciences / Lab of Sociology, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Au Capo di Leuca, au sud de l’Italie, parler dialecte créé immédiatement une proximité qui se traduit généralement par le passage au tutoiement, un regard et un sourire complices, des gestes amples d’affabilité, etc. Cela s’explique peut-être par le fait que mes interlocuteurs pensent, à ce moment de découverte de connivence linguistico-territoriale, que nous partageons, pour ainsi dire, un même « nous ». En effet, partageant une même langue locale, il va presque de soi que nous partageons une culture commune et que nous appartenons au même « nous », bien que celui-ci ne se définisse ou ne s’explicite jamais. Un élément apparait au
Abstract: In turbulent economic times public spending is scrutinized. Especially subsidies for arts and cultural organisations are criticised in a context of financial crisis. Recently governments all over Europe have drastically cut down support for the cultural sector. Cultural organisations are trying to legitimise public support by focusing on participation numbers.

It seems, though, that we are dealing with a very static cultural participation divide. Numerous publications show that the characteristics of cultural participants are well known and are very variable. Among others, parental context and educational level, are excellent predictors of cultural participation.

In the quest for new audiences cultural organisations are experimenting with new technologies, namely internet, which are increasingly domesticated by all social groups. Museums are presenting there collections in a digital way, music concerts are streaming online, youngsters buy or download music on global platforms, etc. The internet seems to have changed both the cultural industry and cultural participation.

In this paper we will compare the outcome of two participation surveys (2003 and 2009) in the northern part of Belgium (Flanders). First of all we will focus on the meaning of digital cultural participation as such. What are people doing online? (on the internet, by using their smart phones, etc?) Which cultural forms are attracting an online audience? What is the evolution of the participation numbers? Secondly we will investigate the correlation between digital cultural participation and variables such as age, education and sexe. Thirdly we will look for an explanation of digital cultural participation by presenting a multivariate model.

Finally we will comment on the impact of our results for the cultural actors and for cultural policy makers.

ITALIANNELNESS AND MADE IN ITALY IN FASHION ADVERTISING: A CONTENT ANALYSIS

Simona Ironicco¹, Nello Barile¹

¹Istituto di Comunicazione, comportamento e consumi, IULM UNIVERSITY, Milano, Italy

Abstract: The aim of this contribution is to investigate the convention of representations of Italianess in fashion advertising. Through the findings of an empirical research carried out on a sample of 360 Italian fashion brands, the authors will provide a better understanding of the image of Made in Italy, emphasizing a progressive shift from a simple notion of “country of origin” to a more complex and universal concept labeled as “metabrand”.

Specifically, qualitative and quantitative content analysis of print advertisements enabled the researchers to identify the discursive strategies through which fashion companies reappropriate their national identity to strengthen their brand imaginaries and values. The comparison of the visual narratives on the Italian geographies, stereotypes, traditions and cultural heritages emerged from the advertisements gave insight into a deeper comprehension of Italianness and Made in Italy distinctive features, highlighting the power of Made in Italy as a metabrand in supporting fashion companies’ communication strategies.

CULTURAL PARTICIPATION IN DIGITAL TIMES

Gert Nulens¹

¹IBBT/SMIT, VRIJE UNIVERSITEIT BRUSSEL, Brussels, Belgium

Abstract: In the quest for new audiences cultural organisations are presenting there collections in a digital way, music concerts are streaming online, youngsters buy or download music on global platforms, etc. The internet seems to have changed both the cultural industry and cultural participation.

In this paper we will compare the outcome of two participation surveys (2003 and 2009) in the northern part of Belgium (Flanders). First of all we will focus on the meaning of digital cultural participation as such. What are people doing online? (on the internet, by using their smart phones, etc?) Which cultural forms are attracting an online audience? What is the evolution of the participation numbers? Secondly we will investigate the correlation between digital cultural participation and variables such as age, education and sexe. Thirdly we will look for an explanation of digital cultural participation by presenting a multivariate model.

Finally we will comment on the impact of our results for the cultural actors and for cultural policy makers.

THE CONTENTIOUS GAP: FROM DIGITAL DIVIDE TO CULTURAL DOMESTICATION?

Jaron Harambam¹

¹Sociology, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: With the rise and widespread application of the internet, social scientists rapidly emphasized that some people were better able to gain control over these technologies than others. This so-called digital divide between the haves and the have-nots was seen as a new feature of contemporary inequality – as a reproduction or transformation of existing social disparities, favoring the rich and aggravating the poor (for an overview: Gunkel, 2003; Hargittai, 2008; Selwyn, 2004; Partridge, 2007). Motivated by these concerns about social inequality, it is argued in this paper, research on the digital divide has been theoretically and empirically blinked over. Even though the focus changed from simplistic questions of having access or not, towards the more informative dimension of usage and skills, the same socio-economic bias was maintained. In this paper we therefore theorize that appropriating the internet (or not) is less related to socio-economic position or usage and skills but is more culturally informed than theories about a digital divide allow for. Especially peoples’ evaluations of social life online, we hypothesize, is nowadays crucial. To empirically test our assumptions we used the internet based community project “Telebrink” as a case-study.

Based on a survey among Dutch citizens involved in this project (N=251) we studied the explanations for (not) using these applications by testing hypotheses about the influence of skills and knowledge on the one hand and culture, i.e. evaluations of online
social life, on the other. Our statistical analyses show that cultural attitudes, i.e. evaluations of online social life, influence appropriations of the internet most strongly. It is therefore concluded that how people actually evaluate the internet, how they feel and think about this technology, is of major importance. Especially when this technology coalesces with people’s social life, like it does today, it should be evident that the cultural dimension of appropriating technology cannot just be ignored as mere socio-economic explanations simply don’t suffice in this discussion.

A TRADING ZONE FOR CONSERVATION OF URBAN HERITAGE AIMING AT REGIONAL SUSTAINABLE DEVELOPMENT

Christer Gustafsson

Abstract: This paper presents an application-oriented theoretical platform and a new model, providing adequate approaches to solving boundary-spanning challenges for regional growth, strengthening competitiveness, sustainability and development of building conservation.

Here, tailor-made multi-stakeholder networks have been operating pro-actively with a jointly organized formula of the historic environment sector together in concert with representatives from other public sectors and industries. The cases observed, illustrate how the historic environment sector took an intermediate position and provided historic buildings at risk, usable as working places for long periods of time as well as “containers” for new functions. This regional cross-sectoral cooperation with a multi-problem-oriented approach has demonstrated win-win situations for the historic environment sector as well as for other partners and for regional sustainable development in general.

Research on such a comprehensive collaboration scheme demands the use of hybrid methodologies and boundary-spanning, transdisciplinary and multidimensional theories. Based on a participatory action research methodology the objective of this paper is to analyse the trading zone. Each separate sector or industry has had its own objectives as well as its own resources, needs, policies, networks and regulations, but also its own vocabulary and mindset. The study of these manifold relations and judgements involved in a different systems of policies and values – it is connected to meta-modelling discourses dealing with sustainable development. A generic model is developed where the trading zone is defined as an active arena or a field of force corresponding to the actors’ various policies, values, facts and resources.

Key words: trading zone, integrated conservation, sustainable conservation, sustainable development, cross-sectoral networks, multi-problem orientation, policies, values, judgements.

CONNECTING PATTERNS: SUSTAINABILITY AND THE CULTURE OF COMPLEXITY

Sacha Kagan

Abstract: Away from a culture of unsustainability characterized by “disjunctive simplification” (Edgar Morin) plaguing the modern modi cognoscendi, and its declination in the autopoiesis of social systems, the shift toward uni-plural ‘culture(s) of sustainability’ requires specific aesthetic experiences fostering a sensibility to complexity, which may contribute to a culture of complexity.

Elaborating a theoretical understanding of the cultural dimension of sustainability as based on a trans-disciplinary understanding of complexity, the paper will explore the importance of ‘aesthetics of sustainability’ for contemporary social agents to become “knowl-ledgeable Earth stewards” (as sought by sustainability science).

Following Morin’s approach to complexity, away from both the simplification of reductionism and the simplification of systemic holism, a culture of complexity implies the possibility to think unity and diversity alongside each other, and to think about any pair of terms, with a combination of unity, complementarity, competition and antagonism, altogether forming a complex relationship and calling forward a dia-logical thinking process.

Furthermore, the proposed understanding of aesthetics of sustainability stresses the importance of the participatory nature of perception (after David Abram) as well as the sensibility to patterns that connect (after Gregory Bateson) and to complexity (after Morin), fostering embodied, transversal modi cognoscendi and an autopoietic evolutionary ability of social systems.

EEPOCH, A MULTIPLE CASE STUDY INVOLVING ENERGY EFFICIENCY, PRESERVATION, AND MANAGEMENT AND WORKING CLIMATE IN CONSERVATION TEAMS

Heidi Norrström, Michael Edén, Christer Gustafsson

Abstract: The research project EEPOCH, Energy Efficiency and Preservation in Our Cultural Heritage, concerns the complex set of problems that hold between these two perspectives including usability and the performance in teams at conservation work.

Energy efficiency is in focus throughout Europe. The potential is pointed out in the existing buildings. At the same time we know that built environment is an important heritage worth preserving, and do not only concern the monuments. This is considered to be a contradiction. There is an imbalance in models and tools in favour of tangible and measurable energy issues. There is also the discourse on usability and preservation. The hypothesis is that all perspectives can converge to be met in applied cases. The aim of EEPOCH is interdisciplinary and transdisciplinary theory building, and development of useful methods. Case studies will form foundation for the methods.

Preserved objects for studies are chosen from the Halland Model, a co-operation project and true model for integrated conservation. Its’ success is described as an outcome of an entrepreneurial model where the trading zone is defined as an active arena for negotiations and a field of force corresponding to the actors’ policies, values, facts and resources. It has, though, not so far been evaluated regarding the energy or the working teams’ performance.

EEPOCH is carried through by multiple case studies and workshops, analysis of different measures and interviews, and document studies. The work so far, indicates that the hypothesis is right and will result in models useful for other objects than the monuments.
EEPOCH is financed by the Swedish Energy Agency and by local companies who are engaged in workshops where solutions evolve.

**CONSERVATION OF “PLACE” TO SUSTAINABLE DEVELOPMENT**

Emiliana Mangone

1 Dep. of Human, Philosophical and Education Science, UNIVERSITY OF SALERNO, Fisciano (SA), Italy

Abstract: Our attention is pointed on Laviano area, a little village in province of Salerno in South of Italy. It destroyed completely by earthquake happened in 1980 on 23rd November, with 300 dead. The earthquake did not destroy only houses, it contributed also to destroy the “common identity” of the territory that was already in crisis for the migrations, but community does not seem surrender and it tends to rebuild a new identity pointing on young people born and growth after earthquake.

The research “Returned Laviano”, is based on the idea that the “soul restitution” to Laviano population could be still possible through the recovery of collective memory starting from an interactive 3D virtual reconstruction and from a plastic model of the town before 1980 earthquake thus to reinforce the territorial belonging sense.

The research, that sees the involvement of several disciplinary areas, hereafter the computer – technologic aim, tries, from a sociocultural point of view, both to make surpass cultural choc due to the substitution of the old town with a new town and put the result of research at disposal of cultural sustainable development in a twofold sense:

- Supporting research, knowledge, recovery, protection and valorisation of cultural and memory heritage considered as identification element for Laviano population but also as attractive force for external and possible occasion of development;
- Supporting, as process of cultural development, appropriation or re-appropriation of these goods and of these realities burdened with values and reminiscences, by local population.

**THE IMPACT OF DIGITISATION OF MUSIC IN ART AND HERITAGE FIELDS**

Jean-Christophe Sevin

1 Centre Norbert Elias, EHESS, Marseille, France

Abstract: The emergence of digital technologies has important implication in many fields of social life and activities. In the case of music, studies have pointed out the transformations of broadcasting and creating implied by the digitisation. Here I would like to discuss the effects of digitisation on the status of records, by investigating the reissue of old records. It concerns analog recording technology and, on one hand, the loss of sound quality due to degradation of this kind of recordings (78 rpm, vinyl, magnetic tapes), on the other hand, technical insufficiency leading to non-desired recording sounds. The analysis deals with remasterisation of old records and way of considering them, taking into account consequences of interventions.

An empirical investigation with some remasterisers helps us understand the practical content of the operations. In order to avoid any risk of confusion, I must precise that remastering and reediting records are not restoration actions in the field of heritage preservation. The paper focuses on making a new master to carry out a new pressing, and thus put the record in circulation. The reissue is not conducted for preservation first but for publication, with a goal of making profit. But for this analysis, we’ll maintain the parallel between remasterisation and restoration. Our objective is to use reference works in the field of restoration of works of art in order to analyze remasterisation operations and their consequences for the recording. How are to consider the transformation of the sound compared to the original recording? Are old recordings improvable?

In the end, this research on remastering leads an investigation of the status of recordings status in a context that includes historical, aesthetic and technological aspects. How can we consider them? As Alvin Zak said, records hold a fundamental place in the dynamic of modern musical life, but what do they represent? Are they documents? Artworks? Fetishes? Commodities? In other words, are recordings simply artistic traces of a music event fixed on a carrier or are they artistic processes in themselves, distinct from music performance?

**PROSTHETIC MEMORY OF COMMUNISM. THE CASE OF NEW ROMANIAN CINEMA AND ITS RECEPTION IN THE MEDIA**

Alexandru I. Carlan

1 Communication and Public Relations, NATIONAL SCHOOL OF POLITICAL AND ADMINISTRATIVE ST, Bucharest, Romania

Abstract: Romania’s cultural background nowadays is a battlefield of conflicting visions about past Communist experience (and the accompanying colonialist discourse about Soviet globalization) and the rivaling temptation of the incoming global culture, with its array of controversial messages, eclectic cultural goods and multicultural cultural providers. Ethno-nationalist discourse was bound to reemerge in this field of cultural transformations, confirming that ‘there is an awful lot of handwriting on the allegedly blank sheet of postcommunist culture’ (Kovács in Berger, Huntington, 2002, 146). Within this framework there is a strong need to come to terms with the previous Communist experience as a constitutive element of national identity. On the very rich cinematic stage reaping the Communist period in Romania, Andrei Ujica’s movie, ‘The Autobiography of Nicolae Ceauşescu’ stands out, and its frank yet unforgettable and uncomfortable meanings have triggered a public debate which might be taken as an indicator of an ongoing elaboration on Communist experience. Starting from a reconceptualization of ‘prosthetic memory’ (Landsberg, 2004), we aim at identifying the processes, frames and contextual understandings through which the meanings of the movie are established and integrated in the social memory on Communism. By confronting the movie with the media debates it generated (opinion articles in major quality papers and cultural weeklies), we will further problematize the prosthetic attributes of the representations created as a consequence: its exterior and possibly unauthentic character, the potential to produce social responsibility (thus confirming Landsberg’s view) but also the potential to block identification or to rule out the possibilities of empathy (thus amending Landsberg’s concept). The communist experience is still difficult to integrate in an identity profile, and the prosthetic character of memory might be conceived as a compromise formation between the traumatic experience of the past and the challenges of contemporary culture.
CHALLENGES OF EUROPEAN CULTURAL IDENTITY IN INTERCULTURAL CONTEXT
Nicoleta Corbu 1, Georgiana Udrea 2
1 CENTER FOR RESEARCH IN COMMUNICATION, 2 College of Communication and Public Relations, NATIONAL SCHOOL OF POLITICAL STUDIES AND PUBLIC AD, Bucharest, Romania

Abstract: This paper discusses the relationship between national and European cultural identities in an intercultural context. More specifically, how identities are activated in short-term sojourns of young people in different national cultural environments.

The problem of cultural identity has long been discussed in the late decades, especially due to the increasing phenomenon of migration in search of a job, an education and/or a change of lifestyle. We argue that cultural identity reacts to the changes in the environment. As long as an individual stays in his/her cultural environment, cultural identity changes slowly, as to incorporate new information into old patterns. However, when individuals find themselves in an intercultural context, cultural identity is challenged by the new patterns, and demands a considerable adaptive effort.

At present, little is known about how people experience European cultural identity in an intercultural context. Do people experience a sense of being European or rather of being citizen of their country? Does the European dimension of one’s identity facilitate in any way the adaptive efforts to a new environment? In order to answer these questions we conducted twenty-four in-depth interviews with Erasmus students studying abroad between 3 and 6 months, in the last two years. The main focus of the research is how young people experience two different layers of cultural identity: national and European.

Research showed that national identity is the strongest cultural dimension of people experiencing an intercultural environment. European identity seems to be rather a theoretical construct than a well established presence. It does not merely support the adaptive effort of short-term sojourners.

CAPITALS, CLASSIFICATIONS, AND LANGUAGE PRACTICES: CONFLICTING DISCOURSES OF SOCIAL EVALUATION IN CONTEMPORARY SERBIA
Ivana Spasic 1, Jovana Dimitrijevic Savic 2, Ana Biresev 3
1 Department of Sociology, Faculty of Philosophy, UNIVERSITY OF BELGRADE, Belgrade, 2 Faculty of Philology and Art, University of Kragujevac, Kragujevac, 3 Institute of Philosophy and Social Theory, UNIVERSITY OF BELGRADE, Belgrade, Serbia

Abstract: The paper aims at presenting the contours of the dynamic field of competing scales of evaluation – of people, social groups, and practices – operating in contemporary Serbia and shaping social inclusion and exclusion. We will be taking our leads from three theorists sometimes seen as incommensurable: Bourdieu’s notion of classification struggles, Boltanski and Thevenot’s economies of worth, and Lamont’s boundary work. This composite theoretical framework will be used to explore how these struggles are manifested in ordinary people’s discourses in semi-formal settings. The paper will be based on analysis of qualitative data collected through focus group discussions set up as part of the research project “Social and Cultural Capital in Serbia”. Special attention will be paid to the differential use of language as a performative instrument in classification practices.

CULTURE CONFLICTS BETWEEN OWNS AND WORKERS ON RUSSIAN PLANTS
Natalia Shushkova 1
1 Perm Branch, State University - Higher Economic School, Perm, Russian Federation

Abstract: Economic changes (the development of market principles, the maintenance of competition, recognition of private property rights, etc.) face with resistance of various groups of contemporary Russian society. This resistance is rarely leads to the open expression of dissatisfaction. Probably, we should speak of the latent cultural conflict (modernizations type). The economic crisis only reinforces this gap.

The report considers the cultural conflicts by the case of the owners of the factory and its laborers. The report is based on data from sociological study one of Urals industrial plant.

At the plant it can be observed at least three groups, whose culture (philosophy, technology of behavior, actions symbolic) is opposed to each other: the owners, top management and workers. Workers are not aware of themselves as workers, their labor at the plant is perceived as natural condition, and the thought of occupational mobility frightens them. Owners use a wide interpretation of their status. In their eyes, they hold not only the plant, but partly its employees. Workers are eventually powerless and helpless. Their work is underestimated, wages may delay, working conditions deteriorate, and safety precautions are not observed. Company’s owners do not have considerable economic knowledge; the plant for them is like a bottomless box from which one can borrow money. This opinion determines the dual position of top management: they share the views of the owners about the powerless workforce, but instead refuse their own professional claims.

As a result, formal and informal norms of labor at the plant have equal status. Workers, management and owners are choosing among them those that conserve the status quo and exclude changes both inside and outside. Employment at the plant alienates its workers from the rational participation in the economy. Ownership of the plant does not give its owners the opportunity to learn rational economic market behavior.

HOW CAN THE FUTURE BE BUILT UPON THE PAST?
Dagmara Beintnere 1
1 Institute of Philosophy and Sociology, UNIVERSITY OF LATVIA, Riga, Latvia

Abstract: The Case of Latvia: March 16 vs. May 9. When Latvia became independent in 1991, it also inherited the legacies of the Soviet occupation. One of the most challenging legacies has been the disagreement between communities who have contrary understandings of themselves and history, in particular between local ethnic Latvians and (primarily) ethnic Russians who arrived with the Soviet regime. Although in 1994 the last Soviet armed forces left Latvia, 20000 retired members of the Soviet military (and their families) decided to stay in Latvia.

The conflicting understandings and identities between the Latvian and Russian communities is reflected in the very different com-
memoration of World War II. Since 1998, ethnic Latvians commemorate “Day of the Legionnaires,” on March 16, which honors the Latvian soldiers who fought, during the Nazi occupation, against the Soviet Union during World War II. The Legion remains a controversial part of Latvia’s past as many Latvians saw, and continue to see, the Legion not as serving the aims of the Nazis, but rather as a possible source of national defense against both the Soviets and the Nazis. The veterans and their supporters gather at the Monument of Freedom (unveiled in 1935). The Russian community, however, commemorates May 9, 1945 as the Day of Victory, gathering at the Soviet Monument of Victory (unveiled in 1985).

These two commemorations reveal contrary understandings of World War II and these days point to both visible and invisible confrontations between the “winners” and “losers” of history. These commemorations point to conflicts between identities, historical and cultural traditions. Moreover, this is not just a conflict between ethnic communities, because ethnic Latvians were also drafted into both the German and Soviet armed forces—the ethnic Latvian community itself is also divided.

This presentation will be based on interviews with members of both commemoration communities and discuss how each community sees the other 60 years after the end of WWII. How can a democracy build its future on the past and reconcile these two communities of people—both of whom are victims of war? Moreover, how does the split within the Latvian community shape the development of collective memory?

SOCIOCULTURAL APPROACH TO THE ANALYSIS OF RUSSIAN POLITICS MODERNIZATION

Yuriy Vasserman1

1Department of Sociology and Political Science, Perm State Technical University, Perm, Russian Federation

Abstract: Sociocultural approach to the analysis of Russian politics-modernization

The intent of this Abstract is to draw attention to some correlations indicating that the same aspects of sociocultural differentiation in contemporary Russian society are reactions to the process of its modernization. These aspects are reflections of the contradictions in the society resulting from the clash of sociocultural features that are normally associated with different stages of historical process of social modernization. According to the theoretical framework, the process of cultural change must follow the process of technological change in adapting human behavior to new technical environment. The cultural and symbolic systems of these people do not correspond to the new environments. Russia is a powerful example of such inconsistencies. Just a few generations ago the majority of Russian population was rural. Their culture corresponded to the low-level technological environment characterized by manual labour. The process of modernization has changed economy and other sides of environment in just a few dozen years, leaving the cultural adaptors far behind. People experience conflict with impacts of modernization such as market economy, new models of division of labour, etc. There are a number of groups with different levels of culture modernization and different reaction to continuation of modernization. The author attempted to investigate the problem of socio-cultural differentiation under the impact of modernization using the methods of quantitative sociology. The main concept of our research is a concept of the socio-cultural type. Socio-cultural types have different degrees of adaptation and connectedness to, or disconnectedness from, the relations of modern market economy. The Likert’s scale was used for the elucidation of the level of modernization of culture of respondents. Two groups emerge from the study results: the first and tenth decile groups. The first decile group had minimal culture modernization score and tenth decile group had maximal culture modernization score. The results of our study show us not only the change in attitudes (culture modernization score) but also in activities and real life decisions in sphere of politics. Sociocultural approach gives an opportunity to see the range of social political and cultural identities produced in the context of processes of politics modernization.

“BE WHO YOU WANT TO BE?” THE MYTH OF AGENCY IN ONLINE COMPUTER GAMES

Stef Aupers1

1Sociology, ERASMUS UNIVERSITY, Rotterdam, Netherlands

Abstract: The academic debate on new media is dominated by the paradigm of a “participatory culture” (Jenkins, 2006). It is not so much anymore about the powers of the “culture industry” (Horkheimer and Adorno, 1944), its dominant-hegemonic ideology and mass media texts that may or may not be “decoded”, negotiated or opposed by the audience (e.g., Fiske, 1980; Hall, 1980). It is primarily about handing over the means of production to an emancipated, critical audience and facilitating self-expression for the individual. This paper critically studies this alleged relation between new digital media and agency using Massively Multi-Player Online Role-Playing Games as a strategic case study. Based on 25 in-depth qualitative interviews with Dutch players of World of Warcraft, a content-analysis of advertisements of 50 MMORPGs and literature on game design, it is argued that MMORPGs are indeed exemplary for “participatory culture” emphasizing player’s agency but that this individual freedom paradoxically has become an hegemonic ideology and an unacknowledged mode of social control. Players, it is first demonstrated, celebrate the opportunity to express their human potential online through role-playing: they act out what they consider to be a better, more heroic version of themselves that does not easily surface in real life. The second part of the analysis demonstrates how this liberating discourse about the self is articulated and (re)produced in game advertisements as an important selling point and how game designers literally engineer immersive experiences, manipulate emotional identifications and enhance feelings of unlimited agency in the game. The paper concludes that agency in online games is a myth in two ways: from a cultural sociologist perspective it provides, like every myth, meaning to the players of online computer games. From a neo-marxist perspective, however, the well-crafted myth of agency online, comparable with Horkheimer and Adorno’s “pseudo-individualism”, veils the bare economic interests of the game (culture) industry and provides a strong ideological enticement for consumers to ‘stay in the game’ of modern capitalism.

MICRONATIONS AND DEMOCRACY 2.0 - CHANCE TO CHANGE?

Adam Dąbrowski1

1Sociology, JAGIELLONIAN UNIVERSITY, Cracow, Poland

Abstract: Contemporary times cannot be analyzed without progressive digitalization and computerization of societies. Nowadays, media are often used in everyday life of almost every individual.
Furthermore, individuals still transmit more and more of their activities, social organizations and structures to the virtual reality. Either these can assume other dimension, adapting to specific form of communication, or – with different effect – they are being copied from the real world without any change.

Some kind of attempt to transmit organization of social life to the virtual space is micronsations, which constitute a practical exemplification of technological remedy for many problems of contemporary democracy. Therefore, I choose functioning of the virtual states possessing their own history, social organization, structure and authorities as a main subject of my paper. An analysis, which was preceded by in-depth interviews with micronsations’ citizens, reveals many interesting conclusions considering both the point of view of the examined medium as well as existing political regime that is democracy.

This kind of activities can serve as an answer to fundamental problems concerning democracy, especially lack of social trust to politicians, poor citizens’ interest or weak involvement in politics. It is important however to determine to what degree such involvement and change in the virtual reality translates into the real world and functioning of the real civil society and state. An analysis of empirical research not only enables one to answer that question but also provides a basis for a more complex conclusion about possibilities of 2.0 democracy, being understood as an application of IT technologies for an increase in civil participation in democracy processes, in terms of both quantitative form as well as the real influence exerted by the individuals on the functioning of a state.

**MEDIA CULTURES AND CREATIVE NETWORKS; FORMAL AND TACIT KNOWLEDGE TRANSFERS IN THE MEDIA AND CULTURAL INDUSTRIES**

Erik Hitters

1**ESHCC, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands**

**Abstract:** In recent years truly global markets have developed with mediated cultural products, films and music flowing relatively freely around the world. Whilst the producers are widely scattered around the world, certain cities have emerged as clusters/hubs for the trade and exchange of such products. These hubs function not only as clusters - important employers and generators of export earnings - but also have important spillover effects on cities’ reputations for innovation and creativity. This paper offers a study of two of such clusters in the Netherlands, Amsterdam and Hilversum, both known for their clustered location of media firms.

The paper investigates to what extent intermediary spaces and actors, rather than primary producers such as artists, directors and musicians are the basis for urban competitiveness and reputations in global cultural markets. The paper is based on a mixed-mode approach of both extensive quantitative information, and intensive qualitative information. The quantitative data consist of detailed statistical and economic data on the cross-media sectors in both cities. The qualitative data consists of 20 interviews with media personnel, analysed by means of Atlas-ti.

The paper contends that we need to understand how intermediaries are not just essential for delivering cultural goods to markets but also to the flows of both formal and tacit knowledge which ultimately links creativity with the market and connects commercial innovation with cultural excellence. It points to the importance of understanding spillovers not just in terms of knowledge transfers but also in the form of reputational economies. Knowledge and value in the cultural industries are crucially related to reputation and the dynamics of taste. Reputation economies affect products’ value and are very often related to and supported by the reputation of the place they are brokered and sold within. Thus the value of a city’s reputation and status for brokering high quality and innovative culture and entertainment is important to the products brokered there but also to the city’s ability to sustain a global market hub. The paper argues that reputational economies accrued within the cultural industries can spillover to other sectors of the economy. Furthermore, it critically assesses the effectiveness of policy interventions in such urban reputational economies.

**PERCEPTION OF CHINA AND CHINESE IN CHILEAN AND ARGENTINIAN MEDIA**

Jarosław Jerzy Jura 1, Kaja Kaluzynska 2

1**LAZARSKI UNIVERSITY, Warsaw, 2Jagiellonian University, Faculty of International and Political Studies, Krakow, Poland**

**Abstract:** The paper is a part of the broader project which aim is to investigate the perception of China and Chinese in Africa and Latin America. The aim of the paper is to categorize the way how China and Chinese are presented in local media: whether the picture is negative or positive, in what context they usually appear. And finally if this picture has been changing during the last few years. We have chosen Chile and Argentina mostly due to the fact that the historical background and economical context of Chinese expansion in these countries differ significantly. Chile is a country with a long lasting history of diplomatic relations with Peoples Republic of China, it is also the first Latin America country that signed a free trade agreement with China in 2006. Argentina, on the other hand, is one of those countries which are trying to limit Chinese economic expansion and its relations with China are not better than moderate.

The purposive sample of Internet news portals and online versions of local newspapers in Chile and Argentina has been chosen for the analysis. In order to obtain some knowledge about the audience reception, the analysis of Internet forums at those portals will be conducted as well. The content analysis (both quantitative and qualitative) is the main method used in this research.

**LUXEMBOURG ET GRANDE REGION, CAPITALE EUROPEENNE DE LA CULTURE 2007, PLATEFORME TRANSFRONTALIÈRE**

Dorina Bohantov 1, 2*

1European studies, UNIVERSITY OF GENEVA, Geneva, Chancy, Switzerland, 2Comparative litérature / Foreign languages, State University of Moldova, Chisinau, Moldova, Republic of

**Abstract:** Luxembourg et Grande Région, désigné Capitale européenne de la Culture en 2007, a dressé le profil d’une ville-frontière située dans un pays-frontière, à vocation européenne. La suite des événements culturels organisés sous le chapeau de ce vaste programme annuel, lancé en 1985 répondaient aux enjeux de l’identité transnationale, propre à notre temps. Couvrant à la fois le volet local, régional, national et international, l’enjeu de cette identité a été de dépasser les frontières (visibles / invisibles, objectives / subjectives, humaines / technologiques, etc.). Le profil de la ville s’est dressé comme un pluriel, mouvant et pacifique (la personne
GLOBALIZATION AS A FACTOR OF ETHNIZATION OF CULTURAL SPACE

Dina Tanatova

1faculty of sociology, RUSSIAN STATE SOCIAL UNIVERSITY, Moscow, Russian Federation

Abstract: In the context of globalization, intention to preserve their culture typically manifests itself in an acute reaction to a threat to their sovereignty. In particular, Russia’s liberal reforms in the 1990s of the 20th century were marked by active attempts to change traditional attitudes, the introduction of new social and moral values. They are based on the ideology of individualism, hard pragmatism, suggestions of historical guilt, civilization backwardness and national disability. All these elements have been more alien to the culture of the Russian society. Rejection of new ideas is predetermined by historical memory of the people, their ethnic character and spiritual guidance. There is the same picture in most countries, which under the influence of global change, changed the political, economic, social, value orientations (State Socialist orientation in the past, the Middle East, a number of European States).

Search for a sustainable position in global coordinates system has led them, in our view, to ethnization of cultural space. Ethnization of cultural space due to us, firstly, the increasing of globalization and the emergence of the internal protective mechanisms to preserve their culture with her attributes. Secondly, external strengthening ethnic emphasis in international politics, business, media, labour markets, ideology. Thirdly, with the understandable intention of ethnic communities to be heard and participate effectively in a historical process. Fourthly, realization of rapid incorporation of ethnic communities in a global society by sustained mental features and cultural preferences. Fifthly, the real threat of ethnic dislocation.

Thus, the projected earlier universalization of culture, the multicultural model of human development, increased by globalization has proved to be untenable. A general movement towards the global community has reinforced the sense of danger to cultural homogeneity, reduced the quality of adaptation mechanisms, dramatically increasing the likelihood of ethno-cultural confrontation and reconstruction of social reality.

FILLING THE PAIL OR LIGHTING THE FIRE? THE OPPORTUNITIES AND PITFALLS OF DIGITAL HERITAGE IN EDUCATION

Lien Mostmans

1IBBT-SMIT, VRIJE UNIVERSITEIT BRUSSEL, Brussels, Belgium

Abstract: In these turbulent times access to and knowledge of our public cultural heritage is being challenged. It appears problematic to broaden existing audiences and to legitimise public funding in times of financial crisis. Nonetheless, digital access to cultural heritage is argued to be an instrument to sustain and support participation. Indeed, sustainable access to digital cultural heritage has become an important long-term objective of cultural heritage institutions and policy makers throughout Europe. Moreover, increasing amounts of audiovisual content and cultural heritage are becoming available online (e.g., European Commission, 2009). Parallel, the educational field has become increasingly digitised, with teachers ever more being invited to apply digital practices to engage their ‘digital native’ pupils (e.g., Parker, 2010). The presentation of digital...
cultural heritage in classrooms can be a means to introduce heritage to the pupils in a way that is close to the social reality of youngstes.

Scholars have, however, pointed to the distinct character of cultural content, i.e., requiring guidance, knowledge and skills to be able to comprehend and appreciate it (e.g., Bourdieu, 1979; Stavlot, 2005), as such requiring additional efforts from educators.

Drawing on own research obtained in the Flemish research project Epics (E-learning Platforms In The Cultural Heritage Sector), the main research question is: How does the postulated 'embeddedness' of digital heritage in education correspond with teachers’ practices, needs and expectations when it comes to using digital heritage in classrooms?

We set out a multi-method qualitative research design in which a mixed (age, gender, subject) group of 19 teachers spread over 2 demo sessions assessed an e-learning environment in a pre-structured form and were interviewed in focus groups.

The majority of participants indicated to feel inadequately trained to educate young people in digital culture. Moreover, some expressed reservations on cultural e-learning environments, e.g., because of the lack of clarity about the (legal) status of own content in environments where commercial players (e.g., educational publishers) prevail.

Subsequently, we propose recommendations to facilitate cross-sector collaboration, respond to curricula and support pedagogies.

**FADO FLOWS IN OUR VEINS: A FAMILIST VIEW OF MUSICAL PASSION AND PRACTICE**

Ana Gonçalves1

1Institute of Social Sciences, LISBON UNIVERSITY, Lisbon, Portugal

Abstract: Assunção, Câmara, Câmara Pereira, Carmo, Carvalho, Duarte, Maurício, Moutinho, Pacheco, Parreira, Proença, Rocha, Santos, just to mention some of many, are surnames that appear in duplicate, triplicate, quadruplicate over the past years within Fado, the most emblematic musical genre of Portugal.

This paper/presentation, that will focus on fado heritage and its intrafamilial and intergenerational transmission, will provide a theoretical and empirical overview of the common phenomenon of family tradition among fado practitioners, will examine the role of families in the preservation and extension of the fado’s heritage and, at last, will explore its social meanings nowadays. These several aspects will be discussed in the light of data obtained from fieldwork in Lisbon (Portugal) with a sample of fado’s families.

**“UNWANTED CULTURAL HERITAGE” – POLES, JEWS, GERMANS, UKRAINIANS – STRUGGLES WITH THE PAST AND MEMORY**

Krystian Polomski1

1RURAL DEVELOPMENT FOUNDATION, Warsaw, Poland

Abstract: In Europe there are made some attempts to establish a certain way of understanding cultural heritage in rural areas. Behind this activity lays an assumption that each rural community has heritage and our duty is to protect it and “bring to life” somehow. This understanding of rural heritage shows villages as nice and peaceful places for living where people should protect all tangible and intangible elements from the past.

In Poland we may observe the process of finding “multicultural heritage” that used to belong to Jews, Ukrainians, Germans. Why this process of discovering heritage is now so important, why does it begin? How this heritage is being constructed, what is considered as “our” heritage and what elements are still “theirs”. What is the role of social memory in constructing local heritage—is it useful or not?

An attempt to answer on those questions will be based on research (participant observation, narratives) that were conducted in two rural communities in Poland laying in boundaries of national parks. The first village is on the south-east of Poland in mountains region called Bieszczady and before WWII Ukrainians and Jews lived there (Lutowiska). The second community is on the north-west of Poland and before WWII Germans lived there (Smolzino). From many reasons inhabitants “disappeared” from their homelands and landscapes. Some of them were murdered, some of them expelled and some of them made decision on their own that they had to migrate. They left their houses, fruit gardens, pasturlands and different kinds of personal belongings. After WWII Poles were settling down in those places. What happened with those territories, how did they change and how is it seen from the point of view of inhabitants. What kind of narratives are connected to this local heritage? In broader sense this presentation is about Polish - German - Ukrainian and Jewish social memory.

**HIGH CULTURE AND GRASSROOTS CULTURE: A CONFRONTATION BETWEEN CULTURAL HERITAGE AND SOCIAL MEDIA**

Tatiana Mazali2

2Media and Communication Faculty, UNIVERSITA' TELEMATICA INTERNAZIONALE UNINETTUNO, Rome, Italy

Abstract: My speech will present the results of an empirical research focus on the study of grassroots cultural production in social media, plus a comparison between the latter and the institutional web communication of Italian Cultural Heritage. The research was focused on photographic contents.

Two research questions:

1) Do the user generated contents in social media tend to be produced by means of individual frames and actions or can we find recurring modus shared by all users? Within the social media, do users produce their contents driven by personalization and technology induced ‘distinction’, or rather driven by their socio-cultural capital?

The key point here is the conflict between a model of cultural reproduction characterized by standardisation and a cultural model characterized by uniqueness and individuality.

My final interpretation, supported by empirical data, was established with the help of three main theoretical frames: Tactical action (De Certeau, 1980), Strategic action (Bourdieu, 1979) and Dramaturgic Teams (Goffman, 1959).

2) Are the grassroots cultural production (ex: social media as Flickr) and the institutional cultural production in conflict or not? Do they produce a collective imagination or not?
The key point here is the confrontation/conflict between high culture of Cultural Institutions and popular culture of social media.

We do not intend to answer the questions that have launched this research project by focussing on a detailed and in-depth analysis of a few data, but rather on a very wide data sample inside a huge environment of similarities and differences between institutional and user-generated contents. For these reasons we have set up an experimental method of visual content analysis, an automated technique for the analysis of photographic contents.

« TASTE OF NECESSITY » OR « CREATIVE LEISURE »?
SOME RESULTS FROM A SOCIOLOGICAL RESEARCH CONDUCTED ABOUT THE USES OF THE « JARDINS FAMILIAUX » IN GENEVA

Arnaud Frauenfelder 1, Christophe Delay 1, Laure Scalambri 2

1Haute école de travail social, Genève, UNIVERSITY OF APPLIED SCIENCES WESTERN SWITZERLAND, Genève, 2Université de Fribourg, Fribourg, Switzerland

Abstract: This contribution aims at describing about many different kinds of practices who are present in the “jardins familiaux”, institution who was spelled “jardins ouvriers” (allotments) until 1958. For this purpose, a plurimethodological perspective have been conducted (20 interviews and 10 direct observations) in many sites of the canton. It demonstrates that the function of this space for the population has been changed since the second part of the 20th century, we would like to show that the sociological signification of the practices engaged (meaning of the gardening, function associated with the production / consumption of vegetables, meaning of this shape of pass time, forms of sociability) is characterised about a lot ambivalences between “taste of necessity” and “creative leisure”. In conclusion, we will also see that this specific social microcosm represented a pertinent laboratory of the analyse of the today “working class culture”.

THE VISIT OF ART EXHIBITIONS AS CULTURAL PRAXIS

Nina Tessa Zahner 1

1Department of Cultural Science, UNIVERSITY OF LEIPZIG, Nürnberg, Germany

Abstract: The visit of art exhibitions as a cultural phenomenon is a complex cultural praxis that cannot be reduced to the act of reception as often done in sociological studies. The function of museum visits for the reproduction of class was famously investigated by Pierre Bourdieu in the 1960s. His theory of art reception is until today often quoted for explaining the elite character of art audiences. I will question this conception by showing that even in the late version of Bourdieu’s reception theory a specific aesthetic knowledge is crucial for the reception of an object as a work of art. Following this conception it is the gaze of the aesthetically educated beholder who produces the artwork as such. This notion of reception is highly ideological as it declares one specific way of reception as the only adequate way of watching artworks. I will show that this notion of reception is only one position in the highly differentiated art field of today, where the idea of autonomous art is only one conception within a vast plurality of art conceptions. On basis of qualitative empirical material I will show that for understanding the praxis of visiting art exhibitions not a certain knowledge or kind of reception is core but the communicative and social value that is ascribed to the visit by the visitors themselves. It is obvious that these results have wide reaching implications for the contemporary attempts to democratize art museums.

POWER STRUGGLES AND HISTORICAL GENESIS OF CINEMA’S PRODUCTION FIELD IN IRAN

Hamid Abdollahyan 1, Masoomeh Taghizadeh 1

1SOCIAL COMMUNICATION, UNIVERSITY OF TEHRAN, TEHRAN, Iran, Islamic Republic Of

Abstract: This article is an attempt to examine the effects of the field of cultural production on movie production in Iran. This examination takes place based on Pierre Bourdieu’s theory of cultural production and on the basis of analyzing the struggles between various agents who are/have been involved in movie industry. The article will also develop a theoretical model to be used for explanation of trends on movies production in Iran.

More particularly, Taking Pierre Bourdieu’s theoretical approach and concepts such as field, capital and power struggle, this article will analyze the historical genesis of movie production in Iran and the accompanying history of struggles for approaching capital in cinema’s field.

Applying the genesis structuralism approach, this article outlines the trend of the formation of field’s parameters with emphasis on two historical periods, i.e., before and after the 1979 revolution.

Some of the findings indicate that in the first period, the formation of popularized and particularized parameters took place. It also indicates that the government-based and private parameters pushed the industry towards outlining the tenets of the movie production in the second period.

In the end, the article will offer an argument on the major trends of the Iranian cinema that occurred due to the effects of these parameters during the 1990s. This will lead the arguments towards the final point and claim of the article which is based on the research results that directed us towards presenting a theoretical model by which the major trends of the Iranian cinema production can be explained.

Keywords: cinema, film’s production, field, capital, power struggles.

“MAKE LOVE WITH THE FLAVOUR”. SYMBOLIC VIOLENCE: SIMILARITIES AND DIFFERENCES IN THE VOCABULARIES OF WOMEN ON A PHOTO AD

Angela Maria Toffanin 1

1Department of Sociology, UNIVERSITY OF PADOVA, Padova, Italy

Abstract: The abstract offers the results of the analysis of 20 biographical interviews conducted with migrant women currently living in the North-East of Italy for the research “Violence against women, family life and security of urban migration processes” directed by prof. Franca Bimbi.

The research deals with the crises of discourses and the debate on violence against women: it focuses on the different vocabularies used by migrant women to refer to the domination between women and men but also between migrants and natives.

The contribution is based on the impressions of the respondents to the image produced by Phoenix Advertising (http://www.phoenix-
adv.it) for the "Mini-Muller" yogurt. We used this photo as a producer of meaning; it looks like a quotation from "The Sleeping Beauty", with a background that recalls Botticelli's Primavera. The image is not explicitly violent or victimizing. It is just ambiguous: the lady is not the typical housewife neither the temptress; within the feelings of relax and pleasure she acts, we can read the incorporation of male models of female appearance, but also a model of subjective pleasure for the woman herself. The different interpretations of respondents seem to show that freedom and violence lay in the same field, which is both confrontational and ambiguous.

Our hypothesis is that this photo let us analyze the structures and forms of symbolic violence (Bourdieu 1998) as well as to explore both the representations of violence and those of the self-determination of the body. In order to investigate domination, it seems useful to consider what is widely recognized as violent and what is not (or, at least, what is not perceived as such).

THE ATTENTION REGIME, OR SITUATING MASS MEDIA WITHIN THE INFORMATION SOCIETY

Rudi Laermans

Abstract: Drawing on the recent writings of German theorist Peter Sloterdijk, the paper unfolds the hypothesis that the power of the various mass media, in the broad sense (including for instance YouTube), has everything to do with their ability to synchronize the attention of a myriad of individuals and other 'ego-spheres', thus temporarily creating a common sphere and a public. Mass media indeed acts as social synthesizers, as producers of an unstable and fleeting social integration via the production of current events, clothing fashions, popular music trends, or (trans)national celebrity information. Moreover, mass media communications excel in 'hot', often value-loaded messages that not only want to arouse a temporary cognitive interest but also try to produce an affective involvement, an urge to take notice and to respond because one feels at once emotionally and normatively concerned. This socio-emotive performativity is situated against the background of the current information society, in which attention is a scarce good and therefore the object of a fierce competition between not only the various mass media or different television channels. The very same competitive logic dominates for instance the sphere of advertising or the selling of popular music. One may therefore defend the thesis that the synchronization of attention and the concomitant creation of mass publics, and thus also the performative production of various modes of an instant socio-cultural integration, is a broader hallmark of contemporary society. This justifies the expression 'attention regime', thus it will be argued.

THE MAN RAY GAME: INVOLVING YOUNG AUDIENCES THROUGH SOCIAL SPACES

Nicoletta Di Blas, Michela Negri, Paolo Paolini

Abstract: This paper presents an innovative way to involve a new audience, of young people mainly, in the art sphere building upon the success of social spaces like Facebook: the new "agora" where youngsters meet, discuss and socialize.

The occasion is an exhibition about Man Ray taking place in Lugano (Switzerland) in spring 2011, at the Museo d'Arte (Art Museums). TEC-LAB of University of Italian Switzerland developed an online game to foster interest in Man Ray's biography and artistic expression. It is a competition for "creative writing" and at the same time an occasion to better understand how the life of Man Ray influenced his artistic production and vice versa. Each week an image is published, featuring a work by Man Ray. Users are invited to make up a fictional episode that could go with it. The most creative ones are awarded while at the same time the "real" explanation of the image is given: entertainment is thus coupled with learning.

Users are strongly involved in the activity according to the rules of the web2.0: in order to take part in the competition, they need to have a Facebook account; moreover, users are voted by other users; eventually, at the end of the competition, all contributions will be published as a "fictional biography", downloadable from the website (a form of "users-contributed content").

The game will take place in spring 2011. For the time of the conference, results on its impact will be fully available.

See the official website: www.manraylugano.ch/game/pages/rules

BEING ORDINARY WHEN DOING EXTRAORDINARY: "ILLUSION OF SURVEILLANCE" IN PORTRAYING THE SELF OF CELEBRITIES

Stefania Matei

Abstract: This paper introduces the concept of "illusion of surveillance" to define the movie narrative in which a celebrity acts his or her own role as a famous person on the basis of an imagined biographical scenario. In the last decade the number of media products (such as the TV series of Hannah Montana, Jonas Brothers, Rebelde etc.) that present the life of a celebrity as part of an unreal story line has increased substantially, but little systematic knowledge was assigned to its thematic cultural coverage. The aim of the present study is to find the mechanism used in the creation and maintenance of the celebrity's status through movie performance by integrating Max Weber's concept of "charisma", a special type of social authority built on the basis of integrating ordinary situations into extraordinary settings. According to the understanding of charisma as a combination of special qualities which set an individual apart from ordinary people, the celebrity charisma is gained in a movie account by endowing a famous person with common attitudes, behaviors, relationships, problems or usual situations (in other words, by assigning a famous person who is special by virtue of his or her popularity with ordinary individual features). Thus, the celebrity's portrayal of the self emerges from the intersection between a fictional private life and a public authentic career. This integration of the two spheres of existence in the same media frame has the potential to draw a blurred boundary line between two discursive realms difficult to be handled by young audience. Moreover, the analysis of media products based on a fictional surveillance scenario, centered on celebrities seen as the metaphor for the actual cultural conditions, is a way of expressing the zeitgeist of actual times.
SOCIOLoGy GONE CROWDED: FIELDWoRK IN THE FRANKFURT INTERNATIONAL BOOK FAIR (2010)

Jerome David1, Thomas David2, Laura Morend3*, Michael Busset4*

1Dpt of French Literature, University of Geneva, Geneva, 2Institute of Economic and Social History, 3Laboratoire de sociologie, 4Laboratoire d’anthropologie culturelle et sociale, University of Lausanne, Lausanne, Switzerland

Abstract: Cultural globalization has its own institutions, operating simultaneously at various scales (be it local, regional, national, international or supranational). When it comes to book trade and translation rights, the International Bookfair held each year at Frankfurt happens to be the most important event in the world: during a few days, it gathers several dozen thousands professionals coming from all the continents, and as many visitors, mostly German.

As a team of researchers mixing professors, graduate assistants and students (Prof. J. David, Prof. T. David, M. Busset, A. Catzeffis, D. Daellenbach, L. Morend, O. Piguet and M. Trezzini), we went to Frankfurt in October 2010 and did intensive fieldwork during the five days of the Fair, hand to hand with Argentinian colleagues who focused their attention on the «Guest of Honor» of this year: namely Argentina. This collective ethnography was oriented by a «questionnaire» both sociological and historical: How did this Fair become within forty years the capital of editorial capitalism? What does its organization (for example its spatial distribution or its financing) tell us about the unequal exchanges between cultural regions? Why do people travel from so far away in order to meet for the duration of a lunch, instead of using the new telecommunication facilities? And, last but not least, how can we sociologize such a huge and crowded event?

The 10th Conference of the ESA would be an opportunity for us to present some of our intermediary results, a month or so before going back to Frankfurt for the Book Fair 2011, and the most appropriate place to raise some tricky sociological issues related to (i) the recent emergence of powerful transnational actors (literary agents), (ii) new ways of negotiating nationality in a supranational context (the case of Switzerland) and (iii) the combination of methodological tools in the analysis of this paradigmatic global institution.

BOJNOURD COMMON CULTURE RESEARCH

Mossayyeb Samanian1,2*

1ISLAMIC AZAD UNIVERSITY, BOJNOURD BRANCH, 2Humanity faculty, BOJNOURD BRANCH, ISLAMIC AZAD UNIVERSITY, Bojnourd, Islamic Republic Of Iran

Abstract: research in the people’s thoughts and lives in terms of social science is useful, literature and culture folkloric tradition rather than written documentary, to say it other way, it is largely narrative and folk orgin. the goals: maingoal: bojnourd common culture research minor goals: common culture indexes investigating bojnourd common culture dimensions how different parts of bojnourd society view common culture research main questions: 1- how are social, economical and population characteristics of bojnourd city? 2- what about culture and religion? 3- what is peoples cultural and political condition? 4- how does family cultural condition in bojnourd look like and how do they react to sexes? method of research: the method of research is post-event. Kolinger holds that in this method, in depended researches have already occurred and research observes the variances. Correlation and causative studying is used (Hasanzade,2003;p158).

Data collection methods: a questionnaire with 156 questions was prepared. the analysis done for 140 questionnaires.

Finding: total respondents 140 persons, male 48/8% and female48/6%; lower than 30 years old 51/5% 30-50years old 33/5%and above 50 years old 15%.

CULTURAL INTERVENTION IN RUSSIAN PROVINCES: TROUBLES AND PROSPECTS IN THE CONTEXT OF COOPERATION WITH EUROPE

Nataliya Velikaya1*

1Department of political sociology, RUSSIAN STATE UNIVERSITY FOR THE HUMANITIES, Moscow, Russian Federation

Abstract: Presentation is devoted to the new cultural policy in Russian regions where culture is considered as the main resource for region developing. That is new approach in Russia because usually culture financed last of all and considered as non important area for investing.

As a data base of the paper we use results of interviewing experts from five regions of Russia and content analysis of federal and regional mass media. We also take case study of Perm region since it was Perm where the policy of cultural intervention had been more successful.

Nowadays culture is not integrated in territorial regional and local policy and mainly cultural sector is excluded from the innovation area in strategic plans of Local Development. Situation has become complicated because of irregularity of developing of different regions in Russia, not equal share of culture in economics of different regions.

Presentation observes some results of cultural intervention policy in regions including establishment of new cultural organizations, new jobs, arrangement of conditions for active cultural values consumption and public opinion about new forms of cultural activity.

We analyze an increasing of cultural activity of inhabitants, media role of culture, and role culture as a factor of city development.

It is shown and described how it’s possible to overcome existing inequality in access to cultural values in Russian provinces.

We are also going to estimate the involvement of Russian cultural sector in all European processes considering level of participating in European events and programs.

FOOD AND MAINTENANCE OF NATIONAL IDENTITY

Atsuko Ichijo1

1Faculty of Arts and Social Sciences, KINGSTON UNIVERSITY, LONDON, London, United Kingdom

Abstract: The importance of food or rituals associated with food in maintaining human relationships is well-recognised and perhaps it is by now part of our anthropological commonsense. Food is essential for life and it is highly symbolic as well as banal. Its significance to personal identity can be seen in conditions such as anorexia, an area on which psychologists and psychiatrists would have much to say. It is therefore logical to assume that there is a strong relation-
ship between food and national identity, one particular form of collective identities which matters to many of us in the world. This relationship is, however, under-explored. Existing studies often focus on the use of food in projecting national identity, as a branding exercise by the state. The proposed paper investigates the more banal aspect of the relationship between food and national identity. It first investigates the emergence and spread of the ‘Japanese’ type pasta source in contemporary Japan. Pasta, which is clearly seen as a foreign food item, has been consumed nonetheless as something Japanese with the help of these sources. Secondly it investigates the flopped idea of instituting a ‘Sushi Police’. While the first example suggests a success in a project of maintaining Japanese national identity, the latter suggests a failure of a branding exercise by the state. By comparing these two examples, the paper aims to shed light on the banal relationship between food and national identity.

Sidonie Naulin

1GEMASS, UNIVERSITE PARIS IV SORBONNE, PARIS, France

Abstract: In 2003, UNESCO set up the first international convention recognizing and protecting intangible cultural heritage. It resulted from an important shift in the conception of heritage. Until then, only tangible cultural heritage was protected by the 1972 World Heritage Convention. This heritage was mainly located in rich northern countries and it was defined by nation states in a top-down approach. The first aim of the 2003 Convention was to offer a tool for protecting the often non tangible cultural heritage of the countries of the South. Its philosophy was also to reverse the traditional top-down approach of heritage by allowing communities to define by themselves the heritage constituent of their identity.

The study[1] of the successful attempt of France to have its gastronomy registered as intangible cultural heritage underlines the discrepancies between UNESCO’s ideals and principles and the concrete process of the definition of intangible cultural heritage.

Far from being an obvious existing element promoted by a community, French gastronomy as intangible cultural heritage is the product of a construct involving many actors[2]. Thus, the study of the iterative process that led to the final definition of gastronomy as “the gastronomic meal of the French” questions the effective role of communities in the definition of their heritage. It also points out the structuring role of UNESCO rules and ideology in the definition of elements constituent of a national identity and it raises the question of the strategic uses of the notion of intangible cultural heritage by lobbies or by nation states.

[1] Methodology: I have based my work on interviews of the different actors (N=13), on observations of events linked with the project, and on a study of the written production in relation with it (official UNESCO texts, working documents of the project promoters and press articles).

[2] Academics, politicians, civil servants, journalists, UNESCO employees and diplomats, etc.

THE MATERIAL ECOCLOGIES OF CULTURAL DIGITAL HERITAGE: THE CASE OF THE MUSEUM OF MODERN ART (MOMA)

Fernando Dominguez Rubio 1,2*

1Sociology, NYU, New York, United States, 2Centre for Research on Socio-Cultural Change, The Open University, Milton Keynes, United Kingdom

Abstract: While it is possible to successfully store, preserve and display cultural objects produced centuries and even millennia ago, preserving cultural digital objects produced just a few years ago poses formidable challenges. The inherent transient nature of some digital objects and the rapid obsolescence of the technological equipment upon which they depend, makes cultural digital objects one of the most vulnerable art forms of our contemporary heritage. This paper explores the ‘material ecologies’ of the digital, that is, the different infrastructures, technologies, practices and forms of expertise, required to transform digital objects into indelible parts of our contemporary artistic heritage. It will do so through ethnographic data gathered at the Museum of Modern Art in New York. As I will show, the relentless change of technology forces the museum to create complex and ever-evolving material ecologies in order to allow the circulation of digital cultural objects over space and time. Exploration of MoMa’s material ecologies will be used to counter dominant narratives of the digital as an immaterial and deterritorialised cultural space in which material constraints and spatial boundaries are minimized or simply become irrelevant. The paper will conclude by offering a reconsideration of the digital heritage as a specific form of material culture.

NEGOTIATING THE PAST, MOBILIZING FOR THE PRESENT: LINKAGES BETWEEN SOCIAL MEMORY AND ACTION

Joanna Jasiewicz

1EUROPEAN CENTRE FOR MINORITY ISSUES, Flensburg, Germany

Abstract: With the ban of censorship in Poland in 1989, the possibilities to freely discuss issues that were once swept under the carpet by the communist governments have greatly expanded. The new elites’ acceptance of ethnic diversity has made room for the debate on at times controversial topics concerning Poland’s ethnic relations. This article draws on collective memory, political mobilization and cultural sociology studies to explore mnemonic conflicts between ethnic groups in Poland and the Polish majority over the interpretation of events that have created sharp divisions between both groups since the early 1990s. Using the claims-analysis method, I examine the discursive strategies employed by actors in the ethnic relations field and in this way explore the nuances of national and ethnic collective memories. One could expect that in a country whose almost entire Jewish population has been killed in the Second World War, Ukrainian and Lemko minorities forcefully resettled and large numbers of Germans expelled, talking about the ethnic relations in the past would be particularly controversial. However, the analysis of claims shows that about 30 per cent of claims advanced by ethnic minority members within the 1992 – 2006 period touch upon the past. Ethnic leaders struggle for a reinterpretation of history and for redressing past wrongs. This article, by examining discursive battles over how past ethnic conflicts should be remembered and interpreted, allows to shed light on the
ways in which history and national and ethnic identities are socially “imagined” and negotiated in the Polish public debates.

THE CONSTRUCTION OF REGIONAL AND NATIONAL IDENTITY IN THE MEDIATIZED GLOBAL VILLAGE. A COMPARISON OF GEOPOLITICAL IDENTIFICATION PROCESSES OF SOCIAL NETWORK SITE USERS AND NON-USERS.

Bernadette Kneidinger\footnote{Department of Communication, UNIVERSITY OF VIENNA, Vienna, Austria}

Abstract: The world as global village (McLuhan 1962) – More than ever before, this future vision seems to become true with the rapid appearance of social network sites (SNS): Where formerly “village gossip” is exchanged between people who live door-by-door, nowadays the interaction partners can live in completely different parts of the world (cf. Nash 2009, Papacharissi 2009, Hampton/Wellman 2002). But traditional mass media as well as SNS are not only used to exchange information, but also used for geopolitical-identity construction, i.e. the regional, national or transnational rootage (cf. Gellner 1995: 15f). Whereas traditional mass media offer “serious” information and identity facets, SNS represent the more individualised form, i.e. they represent the world through the lenses of their users from all over the world. So, the question can be asked how these new forms of communication in SNS can influence and change individual and social geopolitical identity construction. Two oppositional effects are imaginable: Firstly, the increasing interactions with people from all over the world via SNS result in a decreasing importance of the national or even regional belonging because the users feel as members of a global community and so they are even more interested in globalised information than in regional or national information transmitted by the mass media. Secondly, the communication and presentation in SNS give rise to a rediscovery of the own regional or national roots. The citizenship becomes to an integral part of the own identity conception and the mass media remain important as information source about regional or national happenings. My study tries to proof with qualitative interviews and an online survey of Facebook users and non-users (N=650) both of these assumptions and should offer some predictions of future developments in the (virtual) global village.

SOCIAL NETWORKS AND VISUAL REPRESENTATION OF PERSIAN LANGUAGE GROUPS: THE CASE OF PERSIAN LANGUAGE USERS OF NETLOG

Alireza Dehghan\footnote{Communication, THE UNIVERSITY OF TEHRAN, Tehran, Iran, Islamic Republic Of}

Abstract: The aim of this paper is to explore the identities represented through the photographs of Iranian, Afghan, and Tajik Netlog members. Having reviewed three theoretical approaches concerning the issue of identity, we particularly focused on Giddens’ multiple identities in the discussion of globalization.

Methodologically, we used Semiotics and triple category described by Fiske, and accordingly analyzed 31 photos of Persian language users. Our findings indicate that Iranian, Afghan and Tajik Netlog members use two or multiple sources of identity simultaneously. It means that Persian language people who are Netlog members are willing to show and represent their identities both locally and globally. However, in comparison to Afghans, the visual identities and images of Iranian and Tajik users consist of more signs of global identity. Thus, these groups are eager to represent themselves globally rather than locally. On the other hand Afghans who use Netlog are enthusiastic to represent themselves more locally rather than globally.

Keyword: representation, Persian language users, visual identity, cultural identity, Netlog

MODERN POETRY IN THE INTERNET: THE READER AS A SOCIOCULTURAL PROBLEM

Maria Polikashina\footnote{HSE, Moscow, Russian Federation}

Abstract: This address concerns a new perspective of the sociology of culture and literature in the context of development of such new innovations as the Internet. The wide-spreadening of the Internet has resulted in the changes of mass culture and particularly of modern poetry. A lot of recent poems have been placed on the specific websites. This novel developing cultural trend subsumes new representations about aesthetic values in poetry. The major purpose of this project is to reveal the transformations of aesthetic values and social meaning of poetry in the context of popularity of the Internet and the new technological possibility for creative activity. I suppose that aesthetics values have collective nature and are shared among the authors and readers. The empirical materials for this study are based on the text of online discussions on the specific websites about modern poetry and also interviews with modern poets. The future results of this study probably provide a guideline for studying the mass culture.

A SPATIAL SEMIOTICS OF PUBLIC SPACES IN MIGRANT NEIGHBORHOODS IN BROOKLYN AND PARIS

Timothy Shortell\footnote{Sociology, CUNY Brooklyn College, Brooklyn NY, United States}

Abstract: A good deal of the literature on global cities has tended to reduce cities to nodes in the networks of capital and communication. Urban public space, from this perspective, becomes little more than the location of homogenized global culture. What is neglected with such a macro-level focus is the importance of the global flows of people and their cultural practices. Homogenizing forces are real and powerful, but people are not always passive and powerless. Migration is one of the most significant forms of mobility in contemporary cities because it brings together ‘cultural strangers.’ There is a second level of mobility in migrant neighborhoods: the performance of collective identity involves a multitude of forms of movement, both quotidian and spectacular, through urban public space. These forms of mobility create social conflicts that concern visibility; people from different cultural groups change the meaning of urban public spaces by changing the way these places look, through their activities and by their presence. As people make their neighborhood look like ‘home,’ they sometimes come into conflict with their neighbors, whose ‘home’ looks different. Close examination of visual evidence, in the form of hundreds of photographs as well as observations ‘on the streets,’ permits the telling of the story of the agency of ordinary urban dwellers in the midst of political
and economic conflicts. Public space is also used as a ‘public sphere’—a place for communicating identity and moral claim-making. Through their social interactions and their material traces, resulting from the ways that they ‘take possession’ of public spaces, urban dwellers fill social space with expressive, conative and phatic signs of their collective identity. I present data from urban neighborhood communities in Brooklyn and Paris. Analysis of these data demonstrates how collective identity is embedded in urban public space and some of the kinds of social conflict that result. I argue that it is not possible to understand these visibility conflicts—and their reflection in the ‘public sphere’—in global cities without such data.

GLOBALIZATION AND VIDEO FILMS IN EAST AFRICA: A REGIONAL BLOC OF TASTE AND “SOMETHING” GENERATED BY “NOTHING”

Daniel Kuenzler¹

¹Department of Social Sciences, UNIVERSITY OF FRIBOURG, Fribourg, Switzerland

Abstract: If the homogenization thesis is correct, the same kind of movies should be sold across Eastern Africa. Observations in the city centers of Lubumbashi (DR Congo), Bujumbura (Burundi), Kigali (Rwanda), Kampala (Uganda), Nairobi (Kenya), Mwanza and Dar es Salaam (Tanzania) conducted during several field trips between 2005 and 2009 reveal a nuanced picture.

(Pirate) copies of Hollywood films, a prime example of cultural globalization, were abundant at these places. So were video films from India and Hong Kong (China), two other centers of film production with a global appeal. However, also Nigerian movies were common. Conceptually, there are neither global nor (g)local. They form an intermediate category that could be labelled a bloc of dominant taste, using a concept developed by Dave Laing in another context.

All these films were available in international versions and translations (English and partly French), but they were also locally dubbed into East African languages by one voice-over artist. This is a rare example of privately organised translations of cultural products for profit in this area. However, it is rather a form of “re-mediation” (Birgit Meyer) than translation, as new layers of meaning are added.

Furthermore, in several countries locally produced video films adapting the Nigerian production model to the respective contexts were also abundant. To use the conceptual tools of George Ritzer, both this emergence of video films and the re-mediation mentioned are examples where the global dissemination of “nothing” generates the development of “something”.

GÉOLEGALISATION: THE REDISCOVERY OF BODY AND SPACE

Enrico Gandolfi ¹, ²

¹Social sciences, LA SAPIENZA, ²Centre of media and communication studies Massimo Baldini, Luiss, Rome, Italy

Abstract: New media don’t require the geographical proximity, but extended audiences made cohere by common interpretations; the contemporary network society works with a node structure, where the dialoge is apparently complex, an “all to all” and parteci-pative rhapsody, no more “top-down” with a linear medial and informative consumption; the function of new expressive ways changes the traditional aristotelian definitions, giving life to a new type of relationship, fluider and more dynamic than in the past. The readership shows a flexible constitution, similar to the definition of performance as social practice (Moores).

However, it’s borning an “incorporated” generation, that inglobes the technology inside its emotions without the static fritre of the screen, an improvement of reproduction, mobility and creativity typical of the mobile audiences (Sorice): an “always on” and delocated performance remediated by the augmented reality. Local based software like Gowalla and Foursquare starts from the exploration of our habitat such as base field for inner and collective narration. An enhancement of our concrete enviroment; a geo-mapping that recalls to the ground and favors the reformulation of the social and cultural life. But also an opportunity for big companies in order to know everything about people. The nodes of society are re-framing themselves, and also the culture and its definitions.

The purpose of the paper is to analyse the main elements of this new kind of media with a discursive realism approach, describing its possible future developments and the social process that it conveys, also with the support of qualitative methods.

THE POWER STRUGGLE OF FRENCH INTELLECTUALS AT THE END OF WORLD WAR II; A CASE-STUDY IN THE SOCIOLOGY OF IDEAS AND THE STUDY OF CULTURAL TRAUMA

Patrick Baert ¹

¹SOCIETY DEPARTMENT, UNIVERSITY OF CAMBRIDGE, Cambridge, United Kingdom

Abstract: This paper is a contribution to the sociology of ideas, and its core arguments centre round a case-study of intellectuals in France at the end of World War II. In particular, it explores the role intellectuals and their ideas played in the power struggles that took place between 1943 and 1945 in France. It shows the extent to which intellectuals became involved in the political struggles at the time and how, in this process, they themselves became embroiled in battles of legitimacy, using old and new ideas to justify their decisions and condemn the actions of others. It also explains why some hitherto unfashionable or unknown ideas and intellectual currents ultimately prevailed and previously established views were seen as redundant or pernicious.

DEMystification of european Symbolism and the doubLe impact of socialisation

Sterie Anca ¹

¹European Institute, UNIVERSITY OF GENEVA, Grand-Lancy, Switzerland

Abstract: Despite the vast research on cultural symbolism dating from the 60s, few studies have enquered over “modern” political symbols and even less managed to detach from a purely historical perspective.

The current research aims to unpack the concept of political symbolism, thereby examining the different processes linking the European flag to the European society. We have deliberately chosen a
new symbol (the European flag dates from 1955) wishing to study by ourselves the process of creation, legitimisation and empowerment of an originally meaning-deprived image.

To this end, two levels of analysis have been identified and studied.

On a first level, the research has focussed on the socialisation process having as target the European flag, offering a particular attention to the instruments employed by the European institutions in order to create a brand new symbol. This first stage essentially corresponded to the introduction of the European flag into society and the strengthening of its presence as a valid political symbol. On a second level, the analysis discussed the socialising and europeanising impact that the European flag has upon the society.

The findings of the study are based on three methods of analysis and interpretation.

We have performed qualitative interviews on 41 individuals, discovering a large misconception on the name and use of the flag. We have also submitted our various hypotheses to comparison with different political symbolism theories (especially Paul Cohen’s). Furthermore, the present research was also based on personal observations on the terrain, gathered images attesting to the use of the European flag and practices that split from its institutional role.

TV SERIES AND CRITICS : A NEW WAY OF SOCIAL AND CULTURAL DISTINCTION ?
Anne-Sophie Beliard

1Dept of Political Science, UNIVERSITY OF BOLOGNA, Bologna, Italy

Abstract: The paper will focus on the impact that two societal processes have had – and still have – on the political domain, and more particularly on party politics: individualization and secularization.

The paper investigates the expansion of the individualistic mobilization (Pizzorno) in the last third of the XX century which gave rise to the era of narcissism (Lasch), and the diffusion of a secular approach not only to the spiritual-religious domain but to the political sphere too.

These two societal developments had an impact on the political domain in the sense of “liberating” people form ascribed and traditional ties and loyalties, but at the same time leaving them “alone” without cues for understanding and deciding in front of political alternatives.

The paper will discuss whether this situation may have provoked a sense of alienation and frustration which, in turn, had negatively affected either the political systems in terms of confidence and the party politics in terms of representation and responsiveness.

A NARRATIVE APPROACH TO CULTURAL IDENTITY: THE CASE OF PIRATE RADIO IN THE NETHERLANDS.
Arno Van Der Hoeven

1Media & Communication - Erasmus Research Centre for Media, Communication and Culture (ERMeCC), ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: This paper is part of the research project Popular Music Heritage, Cultural Memory and Cultural Identity (POPID), a large scale international collaborative research project funded by HERA (Humanities in the European Research Area). The aim of this particular study is to explore how the heritage of offshore and pirate radio is reworked and employed by local legal and illegal radio stations in the Netherlands. These broadcasters, who are predominantly based in rural areas, cater for a local audience by playing music that gets less attention on public radio.

By paving the way for commercial radio, the offshore radio stations that were broadcasting between 1960 and 1974 had a pivotal role in the popularization of the then emerging beat music. Nowadays, local illegal radio stations build upon this heritage, but focus on Dutch language music and schlager instead. With their festivals and radio marathons they fulfill a cohesive function in local communities.

By drawing on a narrative approach to identity, this study explores how the cultural identity of the pirate stations connects to particular music genres and media history. This theoretical perspective makes it possible to understand the dynamic character of identity. While some of the pirates move their practices to the internet, we see continuity in the way they position themselves in the cultural field. The radio pirates re-interpret the past narratives to fit their present identities. Qualitative interviews with fans, broadcasters and festival organizers will shed light on this relation between the medium of pirate radio, particular music genres and local cultural identity.
DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF VIENNA, VIENNA, Austria

Abstract: Over the past few years, the emergence of blogs and online magazines as fashion media in their own rights has challenged the firmly consolidated and long-established opinion leadership of traditional fashion media. In my paper, I will scrutinize the impact of these new media on the hierarchically structured system of fashion media.

The participatory and user-friendly technologies of web 2.0 have enormously facilitated the access to start a publication and led to a transformation of the recipient’s role: besides being interactive users, fashion bloggers are editors, stylists, models and photographers in one person.

It is during fashion week that the worlds collide: established journalists sit close to amateur fashion bloggers in fashion’s most important place-to-be, the runway shows. This proximity evokes reactions of defence and strengthening on the one side, and struggles for recognition and attention on the other side. The paper is based on empirical research with qualitative methods (text analysis, artefact and picture analysis) using a grounded theory approach. The data consists of texts and pictures from national and international online and print fashion media coverage of the spring-summer 2011 collections in New York, Milan and Paris.

Focusing the differences and similarities between old and new media in fashion, the mutual influences and demarcations will be traced, as well as the strategies of conservation and challenge of power structures, and of exclusion and inclusion. The findings will be supported by a theoretical framework grounded in the empirical data and complemented by current theoretical debates in cultural sociology.

HOW ONLINE CULTURAL INTERMEDIARIES ARE MADE/WORK: IN-DEPTH INTERVIEWS WITH ONLINE CULTURAL CRITICS AND MANIAS

Eun-mee Kim,1, Kyung-Eun Kwon,1, Joong-seek Lee1 2

1Communication, 2Convergence Science & Technology, SEOUL NATIONAL UNIVERSITY, Seoul, Korea, Republic Of

Abstract: This study empirically investigates how the roles of online cultural intermediaries are being formed and affecting arts field in Korea where cultural industries are experiencing a recent expansion with huge amount of information abounding, produced by online discussion groups and communities. The emerging cultural intermediaries working as online community leaders, perform multiple roles such as gatekeepers, promoters, and commercial intermediaries between artistic events and audiences, therefore accumulating their own power and influence. Main questions are: 1. How are audience turned into cultural intermediaries and get legitimized? 2. What are distinctive roles the new intermediaries play? How are they differentiated from traditional ones? 3. What is the influence of the expansion of media space and online participatory activities on the growth and change of art field? 4. What implications can we draw from the comparison of high and popular arts? In-depth interviews were conducted with fourteen well-known online community leaders spanning the fields of classical music, theatre and movie. We found out that they started to get engaged in online activities initially attracted to joy of knowledge-seeking and social collaboration. Without professional education, they grew to be opinion leaders and activity planners for the genres of interest. As a result, they played an important role in both the transfer of knowledge and contagion of enthusiasm to other participants so that the interest can be retained transforming novices into buffs. These online cultural communities hosted regular offline activities such as screenings, lectures, or conversations with artists after a performance. Committed participants had chances to network with promoters or marketers as well as develop their expertise. They were invited to a preview, asked to write for a newspaper or called for jury duty in award shows by existing cultural institutions helping them legitimized as official ‘experts’. They built more non-hierarchical relationship with other audiences. Their emergence affected and reflects Korean arts fields which are used to be dominated by over-supply of artists. The logic of media coverage, whereby audiences talk to one another bypassing the authorities, starts to penetrate even in high-arts. The role of Internet as an enabling medium is also discussed.

Pauwke Berkers1

1Art and Culture Studies, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: Since rock music has been appropriated by white artists and audiences – the “Elvis Effect,” few non-whites have managed to “infiltrate” this music genre, as the Moroccan Dutch singer of Marock&Roll rightly points out. Despite a similar alignment of ethno-racial and artistic distinctions, whites such as Eminem, have been very successful in hip hop music, a traditionally black music genre. The main research question is: How does this alignment of ethno-racial groups and music genres affect the critical evaluation of rock and hip hop artists (white and non-white)?

This paper examines the dynamics of social marking, the distinction between “the marked” – the side of a contrast explicitly given positive or negative value – and “the unmarked,” which is ignored as being neutral or unproblematic. First, while whiteness usually remains invisible or “unmarked”, it might be foregrounded within racialized genre conventions, that is, when whites participate in hip hop music or non-whites in rock music. Furthermore, reversals of markedness are also more likely in publications that serve a predominantly black or ethnic minority readership. Finally, research has shown that national thought communities, drawing on specific national cultural repertoires, also differ in the way and extent they use ethnic and racial markers.

Yet, how various genre, institutional and national contexts interact and influence social marking has remained highly understudied. Therefore this paper studies the critical discourse by content analyzing rock and hip hop album reviews in mainstream media, pop/rock magazines and hip hop periodicals from 1990-2010 in the U.S. and the Netherlands.

THE GREAT MOTHER IN CONTEMPORARY MEDIA IMAGERY: A REFLECTION ABOUT “SYMBOLIC EFFICACY” OF MEDIA IMAGES AND NARRATIVES

Roberta Bartoletti1, Lorenzo Giannini1

1Department of Communication Sciences, UNIVERSITY OF URBINO CARLO BO, Urbino, Italy
The Great Mother is one of the most relevant images running across the collective imagery from the Palaeolithic to the present age: in religion, Greek mythology and also in the fairy tales. In the perspective of the Jungian psychology, the Great Mother is one crucial archetype of collective unconscious. On the basis of the studies in the fields of history of religion (Kerenyi, Gimbutas), sociology of culture (Morin) and analytical psychology (Jung, Von Franz), we can affirm that one fundamental meaning of the Great Mother images is the idea of human life (and social life at the same time) as a complex circle of birth, death and regeneration.

The paper will focus on the images of Great Mother seen in contemporary media imagery, particularly in cartoons and animated films, in order to discover if there are different “medial Great Mothers” expressing and representing the fundamental meanings of the traditional figures, that we can also consider “symbolically effective” (Levi-Strauss, Mary Douglas, Victor Turner), in other words that are able in giving sense and order to contemporary experience of modern media consumers.

In particular we analyzed the animated features of the Japanese cartoonist Hayao Miyazaki and some USA comics (prevalently Marvel Comics superheroes sagas).

THE EFFECT OF DIGITAL TECHNOLOGY ON INDEPENDENT CINEMA IN IRAN: PRODUCTION, DISTRIBUTION AND CONSUMPTION

Mehdi Montazer Ghaem 1, Masoomeh Taghizadegan 2

1SOCIAL COMMUNICATIONS, THE UNIVERSITY OF TEHRAN, Tehran, Iran, Islamic Republic Of

Abstract: The purpose of this article is studying effects of digital technology in expanding independent cinema in Iran. The article explains how digitalism changes current occasions in production and distribution in cinema and because of these changes supplies a good content for independence directors from commercial producers and also producers from controller institutions. Because of this situation, independent cinema production becomes more and more in Iran.

The article, with historical study, explains how digital technologies help Iranian independent filmmakers to reduce their problems in production process and also give them new distribution possibilities. Indeed, independent cinema in Iran resistance with two flows: in one hand, government’s control in production and distribution processes and on the other hand, cinema’s proprietors and producers unwillingness for showing independent films. The article, on this basis, divides independent cinema’s problems to two stages: 1- production 2- distribution and consumption.

The article, in production process, reviews independent cinema’s problems after revolution in Iran and explains how digital equipment in film-taking and compilation processes combine with independent director’s creatorship, cause free them of government control. In production process using the digital camera, omitting the most of the production group and etc could let this kind of cinema to be progressed and it caused the independent cinema to be advanced more and more. When we studying history of this kind of cinema, we can see a lot of problems in distribution and now digital technology can help to solve it. Obviously in consumption because of some limitation of showing this kind of movies in Iran in present time it is broadcasting and showing by internet and DVD. Indeed, DVD and internet supply audience for independent cinema in Iran.

We use of cultural study approach to show this point that independent cinema with using digital technology could grow and progress beside the formal cinema which is under the government power and is support by that. At last we do case study on “No One Knows About Persian Cats” directed by Bahman Ghobadi.

Keywords: Iran, digital technology, digital cinema, production, distribution, consumption.

THE FORMATION OF AN ARTISTIC CATEGORY IN THE FIELD OF ORIENTAL MUSIC IN ISRAEL AS A LEVER FOR SOCIAL CHANGE

Simona Wasserman 1

1COMMUNICATION, POLITICAL SCIENCES AND SOCIOLOGY, OPEN UNIVERSITY, Ramat-Gan, Israel

Abstract: From an historical perspective the field of popular music in Israel was always subject to a cultural hierarchy between East and West. The dominant culture has been traditionally oriented towards Western music an its gatekeepers considered Oriental music as inferior, denying it access to musical institutions and establishing excluding categories used in the media and the academy: “Israeli” music as opposed to “Oriental” music.

In my dissertation I argue that during the last two decades a unique social group has operated, consisting of app. 50 musicians, cultural professionals and agents in the media and the academy, who have conducted a classificatory struggle and established a unique category of ‘Oriental artistic music’, clearly distinct from the common genre known as ‘Musica Mizrahit’.

As part of this process of canonization, leading members of the cultural elite whom I’ve named the ”Oud Aristocracy”, have employed several strategies, which supported an artistic position in the production field, in order to institutionalize the artistic category:

1) Inspired by the international multi-style of ”World Music” and post-colonial discourse, the pioneering musicians produced hybrid music, thus legitimizing types previously considered marginal.

2) The cultural entrepreneurs founded musical centers, orchestras, festivals and recording companies, all dedicated exclusively to the production and dissemination of the new musical style. A parallel process took place with Israeli-Palestinian Music, due to a tight collaboration with Jewish-Israeli music.

3) Media gatekeepers have participated in this process of social stratification, by promoting Oriental music on radio, television and printed media.

4) Music scholars introduced the Oriental music in the academic world, writing professional syllabi, establishing new academic departments, in fact theorizing Oriental music and defining it as a legitimate field of academic research.

Consequently, by claiming recognition of the Arab elements in their cultural roots, members of the ”Oud aristocracy” engaged this classificatory struggle to the cause of social changes.

UNDERSTANDING CONTEMPORARY FILM FESTIVALS AND ITS COMMUNITIES: THE PORTUGUESE CASE

Tânia Leão 1

---

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: The purpose of this communication is to present preliminary results of an ongoing research, a PhD project concerning the participants of two film festivals in Portugal: Curtas - Festival Internacional de Curtas Metragens de Vila do Conde (held in Vila do Conde, a small town that belongs to Oporto’s metropolitan area) and IndieLisboa (held in the portuguese capital, Lisbon).

Cultural festivals are peculiar events that affect the life of cities and city dwellers. No matter its type, cultural festivals provide festive episodes that fracture the normal rhythm of everyday life and, in doing so, they become a paradigmatic expression of city life. In addition, festivals are cyclical and reshape themselves in each of its repetitions, becoming a kind of profane or desacralized rituals (Maisonneuve, 1988) that attempt to recover the magic of sacred ritual and ceremonial participation (Fabiani, 2001).

With this brief presentation we ambition to discuss the significance and complexity of being a festival goer. Based on data gathered using both extensive and ethnographic approaches we wish to discuss: i) the relationship between film festivals, the creation of social and cultural identities, and the (re)definition of urban lifestyles; ii) the possibility of identifying episodes of permanent transformation of distinctive habitus and cultural dispositions, as stated by Lahire (2006); iii) the influence of festivals in the social construction of taste and in the definition of a particular relationship with culture and cinema; iv) and the relationship between participants and the different contexts that surround each of the festivals.

CULTURE, POLITICS AND IDENTITY: THE POLITICAL RAP IN COVA DA MOURA, LISBON.

Edurne De Juan

Abstract: Beginning with a reflection of the concepts of culture, politics and identity, this proposal aims to address a case of study on the representation of rap from a group of young people in the Cova da Moura (Lisbon).

First, we will focus on the transformation of the relationship between culture and space. Today, social space is characterized by an increasing fragmentation and ephemerality (Deleuze & Guattari, 1988), therefore, uniformity and consistency disappears, space of modernity and flexibility arise belongings, deterritorialization and mobility.

We will see how this transformation affects the concepts of culture and identity, controversial themes in the social sciences in recent years. Finally, we reflect on the relationship between the concepts of culture and politics, as the group in question promote ideological initiatives through their lyrics, so that the representation of rap in this case gives rise to some processes we must understand as political.

THE SOCIAL PRODUCTION OF POPULAR MUSIC HISTORIES

Amanda Brandellero, Susanne Janssen

Abstract: This research applies the art worlds and production of culture perspectives to an analysis of the dissemination, reappropriation and reinvention of popular music over time. Exploring the official narratives of popular music history since the post-war in the Netherlands, we are called to look at how the meaning of popular music is formed and changed through the collaborative action, rather than to decode the object itself and uncover a universal meaning. The focus then shifts on how this collaborative action is itself reproduced in time and space, via different intermediaries. Our data draws from a mapping of printed and documentary references on national and local popular music histories over the last fifty years, an analysis of charts and music awards, and in-depth interviews with journalists and music industry representatives. On the one hand, we analyse the diachronic revaluation of particular popular music scenes and styles, exploring how their meaning and popularity evolve in time. On the other, we investigate the actors engaged in these processes of reappropriation and the social situations in which these occur. We conclude by drawing insights on the systems in which national popular music is evaluated and preserved, and their articulation in the context of a globalising popular music industry.

WHEN CULTURE MOVED AWAY FROM CULTURE - CAPITALIZING CULTURE AND INTERNATIONAL CULTURAL STATISTICS

Mirja Liikanen

Abstract: There is a wide and vivid international discussion on the insufficiency of the GDP for describing the progress of societies, or even the economic performance. In this context also culture has come to the centre of the rhetoric of many international bodies and organizations. Culture represents both social wellbeing but especially hope for growth and new economy. Culture is increasingly framed as part of ‘creative economy’ and comprehensive economical frameworks and classifications.

The today’s economical and societal thinking emphasizes countable evidence. The development gives more and more emphasis to quantitative representations in all parts of societies, also in those surrounding where it has not been customary or predominant. The idea of evidence based policy concept has rapidly circulated around the world. The idea of ‘evidence based’ seems to have gotten new uses and tones also in research.

As an example, I use the revising process concerning the UNESCO Cultural statistics framework. I also look for parallel and interactive chains of events. My aim is to examine that phase of action, where different and sometimes conflicting concepts of culture and ideas of the role and justifications of culture in wider societal or economical policy are traveling between nation states, localities, research, consultancies and international organizations. The paper is looking for centers and peripheries, key actors and followers.

Statistics are constitutive to modern societies. A whole group of ideas like nation, economy and state consisting of population developed hand in hand with statistical thinking. I want ask, what is this new renaissance of measuring, monitoring and developing indicators, which seem to captivate all political, also culture political, reasoning. Is there anything left between economics and social?
How are concept like art, high and/or popular culture framed in these different discourses?

WORKING ON THE SELF: POPULAR PSYCHOLOGICAL KNOWLEDGE, AGENCY AND POWER IN RUSSIA

Suvi Salmenniemi 1, Mariia Vorona 2

1Helsinki Collegium for Advanced Studies, UNIVERSITY OF HELSINKI, Helsinki, Finland, 2Dept. of Social work and social anthropology, Saratov state technical university, Saratov, Russian Federation

Abstract: Self-help literature is an increasingly popular genre and a booming business worldwide. It introduces new forms of knowledge and conceptual models with which to make sense of our selves. It also parades a host of ‘engineers of the human soul’ who advise on how to become happy and successful, and find love and harmony. Previous research on self-help has focused, on the one hand, on empirical analysis of mainly Anglo-American self-help literature, or on the other hand, on cultural criticism of the therapeutic ethos of self-help literature, seen as promoting an individualist ethos of self-reliance and deflecting a collective protest against socio-structural inequalities. However, what has not been addressed so far is the consumption and reception of self-help. In this paper we analyse how and why people read self-help literature, and what kinds of meanings they ascribe to it. We examine this topic in a context in which it has not been previously studied, i.e. contemporary Russian society. By drawing on a set of focus group and one-to-one interviews conducted in the city of Saratov during 2010-2011, we trace the readers’ motivations for and experiences about reading this type of literature, and how they reflect upon the ideological messages offered by this literary genre. Our analysis brings together micro and macro levels of analysis so that we interpret our data in relation to larger social processes of Russian society, in particular the restructuring of the welfare state, labour markets, health practices, education and the reconfiguration of class and gender orders.

CULTURAL CAPITAL, KNOWLEDGE AND SOCIAL ORIGIN: THE DIFFERENTIAL INFLUENCE OF PARENTS’ EDUCATIONAL LEVEL ON RESPONDENTS’ CULTURAL PRACTICES

Olivier Moeschler 1, Stephanie VANHOYDONCK 2

1UNIVERSITY OF LAUSANNE, Lausanne, 2Office federal de la statistique, Neuchatel, Switzerland

Abstract: According to Bourdieu’s theory of distinction, various forms of capital determine the agents’ positions in society and, consequently, their cultural practices and life style. Beside the economic and social dimensions, “cultural capital” plays a key role according to this model. This complex form of capital is, among others, composed of a social agent’s educational level and of his overall cultural “background”, in which the parents’ own cultural capital – and educational level – play an important part. Knowledge – of a person, of his or her parents –therefore influences access to culture.

Based on a recent national study of cultural practices in Switzerland, we wish to explore this double relation. What is the influence of the social origin of the respondents – measured by the parental educational level – on their cultural practices? Have respondents with the same educational level, but whose parents have reached different levels, the same opportunity to visit cultural institutions, use print or audiovisual medias or do amateur cultural activities? Can differences be noticed according to the type of institution, media or amateur activity? The analyses show a differential effect. For respondents with low or medium educational level, the parental level clearly influences their cultural practices. For respondents who have reached a tertiary educational level, this statistical link is weaker and often, even non existent.

These results lead to a double conclusion. On one hand, they put into perspective Bourdieu’s findings, as completed tertiary educational level implies a certain autonomy and emancipation from parental heritage and, therefore, lightens the weight of family heritage components in the cultural capital. On the other hand, these findings confirm the importance of the social agents’ reached educational level and, through that, of his of her own cultural capital.

HEALING AND TOURISM: THE CULTURAL SOCIOLOGY OF MANAGEMENT FASHION IN JAPANESE TOURISM INDUSTRY

Takeshi Matsui 1

1Graduate School of Commerce and Management, HITOTSUBASHI UNIVERSITY, Tokyo, Japan

Abstract: This paper asks why many hotels and rural tourism destinations in Japan took imitative behaviors in using the word “healing” in their marketing in the 2000s. This management fashion is analyzed from the standpoint of cultural sociology (Abrahamson and Fairchild 1999; Spillman 2002). The word “healing” is one of the biggest buzzwords in the Japanese business world in the 2000s (Matsui 2010). The categories of healing products and services ranged from massages to compilation CDs during this boom. One of the many industrial sectors that exploited this catchy word was the tourism industry.

Since the end of the 1990s, exclusive hotels in metropolitan areas have launched package deals that featured comfortable music and aromas in rooms, spas, massages, and other relaxation facilities using the term “healing.” Rural tourism destination also promoted their resources such as hot springs and nature areas using the concept of “healing,” such as the “Healing Shikoku” (one of the main islands in Japan) campaign in the 2000s. During the 1980s “bubble economy,” companies had used these hotels for business trips and banquets, and group tourists enjoyed hot springs in local areas. But with the collapse of the “bubble economy in the 1990s, many companies reduced such expenses. As such, hotels and local tourism areas tried to cultivate individual customers with sufficient disposable income (i.e., single young females), and “healing” was utilized to attract them.

Two kinds of data were collected in order to understand the social construction of the meaning behind “healing” (Berger and Luckmann 1966). First, I collected documents from hotels, other tourism companies, and local governments, and conducted interviews with these groups in order to understand their behaviors and intentions. Second, I also collected media coverage that reported the “healing” phenomenon in order to understand how such media discourses promoted “healing” marketing techniques. Using such data, this paper analyzes the reflexive processes between agents and the discourses observed in the meaning-making process regarding “healing” (Sewell 1992; Spillman 2002).

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Sources of Power in Face-to-Face Meetings: Understanding the Cultural Logics of Meeting Talk

Christoph Haug 1,2*
1Dept. of Sociology, 2Gothenburg Centre of Globalization and Development (GCGD), UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: Large parts of coordination and strategizing in social movements (as well as in other domains) takes place in meetings. Despite the ubiquity of meetings and assemblies, they have received little attention in social theory. Scholars tend to be more interested in what happens in meetings (decision-making, deliberation, identity construction etc.) and less in the social form of the meeting itself. As a result, meeting talk is either viewed as mere reflection of larger societal or organizational structures and inequalities or as a “blank slate” or “free space” where participants can engage in non-coercive discourse and resist dominant structures. Both views fail to understand the inherent logic of meetings themselves.

The aim of this paper is to explore this logic of meetings as a social form in its own right. Based on ethnographic material from numerous social movement meetings, it suggests that every meeting comes with six elementary structural constraints (or forces): time, place, cognitive frames of reference, status hierarchies, the needs of face, and sequentiality. These forces, however, do not simply determine the meeting talk but they can be handled in culturally contingent ways. The paper describes a variety of meeting cultures and how they regulate the meeting talk in different ways. Based on an in-depth analysis of micro-interactional sequences in conflictual situations, it shows how conflicts are “solved” or forestalled by the way culture prescribes how the meeting should be held and what kind of moves are perceived as legitimate or “well performed”.

The Cocktail Bar: A Qualitative Analysis of Bar Keeping

Werner Binder 1, Thorn Kray-Rennig 1
1UNIVERSITY OF KONSTANZ, Konstanz, Germany

Abstract: The cocktail is a cultural phenomenon that became a global icon during the second half of the last century. Nowadays, cocktail bars can be found all over the world, even in Konstanz, where we collected several hours of video material in order to analyze the social behavior in a cocktail bar. We were mainly interested in the following research questions: How do the barkeepers manage their work and the limited space behind the bar? How do they interact with each other and the objects around them? And what role do the customers play? We decided against a grounded theory approach and chose to begin with a flexible theoretical framework consisting of two terminological triplets. Space, body and artifact are not only observable items of the social world, but specifically arranged and encoded in a cocktail bar. Practice, ritual and performance are used by us as modes of action that have specific characteristics and fulfill different social functions. After having defined and situated these concepts with regard to the contemporary sociological literature, a selection of our video material will be shown and discussed. A qualitative analysis of the empirical data enables us to see how actors deal with the enabling constraints of body and space; furthermore, the multiple functions of artifacts and performances become visible. This study is a first step towards an understanding of the cocktail bar as a culturally significant phenomenon.

To deepen our insights in this complex microcosm, we wish to discuss our findings with a broader audience.

Perform It Again! Women Images, Historical Archives and Contemporary Art

Maria Antonietta Trasforini 1
1Department of Historical Sciences, UNIVERSITY OF FERRARA, Ferrara, Italy

Abstract: The paper will present and discuss some works of three contemporary artists who restore a visual genealogy of gendered body control, using cultural historical archives. Enacting hyper-realistic photos, they evoke almost literally the action of modernity on women body, transformed into a privileged object of social control, using “the photo as a come-back of the death” (as Roland Barthes suggested). American photographer Cindy Sherman and Indian artist Tajal Shah recreated images from historical and visual archive of nineteenth-century hysteria as represented by Iconographie Photographique de la Salpêtrière (1876-80). Focusing on ambiguous role played by nineteenth-century medical photography on female bodies, Sherman and Shah perform realistically faces and gestures of hysterical women from the past, which have been central in psychiatry and psychoanalysis history, but forgotten in the historical narrative. Crossing medical images as figures of a gendered imaginary, the artists challenge gender stereotypes of hysteria as feminine disease, and enact a provocative statement: they share a gendered visual genealogy identifying themselves with it, and – at the same time – they assert a distance to an encoded gendered role. Swedish photographer and video-maker Ann-Sofi Siden, with her work Codex 1993-2005, recovers judicial archive documents from Middle Age to nineteenth-century, concerning processes against some ‘deviant’ women. Focusing on ferocity of social control practiced on women bodies, she enacts an upsetting gallery of hyper-realistic reconstructed portraits of women, victims of cruel or bizarre corporal punishments or tortures. As the judicial documents put the persons on the light of history – she said - paradoxically we can ‘know’ those women only because of (and after) their confrontation with law. Reversing the calm and transparent light of Vermeer, Siden points out the obscure side of modernity with his gendered bodily effects. The paper will finally discuss how the critical use of historical archives seems to challenge the contemporary spectacle of pain performed by media, and points up the cultural and historical quality of bodies, with their ancient marks produced by gender, religion, policy, science and medicine, as political technologies.

The Performer’s Scenic Experience. Embodiment, Being-In-There, Experiential Translation and the Role of the Audience in Dance Performances

Chiara Bassetti 1
1Department of Disciplines of Communication, UNIVERSITY OF BOLOGNA, Bologna, Italy

Abstract: Starting from the analysis of those artistic performances which are non-verbal, and fully corporeal, par excellence, i.e. dance ones, I address the performer’s scenic experience, with a particular
focus on its embodied, phenomenal and interactional features. The paper derives from the ethnographic research that I have been carrying out on the world of dance. Data primarily include fieldnotes, videorecordings and in-depth interviews.

After a brief panoramic on the process of progressive, collective, and emergent construction of the performance from “nothing” to the form that it shall take on the stage (e.g. Atkinson, 2006; Becker et al., 2006), I discuss the role of embodiment in both learning and enacting a performance, and show how that is fundamental for reaching the “status of experience”, the modality of being-in-the-world (Merleau-Ponty, 1945), in which the performer shall need to be on stage. What is usually called “scenic presence”, and I call being-in-there, in fact, is nothing but the ability to enter – and remain inside – the universe internal to the performance, being thus able to experience “flux” (Csikszentmihalyi, 1975). It is about, therefore, a voluntary experiential translation. This is something that performers also try to rehearse in the staging process’ final phases, yet the audience plays a fundamental role in theatre. If the audience’s quantity and quality affect the performer’s scenic experience, in fact, its simple presence, on the other hand, interactionally works as a legitimizing factor for both the performance as a social ritual and the performer’s acting and transformational experience.

Keywords: being-in-there, dance, embodiment, (aesthetic) experience, (non-verbal) performance, performer-audience interaction.

VIRTUAL ETHNOGRAPHY: AN APPROACH FOR STUDY DIASPORA CULTURE IN THE INTERNET

Sari Pekkola

1KRISTIANSTAD UNIVERSITY, Kristianstad, Sweden

Abstract: This proposed paper discusses strengths and limitations of methodological procedures and approaches which have been experienced in a research project about staging cultural and social identities in Diaspora communities in the Internet. The research project focuses representations of dance groups and socio-cultural, youthful dance groups living outside Bolivia staging social and cultural identities in the cyberspace. Many of these groups are deeply committed to reproduce Bolivian and Andean music culture and dance. Throughout, the paper draws on a range of illustrative empirical materials from a recent still ongoing research project.

Aspects of the use of virtual ethnography, mainly based on field work which has been used in the project will be discussed. Experiences of participant observational research combined and visual analysis of relevant websites about popular culture and popular music to study questions of identity, origins and belongingness through case studies about Diaspora communities will be summarised.

I study virtual rooms as leisure spaces where old and new meanings of identity, and relationships based on a sense of community can be pursued. By describing and analysing the Diaspora culture and its contents I try to understand processes of cultural production as a way of creating new media spaces by using the methodology of virtual ethnography. Issues such as how relationships between the local and global music cultures and new as well as old identities are articulated in the Internet are examined with the methods of ethnography.

Materials from what can be seen ‘on the screen’, visual, audiovisual and textual information have all been used as a source of information. Histories of the groups, social webs of meanings, down-loaded performances, events, recordings made about, and by the groups, are all part of the collected data.

Major points in the paper are: the definition of field locations. The important step of sampling and questions about which are the appropriated units. Aspects as the access to the field, field roles and the potentials of social interaction online are taken up. The use of archival websites which have been used will be discussed.

INDICATOR SUITES AS TOOLS FOR SUB- AND TRANSNATIONAL RESEARCH

Michael Hoelscher 1, 2

1Max-Weber-Institute of Sociology, UNIVERSITY OF HEIDELBERG, Heidelberg, Germany,
2University of Oxford, Oxford, United Kingdom

Abstract: Traditionally, the starting point for many analyses of globalisation is the country level. This has recently been criticised as “methodological nationalism” (e.g. Beck 2002), as the national focus may not be able to grasp current processes of globalisation adequately. Such global trends (Beck’s example is the world risk society; one could add the internet, migration etc.) become ever more important for developments in sociological theory. Therefore, new units of analysis beyond the nation-state and better indicators may be needed. There is, however, a problem with missing data for alternative levels of analysis. To circumvent these problems, we introduced the idea of data suites (Anheier 2007). The basic idea behind indicator suites is that indicators of different units of analysis, and even with incomplete data, can still be brought together in a thematic (not statistical) way, and generate insights about relevant aspects of the relationship between globalization and cultures. What unites indicators to form a thematic suite is not some statistical rationale but a conceptual, qualitative one. In methodological terms, we are using (mostly) quantitative information in a (mostly) qualitative way. Indicator suites are a compromise in the sense that they take the inchoate and incomplete state of quantitative indicators as a given, at least for the medium term, while refusing to accept the interpretative limitations this state imposes on descriptive analysis. The notion of indicator suites is informed by Tufte’s (2001) approach to the visual display of quantitative information. We would like to discuss benefits and problems of this approach and assess its usefulness for analyses of the relationship between cultures and globalisation.

P.S. This paper was already accepted two years ago, but due to illness I was not able to present. Nevertheless, I would like to make good for this, either by a full presentation or a poster, as I still think that the approach is interesting and relevant.

RESEARCHING CULTURAL POLICIES IN SWITZERLAND: METHODOLOGICAL OR POLITICAL ISSUES?

Luc Gauthier 1, Karine Darbellay 1, André Ducret 1

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: To begin with, the Department of Culture of the City of Geneva asked us to compare the cultural policies of several Swiss cities and cantons. Through the analysis of their 2010 budget, our goal was to identify performance indicators to use or construct to systematically evaluate these policies. Now that we have handed our report to the Department of Culture, we discover that we cannot make our results public. Therefore, instead of addressing substantive issues, we focus on specific methodological issues that arose along the way.

We first outline the impacts of the Swiss federalism on the complexity of obtaining and comparing information on the financing of culture. Then we highlight somewhat technical difficulties underlying the comparison of cultural budgets (de- and re-construction of accounting categories to harmonize them, validation of the results, feedback to informants/actors). Further still, we must adopt a reflexive stance due to the necessity, in our case, to work with the political authorities and their administrative staff. Because if for sociologists culture is both an object to scientifically construct and the result of negotiations with political actors, for politicians, culture is both a stake and a tool.

We then adress the reasons preventing us from presenting our results and that in tum leads us to call for further investigation of the relationship between private sponsorship and public support; territorial spillover effects and their consequences; as well as the modes of governing culture now emerging in Switzerland.

WHAT CAN CULTURAL SOCIOLOGY CONTRIBUTE TO ETHNOGRAPHIC WRITING?
Ali Türünz

Abstract: The aim of this paper is to demonstrate what the Strong Program in cultural sociology can contribute to ethno graphic writing. Cultural sociology offers a well-organized alternative for rethinking the logic of the “sociology of culture” perspective, which treats culture as a dependent variable. Ethnographic writing has the potential to benefit greatly from cultural sociology. In order to achieve this, however, ethnographers must break free from the sociology of culture and the habit of forming arguments that are dependent on the economic base. Instead, cultural sociology suggests ethnographic works that focus on the processes of meaning making. First, the paper will introduce the term “cultural sociology” and carefully distinguish it from the “sociology of culture”. Then, it will discuss the similarities and contrasts between the current discourse of constructivist ethnographic writing and that of cultural sociology. Finally, we will argue that cultural sociology, which promises to bring fresh “analytic” perspectives to sociology, may help ethnographic writing to reformulate its discourse.

FINANCIAL CRISIS AS SYMBOLIC ACTION
Mark D Jacobs

Abstract: Financial crisis destroys established understandings and expectations, creating what Clifford Geertz calls a need “to render other-wise incomprehensible social situations meaningful, to so construe them as to make it possible to act purposefully within them.” In other words, the uncertainty produced by financial collapse calls out the search for “maps of problematic social reality and matrices for the creation of collective conscience”—one of the characterizations Geertz offers for the concept of “culture.”

This paper will examine the changing narratives and dramatism that effectuate the cultural construction of the financial system, the ways that the logic and legitimacy of the financial system have been “naturalized” over the centuries, as well as the ways that the financial system re-legitimates itself after crisis despite the “disquietful” properties of finance that crisis dramatizes.

ENCULTURATION OF CHILDREN AND YOUTH IN THE CONSUMER SOCIETY (ON THE MATERIAL OF MODERN RUSSIA)
Mikhail Dyakonov

Abstract: Modern crisis of culture contains two aspects: the crisis of creation of cultural patterns and the crisis of assimilation of cultural values. The last one is associated with the process and mechanism of enculturation. On the basis of sociological researches held during the preparation of the PhD thesis, the author considers children and youth enculturation in modern Russia, becoming the part of the global consumer society. The main problem of this type of society enculturation concludes in extention of consumption stereotypes, which leads to the culture vision only in categories “production/consumption”, and ultimately, to the strains of human relations with the culture. The research results show that a significant part of youth is alienated from the culture. The origins of this phenomenon are based on the child’s experience of contact with the cultural patterns, that is the beginning of enculturation, which analyzes through the basic cultural phenomena – game, toy and fairy tale. Herewith, their distortion is considered as the basis of distortion enculturation itself.

NOKIA TOWN IN ROMANIA, BUKOVEL SKI VILLAGE IN THE UKRAINE AND TAKATA-CITY IN POLAND. ARE LOCAL COMMUNITIES IN CENTRAL AND EASTERN EUROPE OWNED BY FOREIGN INVESTORS?
Milosz Miszczynski

Abstract: Since the transition, the rocketing development of Foreign Direct Investment in Central and Eastern Europe can be observed. However, in recent years, the strategies of investors have changed. Investors, having saturated the big cities, started aiming at smaller towns and villages, where, due to the low costs of living and general socio-economic stagnation, developing new projects is possible and highly promising. On the other side of the table, facing the difficult situation of being on the geographic and economic peripheries, local administrators, politicians and engineers of regional growth try to secure their region’s well-being. One of the means of creating new work-places and boosting social capital is attracting investors to these (usually) remote locations by offering
them endless and lucrative tax privileges and a pool of basic human resources.

In the presentation, I focus on local communities with different cultural specifics. I will show how sudden belonging to the ‘corporate’ town changes its inhabitants’ interpretation of reality. All the places in which my research is being conducted belong to the post-communist bloc and have an ‘Eastern’ past. This includes the both physical and intangible presence of artifacts of post-communist state-run factories and farms. By referring to different aspects of locality, I will present observed social changes and outline selected issues emerging from the decision of a foreign investor to settle in one of these locations. Using the three cases from the three places mentioned in the title, I will signal how the change occurs in each instance. In the presentation, I will limit my focus to shifts in power relations, valorization of local space and local identity. Finally, by analysing the observed impacts, I will try to answer the title question and diagnose to what degree an external investor can ‘buy’ a local (rural) community and change the way a locality functions.

Susan Trencher1
1sociology and anthropology, GEORGE MASON UNIVERSITY, Fairfax, VA, United States

Abstract: How do culture and politics frame the professional ethics of anthropologists? Complex interactions between social scientists and political events in cultural context recurrently challenge definitions of science and ethical practice. In particular contexts how are these definitions engaged? Is the inability to hold a set of unchanging definitions and accompanying principles, ergo unprincipled? Today, a “Network of Concerned Anthropologists” has organized itself to question the recruitment and placement by the U.S. military of anthropologists, sociologists, historians, political scientists and others, in Human Terrain Systems, whose stated goal is cultural knowledge. This paper explores the issues of professional ethics they engage, and the backdrop of comparable exchanges between and among American anthropologists in reaction to domestic and international political events between the 1930s and 1970s.

INDIVIDUAL GÉNIE VS. COMMON RESEARCH—UNIVERSITY TEACHING IN FRANCE AND GERMANY

Uta Liebeskind1
1Fakultät I -- Sociology, SIEGEN UNIVERSITY, Siegen, Germany

Abstract: Pierre Bourdieu once stated that “systems of education” distinctly shape “systems of thought”. Educational systems are “containers” of culture: They preserve and transmit culture. In my paper I want to provide empirical evidence for the cultural shape of higher education systems, more precisely, of French and German university teaching. The study uses the idea of “patterns of interpretation”—a sociological concept that came up in the 1970ies and that I fruitfully anchored in the new sociology of knowledge (Berger and Luckmann 1966) for my study. In respect of cultural-sociological aspects my study mainly leans on more or less structural theories (Münch 1986; Stichweh 1994). I analyzed about 25 in depth-interviews with French and German academics in two different disciplines. In both countries actors of university teaching conceive university teaching (and studies respectively) as matter of the students’ personal education. But this very orientation towards personal education varies culturally. In Germany, the interpretation of university education has a large intersection with disciplinary socialization and thus: with academic research. On the contrary, academics in France stress critical thinking and civil emancipation in expressing their objectives in teaching. University teaching in France is oriented towards students’ refinement of individual reasoning—a focus that reflects French scientific culture. The mode of scientific progress is individual génie rather than collective research. This is especially condensed in the mémoire, the final work for obtaining academic grades. The mémoire is expected to be an original individual performance by the student; it is juxtaposed to the lessons at university being the professor’s realm. Among German professors, student’s written theses are contextualized in a different way: They are seen as the fruit of a common process of work in the laboratory or the class (Seminar) at university. They are perceived rather as contribution to the common discipline and as “fuel” for common intellectual reasoning.

DIALOGIC READING, CONSTRUCTION OF SOCIAL REALITY

Laura López Calvo 1, Mari Àngels Serrano Alfonso 1, Lena DeBotton Fenández2
1Sociological Theory, Philosophy of Law & Methodol., UNIVERSITY OF BARCELONA, Barcelona, Spain
2Sociology and anthropology, GEORGE MASON UNIVERSITY, Fairfax, VA, United States

Abstract: This paper analyses how knowledge which is generated through dialogic reading (Soler, 2004) contributes to the cultural construction of a social reality based on the collective acquisition of values and learning. The project Lectura dialógica e igualdad de género en las interacciones en el aula [Dialogic reading and gender equality in classroom interactions] funded by the National Programme of Scientific Research, Development and Technological Innovation (2003-2005) proved that dialogic reading transforms not only the knowledge of the involved target groups but also the values and the interactions transmitted in the contexts where it is developed. Dialogic reading based on communicative speech acts (Searle & Soler, 2004) promotes respect, solidarity, and collective knowledge when it is based on arguments and not on power relationships. Furthermore, dialogic literary gatherings will also be analysed as a successful action which illustrates the theory of the communicative speech acts, and which is part of the research conducted in the framework of the European Integrated Project INCLUD-ED (2006-2011). Dialogic Literary Gatherings demonstrate how children and adult people without academic degrees involved in literary programmes read and discuss classics works of universal literature such as Lorca’s Gypsy Ballads or Joyce’s Ullyses. Gather-

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
ings in which the collective interpretation of classic works contributes not only to the acquisition of the instrumental dimension of reading but also of a critical stand in front of social inequality.

CONSUMING CULTURE: A CONSIDERATION OF VALUE

Kerry McCall

Abstract: Neo-liberal ideologies are taking centre stage in cultural consumption debates. Input-output considerations now underscore public funding and cultural programming discourses. Cultural producers are increasingly required to operate within the convertible use-values of culture which, confirm the value of the arts to be that of social, economic and often political gain. Cause and effect thereby, justifying the worth of public subvention. However, this value of culture offers a fragmented and incomplete understanding of the value and impact of an individual's consumption of cultural experience.

The sociological paradigm of the ‘Hierarchy of Needs’ by 20th century psychologist, Abraham Maslow, offers us an ontological consideration of the individual intrinsic impact of cultural experience. Questions centring on his three Higher Order psychological needs (Love and Belonging: third level, Self esteem: fourth level, Self actualization: fifth level) provided the basis for research conducted in visual arts venues, July 2010 in Dublin, Ireland. The findings demonstrate that an individual’s engagement with art events cultivates their thinking and sense of themselves as per Maslow’s pyramidal progression. An intrinsic value of cultural consumption was surfaced centring on knowledge accumulation, feelings of connectedness, development of self-esteem and feelings of harmony and inner-tuneness. This research study demonstrated that the consumption of culture can fast-track an individual to a temporal feeling of Self actualization (fifth level) without satiation of a priori lower levels. Further connections were also made between Maslow’s pyramidal theory and Bourdieu’s social and cultural capital. Consuming culture is considered with a frame of personal and ontological value which goes beyond the narrow post-Fordist logic currently in vogue with policy makers.

The gathering of empirical evidence followed a structured format of random sampling within 4, not for profit, publicly funded, visual arts venues, of 100 individuals who engaged in the self completion of a 2 page questionnaire. The findings were furthered contextualised within arts participation national surveys and cultural exclusion and social cohesion empirical research and published findings, conducted in the UK and Ireland in the last 4 years.

REMEMBRANCE OF THE 1980 MILITARY COUP D’ETAT IN TURKEY

Elifcan Karacan

Abstract: After the military coup d'état in 1980 in Turkey junta regime and the following government of 1982 have established new institutions to re-structure the cultural and social life in Turkey. The legal sphere was re-organized by the new constitution, the educational life was completely changed and controlled by the higher education institute and neo-liberal politics were adopted and applied in regard to accommodate Turkey into new world order. Finally the cultural life became one of the key issues for the new regime to be re-constructed in regard to re-construct past. The most obvious changes were the bannings on literature, music, films and TV programs. However within past thirty years the arrangements on cultural life became more visible. The usage of the language, images in the public sphere, the turn of space were key elements of the process of reforming cultural life. In my presentation examples from films and TV serials based on the 1980 coup d'état I will discuss the changes in cultural life after the 1980 and the practices of remembrance/forgetting of the past.

PERFORMANCE OF PERCEPTION: EXPERIENCE AND COMMUNICATION IN AN EXHIBITION SPACE

Nail Farkhatdinov

Abstract: Within the sociological tradition of art studies there is a widely accepted approach to investigate art perception as a process of decoding. It is supposed that an audience member has or does not have culturally attained abilities in order to approach a particular object in an exhibition space. However the performative nature of perception is obscured. In this paper I argue that perception of contemporary art is primarily performative and therefore perception is not reduced to interpretation. Contemporary art objects imply particular patterns of behavior or scripts which are shared by members of audience regardless of their interpretative abilities. Through following these scripts exhibitions’ visitors successfully participate in the process of audience making if the same set of actions is regularly performed. The paper focuses on these performative dimensions of art perception in several exhibitions settings located in Moscow. Video based observation and interviews with visitors provided empirical evidence to support the argument and brought attention to the events when audience making (or following the script) is problematic. The problematic situations are indicated if they cause communication and therefore the study of how these problematic situations are reduced focuses on the processes of communication. The research showed that communication is necessary if experience fails and it helps to perform a proper script. The research also contributes to the discussion of the issue interactivity in contemporary art.

NETWORKED AMATEUR: PARTECIPATORY CULTURE AND THE CONTINUUM PROFESSIONALS-AMATEURS

Giovanni Bocca Artieri, Laura Gemini

Abstract: This paper observe the transformation of the creative and artistic experience concerning with the relationship between cultural production and consumption in relation with the evolution produced by the digital culture characterized by convergence and participative languages.

This transformation reshapes the boundaries between the professional and amateur nature of art in a direction where the “artistic gesture” becomes clearly widespread.

The digital culture, supported by the spread of practices developed by blogs, SNSs and online worlds, makes this process clearer and
1. Professional artists use the creative contribution of the users in their own work (which, thanks to the SNSs, becomes more visible). The performer Jenny Holtzer moves her famous “truisms” from the street to her web site, Facebook and Twitter. In drama we find the works supported by the web of companies as The Builders Association or Rimini Protokoll. In Italy Angelo Pretolani describes his performances on Facebook with short poetical status updates and his users/friends add comments and their contributions.

2. The architecture of the web and the logic of the SNSs allow the spread of the amateur culture and the creation of citizen artists: the artistic creativity spreads over the works of professional artists. An example of this process may be seen in the online worlds as SL. Here each user works in a creative way when creating his/her avatar, projecting environments, objects, dresses, and so on. But the most interesting thing is that many SL residents find in the online world the chance to express their creative streak in art works, installations, performances. They may be artists, as Moya Janus the French artist Patrick Moya, or users-not-professional artists who become online professional artists (Gazira Babeli, Asian Lednev).

The digital culture shows a new relationship between acting and experiencing art (Simmel) creating a new profile of networked amateur as an evolution of the traditional amateur. The NA has at his disposal some appropriate contents and techno-cultural abilities within an easy reach, different from classical artistic ones. This figure works in an environment where an artistic tension and a playful attitude interweave.

Gabor Olah 1

1Department of Sociology, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: The paper examines performance of culture and its influence on social reality of actors and audience. More particularly it explores the conflict between deep iconic meanings and discourses (Alexander 2008) based on different narratives and memories connected to a particular memorial of fallen soviet soldiers in Budapest in September 2006. The topic works in the theoretical framework of cultural sociology and cultural pragmatics (Alexander 2006) which is used as an analytical tool for interpreting the events. The author analyzes the relationships between cultural object’s deep meaning, cultural memory and individual action and argues that the icono-conflict was performed through culture. The author explains how meaning of material object is performed and argues that a cultural and symbolic universe of cultural object is interpreted in different ways and understood from different perspectives. The text uses the 2006 riots in Budapest, particularly the attack of the memorial for fallen soviet soldiers and the removing of the soviet emblem from the memorial to demonstrate the visualization of meanings and their conflict to discuss the relative autonomy of culture. Through this example the author points at the importance of the connection between cultural object, different views of its sacredness, national and cultural identity. The author also shows the consequences and proofs that the performance was fused on the example of media discourses.

‘THE ENERGETIC IMPERATIVE’: WILHELM OSTWALD’S CONTRIBUTION TO THE CULTURAL SOCIOLOGY OF ENERGY

Janet Stewart 1

1UNIVERSITY OF ABERDEEN, Aberdeen, United Kingdom

Abstract: This paper forms part of a larger-scale research project that sets out to explore ‘Cultural Responses to the Dilemmas of the Hydrocarbon Age’ in three interrelated strands: First, it assesses sociological and cultural theoretical approaches to energy; Second, it investigates the place of the arts in ‘energy cities’, and the flow of cultural capital between these cities; Third. It traces artistic and cultural responses to energy, seeking to understand the role they play in constructing the ethical and legal framework that circumscribes the actions of institutions seeking answers to the ‘dilemmas of the hydrocarbon age’. This paper is part of the first strand, which aims to (re)construct an approach to the cultural sociology of energy.

Currently sociology has little to offer in response to key contemporary issues such as energy security and energy transition, and has been slow to offer theoretical tools with which to understand them (MacKinnon 2007). Yet energy was a key concept in the development of classical sociological thought. Simmel’s Philosophy of Money, for example, takes up contemporary scientific debate on energy in a number of ways: drawing analogies between natural and social understandings of energy; relating energy to work and money; and extending the term to encompass ‘intellectual energy’ (Wegener 2006). Meanwhile, the Nobel prize-winning chemist, Wilhelm Ostwald, became involved in the founding of the German Sociological Association, seeking a forum for the dissemination of his ideas on the ‘energetic foundation of the cultural sciences’. Ostwald’s scientific approach to culture received robust criticism from the humanities and social sciences, not least from Weber. This penetrating and damning analysis, together with Ostwald’s social Darwinist views on eugenics and euthanasia, has meant that his work has not been taken up by sociology. While not seeking to downplay these aspects of Ostwald’s thought, this paper aims to revisit his attempt to ground sociology in ‘energetics’, in order to consider the extent to which his work might provide a basis for developing a cultural sociology of energy that can draw together insights gleaned from the natural sciences and the social sciences, without reducing one to the other.

RESEARCHING CULTURE: DEFINING COMMON CULTURAL PRACTICES INDICATORS?

Stéphanie Cassilde 1

1Liens Sociaux, CEPS/INSTEAD, Differdange, Luxembourg

Abstract: Cultural practices indicators are widely used but their definitions are mainly specific to each analysis. The main purpose of this presentation is to provide some insights regarding the possibility of common cultural practices indicators for quantitative analysis at the individual level. This could be useful to allow easier comparisons among European societies and between individuals within countries. Moreover, this could be an appealing way for culture to become much more considered in interaction with other fields of
research. Cultural practices are considered here through a broad definition: all free times activities are included.

The presentation is structured as follow. First, a survey of the already existing cultural practices indicators is considered. This underlines the heterogeneity of these indicators. Second, the presentation focuses on the various potential uses of cultural practices indicators in order to identify — thus in a positive way — the broad shape of a desirable indicator. This underlines both conflicts regarding the manner cultural practices are represented and key points where these different uses could need a common approach. Third, a way to obtain common cultural practices indicators is offered and discussed. An empirical application is presented, using the Culture 2009 data set (Ministry of Culture — Luxembourg and CEPS/INSTEAD), and in comparison with already collected variables throughout Europe to ensure the practical value of proposed procedure for quantitative analysis.

HOW CAN WE UNDERSTAND A CULTURAL INSTITUTION?

Ana Roseira Rodrigues
1
1SOCIOLGY DEPARTEMENT OF UNIV PORTO, INSTITUTE OF SOCIOLOGY, PORTO, Portugal

Abstract: Sociology and institutions are connected since the first sociological texts. The development and specialization of sociological “currents” and intra-disciplines endorse new theories, methodologies and instruments to study institutions, organizations, enterprises, culture, cultural relations, cultural policies, etc. But how can we understand a cultural institution in a comprehensive approach?

In order to understand the uniqueness of a particular equipment of Porto, I have initiated a research device firmly anchored in qualitative methodologies, namely interviews to cultural mediators and decision makers and direct observation. I follow the interest of apprehend how a cultural institution shows itself to its audiences, that is to say, how it establishes its speech and rhetoric. The use of a specific rhetoric helps to institutes a specific organizational culture (and vice versa of course). Therefore, the interviews with cultural mediators are fundamental, e.g. guides of the guided tours service, educational service agents and other specialists. After the collected speeches and the observed reality, can we say that this cultural institution has a particular culture? Is it consistent with the cultural and political values that structure the institution?

Taking this equipment as departure point, how to synthesize the transversal dimensions that pass through all cultural institutions life? How do cultural institutions transform their inputs – organic framework, cultural function and vocation, etc. – into outputs (like mediation strategies, cultural marketing, and audience’s approaches)? Concerning all the above, I propose to present some key aspects to study cultural institutions, mostly regarding in this perspective the social relations towards its publics.

LOCAL CULTURAL VITALITY INDEX: A REVIEW OF EXISTING STUDIES AND A MEASUREMENT APPLICATION FOR ROMANIAN CITIES

Liviu Chelcea1, Bianca Balsan2*, Andrei Craciun2, Lucian Dobraca2
1Sociology, University of Bucharest, Bucharest, 2Center for Research on Culture, Bucharest, Romania

Abstract: During the last decade, creativity and culture have been present in urban planning decisions, local or national economic strategies and boosterist discourses. ‘Creative cities’ has become a popular academic concept and local policy blueprint for a large number of cities. Compared to the ubiquity of the concept, there are very few methodological discussions of how local creativity or cultural vitality may, could or should be measured. Our paper will review the existing models of cultural vitality measurement, by analyzing the work of Richard Florida, François Matarasso, Justin O’Connor, Dominic Power, Allen J. Scott, Andy Pratt, Leonardo Vazquez, Maria Rosario Jackson. Produced in various contexts and designed to measure various dimensions, these studies different significantly, both in terms of units of analysis and in terms of overall emphasis. Using 2009 tier one data (Maria Jackson et al, Cultural Vitality in Communities, The Urban Institute, 2006) fifty Romanian cities have been ranked using six sets of indicators about local cultural economy and cultural sector: the size of creative industries, the existence of educational arts and cultural institutions, the local public financial support for culture, the scope of cultural infrastructure, the size of audiences of cultural institutions and the presence of non-governmental cultural organizations. The paper also presents various typologies which may be created out of these six sets of indicators.

SOCIOLGY OF CULTURE AS A RESOURCE OF THE ANALYSIS OF CONTRADICTIONS IN SOCIETY

Arcady L’vovich Marshak1
1Dept. of Sociology, Russian Academy of Business, Moscow, Russian Federation

Abstract: A specific feature of sociology is that it works as a science in a definite field of social problems. It is the combination of sociocultural problems functioning in the society that defines the essence of sociology of cultural and spiritual sphere. Studying of cultural and spiritual sphere in the frames of sociological paradigm implies marking out a number of levels: conceptual (methodology of study), empirical (specific sociological state of cultural sphere) and applied (management, economy, organization of cultural objects).

First of all, we mean such parameters of the “science of culture” which are now recognized as its methodological bases and let us speak about its scientific status. The conceptual structure and methodological content of sociology of the cultural and spiritual sphere under the present conditions.

STRATEGIC ARTFULNESS – ON PERFORMANCE IN THE SEDUCTION COMMUNITY

Andreas Henriksson1
1Department for social studies, KARLSTAD UNIVERSITY, Karlstad, Sweden

Abstract: Analyzing on-line discussions from the Swedish branch of the so-called Seduction community, the topic of the paper is the relationship between strategic action and artfulness in the reflective performance of gender and sexuality.

The Seduction Community is a male-dominated global phenomenon, organized around enhancing the individual members’ seduction skills. Members organize and discuss their activities on on-line...
THE PERFORMANCE VALUE IN “SOCIAL ART”
Cláudia Guerra Madeira

Abstract: Nowadays the idea that “performance” escapes from the art market value has been undermined by the very process of “musealization” or recovery processes and artistic practices that led to the stabilization of the concept of performance art in the 70s. Given the new cycle of “return to performance” (Alexander, 2006), which is also manifested in the art via the “return to the social” (Bishop, 2006) or “return to real” (Foster, 2001) we should question the value of this art in contemporary society, either in the practices of emerging artists or in the practices of the reference artists of this art. In particular, we should question how can it be possible to buy, sell or collect an art form that has no object, reflecting only a process or experience. Taking for example the Portuguese context, and the return to “social art”, we analyze these various notions of value.

AUTHENTICITY PERFORMED: CONTEMPORARY CONSTRUCTION OF HISTORICAL SIGNIFICANCE
Nataliya Komarova

Abstract: Following Benjamin co-presence with the original is the prerequisite of feeling the aura of authenticity. At the same moment the unique value of the “authentic” work of art has its basis in ritual. Though contemporary world loses the possibilities to feel the aura of the original I assume that the rituals that produce it still occur. This paper focuses on transformations in understandings of authenticity of historical monuments. Contemporary projects of reconstruction raise the question whether results of such projects still have any historical significance. The paper investigates this question through the study of perception of the particular newly built XVIII century manor in Moscow by its visitors. It occurred that perception of visitors is opposed to assessments of experts. I argue that significant number of normative regulations in the place produces successful experience of visiting a historical monument irrespective of its real historical value. Observations and experiments in the manor together with the interviews showed that historical significance today is more a feeling (of aura) than a matter of expert knowledge and that there are certain rituals that are willingly performed both by the norms setters and those who are to obey them. Therefore the authenticity of a place becomes the idea that has to be performed via conventional practices that express respect, importance of the moment of co-presence, fear to harm an artifact etc. Hence today we are able to speak about performance of authenticity instead of authenticity of the original.

EUROPEAN READING AND SOCIOLOGY OF CULTURE. CULTURE, KNOWLEDGE, LITERATURE AND IDENTITY
Florent Gaudez

Abstract: Ten years ago, at the end of 2000, a judicial case broke out in France regarding the inclusion of Le Grand Cahier in middle school curricula, a debut novel written by Agota Kristof, a Hungarian immigrant residing in Switzerland. Provocative and fiendish, Le Grand Cahier was internationally successful from the time of its publication in 1986 and had quickly been translated into sixteen languages. The subsequent explosive judicial case surrounding the novel quickly took on a moral-politico-cultural dimension in the Hexagon.

In 1989, a decade before this highly-publicized case took place in France, the sociologist Jacques Leenhardt, then director of the GSL – EHESS, wrote a report of some fifty pages for the Conseil de la Coopération Culturelle du Conseil de l’Europe, entitled “Does a European Reader Exist??”. The report stemmed from a study of lectors of Kristof’s novel from three different European countries: Germany, Spain and France.

With this moment of judiciary peripeteia as a starting point, this paper will look at the Kristof case through the lens of sociological investigation, attempting to repose several fundamental questions regarding the “conditions of possibility” of production and of diffusion of what some would refer to as a “European culture” as a social and symbolic construction of reality.

CONFLICTS WITH CULTURAL HERITAGE: PREAH VIHEAR AND DRESDEN
Michael Kauppert

Abstract: What are the social mechanisms of the diffusion of UNESCO cultural heritage program when one is not convinced that the (quantitative) success of this program is guaranteed by a worldwide acceptance of its goals? With the help of a collaborative and comparative study we try to find out the influence of two factors: first, the social recasting of the cultural idea of world heritage; se-
cond, and inextricably interwoven with that, the process of becoming a matter of routine within transnational politics. The question in our project is: what are the historical and institutional conditions of and which are the interpretative means for the acceptance of UNESCO idea of cultural heritage? Since we do assume that the standard program of UNESCOs heritage politics can be reconstructed from the standpoint of deviance we will discuss two cases of contested "World heritage": the case of Preah Vihear, a Khmer temple on the border between Cambodia and Thailand and the so called "Waldschlösschenbrücke" in the elb valley of Dresden.

STORYTELLING AND THE VALUATION OF ANTIQUES

Elena Bogdanova

MAX-PLANCK INSTITUTE FOR THE STUDY OF SOCIETIES, Cologne, Germany

Abstract: This presentation examines the problem of valuation in the market for antiques, and the role of stories as devices that are used to create value. The evolution of valuation is a part of a process that reflects social, cultural, and political transformations in European societies. As a result, antiques are viewed as rhetorical goods (Appadurai 1986). They are objects from the past, which is uncertain. Discoveries of new artifacts or even historical facts can thus significantly influence the valuation of antiques. A credible story about a discovery can raise the value of an object. Based on the empirical study of the Russian market for antiques, I analyze the role of narrative in market exchange.

Stories are created and circulated in the market, they are always a generalization that helps to cope with cognitive deficit and personalization that attatches a product to a buyer. The nature of the value of antiques created the possibility for stories to influence the market: to address a lack of information about objects and their relation with the past (which is now imagined, but it was real). They often travel with the objects from one owner to another, sometimes being transformed in the process of personalization. Market actors thus use narratives as specific cognitive supports that stabilize the value of an object in a given transaction, placing it – along with the participants of a transaction – into a fictional period of historical time (Certeau 1984).

PASSAGE FROM ISLAMIC ART TO THE MIDDLE EAST ART

Mohammad Reza Moridi

Islamic Azad University, Bandar Abbas Branch, Iran, Iran, Islamic Republic Of

Abstract: This article analysis discourse of Middle East art. While studying the art of the Middle East, we face various questions: are the artistic works of the Middle Eastern artists a kind of representation of their social and cultural conditions or just cliché responses to the curiosity of the West into Middle Eastern affairs? Are these artists deconstructing the oriental clichés about Islamic territories or reconstructing the same in a new, customer-oriented appearance? Is the Middle Eastern art reconstructing the media clichés of the geography of the Islamic fundamentalism (in terms of al-Qaeda and September 11)? Or have there appeared new social demands in postcolonial Islamic societies seeking common human values regardless of cultural boundaries?

This article shows that the art of the Middle East is a new narration of the tradition versus modernity conflict in a political geopolitics within the cultural scope of the Islamic art. It is also show that the art of the Middle East is not a representative of Islamic art; it is representation of modern art in the most important Islamic countries. We use Foucault’s analysis of discourse forms in order to show the Middle Eastern art as a discourse product; therefore, the four factors of discourse – unity of object, unity of enunciative modalities, unity of concepts system, and unity of strategy – have been analyzed, as regards the Middle Eastern art, in order to specify the characteristics of its discourse. In this study we emphasis on Iranian contemporary painting as example of Middle East art.

Key word: Middle East art, Islamic art, Iranian contemporary painting, art discourse

CULTURE, POLITICS, AND THE DEBATE ABOUT CULTURAL POLICY: THE EVOLUTION OF THE CULTURAL POLICY DEBATE IN SPAIN

Arturo Rodriguez Morato, Edurne de Juan

Department of Sociological Theory, UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: The relationship between culture and politics is very complex. Cultural policy represents just one of its dimensions. In spite of this, cultural policy, and the debate about cultural policy in particular, constitutes a very important key for its interpretation. Cultural policy has always been highly controversial due to the absence of any consensual notion of cultural necessities. On the other hand, cultural policy characterizes by its heterogeneity. It was institutionalized in the 60s in relation with a redistributive mission linked to the welfare state logics (Urfalino, 1996). But it also included a more or less important identity dimension associated with the legitimisation function of culture in nation building (Gellner, 1983). In addition as we move towards a culture society (Rodríguez Morato, 2003), cultural policy also gains a development function. The field of debate on cultural policy is especially open to different actors and themes because of the intrinsic heterogeneity and the controversial nature of cultural policy itself. This is why it is so revealing. To what extent the debate on cultural policy reflects the evolution of cultural policy from one logics to the other (from identity to redistribution and to development)? To what extent the rationalization of the cultural policy domain, repeatedly confirmed in the most diverse contexts (Zimmer and Toepfer, 1996; Gattinger and Saint-Pierre, 2008), translates into the homogenization of the debate? What do we learn about the changes in the relationship between culture and politics from the transformation of the debate? This study centres on Spain. It develops a comparison between the debate on cultural policy that has taken place in a number of its autonomous regions during the last thirty years. Spain and its autonomous communities is an exemplary case due as much to the intense development of cultural policy in the country as to its internal diversity. Samples of media reports – which were published in the newspapers in different autonomous regions during three pre-election periods since 1980– related to cultural policy were ana-
Abstract: Conspiracy theories have a long and universal history in human culture (West, 2003). In contemporary society, however, conspiracy theories are omnipresent and seem to thrive like never before: the assassination of JFK in 1963, the attacks of 9/11, the financial crisis of 2008 are just few of the phenomena that have incited widespread conspirational thinking about the state or other modern institutions. Narratives of conspiracies have concomitantly pervaded contemporary popular culture, i.e. novels like the Da Vinci Code and series like the X-Files. Despite the ubiquitous nature of conspiracy theories and conspirational thinking in our societies, equivalent attention from the social sciences has, strangely enough, not been paid to it. When conspiracy theories are considered, mere moral condemnations dominate its discourse. This paper critically analyzes the literature on conspiracy theories and paranoia in the social sciences: it first disentangles the different ways in which conspiracy theories have been demonized over the last 50 years: it has respectively been depicted as being either delusional and pathological, being utterly dangerous – just for the politicians – or as irrational and a threat to scientific reason (e.g., Aaronovitch, 2009; Hoffstadter, 1966; Jameson, 1988; Pipes, 1997; Popper, 1966). Some recent authors, it is secondly demonstrated, have provided accounts of what they refer to as “conspiracy culture” or “culture of paranoia” respectively, without normatively debunking it (Knight, 2000; Melley, 2000). More in particular, they show how its discourse transformed from neatly confined conspiracies about an exotic Other bolstering in-group identity into ‘insecure’ forms of paranoia, where the infinite regress of suspicion about social systems has become the default mode of more and more people. Conspiracy culture, these studies thus hold, is not so much deviant in contemporary society as it part and parcel of the cultural logic of late-modernity, i.e. processes of individualization, rationalization and globalization. Instead of ignoring conspirational thinking or pathologizing it, the social sciences should, it is concluded, empirically study the meaning it has for individuals and groups in contemporary society.

Paradoxes and Challenges in the Relationship Between the State and Cultural Institutions

Joana Ramalho 1, Ana Roseira Rodrigues 2

1Institute of Social Sciences, UNIVERSITY OF LISBON, Lisbon, 2Institute of Sociology, University of Porto, Porto, Portugal

Abstract: In a period of public investment retraction and economic deregulation the debate about the State involvement in the Culture sector is of paramount significance.

This paper builds on Casa da Música as an example of the decades-long progressive tendency of a commodification of Culture, incentive to private-sector patronage and quasi-privatisation of Cultural institutions. These dynamics are particularly significant in a country such as Portugal where Cultural public policy is strongly influenced by the continental model of interventionism and welfarism.

Casa da Música was the flagship project of the 2001 Porto European Capital of Culture. The State, its initiator and financier, defined the objectives and future uses of the equipment as well as its institutional architecture. The management model choice fell on a Foundation with a strong engagement of private sector stakeholders through their involvement in the board of directors.

This growing private influence in a publicly funded, public service provision equipment raises some pressing issues: what is the degree of conformity between the public design of a Cultural policy and its private implementation? How to balance the public service vocation of an institution with its corporate management and market logics? What possible scenarios are there for this model of Foundation as far as the role of the State and the goals of the institution are concerned? In sum: How public does public Cultural service remain when it goes private?

Memory, Time and Nation: Research Trends in Social Sciences

Emilia Rodrigues Araújo 1, Rita Ribeiro 1

1Sociology, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: In a time when research agenda in Social Sciences seems to give more importance to immediate social problems, this presentation seeks to explore the relevance and the place that memory, a central element for national identity understanding, is acquiring both scientifically and politically in different European countries. This communication is strongly grounded on the sociological conceptions about memory, time and national identity. Therefore, it aims at analyzing how memory is being considered in Sociological studies in the European context particular concerning culture studies. The authors follow through a wide literature analysis, which includes the identification of specific historical features which may justify the variations concerning the relevance given to memory studies. Alongside with theoretical questions, the authors are also worried with exploring the methodological options authors have been addressing, also considering the geographical spaces where research happens.

For many ways and more and more in diverse fields of study and action (from sociology to engineering and digital arts) memory is more and more alive and fueled discursively as well as empirically with the building up of specific projects which, though point out to the future, strongly claim the essence of past, the essence of an deferent and distinctive existence. It is undeniable that social and collective memories are core elements for discussing national identities and these are fundamental to understand today political modes of existence. Above all, memory entangles subjective and objective elements which not only constitute the historical past of societies, but also their present and future to be. Many times understood as a mere repository of events, memory has proved to be a central element for understanding and intervening social, cultural and politically. In deep, memory is together a source of power and a means of power to propel its sources of legitimacy through time and using time and temporal perspectives insidiously. A special terrain for studying memory and its political usage is Europe. In fact, this is the never ending land of nationalisms and omnipresent quests for domination which continuously weaken its projects for future propelling multiple sorts of social and political fears.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
HOW JUDGES LISTEN: EVALUATING PERFORMANCE AT MUSIC COMPETITIONS

Lisa McCormick

Abstract: International music competitions are among the most controversial organizations in the world of classical music. This paper investigates the criticisms of the musicians who judge them. Drawing from eighteen qualitative interviews, I discuss how judges approach the evaluation of musical performance in this context, and the problems of commensuration that arise through bureaucratic attempts to institutionalize fair and objective procedures. I also address jurors’ beliefs about the value and purpose of competitions, and their reasons for participating, even when they doubt their effectiveness as a mechanism for identifying excellence. Finally, I identify two common strategies to redeem the competition context and preserve musical values.

INSTITUTIONAL AND INTERACTIONAL MODES OF SITUATIONAL FRAMING

Geir Tore Brenne

Abstract: My PhD project is a qualitative study of two cases of live roleplaying, Russian and Nordic, respectively. This is a form of leisure activity, where participants organize and take part in play events. In these events the players take up and play fictive characters, and simulate small but complex social worlds for an extended period of time. Ethnographic method is used, with data from Russian and Scandinavian communities analysed comparatively. The theoretical framework leans heavily on symbolic interactionist and related approaches, combined with the sociocultural school in psychology. A chapter of the analysis, concerns the topic of framing. In play and performance activities, situational framing – or, the process of defining social situation – are of particular importance. In such activities, the difference between “playing” and “not playing”, “performing” or “not performing” are the result of a social communicative process. Based on data from a comparative study of Russian and Nordic live roleplaying, a new typology of situational framing is presented. “Institutional” framing involves constructing spatial and temporal boundaries that creating zones that oblige all within them to act in a certain way. Institutional frames work as self-fulfilling prophecies, i.e. as institutions they work because there is a shared expectation that they work. On the other hand, “interactional” framing, refers to the reliance on temporary framing bound to cues elicited in the situated interaction, relying on communication from elicited in face-to-face encounters. After an initial presentation differences between the different modes are discussed. A late draft version of the chapter is ready to the conference.

PERFORMING THE SELF IN A NEW CULTURAL ARENA: AN ESCAPE FROM TURBULENT TIMES?

Jo Woodiwiss

Abstract: This paper will look at cultural constructions of the self and identity. In particular it will explore the virtual worlds of the internet and the opportunities this offers to create new cultural arenas and social realities where the self can be (re)constructed, (re)presented and performed. These new ‘virtual worlds’ can provide a haven or escape from turbulent times, as well as a connection to a world beyond the inner self. They may also open up new possibilities and offer new ways to be that enable an exploration or expression of other personalities or aspects of the self, where we can draw on new cultural constructions of selfhood that include multiple and virtual selves. These selves may commute between ‘real’ and virtual worlds, but might also be confined to the virtual.

The paper draws on two related research projects which share an interest in the ways we construct, represent, communicate and negotiate our sense of self (or selves) – which in the 21st century can involve both the ‘real’ and the virtual. One project, involving in-depth, semi-structured interviews, explored women’s engagement with narratives of childhood sexual abuse, the self and multiple personalities. The second project examined online communities (including message boards, blogs and chat rooms) aimed at those who believe they share their lives with more than one self or personality. Drawing on the work of Hacking (1995) the paper will examine the idea that the virtual offers new arenas and new scripts in which to be (un)happy.

MARCHING FOR A KOSOVO REPUBLIC IN SWITZERLAND: FORGING ALBANIAN NATIONAL IDENTITY

Romaine Farquet

Abstract: This paper analyses demonstrations as a means for building a national consciousness. More specifically it looks at marches organised in Switzerland by Albanian migrants from the former Yugoslavia who called for a Kosovo Republic. The numerous demonstrations that took place in the 1980s are scrutinised as a social performance which involves elements such as a precise script, particular symbols and a well-run mise-en-scène.

Two main sources of data are used to get back to the course of the protests, their various components as well as the intentions of the organisers. On the one hand, documents of the time related to demonstrations were collected and analysed: Swiss and Albanian newspapers articles, photos and organisational material such as leaflets, speeches and books. On the other hand, the analysis is also supported by a series of in-depth interviews carried out in 2010 and 2011 with organisers and active participants of the protests.

Demonstrations contributed to forge a particular national consciousness among Albanian migrants through three main ways. First, they influenced the participants’ cognitive structures, giving them a way to analyse the situation in their country. Second, they helped to create a distinct ethnic consciousness as well as a particular conception of their nation and especially to bring to the fore a specific Albanian identity while erasing the Yugoslav one. Third, they developed solidarity among members and increased their motivation to fight for the national cause.

THE WRITING PROCESS AS A WAY OF (DE)(RE)SOCIALIZATION

Leonor Graser

Abstract: This paper will look at cultural constructions of the self and identity. In particular it will explore the virtual worlds of the internet and the opportunities this offers to create new cultural arenas and social realities where the self can be (re)constructed, (re)presented and performed. These new ‘virtual worlds’ can provide a haven or escape from turbulent times, as well as a connection to a world beyond the inner self. They may also open up new possibilities and offer new ways to be that enable an exploration or expression of other personalities or aspects of the self, where we can draw on new cultural constructions of selfhood that include multiple and virtual selves. These selves may commute between ‘real’ and virtual worlds, but might also be confined to the virtual.

The paper draws on two related research projects which share an interest in the ways we construct, represent, communicate and negotiate our sense of self (or selves) – which in the 21st century can involve both the ‘real’ and the virtual. One project, involving in-depth, semi-structured interviews, explored women’s engagement with narratives of childhood sexual abuse, the self and multiple personalities. The second project examined online communities (including message boards, blogs and chat rooms) aimed at those who believe they share their lives with more than one self or personality. Drawing on the work of Hacking (1995) the paper will examine the idea that the virtual offers new arenas and new scripts in which to be (un)happy.
Abstract: If it has been sociologically proved that literary practices are related to social experiences, could we say that literary experiences take directly part to the socialization process? Could we consider the writing as a way, for the novelists, to confirm themselves as thinking and acting subjects over the social determinations? Does the literary creation, as a work of symbolization, leadto social accomplishment?

An empirical survey, established on a double corpus - interviews with twenty-two parisiannovelists of the 21st century and analysis of their complete fictive work –, allowed us to examine the many interactions between the socialization and the creative process, especially on how novelists tell, lively or fictively, their own story about reading and writing experiences.

We would like to present the theoretical and methodological characteristics of a study which let us think that the paths of novelists, biographical such as bibliographical, could have three main sources: one would be the social and cultural background which introduce someone into a specific literary field; another would be the individual research of an original and personal writing aiming to provide him a status of creator; a last one could be the effects of the literary creation as an attempt of social self-creation, or how the authoring would be particularly favorable to the told-classical ambition to look ahead, beyond his cultural background to define himself as an undetermined individual.

PROCESSUAL CHARACTER OF IDENTITY AND FACTORS LEADING TO CHANGES IN IDENTITY

Nadejda Fedotova

Department of Sociology, MOSCOW STATE INSTITUTE OF INTERNATIONAL RELATIONS, Moscow, Russian Federation

Abstract: The report will focus on the analysis of identity concepts and address the factors that change identity. These include Westernization, modernization, urbanization, cultural change, globalization, identity and multiculturalism, intercultural communication. An important factor in the conceptualization of identity is the least represented in the existing identity concepts is the understanding of the processual nature of identity.

Identity is an important cultural attribute and has implications for all spheres of society, including social sphere, politics and economics. People who change their lives economically, for example, by transforming into middle class, change their identity in no less degree than under political or cultural changes. Attention will be paid to such factors as modernization and globalization stressing the importance of socio-economic changes.

Russian identity and its relation to European identity will be analyzed.

RELIGION AND CULTURAL DIFFERENCES ON MIXED COUPLES IN ITALY: ALLIANCES, MIXITÉ AND GENDER CONSTRUCTIONS WITHIN THE LIFE OF MUSLIM-WESTERN FAMILIES

Francesco Cerchiaro

Dipartimento di Sociologia, UNIVERSITÀ DEGLI STUDI DI PADOVA, Padova, Italy

Abstract: KEY WORDS: Islam, gender, masculinity, mixed couple, mixed-cultural heritage

The research inquires the processes of identity construction within the Muslim-Western mixed couples (characterized by male immigrants from countries with Muslim tradition and Italian women) in Italy.

The survey analyzes the discursive representations of the family members (mothers and fathers with children) in order to investigate how meanings are produced and allocated to the mixture of habits, lifestyles and values. The research involves separate 15 in-depth interviews which are meaningful tools to study the facts and processes in which the word is the main vehicle, essential when the “taken for granted” has to be disclosed into the “world of the interviewed”. The mixed couple is then approached as a “field” beholding the principle and rule of its operation, the nerve center of coexistence, communication and conflict (symbolic and not) around which the mutual recognition between the partners and their different cultures come into play. The strong symbolic resonance of these couples, at the macro level, directly affect the discursive strategies implemented by Muslim men to deal with the “dominant discourse” that knit them to a fundamentalist Islam and to an overwhelming and patriarchal culture. Therefore, it is necessary to go beyond a descriptive factor (if and as it happens), within the dynamic dimension of identity, examine the mechanisms of construction, negotiation and signification of these differences.

Thus, gathering the complexity of the social context, the research is located within an intersectional approach that seeks to argue the use of the same categories, by connecting the multiple dimensions of belonging (race-ethnicity, faith, class, and gender).

Facing the identity construction processes means detecting where and how the couple was formed, what kind of problems their relationship has raised in their own reference groups, how the relations with the outside (the family and their community networks) are managed, their relationship with ritual and religious practices, and their dealing with the important stages of symbolic transition for the children’s education (including questions concerning the transmission of religion and their cultural heritage).
RN 08 Disaster and Social Crisis

SEGREATION: TERRORISM AS A CATALYST FOR STRUCTURAL CHANGE

Rickard Sandell1

1Social Science Department, IMDEA, Madrid, Spain

Abstract: On the morning of March 11 2004 Spain woke up to a nightmare. Just three days before elections a series of ten bombs exploded on three different commuter trains in and around Madrid. 191 people were killed and 1,800 were wounded. The chaos that followed was unprecedented. After initially holding the Basque separatist organization ETA as responsible it soon dawned to the Spanish authorities as well as the general public that al-Qaeda was behind the bombings. The magnitude of the attack in combination with the fact that it represented a new threat turns it into a major dividing event. Contrary to public belief, which maintains that the terrorist attacks in Madrid did not stigmatize Muslims in Spain, I argue that the March 11 event triggered a period of increased segregation of the Arabic Muslim subpopulation. Using data from the Spanish local population register for the period 1999 to 2009, I will analyze about 4.6 million international immigration events and about 10.1 million internal migration events. The data enables me to measure change in the differential distribution of the Muslim subpopulation vis-à-vis the rest of the population, as well as change in the spatial clustering of different immigrant groups. This multi-ethnic approach to segregation show that the Madrid bombings consistently changed internal and international migration patterns in Spain in ways that significantly increased the Muslim population’s degree of segregation. Hence, besides terrorism well known political ramifications my findings show that it can be a catalyst for large scale structural change.

SOCIAL IDENTIFICATIONS IN THE FACE OF CRISIS - THE CASE OF FINNISH TELEVISION DISCUSSIONS ON 9/11 -

Hanna Rautajoki1

1School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: In my PhD I study the formation of participation framework in socio-political television discussions on 9/11. My data consists of three discussion programmes broadcast within weeks after the terrorist attacks in USA in 2001. My focus is on empirical investigation of the emerging field of relations in facing and dealing with a societal crisis situation. Live multiparty television discussions represent a long-established programme format in the Finnish media. They constitute an institutionally regulated arena on which current political affairs are discussed and intermediated to the wider public. 9/11 was an event which indeed shook the order of everyday life worldwide. Exploring three different kinds of programmes I will look at how at this disturbing international news event was domesticated in Finland. How it was made ‘something for us’ and who was involved in trying to solve the crises?

The framework for the study is provided by ethnomethodology, the analytic focus being on the situated accomplishments of actions and identities, manifested in the details of interaction. It turns out that the crisis is met with layered membership categorizations which mark political boundaries and regulate moral standards for being a Finn and a European.

Key words: television discussion, crisis, participant framework, institutional interaction, membership categorization

TERRORISM RISK PERCEPTION AND CRISIS COMMUNICATION PLANNING ON FOOD CHAIN SECURITY

Irina Stanciugelu 1, Hami Alpas 2, Dan Stanescu 1, Faruk Bozoglu 2, Sergiu Stan1

1Faculty of Communication and Public Relations, NATIONAL SCHOOL OF POLITICAL AND ADMIN STUDIES, Bucharest, Romania; 2Middle East Technical University, Dept of Food Eng, Ankara, Turkey

Abstract: The aim of this study is to evaluate terrorism risk perception through a series of hypothesis drawn from a social cognitive model of individual response to terrorism. The study was conducted using a survey method of companies’ managers or directors of regulatory agencies on the food chain from Romania and Turkey. Perception of terrorism on the dimensions of probability, seriousness, personal impact and coping efficacy were examined as specific cognitive factors, while perceptions of institutional preparedness for terrorism were examined as social–contextual factors. Perceived coping efficacy emerged as the cognitive factor associated with the most favorable response to terrorism. Hence findings highlight the importance of social-cognitive models of individual response to terrorism in developing risk management strategies aimed at improving individual and organizational response to terrorist attacks. The results of the field inquiries are used in developing risk/crisis communication plans for Ministry of Agriculture, Forests and Rural Development - Romania and Ministry of Agricultural and Rural Affairs - Turkey. The survey has been made during the Romania - Turkey bilateral research project Risk/crisis communication during terrorist threats using biological agents. Messages management and social behavior, financed by The National Authority for Scientific Research of Romania, and The Scientific and Technological Research Council of Turkey.

THE ALCORA EXERCISE AND TURBULENT RELATIONS DURING NATIONALIST STRUGGLES IN PORTUGUESE FORMER AFRICAN COLONIES: THE ROOTS OF PRESENT DAY SOCIAL CRISIS AND UNCERTAINTY?

Celso Braga Rosa 1, Boaventura Sousa Santos 1, Maria Paula Menezes 2, Bruno Sena Martins 1, Natércia Coimbra 1

1CES - Centre for Social Studies, UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: Portuguese Colonial War, that began half a century ago, remains a little researched topic regarding its broader social and geostrategic implications. This paper seeks to discuss the preliminary results of an ongoing project about the Alcora Exercise. This secret alliance, established between Portugal, South Africa and Rhodesia in 1970, aimed to fight against African nationalist movements, to preserve the “white” sovereignty in Southern Africa.
Colonial War, besides constituting a founding moment of the socio-political reality of present day Portugal, was crucial to independencies of its former African colonies, having, likewise, repercussions in the lasting conflicts that followed (the so called civil wars). Thus, a thorough understanding of Portuguese Colonial War gains relevance in a critical approach to the construction of national memories in all countries involved. It is crucial to understand the roots of present day social and political crisis in liberated African colonies, as well as to recognize how such important secrets – as is this “white” alliance against black nationalisms in Southern Africa – reached present days untold. Exploring research lines suggested by Alcora Exercise, Colonial War will be seen as part of a regional conflict – fight against black independencies in Southern Africa –, and as part of a global one – what some consider having been a Cold War subsystem in Southern Africa. One of our lines of questioning will, then, focus on the implications of the Alcora Exercise in a “post-colonial violent order” in newly independent African states, seeking to shed a new light over the roots of present day sociopolitical crisis sadly affecting those countries.

DISABILITY, INVISIBILITY AND VULNERABILITY AND CAPACITY ASSESSMENT
John Twigg
1UNIVERSITY COLLEGE LONDON, LONDON, United Kingdom

Abstract: Vulnerability and Capacity Assessment (VCA) is now widely used by organisations working in disaster risk reduction to identify vulnerable groups and assess their vulnerability to hazards and other external threats. Many VCA methods and guidelines are available, all of which seek to enable users to focus on the most vulnerable groups in society, which must include disabled people. However, in practice, it is not clear that disability is being identified as a key factor in vulnerability and it appears likely that disabled people continue to be overlooked in assessments. This paper reports on a pilot study that looks at a variety of VCAs, from different locations, at different scales, and using different assessment approaches, to review how they have identified and analysed disability in the context of vulnerability to disasters.

DISASTER RISK REDUCTION STRATEGIES AND INCLUSION OF PERSONS WITH DISABILITIES: PURPOSE EXAMPLES OF GOOD PRACTICES
Mathieu Simard
1MSc Global Health and Development, UNIVERSITY COLLEGE OF LONDON, London, United Kingdom

Abstract: This paper aims to present and analyze examples of disaster risk reduction strategies that are inclusive of persons with disabilities. There is a growing body of literature on disaster-risk reduction strategies, seeking to explore the various ways that we can protect specific populations from the effects of geo-physical disasters (sometimes referred to as natural disasters). However, there is a very limited body of literature on how to best include persons with disabilities into these disaster risk reduction strategies. Through researching what exists in that field, both in the literature and through practical experiences, this research aims to present and analyze examples of such inclusive strategies. The data comes both from a literature review and primary data collection. The primary data collection consists of semi-structured interviews and questionnaires directed at a purposive sample of key informants, consisting of non-governmental organization workers and academics in the field. A qualitative theme content analysis will be performed on the collected data. The poster (or presentation) aims to discuss the findings of the study with the following objectives: (a) to present a review of the literature on disability within disaster-risk reduction strategies; (b) to present experiences and recommendations of NGO workers and academics in the field; (c) to underline examples of good practice; (d) to suggest guiding principles for the inclusion of persons with disabilities in disaster-risk reduction strategies and; (e) to provide suggestions for future research and policies.

EVALUATING PHYSICAL REHABILITATION INTERVENTIONS IN POST-EARTHQUAKE HAITI
Myroslava Tataryn 1, Karl Blanchet 1
1Centre for Disability Research, London School of Hygiene and Tropical Medicine, London, United Kingdom

Abstract: On the 12th of January, 2010, the capital city of Haiti, Port-au-Prince, and surrounding communities were devastated by a massive earthquake that killed over 200,000 people and left over 300,000 injured, many with severe disabling conditions such as spinal cord injuries and limb injuries requiring amputation. Consequently, the humanitarian response to the earthquake included a massive mobilisation in the delivery of physical rehabilitation services: prosthetics, orthotics, physiotherapy. To coordinate the roll-out of these services, an Injury, Rehabilitation and Disability Working Group was spearheaded by the WHO and, for its first year, managed jointly by the State Secretariat for Inclusion of People with Disabilities and two international non-governmental organisations (Handicap International and CBM). A study was carried in 2011 evaluating the effectiveness of the emergency rehabilitation response by interviewing over 125 UN and NGO staff, Haitian government officials and beneficiaries in a combination of in-depth interviews and focus group discussions. The analysis focused on the interventions from the rehabilitation sector compared with post-earthquake responses in other humanitarian sectors (including health and food distribution). Significant challenges in the Haitian humanitarian response centred on major difficulties with coordination between international actors as well as with local and national authorities. The lack of involvement of the Haitian government at the very beginning of the response as well as the exclusion of Haitian civil society (ex. Disabled People’s Organisations) due to the inaccessibility of coordination meetings (barriers related to language and venues) were also touched upon. The study also found that the interventions focused on centres and projects instead of adopting a sectoral approach encompassing various aspects of rehabilitation (including information system, policies and legislation). The paper concludes by exploring the positive and negative aspects of a systemic rehabilitation response in the achievement of overall goals of disability mainstreaming, as articulated in international standards applicable in humanitarian emergency responses such as the UN Convention on the Rights of Persons with Disabilities and the Revised Sphere Guidelines.

SPECIAL NEEDS OR CIVIL RIGHTS: EVACUATION AND SHELTERING CONCERNS FOR THE FUNCTIONALLY AND DEVELOPMENTALLY IMPAIRED
Rochelle Brittingham¹, Tricia Wachtendorf²

¹Disaster Research Center, UNIVERSITY OF DELAWARE, Newark, Delaware, United States

Abstract: Emergency management agencies in the United States are facing new challenges in planning for and responding to disasters. The term “special needs” was previously used in both the scholarly literature and by practitioners to describe the vast range of concerns those vulnerable to disaster might face. Addressing the elderly, the young, those of low income, those whose first language is other than the majority, and non-citizens (among many others), the term was also meant to include those with functional and developmental impairments (FDI). There is a growing recognition of the specific challenges individuals with FDI and their families face when disaster strikes. According to Federal Emergency Management Agency Director Craig Fugate, who spoke at the 2010 meeting of the International Association of Emergency Managers in San Antonio Texas, accommodating individuals with FDI needs to move away from the provision of separate but equal sheltering and evacuation strategies. According to Fugate, segregation of those with FDI and their families is violation of civil rights. Inclusivity should be a fundamental principle of all disaster evacuation and sheltering plans.

Yet what are the needs and challenges facing those with FDI and their caregivers? How do we best foster this inclusivity when a disaster threatens our communities? With funding from the National Science Foundation, this research involves social science and civil engineering approaches in an examination of how best to increase safety during high category hurricane events. Our emphasis is on evacuation and sheltering in North Carolina. The focus of this presentation is on the specific concerns of those with FDI or those who care for them, and how these concerns influence their evacuation decision-making process, their evacuation strategies (including transportation arrangements), and the type of shelter they may seek during a hurricane. Findings are based on a large telephone survey of North Carolina households. Data collection is underway with analysis planned for summer 2011.

How To Improve Emergency Preparedness on a Local Level? A Theoretical Model and Empirical Illustration

Alex Altschuler¹

¹Faculty of Health Sciences, BEN-GURION UNIVERSITY OF THE NEGEV, Beer-Sheva, Israel

Abstract: The modern reality is unfortunately characterized by a growing number of disasters. They can gravely damage a community’s social fabric, aggravate psychological well-being of citizens, aid workers and their families, and even cause death. A scientific research is of great potential to develop knowledge and effective practices in front of these complicated social challenges. The current study was a modest effort in a continuous process of development of theoretical models and valid empirical tools in disaster research.

This research proposed a novel comprehensive analytical framework. In empirical terms it concentrated on examination of emergency preparedness of Jewish and Arab local authorities throughout Israel, and the factors which may predict its level.

A structured questionnaire constructed specifically for the study, included 74 items, divided into 9 sub-questionnaires. The questionnaires were distributed in May-July 2008 among 177 local authorities’ chief emergency managers all over Israel, using a random sampling technique. The response rate was 80.8% (143 out of 177). Results indicate that the regression model was of relatively high predictive capability (adjusted R square of 49.3%). The following factors predicted significantly the preparedness level of the local authorities: joint activity of local emergency managers with governmental and non-governmental stakeholders, socio-economic situation in a local community, collective efficacy and the city’s previous war exposure. However, risk perception, population size, ethnic composition of a local community and financial resources weren’t found significant in the framework of the comprehensive model.

The identification of the factors which contribute to the preparedness level and the validation of the measurement instruments has important theoretical and practical implications. Three of the five significant factors (joint activity of local emergency managers with governmental and non-governmental stakeholders, and collective efficacy) are related to cooperation and coordination. In terms of both policy and research insights, it highlights the importance of networks and effective involvement of multiple stakeholders from various societal sectors for a high level of emergency preparedness

*The abstract is based on my MA thesis from the University of Haifa under supervision of Prof. Yael Yishai and Prof. Faisal Azaiza.

Review of Necessary Policies Across Countries to Implement Hazard Insurance and Risk Reduction as Complementary Strategies

Arzu Taylan¹

¹City and Regional Planning, SELÇUK UNIVERSITY, Konya, Turkey

Abstract: Although hazard insurance is prescribed by the new international disaster policy as a financial risk sharing mechanism, there is evidence that hazard insurance can also be used for disaster risk reduction (DRR). Despite, developing and implementing insurance and DRR strategies as complementary can be difficult in medium-low income countries (MLICs) depending on higher vulnerability of physical environment, lower capacity of insurers, lack of accessibility and affordability to insurance products and lack of insurance culture. That is, insurers have confronted catastrophic losses in recent decades even in high income countries (HICs), where the insurance industry is well-developed. Nonetheless, the suggestion of the World-Bank to establish national and/or regional catastrophe insurance pools (CIPs) could lead to develop DRR strategies in MLICs. Beginning with the Turkish Catastrophe Insurance Pool (TCIP) in Turkey, similar pools have been established in Taiwan, Indonesia, Romania and Caribbean region. However, almost any efforts are observed in their contribution to DRR, whereas risk transfer to global reinsurance markets is emphasized. Then, success of these CIPs in risk sharing and transfer is also precarious, because their efficiency requires DRR in insured values. On the other side, ensuring DRR collectively and social equality principles necessitate strategies beyond market, but dealt with the enhancement of community and household capacities. These strategies that are discussed in this paper include: multi-hazard urban risk maps, urban risk mitigation plans, designing risk-rated premiums, subsidized premiums, contractual methods, land-use planning tools to offer incentives or mandate DRR and inspection, long-term credits as...
linked to hazard insurance, access of poor’s to land and safer hous-
ing and infrastructure, legitimization of informal settlements
through DRR, and financial resources for local authorities. There-
fore, this paper will compare countries in implementing these
strategies based on the progress reports prepared for the Hyogo
Framework for Action. Then, this paper will conclude with a model
that attempts to integrate GIPs into DRR and distributes the priority
of strategies and responsibilities to international, national and local
levels.

SHORTCOMINGS OF CONVENTIONAL APPROACHES IN
MEETING NEW DRR OBJECTIVES

Murat Balamir
1
1city and regional planning, MIDDLE EAST TECHNICAL UNIVERSITY,
Ankara, Turkey

Abstract: Conventional social organizations and modes of conduct
that focus in post-disaster activities and target singular objectives
often prove outdated, as risks are often spread and embedded in
networks of socio-physical systems. New responsibilities and tasks
need be introduced and revisions made in the existing organiza-
tions and systems as circumstances change and finer DRR policies
are adopted. As often is the case, the post-disaster social climate
gives rise to revisions in the legal and organizational apparatus, not
always however in the necessary direction. There are numerous
constraints, belief systems, and interest groups that obstruct ap-
propriate steps of development in DRR even if a large-scale devas-
tation has been experienced.

The 1999 earthquakes in Turkey gave rise to a number of new insti-
tutions as “building supervision”, “obligatory earthquake insurance
system”, “building retrofitting regulation”, and “revisions in the
flat-ownership law” concerning management of the building stock.
These regulatory devices are all related to the structural risks of
individual buildings. This confined attitude is the consequence of
the prevailing conviction of authorities largely fuelled by activities
of dominant professional lobbies, ousting the likelihood of other
approaches. These regulations largely overlook the reality of risks
beyond buildings and ignore the potential contributions of other
professional approaches that tend to explore risks embedded in the
social systems.

To challenge this entrenched point of view, it has been possible to
investigate empirically the risks generated by the social conduct of
land-use decisions, which are almost always determined by local
interests and political pressures. The city of Adapazari, devastated in
the 1999 earthquakes in Turkey prepared and ratified a master
plan in 1985. The plan lost its compatibility, as it was modified by
750+ partial revisions in due course until 1999. These are often in
the form of depletion of open spaces, developments in pockets of
green areas, increases in densities, changes in the building mass-
forms from detached order to attached buildings, commercial uses
in residential areas modifying the environmental conditions. Anal-
yses of these revisions indicate not only their subjective or untena-
ble background arguments and their private interest base, but also
provide ample evidence of a direct correlation with losses in 1999.

TRANSFER OF CONCEPTS OF THE NEW
INTERNATIONAL POLICY FOR DISASTER RISK
REDUCTION: THE CASE OF TURKEY

Elif Daldeniz
1, Nihal Ekin Erkan
2
1Translation Studies, OKAN UNIVERSITY, 2Marmara University, Local
Government Programme, Istanbul, Turkey

Abstract: The experiences of the disasters in the past decades re-
sulted in the need for a new international policy which is being
expressed and disseminated in English as the current lingua franca.
Policy-makers, scientists, and professionals thereby try to transfer
new concepts of the international policy into their local contexts
where the newcomers meet old concepts and perspectives. Where
the new concepts in the international context are often disputed,
their transfer into local contexts is even more complicated. These
transfer processes are not smooth and involve translation, trans-
formation, and negotiation, may trigger conflict, and meet re-
sistence.

This paper aims to interrogate the transfer of the concepts of the
new international policy for disaster risk reduction into Turkey and
Turkish. To this effect, we will analyze a corpus of texts produced in
the related field in the last decade. The method used in this study
will be critical discourse analysis. The corpus includes two groups of
texts. The first group consists of articles which aim to introduce the
new international policy. The second group can be evaluated to
represent the views and practices of traditional post-disaster man-
agement experts and institutions. A comparison between these two
groups of texts will provide insights as to the transfer process in
general whereby points of resistance and of struggle between dif-
ferent agents will be shown.

Being part of a broader research on the transfer and development of
concepts of urban studies in Turkey, also this study is done in the
same multi-disciplinary framework. The two main axis of this
framework are provided by Urban Sociology and Translation Stud-
ies. In addition, we rely on the approaches developed in Conceptual
History. Our target in the long term is to contribute to the field of
disaster risk reduction in Turkey by revealing how some concepts
can become triggering concepts in Kosselleck’s sense and thereby
help to raise awareness.

COMMUNICATING IGNORANCE – A PRECONDITION
FOR DEALING WITH CREEPING DISASTERS?

Alena Bleicher
1
1Department of Urban and Environmental Sociology, HELMHOLTZ-
CENTRE FOR ENVIRONMENTAL RESEARCH, UFZ, Leipzig, Germany

Abstract: Human activities such as mining, industrial production or
military activities have lead to contaminations of soil and ground-
water throughout the 20th century. Contaminated areas can be
seen as creeping disasters which pose a risk for ecosystems and
human health. Due to the fact that knowledge on former dumphies
has often been lost and natural degradation processes transformed
the original contaminants into new substances it is hardly known when
and what exactly will happen. Dealing with such creeping disasters
is permanently confronted with (known) unknowns and actors of-
ten have to decide in spite of ignorance. A major challenge is
achieving awareness and preparedness for potentially unforeseen
events over long time.

To date in sociology no concept of preparedness does exist. Based
on the analysis of decision making processes in revitalization pro-
jects I will discuss a concept of preparedness that is build on the
communication about ignorance. Thus preparedness allows the
development of coping strategies with creeping disasters. I will
show different strategies and media used by actors to create preparedness over long time in society.

NATIONAL SECURITY THREAT AND ITS MEASUREMENT: PROTECTING SOCIETY’S VITAL INFRASTRUCTURES IN FINLAND

Antti Silvast

Abstract: This paper discusses large technological systems and their risks. The key theoretical starting point comes from studies of risk, uncertainty and government, and it emphasizes on risk as a concrete governmental technique. According to this argument, it is important to understand the concrete ways for protection against unwanted events, as these have fundamental consequences for the kinds of people we are and our contemporary ways of life. Social scientific discussions of this idea in the context of technological systems are not that common, and the paper addresses the topic through an empirical case on infrastructures. The research question is: what are the techniques that measure and mitigate uncertain future events in the Finnish efforts to secure society’s vital infrastructures, and in particular, energy supply? An empirical analysis is focused on three sides of the question: first, on the different expert ways that try to take infrastructure threats into account and sensitize actors like ministries, authorities and companies to them; second, on the mechanisms that assign responsibilities and resources to these same actors; and third, on the concrete practices that are applied by the experts to monitor and test the success of the respective measures. The research is based on policy documents, interviews and participatory observations from the security of energy supply field in Finland. These materials were gathered between 2007 and 2008 as part of my ongoing sociology dissertation. Additional sensitivity to the data was gained from my previous professional background on electricity engineering. The paper concludes by discussing the results and the shaping of possibilities for people’s actions and ways of life. The main finding of the study is without doubt the unpredictability of the ways that influential security experts in Finland apply when assessing and mitigating infrastructure threats. Risk in this context is most often not equal to standardized calculation of probabilities and harms of unwanted events. Instead, the experts rely on imaginative methods, like threat scenarios and crisis exercises, to produce knowledge about infrastructure threats and test the capabilities that actors have for protection against them. Risk techniques, in sum, can be a rather diverse set of rational responses to threats, and these can also shape the actions of organizations to various different directions.

REMEMBERING RISK? URBAN FLOOD MANAGEMENT IN ARGENTINA

Susann Ullberg

Abstract: The process of planning for disaster risk reduction and disaster management involves an array of ideas and practices when estimating probabilities, calculating effects and imagining uncertainties. Such processes take place with temporalities that are based on past experience, present knowledge and future scenarios. Multiple governmental and non governmental institutions are involved in such a complex field of action enacted by politicians, government officials, scholars and activists. This paper explores the case of the city of Santa Fe in the northeast of Argentina where disastrous flooding is a historical and recurrent problem. In particular it focuses on how past floods and flooding in the past is remembered -and forgotten- within different institutions in order to understand how these processes forge risky people, places, and practices of the urban landscape.

THE CLASSIFICATION SOCIETY RULES AS MEMORY ARCHIVE IN SHIPPING

Hannu Hänninen

Abstract: The paper explores the safety implications of using the classification society rules in shipping as a collective memory archive for the whole industry. In shipping developing safety has been a long process. Failures and close calls at sea are not efficiently monitored and analyzed, and technologies for controlling them have not been incorporated into daily routines as in airline traffic. Therefore, what is learned from anomalies in shipping remains often localized thus slowing regulatory development. The classification societies set rules for shipbuilding and inspect ships so that they can be insured. The inbuilt safety margins in shipbuilding are taken straightforward from these rules, which are updated after serious accidents. The accumulated knowledge has been memorized in the classification rules. The rules were not intended to form such memory archive, but over time they have been established as that. The workings of the classification system are problematic, however, because the rules by various societies have varied a lot and because by agreement the societies cannot reveal observations about failures and close calls that have occurred to ships they inspect. The dubious role of the classification societies both as a regulatory agency and as a customer for shipbuilders and shipowners prevents learning and open dialogue within the industry. Safety margins are not widely discussed between central actor groups.

Previous literature on technological failures and risk regulation has focused on the importance of recognizing close calls and learning from them. It has been studied how such anomalies have been monitored, analyzed and what type of techniques have been developed for controlling them. More, it has been explored how the safety margins are negotiated and deviance may be normalized. The memory aspect of occurred failures, close calls and the related risk decisions has been studied less. The paper targets this gap in literature by creating understanding of the safety implications of using regulatory rules as the whole industry’s collective memory. The analyzed material consists of public investigation reports, regulatory books and documents, and books on shipbuilding. Oil tanker and ro-ro ferry technologies are used as empirical examples.

HEURISTICS IN RISK ASSESSMENT OF COMPLEX PROJECTS

Martijn Leijten

Abstract: Mishaps in complex projects often originate in issues that the assessors of risk do not oversee. Their expertise is not special-
ized enough to understand everything that happens in the system they are trying to control and they depend on other, more specialized actors to provide information on it. The author has studied several complex infrastructure projects in which this phenomenon occurred. Many studies related to this issue, focus on risk analyses being applied ex ante. And if mishaps occur, most ex post incident investigations focus on the (technical) origin of the mishap and the responsible actors. Such an approach ignores the enormous number of ambiguous and often conflicting messages managers receive. This research therefore uses a different angle by attempting to identify the ‘heuristics’, i.e. the framework of reference, the managers of these projects use to make trade-offs between the values time, cost, scope and quality (including safety). With awareness of the context of both the actor’s framework and the situation and conditions the researcher tries to understand why trade-offs are made the way they are.

Every way out of the dilemmatic trade-offs confronts the manager with double binds. For example: being susceptible to the indespensible input from other actors means managers have to listen to ‘hunch feelings’ about risks and are confronted with potential strategic behavior (because the interests of principal and agents are not aligned). Fending off this input, however, implies ignoring possibly valid warning signals. In such a situation managers for instance tend to do what is easiest to complete their job. They are often preoccupied with objectifiable data (time schedules, costs), because they are being held primarily accountable for them and because these are the values that they can measure and understand.

The paper will attend more of these double binds. It presents the first steps of identification of the double binds and the relevant heuristics and announces further research into this topic by the author. The purpose is to create a better understanding, not of risks, but of the risk assessors. Understanding the work of the risk assessors might enable us to detect managerial deviance in advance or prescribe perspectives to mitigate potential adverse effects of their acts.

**PHRONETIC SKILL AND RISK GOVERNANCE: HOW DOES PRACTICAL WISDOM WORK IN NEW TECHNOLOGY RISK GOVERNANCE OF CARBON NANOTUBES AND ENDOCRINE DISRUPTING CHEMICALS?**

Arho Toikka 1, Nina Janasik 1

1 UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: New technologies posit complex risks with considerable uncertainties. Adequate understanding and response requires the integration of risk knowledge based in multiple fields of expertise. We propose that this integration process can be understood through the concept of *phronesis* or practical wisdom, defined by Aristotle as being a ‘true state’, reasoned, and capable of action with regard to things that are good or bad for man’. Risk governance requires the complementation of disciplinary understanding through active use of their phronetic integrative skills. These skills enable individuals to rise above their knowledge domains and to understand the logic of other domains through pattern recognition, or the ability to recognize complex perceptual patterns of non-symbolic nature.

We analyze two areas of new technology development: carbon nanotubes and endocrine-disrupting chemicals. Risks in both areas are characterized by considerable uncertainty and ambiguity: complex cause-effect links challenge risk assessment procedures, and interpretative and normative challenges question the valuations of benefits and harms.

We demonstrate *phronesis* and pattern recognition in these areas through case-studies. Carbon nanotubes are manufactured cylindrical allotropes of carbon with many unique properties and applications. They have recently attracted concern due to their similarity with asbestos, and a budding scientific literature has emerged around the hypothesis that health concerns of asbestos might be applicable to carbon nanotubes, too. We analyze the literature through the lens of pattern recognition in risk concepts: the most interesting advances were made when researchers took the initiative to utilize these skills. Endocrine-disruptors are usually defined as exogenous substances that alter function(s) of the endocrine or hormone system and consequently cause adverse health effects in organisms or (sub)populations. Here, we analyze the expert deliberation taking place in a series of Finnish workshops on the topic through the lens of pattern recognition in risk concepts. Finally, we compare the results of the two cases.

**RISK ASSESSMENTS AND HANDLING IN A RESCUE COORDINATION CENTER**

Trude Karine olaug Gjernes 1

1 NORDLAND RESEARCH INSTITUT, Bodø, Norway

Abstract: We plan a study of how risk assessments and risks are handled in a rescue coordination center. Data will be collected through fieldwork; in-situ observations, formal interviewing and informal conversations. We are particularly interested in two aspects: the employees risk assessments and risk handling. Firstly, the interaction that takes place between those who are involved in risk assessments or rescue operations and the information they generate as relevant and necessary for understanding and handling the situations at stake. Secondly, how those who take part in these activities relate to and use the information they obtain about the situation. This is information of multiple kinds from multiple sources. It may be information from electronic maps, from weather forecast, directly from vessels in trouble or other direct observations at sites of emergencies or risk situations. It may also be information from other rescue coordination centers or other agencies involved in this kind of activities. The first and the second aspect are both in use to establish an understanding of the situation of those in danger and to decide what to do in situations of crisis or immediate risk. Our intension is to study such activities at a rescue coordination center as collaborative and socially distributed problem solving activities with several participants, some of them are human actors and some of them forms of representations and technological equipment.

**THE « NATURE CITY » AS AN ANSWER TO THE CITY AT RISK, AN EPISTEMOLOGICAL DISRUPT INTO PLANNING: THE “GRAND PARIS” CASE.**

Adrien Gey 1

1 town planning, UNIVERSITE DE GRENOBLE, paris, France

Abstract: In March 2008, ten selected teams have exposed their projects for the Greater Paris concourse. They developed their theories and plans by questioning the future relations between Paris
and its territories, but also by defining what could and should be a post Kyoto metropolis.

In our thesis we are trying to describe and analyze the “naturalization” process in course in contemporary practice of town planning throughout the specific issue of the “Grand Paris” project. Of course, interest in the environment, link between city and nature, are well known topics that are very often discussed and quite effective in urban policies. However, in the field of town planning, neither project nor practical event has ever developed such a variety of solutions all involving a strong city to nature connection. Therefore the “Grand Paris” concourse offers an extraordinary occasion to trigger the town planner’s conceptions on the relation between nature and city. Eventually, our survey is an attempt to set up a history of ideas on the subject through one very specific case, sparing us from an arbitrary compilation of data from different times and different cities trough the world.

Embedded in this deep process of “naturalization”, is the particular use of nature as a key technical element in the risk management. In addition to others pure technical artifacts dealing with natural and technological risks, natural elements like water, plants and air are included in complex technological devices making the whole city a kind of nested super technical object. This treatment is not only showing a representational shift among town planners but also the new status of nature and its relations with society and technology, as Beck demonstrated in his well known essay.

KEYS IN THE SOCIAL ACCEPTABILITY OF RISKS
Andrés García 1, Juan de Dios Ruano 2*
1Centro europeo investigación social emergencias, DIRECCIÓN GENERAL DE PROTECCIÓN CIVIL Y EMERGENCIA, Madrid,
2Universidad de A Coruña, Coruña, Spain
Abstract: Keys in the social acceptability of risks
In that research we can find the blocks or batteries of traditional questions on training, information, perception, acceptability, and reactions of the population in catastrophe situations that provide us with updated information on the confidence levels of citizens in the institutions and organisms of intervention, related to the management of emergencies.

Another variable that is analyzed is the relation and role, so much at present as in the future, which the population plays between the development of the techno-science, catastrophe and risk. It is of special interest the role that the citizens award to the technological and scientific progress, on the one hand as “reason” for future and new risks and on the other one as “solution” and minimization of the same ones. Role which oscillation between one and another saucer of the scale is going to determine with complete certainty our future as society in view of the weight that public opinion has in a democratic society. People think as if they were submitted to processes of destabilization and catastrophe situations whose genesis is out of their system and will.

SOCIAL ACCEPTANCE CRITERIA FOR REFUGE PORTS IN GALICIA (SPAIN)
Juan De Dios Ruano 1, Ariadna Rodríguez 1, Elvira Santiago 1
1Facultad de Sociología, Universidad de A Coruña, A Coruña, Spain
Abstract: On the 25th of April, 2007 the European Parliament agreed the modification of the directive 2002/59/EC which establish –among other things- that Member States should draw up measures to give refuge to ships is distress in their ports or in any other sheltered areas in order to limit the consequences of accidents at sea. As far as places of refuge is concerned the modification of the directive indicate that Member States should compile previous information about possible sheltered areas on the coast so that in case of accidents or incidents at sea, the proper authorities can point out the most appropriate areas to shelter the ships in distress as quickly as possible. The previous information should include a description of the physical, environmental and social characteristics of the places and the means and facilities available to assist the ships that had an accident or those which are fighting against the consequences of a polluting spillage.

So, the importance of social aspects when it comes to determine the shelter areas or ports of refuge in Spain is nowadays one of the biggest problems to apply this Community Directive independently of the political tendencies of the national, regional or local government. In fact the cases of the vessels "Prestige" In November 2002, and “Ostedsjik” in February 2007 are two examples of the difficulty to implement the Directive in our country. So, due to the social alarm and the reluctance shown by people from coastal areas to shelter both vessels, it is decided to move these ships in distress further away. This measure was de subject of political, social and media controversy over the decision.

In this context our research group’s experience on collective risk management has developed from the analysis evaluation and suggestion of social criteria which improve the social acceptances of controversial facilities (Ref. CSO2008-00324).

Our paper has two objectives:
1. To analyse empirically the social image in Galicia (Spain) of the areas and ports of refuge following in detail all the arguments, on the relevant opinions and connotations about this refuge areas on the coast.
2. To supply the necessary knowledge demanded about the social factors which affect the possible available refuge areas. This is, to define the criteria which contribute to the social acceptance of the ports and areas of refuge in Galicia (Spain).

THE MEDIA COMMUNICATION OF REFUGE PORTS IN GALICIA (SPAIN)
Ariadna Rodríguez 1, Elvira Santiago1
1Facultad de Sociología, Universidad de A Coruña, A Coruña, Spain
Abstract: On the 25th of April, 2007 the European Parliament agreed the modification of the directive 2002/59/EC which establish –among other things- that Member States should draw up measures to give refuge to ships is distress in their ports or in any other sheltered areas in order to limit the consequences of accidents at sea. As far as places of refuge is concerned the modification of the directive indicate that Member States should compile previous information about possible sheltered areas on the coast so that in case of accidents or incidents at sea, the proper authorities can point out the most appropriate areas to shelter the ships in distress as quickly as possibly. The previous information should include a description of the physical, environmental and social characteristics of the places and the means and facilities available to assist the ships that had an accident or those which are fighting against the consequences of a polluting spillage.
to assist the ships that had an accident or those which are fighting against the consequences of a polluting spillage.

So, the importance of social aspects when it comes to determine the shelter areas or ports of refuge in Spain is nowadays one of the biggest problems to apply this Community Directive independently of the political tendencies of the national, regional or local government. In fact the cases of the vessels "Prestige" in November 2002, and "Ostendijk" in February 2007 are two examples of the difficulty to implement the Directive in our country. So, due to the social alarm and the reluctance shown by people from coastal areas to shelter both vessels, it is decided to move these ships in distress further away. This measure was de subject of political, social and media controversy over the decision.

In this context our paper is focussed on the media communication carry on in relation of refuge ports in Galicia (Spain). Concretely, we will present how several newspapers present the messages relative to the possibility of receiving a refuge port in certain geographical points. Several cases of maritime catastrophe that took place in Spain show the need to know the media keys that are started on the occasion of this type of events of critical or catastrophic nature.

TWO WAYS OF UNDERSTANDING THE SEA RISK IN SPAIN. ZERO RISK VERSUS ABSENCE OF ABSOLUTE SECURITY.

Elvira Santiago 1, Ariadna Rodríguez 1
1Facultad de Sociología, Universidad de A Coruña, A Coruña, Spain

Abstract: On the 25th of April, 2007 the European Parliament agreed the modification of the directive 2002/59/EC which establish –among other things- that Member States should draw up measures to give refuge to ships is distress in their ports or in any other sheltered areas in order to limit the consequences of accidents at sea. As far as places of refuge is concerned the modification of the directive indicate that Member States should compile previous information about possible sheltered areas on the coast so that in case of accidents or incidents at sea, the proper authorities can point out the most appropriate area to shelter the ships in distress as quickly as possibly. The previous information should include a description of the physical, environmental and social characteristics of the places and the means and facilities available to assist the ships thathad an accident or those which are fighting against the consequences of a polluting spillage.

So, the importance of social aspects when it comes to determine the shelter areas or ports of refuge in Spain is nowadays one of the biggest problems to apply this Community Directive independently of the political tendencies of the national, regional or local government. In fact the cases of the vessels "Prestige" in November 2002, and "Ostendijk" in February 2007 are two examples of the difficulty to implement the Directive in our country. So, due to the social alarm and the reluctance shown by people from coastal areas to shelter both vessels, it is decided to move these ships in distress further away. This measure was de subject of political, social and media controversy over the decision.

This paper is focus on the study about the different ways in Spain of understanding the sea risk. Using a qualitative analysis of the ten discussion groups conducted in the project (Ref. CSO2008-00324) we could find and analyze the differences in the public perception of risk by geographic region. While in Galicia and Andalusia is accepted we can not attain absolute security and that the risk of sea accidents is always present. In Catalonia defends the possibility of achieving zero risk disappearing the possibility of an accident. It is essential to study these differences as they require different management by crisis managers and politicians when planning to prevent and if necessary deal in the management of a potential accident.

AGENCY, STRUCTURE AND SOCIAL CRISIS: EXPLORING SOCIAL RELATIONS IN TWO FOREST-BASED COMMUNITIES IN RURAL BRITISH COLUMBIA, CANADA

Wayne Crosby 1
1Rural Economy, University of Alberta, Edmonton, Canada

Abstract: To what degree an individual has agency to respond during crisis and the degree social structures influence their course of action are important questions when examining social relations during uncertain times. This paper explores theoretical approaches to the agency-structure framework to examine constraining/enabling factors influencing individuals’ response (i.e., individual vs. collective action) to social crisis. The framework questions the degree social structures and/or agency shape human behaviour, and speaks to central dilemmas in sociology pertaining to the degree human action is voluntary or determined. How independent each concept is or how much interplay exists between them has shaped a long tradition in social theory. For earlier theorists, the relationship is characterized in terms of ontologically fixed poles such as those emphasizing structure (e.g., Durkheim & Parsons) and those giving analytical priority to agency (e.g., Weber & Mead). Much of the work today is advancing attempts at synthesizing and accounting for the varying degrees of interplay between the two concepts (e.g., Anthony Giddens’ Structuration & Margaret Archer’s Morphogenetic Approach). The morphogenetic approach is of interest as it provides analytical means to examine the interplay over time and space whereby none of the ‘parts’ (i.e., structure & agency) are conflated into either component. Analytical attention is instead given to the conditional and generative mechanisms operating between agency and structure.

This paper draws on my doctoral research that examines individuals’ response to a social crisis characterized by a threat of community decline/collapse in two forest-based communities in rural British Columbia, Canada. The cause of the current local crisis is often attributed to the recent economic recession and is experienced by individuals in terms of mill closures and job loss in communities economically dependent on the forest industry. This situation translates into individuals facing lost livelihoods and an uncertain forest economy, which pose a threat to community sustainability as industry undergoes transition and individuals face the possibility of uprooting in search of employment elsewhere. How to theoretically account for both agency and structure to understand the degree each constrain/enable response during this crisis offers useful insight into the nature of social relations during uncertain times.

RESILIENCE MEETS REFLEXIVITY: ANTICIPATING CLIMATE CHANGE CATASTROPHE

Debra J D 1
1University of Alberta, Edmonton, Canada
Abstract: When it comes to climate change, the question is increasingly becoming not ‘if’ but ‘when.’ Appropriately, a growing level of social scientific attention has been directed in recent years toward studies of vulnerability and adaptation in the face of a multitude of forecasted negative consequences. Sociologists have been notably absent in this new field, however, with geographers and others playing a far more prominent role. As is true of any new field of inquiry, particularly one with a strong applied imperative, the conceptual frameworks of vulnerability and resilience guiding the research to date have much room for improvement, particularly in the area of catastrophe anticipation and planning. One potential advance could be achieved through closer engagement with sociological theories of reflexivity, particularly the work of Margaret Archer, who asks just how individuals come to give attention to certain problems, and formulate responses to them. In the case of climate change, individuals vary significantly in regard to their understanding of and concern for climate change and its impacts, and these standpoints in turn influence not just commitment to mitigation, but also propensity to plan for the potentially catastrophic consequences of climate change. Identifying pathways toward increased individual reflexivity in relation to climate change can make a valuable contribution to our understanding of collective responses to climate change risks, or the lack of them. In this presentation, I will make an initial exploration of climate change vulnerability from the lens of reflexivity, including an analysis of a comparative study of the residents of four small, forest-based communities in Western Canada, all of which are situated in eco-regions at risk of drought, catastrophic forest fires, and the loss of their community economic base.

THE DISTANCE ANALYSIS FRAMEWORK: A NEW UNDERSTANDING OF WARNING PROCESSES

Laurence Créton-Cazanave¹

¹LTHE, CNRS, grenoble, France

Abstract: For a long time now, we know that, despite many studies and researches on warning systems, we do not succeed in improving real warning processes (Sorensen, 2000).

Obviously, we need new theoretical frames in order to undertake real actors’ practices, in real situations. More, it seems that we should also address the problem of “sense-making” (Weick, 1995, 2003) if we seek to understand what is at stake during a warning process.

This communication will present the outcomes of a new approach of warning: the “Distance Analysis Frame” (DAF).

This approach, based on a “pragmatic sociology” background, is characterized by:

- Integration: considers all the actors involved (even the unexpected ones, and non-humans entities)
- Symmetry: all actors are treated in the same way, within the same analysis frame
- Comprehensive: actors’ actions and choices are regarded through their meaning for actors.

The warning is defined as the process by which we undertake some entities from the environment to make sense out of the situation, in order to ground and coordinate our actions.

Analyzing all distances at stake during a warning process, and how actors do achieve to deal /play with them (thanks to many technologies and strategies), the DAF allows us to built a new understanding of warning processes. For instance, we are finally able to provide (some pieces of) knowledge about - the whole warning process (from the meteo-forecaster to the riverside resident), - how actors make sense out of their environment, - how local issues and knowledge may “make the system efficient”, - how technical improvement may also be a problem (if it creates new distances), etc.

So, going through the classical approach of warnings, and bringing in the DAF, seems to be a promising way to improve our understanding of real warning processes, in their situational complexity and their “sense-making” dimension.

THE USE OF ACTOR-NETWORK THEORY IN ANALYSIS OF SOCIAL CRISIS AND DISASTERS

Nina Blom Andersen¹, Pernille Almlund¹

¹Communication, Business and Information Technologi, ROSKILDE UNIVERSITY, Roskilde, Denmark

Abstract: In disaster research it has been discussed how to approach floods, earthquakes chemical spills, terror attacks etc – if they are to be regarded as external agents appearing from outside or as inherent parts of society.

The 2009 pandemic flu was presented as a large scale threat towards society. Though the accounts of the severity of the flu went through several changes from the virus was detected in Mexico in April until December 2009. High mortality was foreseen, much effort was put into prevention of contagion and production of vaccines. As the epidemic approached Europe, vaccines were released but a number of citizens rejected the offer. In Denmark – as well as in other European countries – it was questioned whether the vaccine posed an even worse threat than the virus.

Within the sociological research on disaster and social crisis it is a dominant tradition to analyse social agency and discourses identified in relation to disasters. Though as the virus and the vaccines seem to have constructed and structured many social practices in the course of the pandemic this paper questions if the analysis of the social crisis of the flu can gain from actor-network theory.

The virus, the vaccines, the medical experts, civil servants, the media and citizens will be investigated as actors, whether human or non-human, from the principles of ‘generalized symmetry’ and ‘free association’. This kind of relational actor analysis may show how the virus and the vaccines are of strong autonomous relevance in order to understand the many different interpretations of the severity of the virus and the relevance of vaccination. These different interpretations and struggles could be seen as more than a conflict between laymen and experts and should be understood through the logic of both human and non-human actors.

The empirical data are produced through interviews with Danish authorities on national level, with general medical practitioners and women who were offered vaccination due to pregnancy during the pandemic flu. In addition a media analysis has been carried out.

AN INNOVATIVE THEORETICAL ANALYSIS BY SOCIOLICAL PERSPECTIVES IN SOCIAL CRISIS
CONTEMPORARY CONTEXT: RETHINKING PHENOMENOLOGICAL AND SYMBOLIC INTERACTIONISM APPROACHES AND THEIR METHODOLOGICAL RELAPSES

Barbara Lucini

Abstract: Sociological theories have had in the past forty years a core role for the comprehension of disasters and catastrophes regarding collective behaviours, social dynamics and relationships as shown with the first classical studies on social crisis from USA to Europe. First of all a crisis may be defined as a disruption from the normality daily routine and could involve people as individual, part of group, community or institution.

The aim of this paper is enhanced the value of a new mixed sociological theory to understand the importance of these studies within the context of social crisis and sociology. This piece of writing arises from a specific analysis of social relations in our contemporary time of uncertainty during a crisis, whatever may be and in all its developing phases, through sociological theories used as theoretical instruments with a particular consideration to the possible methodological relapses in the human social science. The innovation in this field is represented by the interconnection among different sociological theories used to explain the crisis, its definition, development, management and response. According to the sociological tradition of phenomenological approach and its best known author A. Schutz, we define social relations as social environment relation.

It is a useful logical operation to do for the following reasons: the importance assigned to historical and environmental context in which taken place social relation and social crisis and the methodological relapses within direct and indirect observations techniques, correlated with the implement and the social impact of new technologies applied to simulation game and training experiences.

The consideration of re - shaping new theoretical framework has been also considered by symbolic interactionism approach that taken into account the importance of key concept as role, identity, interaction process and communication process during a crisis. The possible methodological relapses in this area could be, thinking to a social crisis especially natural or technological, an increase in value about depth interviews combine with indirect or participative observations as well as focus group. Consider a new theoretical approach by sociological perspectives in social crisis context is a need of our contemporary society and its most strong characteristic of uncertainty to achieve the general aim of dealing with a crisis.

POLITICS OF DISASTER: RELIEF, INEQUALITY AND RESISTANCE IN 5.12 SICHUAN EARTHQUAKE IN CHINA

Hok Bun Ku, Qin Shi

Abstract: On May 12, 2008, a major earthquake, measuring 8.0 on the Richter scale, struck the Wenchuan County in Sichuan Province of China. A lot of people experienced suffering and sorrow in terms of losing their family members, property and psychological trauma. The impact of the disaster on social level is also phenomenal and the challenge of recovery, rehabilitation and rebuilding is daunting. Our research team has stayed in the quake-affected township – Yingxiu – for about three years for helping the post-disaster community rebuilding. Although the Chinese government claimed that they had won the war of fighting against the disaster in terms of relief and resettlement, we discovered that in fact due to the unequal distribution of the relief resources, some marginal groups in the disaster affected community did not obtain the aids from the government. Meanwhile, we discovered the power of the local people in this catastrophe. They did not passively accept the inequality caused by the misconduct, corruption and abuse of the power of the local government. However, they collectively resisted to the policy of the local government, but also actively participated in the community rebuilding process in response to the extreme difficult situation. In this paper, we will uncover the inequality in the relief process and demonstrate the power of the local people by using the case of self-help movement of the local women.

THE ORDER OF THINGS AND THE WORLD ORDER: MAKING PSYCHOSOCIAL AND ENVIRONMENTAL SENSE AFTER DISASTER

Ludvina Colbeau-Justin, Laurence Creton-Cazanave

Abstract: Natural disasters have multiple social and individual consequences: they affect routines, disturb social organization, and provoke individual and collective stress. The classic management of these events targets essential needs through emergency assistance. But environmental psychology develops an approach to risk management, based on addressing psycho-social factors and restablishing spatial habits and uses in the transformed environment, in order to tame its chaotic aspect. Systematically observing reordering behaviors becomes then as important as organizing emergency assistance.

Those reordering behaviors aim at reestablishing physical and symbolic sense to the surrounding space. They appear to be necessary as part of the active reconstruction of own’s universe each individual undertakes, preceding the building of a new world and reality.

Living in a devastated area requires the implementation of new individual and social adaptation processes aiming at reducing uncertainties and insecurity. Those processes tend to model a new relation towards space and people, making new sense to daily reality. This communication will expose results of researches led after major flooding and earthquake.

In terms of social responses, even though deviant behaviors exist, they are quickly stigmatized. So what dominates is altruism and solidarity. Selfless behaviors and social mobilization appear as an efficient coping strategy (for instance providing social support through involvement in militant activities or improvement of the living conditions). With these activities develops a stronger sense of territorial and social identity.

In terms of spatial responses, the changing relation to space leads immediately to attempts of reapropriation. Related to this, insignificant behaviors are observed seeking to reestablish order: a newly high school graduate putting back her framed diploma of a crumbling wall, personalization of shelters. As a group, people tend to restore routines with symbolic markings and transitory social and meeting places.
These processes are part of individual and social recovery, as they allow reorganization of the world at individual and collective scales. They can act as resources or constraints depending on their integration to post-disaster social response. This presentation argues that these elements are crucial in the response’s improvement.

VULNERABILITY AND REMEDIAL RESPONSIBILITY

Barbara Anna Misztal

Abstract: It is the aim of the paper to argue that the discourse of vulnerability not only reflects the main social characteristics of modern society; it also has a significant role in facilitating a critical understanding and evaluation of the present day socio-economic conditions. Today, in the context of financial austerity, major reductions to public expenditure and changes to the welfare state, the notion of vulnerability becomes especially topical as it, by capturing an individual’s experience of many aspects of disadvantage, can expand our comprehension of changing social relationships and mechanisms shaping the quality of social life. Seen as a marker of the socio-economic system, vulnerability can shed light on the way in which individual resilience, social struggle and governmental intervention challenge the conditions of vulnerability. After a compact discussion of shortfalls, potential limitations and commonalities in the dominant conceptualizations of vulnerability, the paper defines the notion of vulnerability as a three dimensional phenomenon rooted in an individual’s experience of different aspects of disadvantage connected with human dependence on others, the unpredictability of action and the irreversibility of human experiences. The paper argues that to mitigate the first form of vulnerability, that is, people’s dependence on others, there is a need to take responsibility for making sure everyone in need is cared for with respect and that her or his rights are recognised.

CHILDREN AND RESILIENCE IN ENVIRONMENTAL DISASTERS

Jo Moran-Ellis, Kate Burningham, Will Medd, Sue Tapsell, Marion Walker, Rebecca Whittle

Abstract: The concept of ‘resilience’ has great potential for enhancing the life-chances of individuals caught up in traumatic situations. In this paper we argue, however, that how resilience is conceptualised is crucial for it to have practical as well as analytic value in relation to children’s capacities to survive and withstand traumatic crisis events such as floods. The positive potential of resilience can be diminished in scope where conceptualisations are embedded in hegemonic ideologies of what children need or what is of significance in their lives. Such assumptions are not uncommon in adult-centric conceptualisations of children’s subjectivities as they often draw on presumptions about inter-generational orderings. In this paper we argue that studies of the effects and aftermaths of disasters need to include empirical research which documents children’s own sense of their subjectivities and use that research to develop the application and relevance of notions of resilience in guiding policy development and practical interventions. Drawing on our own research with children in Hull (in England) whose homes and schools were extensively flooded in June 2007, we present a case for the value of such an analysis but also highlight the challenges involved in undertaking such research.

JOINT STAFF FOR EMERGENCY RESPONSE OPERATIONS

Erna V Danielsson, Roine Johansson

Abstract: When incidents or disasters occur, focus is often on response operations at the incident site, or on the highest command of emergency response organizations. Studies on the work performed in staffs are, however, rare. The term “staff” is often used in connection with the line-staff organization, to denote a permanent support unit for executives. The staffs in focus for this study are, however, temporary and specific for a certain emergency response organization. They are activated when a sizeable incident or a disaster has taken place, and they are disbanded when the incident is over. The aim of this study was to investigate interaction within a joint staff when a number of emergency response organizations, geographically localized in the same building, created a joint staff during an exercise, in response to a (fictional) major incident. Thereby, organizational boundaries were transgressed in a way that may sometimes occur at the incident site, but is very uncommon in staff organizations. The boundaries between staff units of different emergency response organizations are generally fixed and rigidly upheld, each staff more or less independently supporting the operative units of its own organization. The focus of this study was trans-boundary interaction under pressure within a joint staff.

SPORT AND ITS STORIES. YOUTH PROTAGONISTS IN THE CONSTRUCTION OF THE SOCIAL COHESION THROUGH SPORT.

Marco Pasini

Abstract: This is a project of research committed by the Ministry of Wealthfare (started July 2010, end in July 2011), for the reconstruction of the social fabric through sports in the secondary school of L’Aquila after the earthquake of the 6th of April 2009.

Aims:
- promote an awareness campaign among people of different ages focusing on the importance of physical activities for the creation of strong relations and social events;
- underline the central role of the youngest and a good use of the spare time;
- study the effects that this project would have upon the attitudes of the participants in a context of social share.

Phases: workshops “Sport and more”, final event “Sport and its stories”.

Together sport activities, there will be some meetings for each sports and their purpose will be the creation of products related to the activities taken into consideration.
The production will be built through communication and representations laboratories (art, theatre, video-photography, interviews) in order to create a relation among corporeity and collective memory and an approach to competences for its active learning, social character and sense of community.

The intent of the study is to reach out how sports could modify and impact on the reconstruction of the social net and its attitudes in context of reference.

We will present the final report:

- results attended: a good frequency (about 80%) of the activities and an increase of the relationships of the 30% circa for the subjects take into consideration;
- monitoring and valuation instruments: questionnaire in two steps (initial and final phase) on pilot group (240 persons) and privileged and significant testimony (160), survey on empirical/qualitative data produced in laboratories (competence approach). We will allow to have a descriptive analysis of phenomenon and a comparison among who have always practice a physical activity and whom that gave up after the earthquake.
RN 09 Economic Sociology

IMMIGRANTS IN EUROPE AND IN WORK BUT UNDER THE POVERTY LINE
Berta Alvarez-Miranda¹
¹Sociology III, Complutense University Madrid, Madrid, Spain

Abstract: The current economic crisis found immigrant workers in Europe in a particularly vulnerable situation. This paper aims at gauging the risk and the causes of in work poverty among non EU immigrants in the Union on the basis of the European Union Survey on Living Conditions. First, it compares the risk of in work poverty of those who migrate within the Union and those who migrate from non EU countries to the risk of those who remain in their country of birth. Second, it estimates the effect that being an immigrant (from within and from without the Union) has on the risk of poverty among workers in Europe, as against other relevant factors. Third, it analyses the impact of in work poverty among the most vulnerable group, non-EU immigrants, taking into consideration their socio demographic characteristics, the presence of other workers and dependants in their household, and their labour market situation. Conclusions to this chapter apply to immigrants in the Union as a whole, but also to their particular situation in four large countries: Germany, France, Britain and Spain.

SUCCESSFUL LIFE SCENARIOS TRANSFORMATION AS RESULT OF GLOBALIZATION PROCESSES IN MODERN WORLD
Irina Kruty¹
¹Center for strategic researches, MODERN UNIVERSITY FOR THE HUMANITIES, Moscow, Russian Federation

Abstract: The main goal of the proposed research is to analyze on RF and EU countries experience how mechanisms of welfare state could empower individual human capital and support successful life scenarios in spite of turbulent state of modern politics.

Globalization creates new risks for individual realization of life scenarios making life of modern individual unstable and unsafe. Among these risks can be stated such effects as effect of turbulence (world economy crisis, new threats, rapid changes in world economy development strategies, etc.), changing shapes of social time and space (where development of ICT and transport communications changes our understanding of time and space, when it takes same time to get from Moscow to London and to Ryazan - city in central part of Russia if you take different kinds of transport), new forms of competition in labor market (transparency of local labor market influenced mostly by global and regional labor markets, i.e. US firm hiring a soft engineer living in India on a distant base) and effect of virtualization of world politics, connected with ICT and global mass-media fast spread in the modern world.

On the other hand, welfare state supported by Western culture pushes up individual human capital development as a base for successful life scenario. Particularly, based on the ideas of political philosophy of Enlightenment with its idea of individualism, welfare state supposes creation of social, political and economic structures preserving individual private space and opening chances for individual self-realization.

Hence, possibility for both EU member-countries and RF to maintain institutes of welfare state in order to empower individual life strategies and human capital development. Analysis includes 3 levels: legal data, political support, social institutes which are seen as interconnected an supporting development of individual human capital in spite of risks created by globalization and opening possibilities for successful life scenario.

WOMEN AS ENTREPRENEURS. A CRITICAL VIEW ON ECONOMIC ENTREPRENEURSHIP RESEARCH WHILE BEING ON THE SCENT OF THE HABITU OF FOUNDERS
Caroline Ruiner¹
¹RUHR-UNIVERSITY BOCHUM, Bochum, Germany

Abstract: Even though entrepreneurship is a very diverse phenomenon that calls for divergence and multiplicity in understanding it, the majority of entrepreneurship research is still based on economics. This paper will be a contribution to the discussion of entrepreneurialism and shall highlight the socio-cultural factors which influence entrepreneurial processes, identities and activities.

Especially self-employed women contrast the economic view as they found (according to the scientific literature) less often and ‘different’ – which means slower, smaller, more careful, less orientated to growth and economic profit. In this respect and starting from the hypothesis that the aspiration for self-employment has to be considered against the background of the familial habitus, this paper highlights the relevance of embodied cultural and social capital for the propensity for and the success of founding and searches for the familial interfered and acquired dispositions of perceiving, thinking and acting which influence the process of founding.

The underlying empirical findings stem from a qualitative study of female founders in Germany. The study asks about the inclination and the success of women founding a business. The project bases on the assumption that this process is influenced by and a manifestation of the familial culture of origin: The habitus can be found in the way of founding. In total twenty founders, their partners and their families (mother, father and sibling) were interviewed with the help of guided narrative interviews and additionally group discussions with the family members were realised.

In principal our founders have the same (or similar) structural preconditions but they differ from each other essentially in the way how they manage (the process of) their self-employment, what is imaginable and conceivable to them as well as their aims, their problems and their success. The related patterns of thinking, acting and perceiving are expressions of the familial habitus and refer to their individual experiences in growing up in their specific culture of origin.

According to this, the (implicit or explicit) process of continuation, transformation and renunciation of the familial culture of origin shall be highlighted to understand the inclination and the success of women founding a business and to finally support the sociological reflection on this traditional economic phenomenon.
CRISIS, PUBLIC DEBT AND FINANCIALIZATION OF THE BRAZILIAN ECONOMY

Daniel Bin

UNIVERSITY OF BRASILIA - UNB, Brasilia - DF, Brazil

Abstract: Departing from analysis of the global context of substitution of liberal Keynesian ideology for the monetarist neoliberal one, the text tackles crisis phenomena and capitalist reconstruction which contributed to the financial expansion of the Brazilian economy. The central hypothesis of this paper is that such a process occurred in a context of reorganization of economic relations, in which the role of the state was fundamental, despite the neoliberal discourse that was actually sidelines by the intention to restore the level of economic power held by the classes whose incomes were reduced by welfare policies. In the case of Brazil, the neoliberal ideology and its monetarist logic started to become consolidated in the middle of the 1990s, with the Real Plan (1994) as one mark of the beginning of the current phase of Brazilian capitalism. Besides inflation control, that plan aimed to ensure Brazil as destination of financial capital in global circulation which was suffering from few investment possibilities. To do so, besides measures aiming for status as market economy, Brazil started to attract short term capital through the practice of inflating interest rates to among the highest in the world. Reproducing the historical connection between capitalism and state, financial expansion of the Brazilian economy also occurred under this association in which public debt was the great engine of the process. If on one hand Brazilian public debt was not too high amongst the main world economies, on the other hand, interest expenditure is the second greatest public expense, beaten only by public pension expenses. It is in this point—besides the crises that tend to assume catastrophic effects for the poorest—that the fictitious economy reveals its concrete face. If public debt, as well as the other types of interest-bearing capital, is not concrete in a strict economic meaning—production of value—it is concrete in its capacity to impose material restrictions to large social segments. Another effect of the above mentioned substitution of ideologies was moving the old polarisation ‘capitalism versus socialism’ into another polarisation within the former. As in the Keynesian consensus, the discussion would continue restrict in how, inside capitalism, to augment the production and, in a controlled form, distribute some wealth. Hence, neoliberalism was actually a conservative revolution inside capitalism.

CRISIS, REPUTATION AND TRUST : A NEW MONEY IN ONLINE CONTEST

Anna Cossetta

1DISA, UNIVERSITÀ DEGLI STUDI DI GENOVA, Genova, Italy

Abstract: We are living the ongoing economic crisis and at the same time we are more and more connected to the Internet. Trust, has been hit hardly in the offline world, but is increasingly crucial, it is the glue that holds modern societies together. (Ritzer, Ryan, 2011). However trust is also the currency of online social interaction, a “whoffie” if we use the term of Cory Doctorow’s science fiction novel, Down and Out in the Magic Kingdom. This kind of money is composed by reputation, contacts, influence, resource access and especially trust. Contrary to the decline of formal institutions this mechanism in the Net became the “shadow of the future” (Axelroad, 1984), because it promotes social cooperation, with a dynam-
ic balance of sanctions and incentives, but also supports credibility of influencers.

In this paper we focused on the relationship between trust and reputation and in particular in the dynamics from a “prosumer” to a “prouser” behaviour in social networks. Starting from some specific cases we will explore some attempts of new alternatives to capitalism based on reputation and trust. With some enthusiasms and some illusions.

EXPLORING THE PRINCIPAL-AGENT PROBLEM THROUGH A MICRO-SOCSILOGICAL LENS

Friedrich Eierdanz

1School of Social and Political Science, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: The principal-agent problem has been examined by Neo-Institutional Economics [TS1] (Ménard 2008) mostly in managerial contexts. In the prototypical example of the principle-agent problem, there is one actor (the principal), who delegates action to another (the agent).

The theory is sociologically problematic because it assumes each agent is able to make optimal action choices with respect to well-defined preferences, thus informal quality of action and agreements is ignored. [TS2] Also the role of emotions in decision-making [TS3] (Berezin 2005, Hochschild 2003) can be considered as under-exposed. My aim is to explore this topic while drawing from Symbolic Interactionism (Blumer 1986) and Pragmatism [TS4] (Jung 2010) to study [TS5] this topic from an actor’s point of view. From this perspective, action is constructed by the actor, his/her reciprocity with others and their cognitive framing/sense-making of ongoing interactions. This could lead to explanations of deviant behaviour related to people acting on behalf of others. Ethnographic accounts may start out with the inquiry of fund managers as agents (MacKenzie 2003). Additionally the role of professional football coaches might be interesting, since they inherit a certain duality of being an agent and a principal. Coaches may also operationalize played emotions (Goffman 1969) for strategic reason. They may also be genuinely overwhelmed by emotions during a close match. Furthermore the context of the family might be interesting to investigate, since parents act on behalf of their children up to certain age. This may serve as an example for interactions with ongoing contingencies.

THE REGULATION OF FINANCIAL MARKETS: ON THE PERFORMATIVITY OF ECONOMICS AND EPISTEMIC REGULATORY CAPTURE

Trond Loyning

1Department of History, Sociology and Innovation, VESTFOLD UNIVERSITY COLLEGE, N-3103 Tønsberg, Norway

Abstract: The regulation of financial markets: On the performativity of economics and epistemic regulatory capture

Traditionally, the notion of regulatory capture is applied to regulatory agencies that in some way have been “persuaded” to cater for special interests rather than broad societal interests. This persuasion can take many forms, including lobbying, participation in committees, various “reinventing door” mechanisms, and the threat to move business abroad and hence outside national jurisdiction.
Either way, this involves conscious efforts from business to influence regulatory agencies and personnel, and conscious efforts from regulatory agencies and personnel to accommodate the regulated business. The aim of this paper is to explore other types of regulatory capture, which do not involve the same type of persuasion and direct efforts at influencing agencies. Notions like “cognitive regulatory capture”, epistemic capture and discursive capture describe this type of regulatory capture. These notions highlight how regulatory efforts are based on certain understandings and models on how markets (should) function, for example with regard to risk management. In this paper it is argued that with regard to financial markets, governmental agencies, market actors and academic economists to a considerable extent have common understandings and models. Furthermore, partly based on the notion of the performativity of economists, it is argued that both market actors and especially academic economists have been instrumental in developing these models, and that regulatory agencies have not been able to develop any notion of what constitutes a well-functioning financial market independently of market actors and academic economists. In other words, the question being explored is not only whether economists make markets, but also whether they make regulatory politics. In a concluding section, the recent financial crisis is discussed: It is often argued that a main cause of this crisis was regulatory failure; here it is argued that this failure cannot be fully understood without taking into account epistemic capture. In this section, efforts at regulatory reforms are also discussed with the notion of epistemic capture as a starting point.

A NEW PROSPECTIVE TO THE STUDY OF SOCIAL INEQUALITIES. EXPLORING THE IMPACT OF BEAUTY ON LABOR MARKET OUTCOMES

Emanuela Sala 1, Marco Terraneo 1, Mario Lucchini 1, Gundi Knies 2

1Dept. Sociology and social research, UNIVERSITÀ DI MILANO-BICOCCA, Milano, Italy, 2ISER, University of Essex, Colchester, United Kingdom

Abstract: Traditionally, social scientists have studied social inequalities between individuals by looking at the impact of their socioeconomic background, their education and, more recently, their cognitive skills on a different range of socio-economic outcomes. Physical attractiveness, on the other hand, has not been considered by social researchers until recently. The few studies that consider beauty find that it strongly impacts on a wide range of social outcomes including labor market outcomes (Hamermesh and Biddle, 1994, Judge et al., 2009), family formation/dissolution processes (Jones et al., 1995, Lundborg et al., 2006), electoral success (Belot et al., 2007, Berggren et al., 2007). However, due to the lack of data on respondents’ physical attractiveness, the effects of individual physical attractiveness on people’s life chances are still under-researched.

Aims: This paper contributes to the current knowledge in the field by providing a new and fresh prospective to the study of social inequalities in sociology. The paper is an attempt to evaluate the role of individual physical attractiveness on a different range of labor market outcomes including entry in the labor market and career progressions.

Data: We use a unique dataset, the Wisconsin Longitudinal Study (WLS). This is a long-term study of a random sample of 10,317 men and women who graduated from Wisconsin high schools in 1957. WLS data cover social background, youthful aspirations, schooling, labor market experiences, family characteristics and events, psychological characteristics, and retirement. The WLS has a complex design which includes the collection of survey data from different units (original respondents, their parents, a selected sibling, the spouse of the original respondent etc.). To score respondents’ physical attractiveness, in 2004 and in 2008 pictures from two yearbook photos were rated by a six men and six women using a photo-labeled 11-point rating scale, with end points labeled as “not at all attractive” (=1) and “extremely attractive” (=11).

Methods: To fully explore the richness of the WLS dataset and to answer our research questions we use appropriate regression methods for longitudinal data including random/ fixed effects regression models.

ETHNICITY AND LABOUR MARKET INTEGRATION OF IMMIGRANTS IN GERMANY

Friedrich Scheller 1, Marcel Erlinghagen 2

1Institut Arbeit und Qualifikation (IAQ), 2Institut für Soziologie, Universität Duisburg-Essen, Duisburg, Germany

Abstract: The labour market performance of immigrants and natives often differs substantially. Already in less turbulent times labour market integration of immigrants has been a key issue of the political agenda in many European countries. Against the background of the recent crisis the problem did not lose anything of its relevance. Accordingly, a large body of studies deals with general disparities between natives and non-natives. But to what extent is the ethnic background of immigrants related to their performance on the labour market and what are possible explanations for these differences? Focusing on the long term development of the labour market integration of former “guest-workers” from different countries of origin and their offspring in Germany we would like to present preliminary results of an ongoing research project. Combining German panel data (SOEP) since the mid 1980s with official statistics certain aspects of labour market integration like job status, educational adequacy, unemployment duration, job tenure or job satisfaction will be discussed, emphasizing ethno-specific differences and their possible underlying causes.

ETHICS AND COMMONS ON FISHERIES: HOW TO DEAL WITH PROBLEMS IN COASTAL COMMUNITIES

Manuel Pacheco Coelho 1, Jose Filipe 2, Manuel Ferreira 2, Rui Lopes 3

1Economics, SOCIUS ISEG/TECHNICAL UNIVERSITY LISBON, 2UNIDE-ISCTE, Lisboa, 3Univ. Evora, Evora, Portugal

Abstract: Commons have a very important place in theoretical developments considering the problems that have emerged in this field. In the analysis of the resources on Earth, many social concerns have raised when the problems of overexploitation have come to be evident. In the last decades, international organisms related to commons have searched for good solutions for the exploitation of natural resources and for the environment. In the international cooperation field or in the processes of decision making in international, national, regional or local resource management institutions this matter has become very important. The need of reducing the fleets capacity has brought serious problems to coastal populations. Ethical concerns with these situations have provoked political measures and socio-economic support to coastal commu-
nities. This need for restructuring the sector made the populations to find out alternative occupations or simply to be on mercy of unemployment and consequently social problems have increased on these areas. Considering the need of contribution of several areas of knowledge, this paper intends to answer to some questions related to the problems that resulted from the overexploitation and from the overcapacity of fleets.

So, this paper will introduce the commons and present some theoretical ideas about ethics, infringements and penalties; than some ideas about social concerns that came to coastal populations because the need of reducing fisheries are presented. After that, it is shown that populations and national and international bodies must cooperate to come to a balanced situation and consequently some solutions are presented for populations in these areas.

INCOME INEQUALITY AND SUBJECTIVE WELL-BEING – ABOUT THE ROLE OF SOCIAL PREFERENCES AND CULTURAL BELIEF PATTERNS

Simone M. Schneider

Abstract: While it is generally agreed that income inequality affects an individual’s well-being, researchers disagree on whether people living in areas of high income disparity report more or less happiness than those in more equal environments, thereby indicating the need to study how and why income inequality matters to the individual’s well-being. Findings on group-specific reaction patterns to income inequality further fuel this need. Economists argue that a preference for inequality and the perception of the possibility of social mobility account for the indistinct relationship between income inequality and well-being. Combining this hypothesis with sociological theory (such as sociological cognition theory and social justice theory) this paper aims (1) to identify a set of potential mechanisms and (2) to demonstrate its mediating nature. It argues that the perceived legitimacy of distributive outcomes and procedures contributes to how income inequalities affect individuals and their sense of well-being. The empirical analysis is based on data from the International Social Justice Project, developed from face-to-face interviews with a representative sample of the German population (N=3059). Using structural equation modeling, the paper finds structural and cultural biases in the perception of income inequality, on the micro and macro level. The paper concludes that well-being is a product of the individual’s perception and legitimating processes which in turn are embedded within a cultural value system. The results indicate that social cognition is a useful tool for studies of income inequality and well-being.

ON ANATOMY OF ECONOMIC INEQUALITY IN UKRAINE: SOCIOLOGICAL EXPERIMENTS

Olga Vasylivna Ivashchenko, Olga Vasylivna Ivashchenko

Abstract: Economic inequality research in Ukraine based on ISSP data of module Social Inequality-2009, statistical and sociological peculiarities of social-economic standards in USSR and modern Ukraine, some similarities and differences within inequality context of Poland and Ukraine. The main findings make possibility to change some accents in inequality studies concerning the economic and social behaviour of Ukrainians in case of convergence of survival and consumer cultures.

BEYOND HIGH AND LOW – NORMATIVE AND CALCULATIVE KINDS OF SOCIAL TRUST ACROSS EUROPE.

Niels Michalski

Abstract: In survey-based studies, two different theoretical concepts are applied to define interpersonal trust in unknown people. While rational or calculative approaches rather conceptualize social trust as an evaluation of the trustworthiness of other people, norm-driven approaches draw upon norms and values which are acquired in socialization processes and which urge people to be trustworthy towards others. However, the standard survey question “Would you say most people can be trusted?” does not differentiate between the approaches. Starting from the assumption that this indicator concurrently measures both concepts, the present paper argues that observed trust levels of individuals or groups reflect a composition of the two sorts. Hence, individuals as well as collectives do not only differ regarding high or low levels of trust, but also in the kind of social trust which is prevalent for them. Based on empirical data from the ESS, the paper aims to separate the respective sorts of trust with the help of the covariance between trust and value dimensions from Schwartz’s Human Values scale. First, Schwartz’s value dimensions are discussed in the light of their association with either calculative or norm-driven approaches of trust. Second, multilevel models are applied to test for individual and country level effects simultaneously. Results show that individuals with universalistic or benevolent values have higher levels of trust while people with conservative values of security, conformity and tradition trust less. Furthermore, people in countries where individuals report high scores on values of creativity, freedom and self-stimulation have higher trust levels, and in countries with prevailing values of individual power and achievement trust is lower. The individual level effects remain stable when controlling for several other covariates. However, the statistical associations largely vary across countries. Hence, in a third step, random coefficient models are applied to assess the magnitude of this variance and to explain the variation by adding further country specific variables to the model. Finally, the paper promotes a more complex understanding of social trust beyond the simple linear conception of high and low.

COOPERATIVE NETWORKS IN THE GERMAN ENERGY INDUSTRY – A SOCIAL CAPITAL PERSPECTIVE

André Bleicher

Abstract: The German Energy Industry experienced a massive transformation during the last decade. The regulative institutions – the German Energy Industry Act - were razed and the fiefdoms of the incumbent firms have been up for readjustment. New competitors entered the market and especially the large number of municipal utilities in the field seemed to be doomed.
The further role of municipal utilities was queried by energy-experts as well as energy-politicians. How should these organizations survive in the marketplace neither playing a relevant role in the field of energy-generation nor seen competent in providing additional energy services? Being largely restricted to the retailer role, the utilities had to face the problem of a gradually diminishing margin and therefore feared to be outperformed in the marketplace sooner or later. Instead of this, the municipal utilities reassembled their value chains, developed new services and − most important − reorganized their business segments by developing cooperative networks among each other.

This paper will shed some light on that resurgence by applying the social capital theory in order to explain the assembly of a new organizational form in that organizational field. Social capital is multidimensional in nature and most frequently defined in terms of groups, networks, norms, and trust. Therefore the networks have been examined by conceptualizing their history, their social capital structure, their functioning mode and their strategic orientation.

Three types of networks emerged:

- The model ‘Athen’: A democratic oriented network type in which the central position is acting a ‘primum inter pares’ (Role model Pericles). Main value are openness for other municipal utilities, becoming a relevant market player, supplying a wide range of services for members.

- The model ‘Theben’: A strong network leader (Role model Kreon) type which adhesiveness is derived from strong social relations and a strict value orientation. Strict orientation on inside-outside-relation. Constriction on few members with a shared value orientation.

- The model ‘Sparta’: Dominating role of the network leader, who is forcing other actors into the cooperation by applying power. Bit by bit social capital has been destroyed and then substituted step by step by establishing strong financial dependency.

### NORTH OF PORTUGAL - GALICIA CROSS-BORDER COOPERATION: MAPPING THE CAR INDUSTRY SOCIAL NETWORK

Paula Cristina Urze, Iva Miranda Pires

1Applied Social Sciences, FCT/UNL, SOCIUS, Caparica, 2Sociology, FCSH/UNL, Lisboa, Portugal

Abstract: Since the first Euroregion was established at the late 50’s several forms of cross-border cooperation have been developed across Europe. The cross-border cooperation, as part of a process of de-bordering has been supported by EU funds and programmes (namely INTERREG programmes) and territorial cooperation emerges as the third pillar of the Cohesion Policy for the period 2007-2013, along with convergence and regional competitiveness.

Despite sharing one of the most extensive and stable borders of Europe there weren’t a tradition in cross-border cooperation between Portugal and Spain due to political constrains. Jointly EEC adhesion, in 1986, and the consequent de-bordering process created a totally new context that would come to facilitate and even to stimulate the development of the relationship between the two Iberian countries.

Although there has been an increasing in economic relationships at the country level, not all regions have been active participants. Previous studies shown that only the strongest regions where active participants (namely Madrid, Catalonia or Lisbon and Tagus Valley) while border region, on the reverse of other EU countries, where less involved. An exception has been the trade between cross-border regions Galicia and North of Portugal, where we can find perhaps one of the highest levels of cross-border economic integration.

Exports from the north to Galicia components for the automotive industry in 1994 had a low weight (2.2%), a decade later, this product accounted for 8% of total exports. These flows are likely related to the location of the plant from the French consortium PSA (Renault, Peugeot-Citroen) and CEAG in Pontevedra, Galicia cluster production of automotive components.

This presentation aims to address the issue of cross-borders cooperation, in particular the relationships among companies on the two sides of the border in automobile industry based on the empirical results of an ongoing research project regarding the Inter-Firm Cross-Border Networks. Empirical data stems from two main sources: a survey applied to entrepreneurs and interviews conducted with some key players within these cross-border regions using asocial network analysis.

**THE ENTERPRISE BEYOND THE CAPITAL. SOCIAL ENTERPRISE**

Grazia Del Negro, JUAN DAVID GOMEZ QUINTERO

1Universidad de Zaragoza, Zaragoza, Spain, 2Sociology, Universidad de Zaragoza, Zaragoza, Spain

Abstract: The changes of the setting in which economic actors operate determine important structural changes that, in turn, require to organizations an effort to adapt it (eg, through the development of new departments or the demand for new professional profiles). Specifically, the processes of change which are undergone by the enterprise, have lived in recent years an intense acceleration, giving rise to multiple forms of organisational management. The most developed societies have entered a new phase of evolution, so-called postindustrial, but despite this, it hasn’t produced a shift to a new economic system: the companies continue to operate within the capitalist system, governed by the principle of economic rationality.

Some approaches to enterprise put its role beyond the production of goods and services: it’s also a social institution with the capability for intervention in the context in which it operates. In the words of Zadek, “the role of business in society is this century’s most important and contentious public policy issue”. So legitimacy not only derives from the results of economic production, but also from the ability to reflect the wider social reality of which it is part. In parallel, the past two decades were witnesses, in the European context, to the emergence and spread of a particular form of enterprise, often under an evolutionary process of the so-called third sector organizations: the social enterprise.

Conceptually, it first appeared in Italy in the late 1980s, but it was used at European level through the divulgation work of the EMES Network in the mid 1990s. Despite it, a definition universally accepted doesn’t exist. They are organizations – generally SME – subjected to a double tension: they have to participate in the market, being competitive with other firms and viable in terms of price, cost and quality; and they have to comply a social mission: to produce welfare services or to promote social inclusion by means of employment.
In the setting outlined, which is the role that social enterprises play? What individual and collective needs do its emergence and its spread meet in the European context? This contribution proposes an analysis of the place occupied by social enterprise in the emerging configurations, utilizing sociological concepts and categories.

**URBAN VERSUS RURAL VARIATION IN SOCIAL CAPITAL. EVIDENCE FROM BELGIUM AND SPAIN.**

Steven Lannoo 1, Francisco Entrena Durán 2, Pieter-Paul Verhaeghe 3

1Department of Political Sciences, GHENT UNIVERSITY, Gent, Belgium, 2Department of Sociology, University of Granada, Granada, Spain, 3Department of Sociology, Ghent University, Gent, Belgium

Abstract: Our study investigates the influence of a rural versus urban living environment on social capital, defined as resources available to individuals through their ties with others (Bourdieu 1986; Lin 2001). In the literature different views regarding this subject can be found, arguing respectively that (1) an urban living environment erodes the social capital of individuals, (2) it alters individuals opportunities to invest in social capital, (3) that rural-urban differences solely exist due to compositional effects, and (4) that urban-rural differences can no longer be observed. Empirical research on the subject is limited for a number of reasons. One problem is that most studies do not examine individual social capital in general, but focus on the availability of one very specific resource in the social network, such as money, food, or support for the elderly. The incomparability of these measures leads to contradictory findings. Our research tries to overcome this problem by using Nan Lin’s concept of general social capital. Secondly, most research does not make any distinction between social capital originating from family, friends or acquaintances. Because different effects of the living environment for different origins of social capital can be expected, we take this important distinction into account. Finally, earlier research has disregarded that the different structure of urbanisation existing in different countries might generate different effects. Our study is the first one to collect comparable data in two countries with a very distinct urban structure, i.e. Belgium and Spain. In this study we use multilevel modelling techniques on data collected from students studying at the universities of Ghent (Belgium) and Granada (Spain). Preliminary results indicate that individual social capital is higher for students coming from municipalities in central agglomerations as compared to those coming from more rural municipalities. This effect could not be observed with respect to the social capital of the family network, but was established regarding the social capital of the network of friends and the network of acquaintances. As for the network of friends, we also found that an urban living environment reinforces the socio-economic inequality in social capital.

**PERFORMING TRANSPARENCY. THE EUROPEAN CENTRAL BANK’S COMMUNICATION POLICY AND ITS INTERACTIONS WITH THE MEDIA**

Olav Velthuis 1

1Sociology and Anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: In the 1990s a paradigm change within monetary economics took place: within the old paradigm of ‘monetary mystique’, policy was understood to be most effective if central bankers took financial markets by surprise. Within the new ‘transparency paradigm’, by contrast, communication with the market became one of the key policy instruments. This paradigm change was soon ‘performed’ within the newly established European Central Bank. Monetary economists have subsequently focused on the effectiveness of this new policy. Very little attention has been devoted to the way transparency is socially constructed and to the institutional obstacles and professional opposition central bankers face when performing the ‘transparency paradigm’. This paper will study one specific set of obstacles: the interaction between the ECB and the media, who are within the paradigm supposed to transmit communicative utterances to the public. The paper focuses on the framing efforts and the oppositional reward systems of journalists and central bankers that are key in this performance of transparency. For instance, whereas the ECB holds that “[i]f markets are accidentally moved, it is likely that a communication mistake was made” (Bini Smaghi), within in the reward system of financial journalism ‘moving the markets’ is one of the main objectives and sources of prestige. Based on their diverging interests, a structural opposition between the media and the ECB is at stake. The paper will show how attempts are made to realign diverging interests of journalists and central bankers through among others gift exchanges and through power struggles. The paper will contribute to a better understanding of monetary policy conduct and to the interactions between journalism and the financial markets. Empirically, the paper is based on in-depth ethnographic material collected between 2004 and 2008, when the author worked as a financial journalist for a large Dutch newspaper.

**THE SEMANTICS OF CRISIS BRINGING KNOWLEDGE BACK INTO SOCIOLOGY AND ECONOMY BACK TO A SOCIOLOGY OF KNOWLEDGE**

Claudia Globisch 1

1Department of Sociology, UNIVERSITY OF INNSBRUCK, Innsbruck, Austria

Abstract: Capitalist orders are not imaginable without crisis and have gone through crisis within different cycles throughout history. Crises are not ontological facts that can be observed without being interpreted as crisis. From the perspective of a sociology of knowledge, crisis can only be described as interpreted crisis. Starting from the observation, that there’s a gap between the sociology of knowledge and economic sociology, my paper tries to connect both fields and its areas of study.

Taking a look at the contemporary semantics of crisis within the political system (government, trade unions, social movements) one can observe that the semantics of crisis is characterized by a number of stable interdependent dichotomies (political/economic; financial sphere/ real sphere, dream/ reality, nature/culture) and their moralization.

This semantics has a specific function and tells us about the worldviews and particular imaginations of economy and society. My paper analyses the patterns of the contemporary semantics of crisis, offers an explanation of its function and discusses the dependency of the semantics on its context.

**DOES SPACE MATTER FOR TRUST? CASE STUDY OF MARDIN**
Nurdan Zehra Atalay-Gunes

Sociology, MARDIN ARTUKLU UNIVERSITY, Mardin, Turkey

Abstract: As a part of more comprehensive PhD thesis, this study is based on findings of qualitative interviews done by entrepreneurs living in Mardin[1] and producing wheat and bulgur and selling their products to Iraq. The aim of the study is to discuss the role of trust in both the formation and sustainability of economic relations between Iraq and Mardin with reference to actor’s perspective. Why does trust play a crucial role for these relations? What are the sources of trust? How do the institutional frameworks of both Iraq and Mardin shape trust relations? By answering these kinds of questions, this study tries to contribute to trust literature in that space dimension usually is not integrated.

[1] Mardin is the province located at the southeastern part of Turkey.

IS TRUST A SOCIAL MECHANISM? SOME CRITICAL REMARKS ON THE MECHANISM CONCEPT

Michael Jonas

Sociology, INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria

Abstract: In many sociological approaches trust is understood as an important social mechanism. It is argued that as such trust is able to reduce the complexity of interaction and communication processes. Doing this it protects actors in economic fields from the risk of exploitation. Representatives of mechanism based approaches argue that a mechanism like trust should be treated as a causal proposition explaining specific outcomes by identifying the generative process that produces them. Using the example of trust in economic activities the aims of my contribution are to criticize the mentioned conceptualization of trust as a social mechanism and to offer an alternative based on praxeological approaches.

MONEY, TRUST AND HIERARCHIES: UNDERSTANDING THE FOUNDATIONS FOR PLACING CONFIDENCE IN COMPLEX ECONOMIC INSTITUTIONS

Alexander Lyasko

1Institute of Business Studies, ACADEMY OF NATIONAL ECONOMY, Moscow, Russian Federation, 1Business School, University of Hertfordshire, Hatfield, United Kingdom

Abstract: This paper considers the foundations for placing trust in complex socioeconomic systems, taking an example of monetary circulation to illustrate the main predicaments in developing and sustaining trusting attitudes towards the monetary systems and their constituents. It offers an institutional theory of emergence and continuation of trust in monetary relationships. Drawing on the credit theories of money and a concept of ‘multiple monies’ reflecting variegated social contexts of earning, saving and spending money, this approach suggests that individuals involved into the monetary exchanges rely on the orderly hierarchies of attendant institutions that shore up their trust in money. The diversity of these institutional pyramids is brought about by the multiplicity of social circumstances in which monetary transactions are embedded. An institutional theory of trust in money also assumes that the higher levels of the institutional trust-supporting hierarchies correspond to increased liquidity or enforceability of the monetary promises made within the structure of economic exchanges. These hierarchies, however, fail to perform their supposed function of protecting economic agents’ trust in money, since their working is confronted with the inherent problems of infinite regress, lack of the guarantor of last resort and incontrollability of complex monetary systems. These obstacles lead to erosion of trust in three important dimensions of monetary relationships: trust in the liquidity of monetary promises, concerning the perspectives of receiving the payments in discharging the other party’s debt obligations; trust in the acceptability of money, reflecting the opportunities to use the official currency to pay off both private debts and financial liabilities to the state; and trust in the stability of money, referring to predictability in the fluctuations of an exchange rate of domestic money to other valuable goods and services. The paper argues that the breakdown of institutional insurances and guarantees prompts economic agents to accept a weak form of trust in money, not being rationalized or substantiated by the power of auxiliary institutions, but merely combining blind faith with inductive inferences about the conditions of future circulation of monetary forms and instruments.

TRUST AND CONTRACTS IN INTERBANK MARKETS

Claudia Lambert

1Applied Econometrics and Economic Policy, GOETHE UNIVERSITY FRANKFURT, Frankfurt am Main, Germany

Abstract: The subprime crisis revealed that trust is essential to interbank markets. Financial crises are characterized by uncertainty, particularly concerning the enforcement of contracts. Economic theory has only recently recognized the role of trust in market exchange. It is thus not surprising that the orthodox analysis on incomplete contracts, albeit acknowledging the limits on contract enforcement, has not incorporated trust. The recent turbulence in the interbank market urge academics to decipher the trust-contract relation. Though the importance of interbank relations was recently confirmed by Cocco (2009) few empirical studies have assessed the peculiarities of financial contracts (Kaplan 2003) and none have related trust and contracts in banking. To date trust was addressed in macroeconomics and in organizations. Filling this gap we investigate how interbank trust influences contract participation and contract complexity empirically. Contractual incompleteness derives from uncertainty of the future being too complex to be formulated in a contingent contract. Williamson’s work (1993, 1985) on transaction cost hindering negotiation of all future trade ex ante opened a path towards the implementation of trust in the theory. However, as Williamson remains to rely on a calculative relation, trust remains neglected in the context of incomplete contracts. It is foremost the organizational literature that incorporates the concept of trust and contracts building on the incomplete contract literature (e.g. Madhok 2007). To empirically test the trust-contract relation we employ a probit estimation technique. We use data from a 2009 survey among 438 banks of the German Savings Bank Finance Group with a response rate above 60%. This data was combined with balance-sheet, income-statement and regional economic data. Our results are symptomatic as the German banking industry is representative of other banks in Europe and the US. We find evidence of a positive relation between trust and contract. Ex ante cooperation increases the probability of contract involvement. In interacting the level of trust and prior contract relationship, we find trust to predominantly influence contract participation. We further analyse the relation of bank trust and contractual complexity. We detect trust to complement (rather than substitute) contracts. We
extend the current debate on trust and contracts to the banking literature.

**TRUST MATTERS. ANALYZING THE RELATIONSHIP MODEL IN A ENTERPRISES NETWORK.**

Maria Manuel Serrano¹, Paulo Neto ²

¹Department of Sociology, ²Department of Economics, UNIVERSITY OF ÉVORA, Évora, Portugal

Abstract: The growing demand for flexibility encourages forms of cooperation between enterprises and, consequently, promote its network.

Networks organization suggest new models of relationships between enterprises, which integrate different organizational structures with different operating logics.

In business networks context, relations of cooperation and subcontracting are more or less profitable for enterprises, depending on the role they play in the network, namely the division of labor between enterprises.

The client - who have the skilled and technological work - have the opportunity to develop expertise, increase flexibility, focus resources on core activities and access to foreign markets, for example. The subcontractors - who have the manual and unskilled work - make learning opportunities in various fields (e.g. management, technological), but also suffer some disadvantages: participation in networks as a condition for survival, imposition of exclusivity, loss of contact with market, weak bargaining power and dependence, among others.

This paper aims to analyze the relationship model of a enterprises network, with special attention to the issues of dependency and the role trust plays in the relational dynamics between network elements.

To characterize the relationship model of the network had been considered the following indicators: duration of the relationship, contractual forms, dependence, dominant values and benefits from cooperation. In what trust may concerns, through the discourse analysis of entrepreneurs, had been identified what they think to be the main supporters of trust.

We examine the formal aspects (defined in trade agreements) and informal (trust-based) of network operation.

The results presented are based on a case study of a network formed by six enterprises (a multinational company and five subcontractors SMEs) located in southern Portugal. The data collection was essentially based on interviews (to company directors) and questionnaires (for employees). We try to answer to the following research questions: i) Does networks potentiate trust as a positive value? ii) What kind of role trust plays in business and social capital development? iii) Does networks based on trust potentiate learning processes and good practices incorporation? iv) Does exists some relation between dependency level and trust relationship?

**IS DEINDUSTRIALIZATION CAUSING HIGH UNEMPLOYMENT IN AFFLUENT COUNTRIES? EVIDENCE FROM 18 OECD COUNTRIES, 1970-2003**

Christopher Kollmeyer¹, Florian Pichler ²

¹Department of Sociology, University of Aberdeen, Aberdeen, United Kingdom, ²Department of Industrial Sociology, University of Vienna, Vienna, Austria

Abstract: This study develops a new explanation for the persistence of high unemployment in affluent countries since the mid 1970s. In what became known as the "sectoral shift" thesis, Lilien (1982) argued that unemployment rates usually increase when changing employment patterns force workers from declining sectors of the economy to seek employment elsewhere. This causes unemployment because the displaced workers often struggle to find new jobs in unfamiliar sectors of the economy. Combining this insight with recent scholarship on deindustrialization, the authors contend that the ongoing contraction of manufacturing employment in affluent countries amounts to a decades-long sectoral shift, in which unemployment rates remain high because the service sector cannot absorb all of the displaced manufacturing workers. This explanation is tested against other explanations for unemployment using data from 18 OECD countries over a recent 34-year period. Results from two-way, fixed-effects regression models suggest that, net of other factors, deindustrialization has significantly contributed to the unemployment problems of affluent countries. Robust trade unionism and several sources of labor market rigidities are implicated as well. The study ends by discussing the theoretical and policy implications of these findings.

**IS IT POSSIBLE A SME-BASED WELFARE CAPITALISM IN EUROPE?**

Manuel Ahedo ³

³BUSINESS ADMINISTRATION / SOCIOLOGY, UNIVERSITY ROVIRA I VIRGILI, Tarragona, Spain

Abstract: The European model of capitalism has been characterized by its welfare system, where state and society have during the second half of the 20th century developed different collaborative arrangements of intra-group, inter-group and inter-generational socio-economic solidarity. The post-war welfare development was mainly pivoted on the role of large national industrial firms in securing permanent employment and stable growth. However, Europe has also seen a historical relevant presence of Small and Medium-Sized Enterprises (SME) in most of its national business systems, compared to other developed economies in North America and East Asia. In the last three decades of increasingly neo-liberal post-industrial development, SMEs have grown in importance in most advanced economies. In Europe this growth of SMEs in industry and services has brought about new challenges to the adaptation of the different welfare regimes to the new conditions of capitalism, which is characterized by Multi-National Corporations, volatile labour and product markets, and globalizing chains or networks of production and commodities.

The combination of SMEs and welfare in the current conditions of capitalism is a very challenging objective. Can a SME-based capitalism be combined with a generous welfare regime? Can a SME-based production provide enough public revenues and foster cohesive labour markets as key ingredients of the traditional European welfare capitalism? General empirical evidence points to rather negative answers to these questions, but real exceptions are also found. In the article the problems, prospects, and possibilities of such a SME-based welfare capitalism in Europe are discussed. Several national and sub-national examples of such a possible combination are presented and analyzed, such as Austria, Denmark,
Netherlands, Basque Country (Spain) and Emilia-Romagna (Italy). At a supra-national level, it is specially discussed the role of the European Union as a potentially crucial promoter of the possibilities of such SME-based welfare capitalism, through adequate regulative and policy initiatives in key domains, such as business and industry, labour markets, employment and innovation policies. It is concluded that some European societies, and the European Union as a whole, can be a potentially real laboratory to find ways and models of such a SME-based welfare capitalism.

THE INSTITUTIONAL EMBEDDEDNESS OF SOCIAL RESPONSIBILITY: A MULTILEVEL ANALYSIS OF SMALLER FIRMS' CIVIC ENGAGEMENT IN WESTERN EUROPE

Sebastian Koos1
1UNIVERSITÄT MANNHEIM, Mannheim, Germany

Abstract: This study sets out to apply institutional analysis to small and medium-sized enterprises’ (SMEs) corporate social responsibility (CSR). CSR is understood as the voluntary contribution of businesses to some external social good. As smaller enterprises differ in their business culture and structure from larger firms, this study focuses on one important manifestation of CSR as civic engagement, through business donations and volunteering. Drawing on recent institutional analysis of CSR two contradictory hypotheses - institutional mirror versus substitute - are discussed for the smaller business context. Using a quantitative comparative research design and a multilevel approach, institutional, organizational and sectoral determinants of enterprises’ civic engagement are empirically analyzed drawing on a survey of SMEs in 17 Western European countries. While size remains an important determinant of civic engagement in SMEs, especially corporatist institutions provide a facilitating normative environment for smaller firms’ civic engagement, lending some support to the institutional mirror hypothesis.

THE SOCIAL FOUNDATION OF COMPETITION IN THE GLOBAL SERVICE ECONOMY: OUTLINE OF AN ECONOMIC SOCIOLOGY OF LAW

Eva Hartmann1
1Institute of political and international studies, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: This paper focuses on the recent engagement between International (IR) Relations and Economic Sociology. It shows how this new field of studies can avoid the methodological nationalism built into many sociological studies. This new field also helps to overcome some major shortcomings of actor-centric accounts that prevail in IR. The paper argues that a sociological account of IR is better equipped for taking the social foundation of international politics into account, which in turn is crucial for highlighting the enabling conditions of the international actors. However, drawing heavily on Emir Durkheim and Max Weber many of these sociological studies have ignored so far historical materialist accounts and their potential for further developing the sociological turn in IR. A second shortcoming which the paper outlines is the lack of attention to the difference between law and politics. The paper presents in a second section an outline of an economic sociology of international law that draws on Durkheim and Weber but also on Evgeny Pashukanis and other historical materialist theories of law. A third section illustrates the explanatory power of this theoretical proposal for empiricial research. It makes it possible to identify the enabling conditions of economic law in the emerging global service economy and the social foundation of quality and competition in this context.

FRAMEWORKS FOR ANALYSING REGULATORY REFORMS IN THE OIL SECTOR: THE DUAL ROLE FOR A SOCIOLOGICAL APPROACH

Iagê Zendron Miola1
1Sociology of Law, UNIVERSITY OF MILAN, Milan, Italy

Abstract: The paper presents a sociological analysis of the contributions, limits and influences of the mainstream approaches to economic regulation produced within the fields of economics and legal scholarship. The study focuses on the specialised literature on regulatory models and regulatory reforms in the oil sector, its epistemological foundations and policy-making implications. The general objective is to sustain the role of sociology as an alternative analytical model to discuss regulatory reforms in that economic field. I first present how the dominant views in economics and legal scholarship pose the debate about regulatory models for oil exploration and production, i.e. what are the main questions formulated, and through which methodologies and conceptual tools are they addressed. By doing so, I aim at identifying how these approaches deal with a set of variables: property rights, State power and its role in regulating the economy, legal strategies, economic efficiency and political struggles. Alternatively to the rational-choice theory underlying mainstream economics, and to the agentless accounts of legal analysis, I rely on Pierre Bourdieu’s sociological frame of the conditions of production and reproduction of the agents and institutions of the economic field. Translating this framework into methodology, I sustain the analytical advantages of focusing on the professional trajectories of the actors involved in the formulation of the regulatory models, and on their strategies in politically justifying and legally enabling a regulatory reform. I sustain, in conclusion, a dual role for a sociological approach to regulatory models: firstly, sociology may reveal the political compromises and underlying assumptions of the mainstream approaches to the object by unveiling how and why economics and legal scholarship construct it normatively and elucidating the interconnectedness between the mainstream frameworks and policy-making; secondly, in dealing with the object itself, opening space for sociological variables and methodologies may enhance the analysis of regulatory models in both positive and normative terms.

HOW MARKET COMPETITION IS UNDERMINED BY ENDOGENOUS FORCES: THE CASE OF ONLINE TRADE IN RUSSIA

Vadim Radaev1, Zoya Kotelnikova1
1Economic Sociology, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: Transformation of markets may result not only from exogenous forces (like economic crises or state intervention) but from the development of alternative marketing channels challenging the existing market hierarchy and undermining established institutional arrangements. At present Russian online trade demonstrates it...
Remarkably. Apart from providing a set of new services to the customers, it gives a room to a new group of market actors destabilizing the off-line sales by means of predatory price competition. But what is more important, an active recovery of shadow activities by these online market actors is also observed in case of Russia. It brings back tax evasion practices and black cash transactions which were eliminated by the leading off-line sellers during the first half of the 2000s. Given the state is not capable to provide an effective regulation there, it is incumbent firms (large vendors and off-line retailers) that are supposed to stabilize the market and revitalize transparent rules of exchange.

The paper is aimed at clarifying several issues: how the existence of unfair competition could be revealed? What kind of grey schemes are used by the online actors? What strategies do large off-line retailers pursue to regain the dominant market positions?

Investigation of the online sellers’ behavior is based upon empirical data collected in 2010 in the sector of home electronic appliances of Russia. It includes series of in-depth interviews with top-managers of e-shops and experts; monitoring of pricing strategies pursued by the chain-stores and independent online traders; and an analysis of services provided by 105 e-shops operating close to the price bottom line of the market.

NETWORKING AND STORYTELLING IN THE ANTIQUES MARKET COORDINATION

Elena Bogdanova

Abstract: As objects from the past have grown in value, a market for antiques has emerged that is continually changing and developing. Antiques are not produced for the market – they are rediscovered, which means that their quality is not standardized. This raises the question of how incommensurable goods such as antiques are valued, when their quality is uncertain. I use the results of an empirical study of the market for antiques in Russia in order to demonstrate the role of professional networks in valuation. The process of valuing antiques that involves appraisal and attribution is an ambiguous one: market actors need specialized knowledge in the field of decorative art and art history in order to make the correct judgments. Discontinuities in historical records mean that this specialized knowledge is often open to debate. What is more, specialized knowledge may be inaccessible to some market actors, or be too difficult for them to grasp in order to be able to make proper use of it. Networks that emerge in the Russian market for antiques while institutions are deficient are aimed at reducing uncertainty. Objects are circulating in these networks, but not only them: stories about antiques are used as a market tool that shifts them from one market segment to another. Storytelling is one of the network activities that promote transactions and order the market. Characteristics of networks and types of stories are discussed in the presentation.

PERVERTING THE PANOPTICON: COERCIVE POWER IN AN INDIAN COCA COLA FACTORY

Ismael Al-Amoudi, Rohit Varman

Abstract: While the Swedish economy is recovering fast from the financial crisis of 2008-9, many households are still in severe and increasing debt problems, not least because of credit driven private consumption. Even though the increase of over-indebted persons is coming to a halt at app. 5% of the population, the number of applications to the Swedish Enforcement Agency for debt release is still increasing (appr 1%). This paper is part of a project studying the process of debt release in Sweden and analyses 60 such applications. The aim is to describe and understand the accounts given in these applications in relation to the “question situation” that the over-indebted person stands before in their encounters with the
MIGRANTS FACING THE ECONOMIC CRISIS.
MOROCCAN AND ROMANIAN UNEMPLOYED IN ITALY
Francesca Alice Vianello 1, Devi Sacchetto 1

1Department of Sociology, UNIVERSITY OF PADUA, Padua, Italy

Abstract: The international economic crisis has brought the unemployment issue again to the attention of the European Union. This paper is based on a comparative research project concerning the impact of the economic crisis on Moroccans (TCNs) and Romanian (EU citizens) immigrants who are resident in two areas of northeastern Italy. Our research group has done 386 telephone interviews to as many unemployed Romanians and 400 telephone interviews to as many unemployed Moroccans. Both these groups have been selected from lists of names registered with two job centres. Moreover, we have done 150 in-depth interviews (70 with unemployed Romanians and 80 with unemployed Moroccans).

This paper is focused on the following dimensions of analysis:
1) work trajectories, we note both a strong casualisation of labour and a drop of wages among unemployed people who have already found a new job at the time of our interviews. The crisis has drained the capacity of social networks to provide useful information aimed at finding jobs. Excluding women who are employed in the care and domestic sector, migrant women were the first ones to lose their job, mainly because they often had a temporary contract. They have a more difficult time than men to find a new job, especially if they do not want to work round the clock as care providers or if they have children;
2) repercussions on gender relations, the loss of job seems to have few implications on gender roles within the family. Traditional division of work persists among both Moroccans and Romanians, even if there are different kinds of gender contracts;
3) migratory strategies, we observe a low propensity both to return definitely and to move to another country among Romanians. Vice versa, Moroccans are more mobile, even if the necessity to revalidate their permit of residence compels them to remain in Italy;
4) experiences of racism and forms of discrimination, the current crisis appears to make such experiences more conspicuous, while unfair disparities with Italian citizens in receiving local welfare are on the increase;
5) strategies for survival in poor conditions, we observe a notable impoverishment of diet, a drastic contraction in the use of electricity and heating at home and in the mobility, widespread delays in the repayment of bank loans, and in the payment of rents and utility bills, and frequent demands of loans to friends and relatives.

THE INERTIA OF CRISIS RECOVERY: POLITICS OF CHANGE AND URBAN ECONOMY IN MILAN REGION
Federico Savini 1, Francesca Buonocore 2

1Amsterdam Institute for Social Science Research, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands, 2Department of Sociology and Social Research, University of Milano Bicocca, Milano, Italy

Abstract: This paper deals with the politics of change under socioeconomic ruptures. While the global economy is struggling to design effective responses to the current financial crisis, the recovery from previous de-industrialization has not yet been fully achieved. Not all urban fringes of former industrial metropolises experienced successful redevelopment paths. Some of the old industrial sites of many European cities have not yet been converted into new activities and functions and are still suffering from the damages of previous uses: many are still coping with polluted soil, infrastructure deficit and lack of investments, and are struggling to generate a long term strategy of development. Why did some urban areas make it through and others have not find new identities yet? There is no agreement on the crucial factors explaining failure or success of socio-economic adjustments after Fordism. We hypothesize that consolidated power structures tend to reproduce themselves and to hold fast to their social base during socio-economic crisis. In order to investigate this issue, we draw on two case studies located in the same municipality, Sesto San Giovanni, in the Milan metropolitan area. Formerly named the ‘Stalingrad of Italy’ and the City of Factories – the area underwent a deep and prolonged deindustrialization process which heavily challenged its power regime, historically shaped around a close relationship between industry, a Leftist ruling coalition and active trade unions. The trajectory of two main former industrial areas will be compared and the political dynamics driving the two different transformation processes will be presented and discussed. In the final section the different outcomes will be related to the capacity of local governments to ensure the continuity of existent power regimes favoring the redevelopment path in one case and blocking it when it was in contrast with the interests of the existent power coalition.

THE POLITICAL CLASS AND NEO-LIBERALISM IN THE MAKING OF THE CURRENT GREEK CRISIS
Sokratis Koniorodis 1

1Sociology, UNIVERSITY OF CRETE, Athens, Greece

Abstract: The current economic crisis has struck Greece particularly hard, leading to insolvency and near-bankruptcy. Part and parcel of the agreed bail-out arrangement is the imposition of a set of conditions. The downside is that the country is now under the tight tutelage of an IMF-EU troika (with the local government a most willing
participant), and this has led to substantial wage cuts and other most severe austerity measures.

While the question largely looms on who is to blame for the crisis in the country, among the various interpretations that have surfaced, two dimensions stand out. The first, relates to impersonal money markets. Their whims and wishes are perceptually framed, appraised and interpreted by analysts, economists, and politicians too. Such markets appear to form the autonomous centre around which everything revolves and emanates. They also appear as natural and fetishized, which negates their social constructiveness. Secondly, markets are open and unrestrained because of globalization. Globalization in itself is perceived not in a realist manner. Instead it is seen as something inherently positive and a blessing in disguise: it is seen to delimit or render aspects of the nation-state redundant, particularly its ability to act effectively. Accordingly, globalization comes to mean the reigning of unrestrained free competition, whose prime function is ideologically perceived to be none other than the efficient allocation of resources. Crises then tend to become normalized as (unwanted) aspects of the economic circle in a competitive context. My aim then is to query such assumptions and describe the processes by means of which the country has been reduced to its current sorry situation. I start by seeing the Greek crisis as partly an outcome of unrestrained “free marketeering”. I intend to query and challenge the dominant perspective about the naturalness of the (money) markets, and of the taboo character of the various financial products (e.g. securitization, interest-rate swaps, collateralized debt obligations, etc.) that have been sold to Greece (and other governments) by Salomon Bros and like. Also, to look at some more country-specific patterns that I consider essential for an overall understanding of the current Greek crisis, namely the local variant of amoral familism, role of the state, and party-tocracy.

DIVerging BOARD SOLUTIONS? A STRUCTURAL AND CONTEXTUAL APPROACH OF BOARD INTERLOCKING IN HIGH-TECH VERSUS LOW-TECH INDUSTRIES IN BELGIUM.

Nathalie Nuyts 1, Cédric Verstraete 1, Ronan Van Rossem 1
1Sociology Department, GHENT UNIVERSITY, Ghent, Belgium

Abstract: Firms are embedded in and dependent on specific business contexts. As these contexts become more uncertain, the importance of inter-organizational relations increases. Turbulent high-tech business environments, these days, make the demands on embedded organizations even higher. High-tech organizations are immersed in a competition for both R&D, as well as strategic innovation. The management of their environment is crucial to these firms. Alliances, joint ventures, board interlocks, shareholding, etc. are all strategies to manage the relationships with these environments. This paper addresses the difference between high and low tech industries' board interlock ties. Because of the greater instability of their environment and the need for more diverse information we expect boards of high tech firms to be both larger and more heterogeneous (in terms of economic sectors) than those of low tech firms.

To test our hypotheses the interlocking directorates of Belgium’s 1000 largest firms (considering turnover) and 43 financial institutions are studied. The analyses reveal substantial similarities and dissimilarities in network patterns of board members among sectors. The results confirm that high-tech and low-tech industries form distinct business environments. Using social network analysis and multi-level regression techniques, parameters such as clustering, reach, degree, heterogeneity and homophily are examined for each sector. Our results indicate no significant differences in boards’ general structural network properties (clustering and reach) when comparing high-tech to low-tech industries. However, the board diversity is quite different: in high-tech industries, boards are more heterogeneous. There are significantly more interlock ties with other industries compared to low-tech environments, indicating a need for more diverse information. The goal specific and selective nature of these between-industry interlock patterns, underline the strategic nature of high-tech business environments even more. These results suggest that the role and function of board interlocks should be viewed as a response to the specific business environment.

LATE BLOOMERS OR LAST RESORT? ENTREPRENEURSHIP IN THE SECOND PHASE OF LIFE IN GERMANY

Annette Astrid Franke 1
1Social Gerontology and Life course research, TU DORTMUND UNIVERSITY, Dortmund, Germany

Abstract: Ageing societies and entrepreneurship activities often seem to be incomparable as setting up a new business is still associated with persons in their 30s-40s. On the other hand, demographic changes in western societies bear the potential to reveal late entrepreneurship activities – in particular with regard to the current economic crisis, the increasing rate of non-linear biographies, the still high rate of unemployed elderly, an increasing retirement age, and the aging of the baby boomers. Comparing with academic research on other types of “unusual” entrepreneurs (women, immigrants), little is known about late self-employers. This is particularly the case in Germany with its lack of “self-employed culture” in general.

This paper presents findings from a Ph.D-project, which contributes to fill the existing lack of research on elderly entrepreneurs in Germany. This research compares to different aspects as it pays attention both to the entrepreneurs' and to the experts' view. According to the Grounded Theory approach by Glaser and Strauss the research was realised in the stages of fieldwork approach, qualitative interviews with entrepreneurs 50+ (N=17), and expert interviews with representatives from local banks, politics, consulting institutions etc. (N=17).

The main research questions were:

• How do experts estimate this target group?
• Which branches or businesses are typical to be attractive for later entrepreneurs?
• Which motives for becoming self-employed are typical among the elderly?
• Which role plays the work history?
• What kinds of gender differences can be revealed?
• Which kinds of support at private, public or political level best enable entrepreneurs 50+?
• Which experiences do exist regarding specific social policy instruments and entrepreneurship promotion?
• Which factors are of high importance for the success of a late business?
• How satisfied are 50+ entrepreneurs?

This paper provides an insight in specific characteristics, attitudes, opinions and types in the context of late entrepreneurship. Furthermore, this research highlights the influence of the social policy framework to set up a business in the second half of life. The research also refers to the questions of “push” and “pull” self-employment, good working conditions and the options of late entrepreneurship as a “third way” between voluntary activities and further trainings for older (unemployed) workers.

ORGANIZATIONAL CORRUPTION: AN EMPIRICAL STUDY

David Jancsics 1, Istvan Javor 2
1CUNY - Graduate Center, New York, United States, 2Eötvös Loránd University, Budapest, Hungary

Abstract: In this study, we provide an analysis of organizational aspects of corruption, examining how corrupt practices at different levels of the power structure influence an organization’s operation. Based on qualitative research in Hungary, we develop a theory of organizational corruption. Our findings show that organizations have slack areas, extra resources for informal and illegal reallocation at different levels of the power structure. Corruption is rarely the business of isolated individuals. Other organizational members’ cooperation, or at least their silence, is needed to successfully conduct corruption in the long term. Knowledge about others’ corrupt behavior may be used as leverage in negotiations and become the part of an informal management system. Two mechanisms play important roles in covering up organizational corruption. First, corrupt machinations by the dominant coalition are often legalized by middle level professionals and expert groups, and second, the organizational elite is able to intentionally ‘turn off’ internal and external control mechanisms in order to avoid detection. Finally our study highlights that corruption is institutionalized between as well as within organizations, because elites can create complete inter-organizational corrupt systems that become marketable commodities. Corruption brokers play an important role in organizing and trading these ‘franchise’ corruption systems.

GOVERNANCE AND SOCIOECONOMIC INNOVATION: TWO EUROPEAN TERRITORIES COMPARED

Marc Pradel Miquel 1
1Teoria sociologica, Universitat de Barcelona, Barcelona, Spain

Abstract: This paper aims to analyse the emergence of forms of local welfare in territories under economic transformation. Traditionally welfare states have been conceived with a national dimension. Nevertheless, with the emergence of multi-level governance, local and regional levels are playing a stronger role in the delivery of social policies. The paper explores the decentralization of active employment policies in two subnational territories: the black country, in the West Midlands region of the UK and Valles Occidental in the Barcelona metropolitan region. In this two areas partnerships for local economic development have been developed recently in order to tackle economic restructuring. The objective of these partnerships is to coordinate efforts between municipalities in the development of local economic development and active employment policies. The paper analyses to what extent local public actors can play a role in economic development policies and to what extent these partnerships create systems of local welfare in terms of employment, and how new local identities are created to foster territorial cohesion. The conclusion is that although these partnerships bring changes in terms of more coordination and efficiency, their impact in welfare depend to a great extent on the national context. Variables such as the welfare tradition, the integration between levels of government, or labour market structure explain the consolidation and action of the partnerships. The role of national and regional governments providing material and immaterial resources is also key.

IN THE NAME OF CONSUMER : THE SOCIAL CONSTRUCTION OF INNOVATION IN THE EUROPEAN AUTOMOBILE INDUSTRY AND ITS POLITICAL CONSEQUENCES

Tommaso Pardi 1, Bernard Jullien 1
1Gerpisa, ENS CACHAN, Cachan, France

Abstract: After the crisis of “fordism” the European automobile industry has undergone several mutations that have concerned its production systems, the organisation of work and its content, and the conception and distribution of cars. The paradigm which has “triumphed” in the 1990s has been labelled under the managerial term of lean production (as opposed to mass production): a system of production which is supposed to be pulled by the demand of the consumer. A consumer eager to have more variety of models, faster renewals, better quality, higher performances and more technology.

But when one looks closer, he realizes that this consumption mode has concerned in reality only a decreasing minority of the European population: those who have the means to buy a new car. The others, the majority, have been compelled to buy a second hand car in order to satisfy their mobility needs. The industrial workforce in particular, whose access to mass consumption has been one of the engines of the “fordist” growth, cannot afford anymore to buy the cars they manufacture, and this at a time when the productivity of this workforce has never been higher than today. This conclusion concerns to different degrees “old” European states as France, Germany Italy and the United Kingdom, but it is even more striking for the new member states of the EU, where a fast growing proportion of the European automobile production is concentrated today.

On the basis of a detailed analysis of this evolution in France, Germany (and whether possible in Italy, Spain and the UK) and in few Eastern European countries (in particular Poland, Czech Republic and Hungary) which has been developed in the framework of an ongoing European project[1], our contribution aims at questioning the political content of the innovation regime developed by the automobile industry. It will show in particular that the “technological drift” in the product policy of the carmakers has not been only the reflection of growing inequalities in our societies, but also one of their carrier.

NANOTECHNOLOGY: CYCLES, WAVES AND GENERAL PURPOSE TECHNOLOGY

Rui Vieira Cruz 1

1 UNIVERSITY OF MINHO, Braga, Portugal

Abstract: This article presents a model of how nanotechnology (NT) is developing worldwide and its phases through capitalism evolution. As a multidisciplinary field with various inter-industrial applications NT is fomenting the convergence of new technological paradigms such as BANG (Bits, Atoms, Neurons, Genes), GNR (Genetics, Nanotechnology, Robotics) and NBIC (Nanotechnology, Biotechnology, Information Technology, Cognitive Sciences) and consequently creating new hopes, promises, expectations, risks and ethical issues.

When studying the cycles/waves of capitalist development the crisis phenomenon plays an enormous role namely, due to the socioeconomic and political transformations that it may envisage and create. But not all crises necessarily signify change. Instead some reinforce the politic, economic and social system continuity. This raises the question of the recent economic crises importance to the development of a new emerging technology such as nanotechnology and of the real and expected contributes to the various sectors of application but also the impacts of a technology bubble in a global economy.

This paper is sustained by an extended bibliographical analysis alongside with statistical analysis regarding the Kondratieff and Schumpeter (ian) cycle/wave theories in promoting socioeconomic change but also on the networks creation in explaining how the dissemination process that (possibly) make nanotechnology a General Purpose Technology (GPT) is evolving.

Trough the study of capitalism (r)evolution(s) combined with the technological paradigm phases and the formation/diffusion of nanotechnology networks (and clusters) this work seeks to framework the first steps of this emerging and possible future dominant technology. By combining the short term and long term analysis, it will be shown that nanotechnology is presently following (some of) the steps as the others previous dominant technologies.

THE EMBEDDEDNESS OF ECONOMIC GROWTH IN NATIONAL INSTITUTIONS AND TRANSNATIONAL STRUCTURES

Ivo Staub 1

1 Studienbereich Soziologie, Sozialpolitik und Sozialarbeit, UNIVERSITÄT FRIBOURG, Fribourg, Switzerland

Abstract: The Embeddedness of Economic Growth in National Institutions and Transnational Structures

The process of economic development is deeply embedded in the national and transnational context of a nation-state. The intent of this presentation is to show – from a theoretical and empirical perspective – how national institutions, cultural orientations and transnational economic interconnections influence capital accumulation and technological progress and therefore the speed of economic growth.

While neo-classical economics and endogenous growth theory think of growth as the result of capital accumulation and technological progress (and investment in other factors of production), they mostly ignore the social context that influences factor accumulation. Particular aspects of this context are highlighted by institutional economics (e.g. the political system) and by sociological theories of economic growth. Ever since Max Weber’s seminal work on religion economic development is thought of an enactment of values (e.g. Inkeles, Inglehart). Other sociologists, however, point out that national development is mostly the consequence of the position of a nation-state in transnational economic networks and the global economy (dependency theory and world-system theory; e.g. Wallerstein, Chase-Dunn).

I argue that long-term growth-rates are a function of the speed of capital accumulation and technological progress. But they, however, depend on various aspects of the economic and social context: the level of economic development (conditional convergence), spillover-effects of factor accumulation, national institutions (e.g. political system), national cultural orientations (trust, post-materialism) and the position in the transnational economy (trade and capital dependency). The empirical data shows that economic growth is best explained by multi-causal models that incorporate a wide range of context factors. Monocausal explanations, in contrast, struggle to provide robust models of economic growth.

EMOTIONS AND FINANCIAL CRISIS: THE END OF GREED AS “CALM PASSION”

Sighard Neckel 1

1 DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF VIENNA, Vienna, Austria

Abstract: Max Weber once dismissed the assumption that emotions such as “greed” operate as driving force of modern capitalism as “naive”. Almost ninety years later, when the global economy was hit by the breakdown of the financial markets in the fall of 2008, it became popular to deploy emotions, and in particular greed, as reason for the crisis. Greed emerged as the most influential public interpretation pattern of the meltdown of the financial markets.

From an ideology-critical perspective these references to hardly controllable emotions like greed could be understood as move to explain structural phenomena through the ideology of “natural” drives, as an attempt to conceal the structural reasons for the disaster of the financial markets. However, such an analytical perspective risks to reduce the explanation of economic processes in an objective and rationalistic manner. Therefore, this paper examines the public recourse on greed not in the light of a critique of ideology, but considers it as sociological information on the ongoing change in the orientation patterns of economic action in present-day financial market capitalism. In particular the references to greed by the actors of the banking sector themselves can be seen as evidence that the way economy shapes our emotions – an intrinsic part of capitalism itself – is currently significantly changing. Here the paper will draw on a recently finished research project about the banking sector in Austria, Switzerland and Germany after the financial crisis (see “Strukturierte Verantwortungslosigkeit. Berichte aus der Bankenwelt”, Berlin 2010 / Suhrkamp).

In classical liberal thought, “greed” is viewed as useful emotion that can be transformed into a “calm passion” (David Hume) through economic action that would bind emotions to economic interests. Quite on the contrary, today the economic system seems to match with the “calm passion” in a rather destructive way. With the banks failing to set systemic boundaries against the escalatory logic of speculative gains by setting their own organizational goals, greed
becomes the structural principle of economic action itself. This also affects the emotional habitus of economic actors and shapes the emotion management within the financial sector. As a result, the alignment of greed with long-term economic interests can no longer be established, and greed can no longer be transformed in an emotion useful for modern economic life.

FINANCIALIZATION AND ORGANIZATIONAL CHANGE: A COMPARATIVE STUDY ON MULTINATIONAL ENTERPRISES

Angelo Salento\textsuperscript{1}, Giovanni Masino\textsuperscript{2}

\textsuperscript{1}Department of Social science and communication, UNIVERSITY OF SALENTO, Lecce, \textsuperscript{2}Department of Economy, Institutions, Territory, University of Ferrara, Ferrara, Italy

Abstract: The aim of the paper is to provide both a theoretical and an empirical contribution to the debate concerning the relationship between the financialization process of the economy and the organizational changes in enterprises. Our hypothesis is that there is a tight connection between the two elements.

We performed an empirical research concerning several large multinational corporations. We conducted in-depth interviews with top level senior managers through which we reconstructed the “organizational stories” of those companies during the last two decades. We also relied on other information sources, such as corporate documents and academic case studies.

While the financialization of the economy is a well studied process, its influence on companies’ organizational changes is much less explored. By “organizational change” we refer to any transformation of the internal structure of firms: the general design of responsibilities, the relationships with external actors (suppliers, customers, etc.), human resources management policies, knowledge management and communication practices, work organization arrangements, rules and procedures, technology-based coordination and control practices, etc.

By considering longitudinal, macro-level phenomena together with the organizational changes in corporations it is possible to better understand both the nature of those organizational changes, as well as the intended and unintended consequences (social, economic and managerial ones) of the financialization process itself. Our findings confirm the interpretive relevance of such an approach. In the paper, we describe the organizational practices through the direct experience of the same managers whom implemented them in the last two decades within major multinational enterprises. Our qualitative approach does not allow to claim statistical significance for our results. However, the economic and social importance of the enterprises whose managers were interviewed, the length of the time span covered, and the striking similarities and consistency between different organizational stories (in very different industries: automotive, chemical, oil and energy, insurance, communication) seem to stimulate a critical reflection about the relationship between financialization and radical organizational changes within enterprises.

FINANCIALIZATION AND THE WEAKENING KNOWLEDGE EMPLOYMENT RELATIONSHIP

Jean Cushen\textsuperscript{1}

\textsuperscript{1}School of Management, QUEEN’S UNIVERSITY BELFAST, Belfast, United Kingdom

Abstract: It is accepted, in a range of academic disciplines, that financialization at the level of the economy shapes management practices and the nature of employment. However detailed firm level explorations of these trajectories, practices and impacts are lacking. More specifically, scholarship remains unclear about the mechanisms through which financial market pressures are transferred to the workplace. There is a lack of qualitative studies that connect trajectories of financial market pressures to management practices and the employment relationship. Based on a critical realist, ethnographic study of a knowledge intensive, high-technology, Multinational Corporation, this paper seeks to address this gap and answer two questions:

- what are the mechanisms that carry the pressures of macroeconomic financialization to workplace, and
- how does this shape the knowledge employment relationship?

By answering these questions this paper makes visible the structures and practices that management create which enable them to meet the interests of financial investors. First, the article explores how top management interacts with financial markets. Secondly, it highlights how top management can leverage international accounting regulations as a supra-national tool for communicating, monitoring and disciplining financial performance. Thirdly, the article demonstrates how the socialisation of top management orients them toward the achievement of financial targets. Fourthly, it reviews how ‘high-road’, ‘soft’ HRM rhetoric can sit atop a ‘hard’ approach to people management resulting in a weakening of the knowledge employment relationship. Finally the implications for academics and practitioners are discussed.

ORDERS OF WORTH AND CAPITALS: DISTINGUISHING SOCIAL, CIVIC AND POLITICAL CAPITAL

Efim Fidyra\textsuperscript{1}

\textsuperscript{1}research & educational centre ‘Sociological tools’, IMMANUEL KANT BALTIC FEDERAL UNIVERSITY, Kaliningrad, Russian Federation

Abstract: The aim of this theoretical paper is to show that what is usually called social capital is indeed at least two different types of capital implying two logics – not just different, but even antagonistic – which must be distinguished both theoretically and empirically.

We start from the brief history of notion of social capital – from Bourdieu to Putnam and others. Then the self contradictions of ‘social capital’ notion are being examined (opposition between individual and collective, micro and macro aspects of social capital, role of trust, role of the organizations and associations). As a result, we can conclude that in fact these different approaches to social capital deal with different logics, the ‘discriminating’ and ‘unifying’. Drawing on the ‘orders of worth’ concept by Boltanski and Thévenot the one type of capital considered as one based on ‘domestic’ order, while the other – on civic order of worth. As these orders of worth and the logics they imply are antagonistic in nature, we must clearly distinguish between related types of capital.

In this paper, capital is defined as socially put resource, aimed at regulation of uncertainty and able to be converted into its other forms. Capital involves different objects into specific relations based on certain logic, making them socially recognized, evaluated,
culturally and normatively defined. The specific kind of uncertainty in relation to which social capital is constituted is uncertainty of interpersonal relations and unpredictability of human behavior. Thus, social capital may be defined as reciprocal voluntary interpersonal obligations and could be converted in other forms of capital. The second type of capital, which is called the communal capital, is a resource which allows regulating uncertainty about achievement of collective good, and can be defined as a socially recognized, generally useful and equal membership in a certain community. Finally, another type of capital related with the secondary uncertainty concerning relations between collective entities – the political capital is defined here as mobilization of collective action and representation of collective interests. For every type of capital its incorporated, objectified and institutionalized forms are described.

In conclusion, some measurement procedures for different types of capital are offered.

TECHNICAL UNIVERSITY AS AN AGENT IN THE KNOWLEDGE ECONOMY

Maria Nawojczyk

1Department of Economic Sociology and Social Commun, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: In post-industrial societies and economies the process of commercialization of knowledge plays crucial role. In knowledge economies universities becoming very important agents in this process. Based on the case study of the Polish best technical university I would like to show the place of this agent in the social network, the ties between different agents and the characteristics of these ties as well as the strategies of using the social capital to obtain the best positions within the network.

TIME, MATERIAL CONSUMPTION AND SUSTAINABILITY

Stephen Derrick

1Monash Sustainability Institute, MONASH UNIVERSITY, Clayton, Victoria, Australia

Abstract: Climate change and excessive material consumption have their roots in the past, with developed nations being the major polluters on a per capita basis. This high level of consumption cannot continue (OECD Sustainable Development 2008; World Business Council for Sustainable Development 2010; UK Sustainable Development Commission 2009 and World Wildlife Fund 2010).

Measuring the change in factors that shape sustainability requires an understanding of the past and present and an orientation to the future. As Barbara Adam suggests, a past orientation sheds light on patterns of inequality and the unintended consequences of technologies. A present orientation measures what we have – a kind of stock-take of well being (sustainability) that has resulted from past actions. A future orientation raises questions such as: how do we measure future well-being, and by what factors? Whose well being? And, what is a reasonable level of consumption at an individual and a national level? I also draw on the work of Anthony Giddens and Juliet Schor to suggest that the increasing separation of production from consumption is at the heart of unsustainable behaviours.

Drawing on an examination of unforeseen consequences of technological developments, and the economic analytical tool of discounting, this paper will consider some of these questions and will argue that time, both the past and the future perspectives, is a key factor that influences attitudes to sustainability. The ecological footprints of humans include ‘time-prints’ that shape future sustainability and wellbeing.

FINANCIAL CRISIS AND PROFESSIONAL GOVERNANCE: HIGH SALARIES, ELITE PROFESSIONS AND SPECULATION INSIDE FINANCIAL SECTORS

Gilles Verpraet

1Sophiapole, University Paris Ouest, NAnterre, France

Abstract: The debate on high salarye inside the financial sectors moves from national communities to the international debate on bank regulation, after the economic turndown of 2008 / 2009. We will present the debate on the high salarye in France ( Sogen ) and in USA ( AIG ) and the sequence of political of media response, such as moralization of capitalism, such as international regulation ( GB )

The reference theories for the high salarye are heterogeneous. They comes by extension of diverse classic theories such as theories of incitation ( Stiglitz ), theories of human capital ( Becker ), theory of excellence rewards ( Karpik ).The push and pull factors in the ( western ) international debate on regulation ( 2009: 2010 ) of high salarye appears in some specific groups. The argument are developed between social darwinism, moralization of capitalism, equilibrarian justice.

The regulation debate inside the financial sectors questions the directionality between the condition of financial accumulation and the other economic sectors...The high salarye debate questions the relation between economic incentives and public responsibilities.

IDEOLOGICAL ROOTS OF ECONOMIC POLICY IN THE MIDDLE EAST AND THE CURRENT CRISIS

Kay Elizabeth Adamson

1Social Sciences, GLASGOW CALEDONIAN UNIVERSITY, Glasgow, United Kingdom

Abstract: Although the immediate inspiration for this paper is the current wave of political and social upheaval in the Middle East and North Africa, its origins lie in a much longer project to understand how the promise of the post-colonial was not fulfilled in practice. While undoubtedly, the politics of the Cold War were a constant destabilising factor, those cannot account alone for how it is that the governments themselves have been unable to deliver the promises they made during the diverse struggles for independence. Criticism from across the political spectrum has found easy scapegoats in the politics of the other. However, a closer examination of the ideas and ideological basis for economic growth suggest that there are common strands between them that while they have been expressed in very contrasting ways are rather less different in their practice. Indeed, and this is what this paper will explore is the extent to which there is a common collective base of norms derived from the struggles to deal with economic and industrial growth in western Europe in the eighteen and nineteenth centuries that continue to underpin the inability to find solutions to the unequal distribution of resources. These phenomena can be most clearly observed in the field of agriculture/farming with the contradiction between an increasing concentration of population in urban cen-
Abstract: Sociological approaches to economization have largely neglected the influence of market crisis on the expansion of market relations. This is particularly astonishing because marketization often takes place when the economic situation in a particular field deteriorates. In this paper, I draw on a case study of the transformation of the death care industry in Germany to illuminate the conditions under which market crisis may culminate in processes of economization. I argue that markets in which certain forms of economic activity are considered illegitimate are especially prone to counteract crisis symptoms with an expansion and intensification of market relations. With emphasis on changes in socio-demographic and cultural conditions I show how moral boundaries that normally inhibit some economic activities are removed when a market enters into crisis. In doing so, this paper contributes to the understanding of the interrelation between economic crisis phenomena and processes of marketization.

INVESTMENTS AND RELATIONS: RELATIONAL MANAGEMENT UNDER UNCERTAINTY

Ilan Talmud

1Sociology, University of Haifa, Haifa, Israel

Abstract: This study examines the social embeddedness of venture capital (hereafter: VC) industry in Israel, operate under severe uncertainty, lack of solid business model, and high financial risks.

More specifically, it inquires into the social organization of the Israeli VC industry between 1994–2005. The study purposes are (a) to explore epistemic accounts of mental models of investors, using narrative research; (b) expose structural patterns of VC networks, and (c) to shed light onto these patterns over time. Moreover, the study aims to analyze relations between VC funds via their joint investments in entrepreneurial firms. Venture capital funds and entrepreneurial firms have symbiotic, inter dependent relations. Previous studies have explained the tendency of VC funds to co-invest by their need to reduce higher degree of uncertainty and information asymmetry they encounter (Bygrave, 1988; Amit, et. al., 1990; Podolny, 2004; 2005). Additionally, an investment by a VC fund provides the entrepreneurial firm social access to new information and market opportunities (Burt, 1992; Nohria, 1992; Darr and Talmud, 2003).

The main hypothesis, derived from network governance theories and from the resource-exchange model, is that the level of VC’s interconnectedness increases with the degree to which uncertainty is prevalent in the environment.

The analysis delineates two contrasting exchange forms of joint investments: market reach, proxied by betweenness centrality, and social closure, operationalized as local VC density.

Estimating performance, the number of VC successful exists, exists rate, and failures and failure rate are explained by these two seemingly contrasting forms of structural embeddedness.

The analysis is also informed by complementary secondary and qualitative data sources as well.

Finally, we discuss implications for business strategy and policy, organizational sociology, network theory, and the structural analysis of emerging markets for contextual knowledge, and for firms operating under severe hyper-competition and environmental uncertainty. Finally, this paper draws some implications for future research on VC’s structural and semantic networks.

FROM MARKET CRISIS TO ECONOMIZATION: THE CASE OF THE DEATH CARE INDUSTRY IN GERMANY

Dominic Akyel

1MAX PLANCK INSTITUTE FOR THE STUDY OF SOCIETIES, Köln, Germany

Abstract: Before and during the crisis of 2008-2009 many of the death care industry in Germany from market crisis to economization: the case of the death care industry in Germany.
SMES IN PORTUGAL: DIVERSITY OF CONTEXTS AND PATHS TO BUSINESS CREATION

Ana Isabel Couto1

1CIES-IUL, Lisboa, Portugal

Abstract: This paper follows an on-going doctoral thesis about small and medium sized enterprises in Portugal. The main objectives are: a) to identify and analyse typical trajectories to business creation among SME owners; b) to identify and analyse explanatory constellations of factors that combine to produce these typical courses, with particular attention being given to structural, organizational and individual dimensions and finally c) to understand the social conditions that promote the creation of new businesses or enterprises, otherwise known as the entrepreneurship process.

In the current socio-economic context characterized by growing difficulties of insertion in the dominant employee work model, the creation of own business is seen as a potential source of employment for many non-active people, young people who finish their studies, or even workers. A number of factors and actors come together in this process. The presentation will discuss the role played by the State - through its modern active employment policies, closely connected in our country with policies targeted to the creation and development of SMEs - but also by other actors such as school, family or by individual's social capital, in the process under which new enterprises are created.

The research focus on 24 case studies in SMEs selected all over the country based on a set of criteria. The methodological design includes comprehensive interviews to a limited but diverse group of SME business owners/entrepreneurs. These biographical in-depth interviews will allow us to examine and highlight the main motivations for creating new businesses, the obstacles and the creating facilitating conditions and to rethink social inequalities regarding this specific socioeconomic process. The aim of this paper is, therefore, to share and discuss relevant issues arising from the main theoretical and empirical advances already made in these phases of the research.

THE MORE THINGS CHANGE, THE MORE THEY STAY THE SAME?: SOCIAL NETWORKS, TRUST, AND ENTREPRENEURSHIP IN POST-COMMUNIST ROMANIA

Augustin Stoica1

1UNIVERSITY OF BUCHAREST, Bucharest, Romania

Abstract: In this paper, I address the current debates about the growing (or declining) significance of communist-era social relations in post-socialism. Employing survey data from 2000 and ethnographic data (i.e., in-depth interviews with 35 current and former entrepreneurs), I discuss the role played by social networks and trust in entrepreneurship in post-socialist Romania. For some scholars, the communist-era social ties have not only survived the transition but they have become the backbone of successful economic transactions in reforming economies. Other scholars have claimed that, because a market economy tends to reward an individual’s skills and merits (or her human capital), the significance of such ties has decreased and will decrease during transition. I contend that the debate over the declining or continuing significance of communist-era ties during transition has lacked conceptual clarity. This is because these so-called communist-era ties included a wide range of phenomena (from party clientelism to blat to corruption).

Second, previous debates about the significance of communist network ties during transition have also failed to address changes in the content of such ties in terms of trust. Some authors deem arm’s-length relationship crucial for successful economic transactions. Other scholars see high trust relations as central components of such transactions and entrepreneurship.

My analyses show that, in a context where shortages in goods have been replaced by financial shortages, an individual’s social capital has been the key resource in the former communist politicians’ transition to private market activities. Moreover, cultivating and maintaining relations with public officials are essential for running a business during post-communism. Like in the old days of socialism, “blat” and “relatii” (relations) still open many doors and get things done. My ethnographic data suggests that the relations my respondents cultivate, although enhancing their chances for doing business, are not characterized by the high levels of trust found in other countries. In many cases, my respondents preferred to keep arm’s-length relationships with other people, be they business associates, customers, or employees. Against the backdrop of a highly uncertain political and economic environment, the lack of institutional and interpersonal trust negatively impact business growth and economic development.

TRACING THE OUTLINES OF AN ECONOMY: A THOUGHT EXPERIMENT WITH MONIES

Sandy Ross1

1Sociology, LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE, London, United Kingdom

Abstract: Guyer (2004) suggests that monetary conversions are compasses, they direct our attention to where the economic “action” is. This paper asks how an economy would look if our point of departure were monies, not markets. This thought experiment was suggested by lay formulations and theories of economies and economic life – as explored in seven years of ethnographic field work in two virtual worlds – which emphasise the importance of monies in organising economic life.

For the purposes of this thought experiment, monies are not a dominant category, but tracking dyes tracing the contours of an economy through exchanges, conversions and other money acts. Drawing on Bohannon and Bohannon’s (1968) spheres of exchange – the uncredited inspiration for Zelizer’s (2004) circuits of commerce – with Guyer’s (2004) and Graeber’s (2001) reconsiderations; and using a conceptualisation of monies that embraces monetary proliferation, I propose a bottom-up assembly of economic life that focuses on economic structures and patterns produced through repeated monetary circulations. When economic life in Western capitalist consumer societies is seen in this way, economic practices and social structures more familiar from so-called “primitive” societies appear in strange, yet quotidian guises. For example, special domains of consumption, generated not by the cosmological or cultural significance of objects, but created and sustained by consumers’ reliance upon corporate controlled and produced token monies, emerge as an important element of economic life. These ring-fenced economic areas – which produce their own logics of consumption, and their own practices of valuation, exchange and money use – are explicitly separated from markets and market logics.

ADVANCED LEVEL SUBJECT CHOICE IN BRITAIN: A CONFIGURATIONAL ANALYSIS OF THE CONTRIBUTION OF ABILITY AND SOCIO-CULTURAL CAPITAL

Judith Glaesser 1, Barry Cooper 1

1School of Education, DURHAM UNIVERSITY, Durham, United Kingdom

Abstract: We focus on risks, for British pupils, in A level (pre-university) subject choice. The usual university entrance requirement comprises 3 A levels but qualifications are “positional goods”. Their value is not absolute; it depends partly on others’ qualifications. Following educational expansion, more pupils take A levels, across a wider range of subjects. Prestigious universities face many qualified applicants, many with high marks. Given they see to admit the most able, they increasingly use other indicators of ability, including subjects studied. “Traditional” subjects, perceived as intellectually demanding, are favoured, though most institutions deny using strict rules. Pupils partly choose subjects through ability and interest; this risks constraining later university choice. Since officially all subjects are of equal value, some pupils are unaware of this risk. Socio-cultural capital can provide informal knowledge which allows them to avoid choosing “unsuitable” subjects. We investigate parents and schools as sources of this knowledge. Graduate parents are likely to have such knowledge, providing their children with advantages. Academically selective schools also can provide it. It is in their interest to do so since their reputation partly depends on their pupils entering prestigious universities. We use lists published by two prestigious universities to code subjects as being “suitable”. Using data from Durham University’s CEM Centre, we use Ragin’s Qualitative Comparative Analysis to undertake a configurational analysis of the ways in which ability, gender, parental education and school type in various combinations are sufficient for pupils’ to choose “suitable” subjects. We find, for pupils to choose “suitable” subjects, it is not sufficient to be of high ability. Socio-cultural capital via parental education or selective schooling or both has to be combined with ability to avoid the risk of being ineligible for the most “desirable” universities. By basing selection on just some subjects, prestigious institutions may lose able candidates, those lacking support from graduate parents or selective schools. Furthermore, attempting to widen participation by labelling more qualifications as nominally “equivalent” is unlikely to lead to a wider range of students attending the most prestigious universities without additional changes either in university selection practices or pupil support.

ALUMNI ASSOCIATIONS AS GENERATORS OF SOCIAL CAPITAL. A CASE STUDY OF ALUMNI ASSOCIATIONS IN ATHENS.

Marina Stathi 1, Mary Leontsini 1

1Department of Early Childhood Education, NATIONAL AND KAPODISTRIAN UNIVERSITY OF ATHENS, Athens, Greece

Abstract: Social networking and connections may acquire new meanings in “turbulent” times. Educational choices and school attainment of the past are susceptible to become tools for a contemporary re/production of usable social relations in this presentation we are drawing data from a broader doctoral research on Alumni Associations of private and public secondary schools in the region of Attica, (Athens, Greece). Alumni Associations are thought of as networks of recreational activities offering bonding opportunities to members. Participation is voluntary and based on the desire to share memories of adolescence and to create a coherent narrative of members’ pathways. Memories and experiences of a common (though by-and-large constructed) past constitute the solid ground for “building” mutual acquaintance and solidarity. Networking activities often enhance the possibility to create and share resources. The theoretical background of Pierre Bourdieu, James Coleman and Robert Putnam (among others) will be discussed in order to examine Alumni Associations as networks that function as an investment and as an attainable set of resources available to their members. Through the analysis of in-depth interviews conducted with a member of each Association’s Board of Directors, we are examining the ways in which trust becomes not only the essential component for the establishment of the Alumni Associations themselves, but also, a resource that can be used for the re-production of social capital. We are focusing on the new meanings and on subjective appreciations of networking activity that Board members elaborate in order stress the “value” of participation. Narratives of Volunteer- ing, Philanthropy and Charity reveal that while fostering a public-good profile, the Alumni Associations increase their stock of capital and negotiate ways of participation to the public sphere. On the theoretical level, we are arguing that existing literature on social capital needs further refinement in order to include the ways in which narratives of the past (based on educational choices) are susceptible to become vital resources in the making of the public sphere.

CULTURAL CAPITAL AND EDUCATIONAL ACHIEVEMENT AMONG IMMIGRANT AND NATIVE STUDENTS IN ISRAEL

Yossi Shavit 1, Liliya Leopold 2*, Svetlana Chachashvili-Bolotin 3

1Department of Sociology & Anthropology, Tel Aviv University, Tel Aviv, Israel. 2Department of the Population Studies, OTTO-FRIEDRICH-UNIVERSITÄT-BAMBERG, Bamberg, Germany. 3The Institute for Immigration & Social Integration, Ruppin Academic Center, Emek Hefer, Israel

Abstract: In this study, we examine how the cultural capital of immigrants from the Former Soviet Union to Israel influences their children’s scholastic achievement. Compared to other immigrant groups this group of immigrants is well-educated and culturally well endowed. However, we argue, the cultural capital of immigrants may be of little value if it differs from the codes that prevail in schools of the host society, and immigrant parents, even those who are culturally endowed, may find it difficult to capitalize on their cultural capital in their children’s educational process.

Our main hypothesis posited that parental cultural capital has weaker effects on the achievements of immigrant children when compared to native children. We also tested for possible differences between immigrants and natives in the effects of parents’ education on achievements.
We analyze survey data collected in 2008 on a sample of about 1,600 fourth, ninth and eleventh grade students and their mothers in Israel.

The results support our hypothesis in part. On the one hand, we did not find differences between immigrant and native children in the effects of parental cultural capital on the verbal and non-verbal test scores. This indicates that immigrant and native parents do not differ in translating their cultural capital into their children’s cognitive and linguistic achievements. On the other hand, we did find a significant negative interaction between immigrant status and cultural capital for school grades, suggesting that immigrant children benefit less from parental cultural capital than native children.

We also studied whether there are differences between immigrant and native students in the effects of parental education on grades and test scores and found non to be significant.

**PRE-SCHOOL EDUCATION IN FRANCE: DEALING WITH FUTURE SCHOOL ACHIEVEMENT AT HOME**

Pascale Garnier

1EXPERICE, University PARIS 13, Villetteaune, France

Abstract: The importance of preschool education is very strong in France, in the context of a very selective and academic school system (OECD, 2006). All children from three to six years old go to the “école maternelle” (nursery school or kindergarten) which is involved in a wide range of institutional transformations, stressing the priority of cognitive and linguistic curriculum (Garnier, 2011). Additionally, the impact of family educational practices is long considered as a major factor of educational inequalities, and takes place very early (Bourdieu, 1983). This paper intends to examine them from original objects: educational activity books for young children.

At first, we show how they are to be regarded as hybrid objects of consumption, participating to a cross cultural dynamic, including children’s mass culture, fun culture and school culture. They are designed to appeal both children and parents alike and embodied in representations and constructions of children and parents as consumers (Cook, 2004). These objects mix together rhetoric of games, images of childhood heroes, for girls and boys, and rhetoric of school which refers to the program of “école maternelle” (writing, reading, math’s exercises...).

Secondly, a work of interviews with families from different social classes analyzes the uses and absence of these objects at home. This qualitative analysis shows a series of practices, which are not limited to the only concern of school effectiveness. We insist on uses both serious and dilettante fashion of these notebooks, according to their hybrid nature.

We particularly focus on how these notebooks mix together parent-child relations and temporal dynamics toward child learning, highlighting how they participate to a day to day parents’ vigilance. With the increasing uncertainties of social changes, this vigilance necessarily completes a strategic and planed vision of the future school achievement of the child. Thus, parents conceive early childhood as a period of life dedicated both to fun and to a preparation of a successful scholarship.

**UNDERSTANDING SOCIAL NETWORKS, SOCIAL DISADVANTAGE AND HIGH ATTAINMENT**

Alastair Wilson 1, Katie Hunter 1, Anna Beesley 2

1School of Education, UNIVERSITY OF STRATHCLYDE, GLASGOW, United Kingdom

Abstract: The link between social disadvantage and low educational attainment has been persistent over the past few decades. In the UK recent research exploring this issue has challenged the dominance of ‘school effectiveness’ and indicated the importance of out of school factors in explaining educational attainment (Ball, S 2010; Gorard, S 2010; Lupton, R 2004). In examining the lives of young people outside school researchers have drawn heavily on the explanatory power of social capital theory as illuminated by the work of Bourdieu, Coleman and Putnam. Often this work has challenged the imposition of ‘middle class’ values and aspirations on disadvantaged young people, a process that demands their individual adaptation and fails to sufficiently address crucial structural factors (see Archer et al., 2010). A feature of this research has been an emphasis on the social relationships and networks that young people have access to and the role that these play in their realising of ‘valued’ educational opportunities. In this research we narrow the focus further by examining the role of social networks in the educational attainment of a small group of high attaining pupils in a school where few pupils proceed to higher education. Three research questions framed this research:

- What is the landscape of the young people’s social networks?
- In what ways do young people draw on these networks in planning their futures?
- What contribution do these social networks make to young people’s educational attainment?

This research project involved working with a large secondary school within a socially disadvantaged area of a large Scottish city. A group of 30 pupils were each given a smart phone with added software capable of recording their text message traffic, phone calls and proximity to other (within group) phones. In parallel with this process researchers conducted a qualitative mapping of the young people and their potential social networks using a variety of methods including interviews, observation and photo based analysis. Initial findings from this research indicate that the highest attaining young people were members of several, small social networks composed of other young people in the wider study group. These initial findings have important implications for the ways in which policy makers and schools recognise and perhaps nurture young people’s social networks.

**EDUCATION AND SOCIAL CAPITAL: DOES SCHOOL EXPERIENCE CONTRIBUTE FOR THE EXPANSION OF THE UNIVERSE OF REFERENCES OF YOUNGSTERS WITH IMMIGRANT BACKGROUND?**

Sandra Mateus 1

1ISCTE – UNIVERSITY INSTITUTE OF LISBON, CIES-IUL, Lisboa, Portugal

Abstract: More than ever before, school is responsible for preparing young people for active life, a complex and instable world of work and the individual and collective needs for employment and social mobility, not to mention other social goals, such as personal develop-
opment, a capacity for participation and the exercise of rights of citizenship and the transmission of rules and values. Formal education continues to be, therefore, central to the mediation, integration and the construction of identities and individual life pathways.

At the same time, migratory pressures felt in Europe in general and Portugal in particular in recent years, though with different rhythms, origins, expressions and settlements, have brought out in Portuguese society, particularly since the early 1990s, new generations of children and young people with more complex legacies than the dominant population, the children of immigrants. According to data published by the Ministry of Education, between 1994/95 and 2003/04 primary and secondary schools took on around 9,000 pupils of immigrant origin. These young people who had been born or socialised in their parents’ host society. School represents an inevitable place of socialisation for them. But to what extent school can provide new opportunities of expansion of the social capital of these students? How do school enlarge their social universes of origin?

We will discuss the ways in which, in the context of completion of compulsory schooling and transition to higher education or employment, school experience (trajectories, performance, social networks) intersects with ethnic, social and cultural belonging and contribute to the enlargement of the universe of references of these youngsters and the definition of future aspirations and expectations. The discussion is based on data from mixed-method research carried out in 2007 – ITEOP (Survey of Educational Pathways and Vocational Orientations), involving about 1,200 9th grade Portuguese students and immigrants students (ages 14-19), surveyed at 13 schools, all of which had a highly diverse student body.

PARENTAL INVOLVEMENT IN CHILDREN SCHOLAR PATHS IN DIFFERENT SCHOLAR ORGANIZATIONAL MODELS - THE INFLUENCE IN SCHOLAR RESULTS

Eva Patricia Gonçalves¹

¹FCSH-UNL, Lisbon, Portugal

Abstract: The way school and family connects has been changing, not so much due to the actors’ needs (teachers, parents and students), but because economic, political and social demands. Economy and information globalization, the European Union and the new forms of family organization have changed the political and social discourse towards what is school and how it should serve society. Using an economics language, the educational system of a country must now be able to respond to its work market’s needs. Which demands more proximity of the school to the community in order to allow communication, benchmarks and strategies creation in a concerted effort. Parents higher levels of education and their access to a great number of information, gave way to more attention paid to the school. Student’s failure can no longer be explained only by social reproduction theories and many investigations show strategies towards school in the lower social classes. Other investigations show that a higher proximity between families and school and a higher level of parent involvement increases student’s success. In an attempt to find if higher levels of social capital and parent involvement promotes scholar success, we studied two different scholar organizational models in order to see if they make it possible to obtain higher levels of social capital and parent involvement - segmented versus integrated schools - as was benchmarked by the creation of the second schools. And also to see if a higher level of parent involvement creates higher probabilities of scholar success. Through the collected data, we were able to see that there are no differences between those two types of school in most studied dimensions. Maybe because in our country those are relatively new schools (1993); and also because in many still doesn’t exist educational projects that promote scholar success as a continuum from pre-school to the end of mandatory school. On the other end, we found that, in the two types of school, a higher level of parent involvement creates higher probabilities of scholar success.

METHODOLOGY CHANGES AND SOCIAL CAPITAL AT THE HIGHER EDUCATION TODAY

Lidia Daza¹, Marina Elias Andreu²

¹Sociology and Organizational Analysis, UNIVERSITY OF BARCELONA, ²University of Barcelona, Barcelona, Spain

Abstract: The Bologna process has introduced, in the case of Spanish universities, changes in the college student experience. Methodological reformulation; the importance of mentoring programs, reception and orientation; and more intensive use of information and communication technologies, in the new degrees, involve more student participation, with a more visibility role in the classroom, and with the need to work with peers and academics in the learning process. From the point of view of university history and evolution of our higher education system, we are moving from a mass university and sometimes impersonal, to a university where spaces and opportunities to be related to institution increase.

Multiple researches from English speaking countries, from seventies, have highlighted the importance of student’s social relations for academic outcomes at the university. Especially academic and peers are an important agent of socialization, and therefore, all practices and policies that create stronger links between them, have a positive impact on learning.

Thus, in front of the new air of reform, we wonder what effect these changes are having on the student’s university life. Does the plan Bologna means greater student involvement in college? Activities such as group work, tutoring or practices encourage students to contact with peers, academics and campus life more frequently? Do they participate more at the university? Do they spend more time in the institution? And do those experiences help to improve quality of student learning?

We are going to discuss these issues in four public Catalan universities: University of Barcelona, Autonomous University of Barcelona, Polytechnical University of Catalonia and University Pompeu Fabra, using the technique of a survey. The questionnaire was handed out to 1000 students from different studies, at their second and third year. This information will provide relevant data on how the reform is performing and what effects it is having on the student’s social relationships and involvement in college.

The results are part of a 3 year R+D research about the Bologna reform where experts on teaching-learning process from sociology and pedagogy are participating.

COMPARATIVE STUDY OF SCHOOL – PARENT RELATIONS: DIFFERENT VIEWS ON SCHOOL CLIMATE (CROATIA, SLOVENIA AND SERBIA, PISA 2009)

Ines Elezović¹, Josip Šabić¹

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: The most recent cycle of PISA studies showed that students in general achieve better results in classrooms with clearly defined relationships and discipline climate, along with the support of engaged teachers and parents. It is concluded that solely economic background approach is not sufficient for explaining which schools and countries are more successful and satisfied with their education system than others, and why is that so. In that respect it is crucial to investigate other sources of different views on learning environment and school climate in particular, as a potential alternative. In this study we have analysed interactions and relationships between schools’ and parents’ level of perception and different views on their school quality in three countries from the region. These countries are: Slovenia, Serbia and Croatia.

Main social actors or interested parties in educational process are students, their parents and schools. Principals are here regarded as the representatives of schools’ organizational authority. There are six main aspects of learning environment according to the PISA design, of which two are more thoroughly analysed in this article: teacher and student behaviours that effect learning (1) and parents’ involvement in and expectations of schooling (2). We have taken into consideration six different instruments from two background questionnaires: parents’ and principals’ questionnaires and investigated their mutual relations in different educational systems. Some of those questions are how parents’ satisfaction with child’s school reflects on their own expectations of school as an institution of learning, how parents’ perception of their own involvement in school decision making influence their satisfaction with school or how principals’ view of schools’ human and material resources relate to overall school climate (defined as student – teacher relationships).

All these proposed directions of thought represent paths to making schools more aware of their original mission. Besides transferring knowledge as a commodity in a modern world, communities need schools to have functional roles in both child’s and parents’ lives to achieve acceptable personal and system level of quality that all countries strive to in education.

**BEYOND THE RHETORIC OF ENGAGEMENT: UNIVERSITIES’ RESPONSES TO LOCAL DEMANDS IN CHALLENGING TIMES**

Yann Lebeau1

1School of education and lifelong learning, UNIVERSITY OF EAST ANGLIA, Norwich, United Kingdom

Abstract: Pressures associated with the rise of the so-called knowledge economy, with increased participation in higher education, processes of decentralisation and decreasing support from the state, have led in many countries around the world to a rediscovery in recent decades of the relevance and responsibility of higher education to local and regional communities. A rhetoric of “regionally-engaged higher education” seeing universities as “powerhouses for economic development” has developed in policy circles, rapidly picked up by institutions themselves keen to publicise their ‘third mission’ agenda and diversify their sources of funding.

Among the key consequences of this policy trend have been a diversification of higher education systems to meet the needs and requirements of new “non-traditional” entrants, and in some countries an increasing dependence of universities on regional and local levels of governments for research funding.

The common rhetoric of community engagement associated with this trend is however masking very different types of “impact” and “roles” according to contexts and institutions. Differences in universities’ attitudes towards local communities are further exacerbated by the current economic climate and funding crisis to which universities, particularly in quasi market contexts such as the UK, are unevenly equipped to respond.

Using findings form a qualitative study conducted in contrasting regional settings of Scotland and England, I will seek to relate the levels and nature of structural embeddedness of universities in their immediate environment to their complex relationships with “their” place and “communities”, including the most ‘disadvantaged’ ones. Looking at issues of local policy networks, studentification, cultural development, and social stratification, the presentation will seek to highlight the intended and non-intended local impacts of universities beyond their expected responses to regional development.

**EDUCATION AND SOCIAL COHESION: RETHINKING THE RELATION**

Vasili Koutsara1

1Sociology, PANTEION UNIVERSITY OF SOCIAL AND POLITICAL SCIENC, Athens, Greece

Abstract: The relation of education to social cohesion has been the subject of inquiry in social sciences in general and in sociology of education in particular. The concept of cohesion replaced recently the concern about securing social continuity. Though cohesion is a highly abstract and difficult to define unequivocally, nonetheless it is being increasingly used having acquired in the mean time a ‘feeling good flavour’.

Historically, institutionalizing the education system has been closely linked with securing social continuity, which is an aspect of social cohesion. An education system has been viewed as serving the purpose of continuity and social cohesion by educating, socialising, providing training and selecting the new members of society that later as adults will occupy a position in the dominant division of labour and play a role in retaining cultural tradition as well.

A dominant idea about social cohesion it that it denotes absence of social conflicts, which amounts to an idealised view of society similar to a paradise world of a religious doctrine. The questions that arise and I shall attempt to answer are, *In what ways does education today is related to social order and continuity? And how does it affect social cohesion?*

In the paper I propose I shall examine some aspects that link education to social cohesion in current society according to theorists in sociology of education. From thereon I tackle the emerging role of education in mitigating social conflicts on the one hand and the instrumentalisation it underwent on the other. Education is a means to govern society as a whole, while educational titles increasingly become significant for individuals in order to participate meaningfully in society. Parallel to this, the implicit question I also pose is that striving for social cohesion means that current, unequal organisation of social relations remains unchanged in the future or that through education social change is monitored.
FILLING IN SOCIAL SERVICE GAPS? CIVICS AS SCHOOL SUBJECT AND ITS TASKS IN EUROPE

Tatjana Zimenkova

Abstract: Civic and citizenship education in European countries is designed to educate active citizens for democratic systems. De facto it is both, instrumentalised- and criticized for orienting itself on social services. On the level of educational materials, school practices and non-school projects, civic education seems to be used by schools, educators and school authorities on different levels to fill in the gaps of social system, to increase social cohesion in a way that partly charges citizens for solving social problems, replacing state services.

The presentation elaborates on the reasons for this shift of civics towards social services. Can it be explained fundamentally through the rise of social problems of European societies, decline of the state services and school system reaction towards it? Or does such shift indicate a genuine transformation of civic education within western democracies? Is the shift towards social services a welcomed opportunity to alienate the subject and to lessen the political dimensions of education in school?

Analysing the turn of civics towards social services, the presentation furthermore articulates the question, whether the turn towards service learning and social cohesion can be seen as a generalizable trend in Europe. The presentation indicates two different clusters of European countries with reference to social services within civics (the so called “transformation societies” and “old” democracies, indicated as “migration societies”). The practice of service learning and learning for cohesion through civics is rather alike within the both clusters. The analysis of teaching materials and practices shows however that the educational goals with respect to understanding the role of the state and civil society in maintaining cohesion and social services are admittedly different within the both clusters.

SUCCESSFUL EDUCATIONAL ACTIONS: FAMILY EDUCATION AND INTERACTIVE GROUPS

Esther Oliver, Maria del Mar Ramis, Ana Vidu

Abstract: This paper presents part of the results of the INCLUD-ED: Strategies for inclusion and social cohesion in Europe from education (2006-2011) a project from the Sixth Framework Programme of the European Union. It is the only Integrated Project dedicated to the analysis of school education in Europe. INCLUD-ED, has analysed four ways of family and community involvement in schools which successfully contribute to overcome school failure and achieve social cohesion: participation in decision-making processes, in curriculum development and evaluation, in learning spaces and in family education. This paper will focus on those forms of family education which are providing successful results, namely Interactive groups and Dialogic literary gatherings (Flecha, 2000). The latter implies that through reading classical works of universal literature, families increase their instrumental knowledge and at the same time contribute to their children’s educational success. In the context of the classroom, family and other community members take part in the student’s learning process through Interactive Groups (Elboj & Niemela, 2010). These consist of a form of classroom organization of students in small heterogeneous groups through the redistribution of already existing resources, which involve the participation in the classroom of families and other members of the community. The richness of the interactions provided by the diversity of participants in the classroom had already been pointed out by Vygostky (1978) who referred to the importance of students interacting with non-professional people. The implementation of these successful actions in the context of the Learning communities makes of the diversity present in our societies an opportunity to achieve better learning and better coexistence. Proof of this, is the success in student’s achievements - specially vulnerable and marginalized groups- and social cohesion within the community.
Abstract Book

Keywords: family education, interactive groups, successful actions, social cohesion

LEARNING BY COMPETENCIES. FROM BASIC COMPETENCIES TO A GLOBAL KNOWLEDGE
Rafael Feito
Social Structure, Universidad Complutense, Madrid, Spain
Abstract: Learning by competencies implementation is quite an opportunity to reconsider the meaning of educational purposes. What could be expected for a person that will devote ten years at least at school? What is the minimal knowledge and skill he or she will need to manage at ease as a worker, as a citizen, as member of a family or a community.

A person could be considered competent if he is able to solve real problems which, by definition, are always complex. Knowing means being able of using what has been learned in new settings.

Current school is a product of the industrial society in which people had the expectations that school knowledge would be enough to manage through working life. This way it is easy to understand emphasis on root memorization. Nevertheless, today long life learning and predisposition to face the unexpected are crucial.

TURKEY’S NEW CITIZENSHIP AND DEMOCRACY EDUCATION COURSE: IS THERE REALLY SOMETHING NEW ON CITIZENSHIP?
Kenan Cayır
SOCIODY, ISTANBUL BILGI UNIVERSITY, Istanbul, Turkey
Abstract: The paper explores the curriculum and offered activities of Turkey’s new Citizenship and Democracy Education course which is going to be incorporated into the formal curriculum in 2011-2012 academic years. The Ministry of National Education aims to introduce this course to empower students in acquiring new citizenship and democratic skills. However, there is still a major discrepancy between the curriculum and recent social and political developments in Turkey. Contemporary Turkey has been undergoing a major social and political transformation due to various internal and external developments. Non-Turkish and non-Muslim ethnic, religious minorities, submerged during the nation-formation process, are gaining public visibility and claiming their right to recognition. New conservative groups have recently achieved an upward mobility and attained new public and political roles with their Islamic identities. In addition, Turkey has started accession negotiations with the European Union in 2005. As a result of these developments Turkey is facing its past and questioning the borders of “Us” along with an aim to devise a new social and political framework in order to include newly emerging different groups and interests. The curriculum of the new Citizenship and Democracy Education course, however, are far from reflecting these social and political developments. The paper discusses the challenges and opportunities in promoting a pluralist and democratic civic imaginary in Turkey.

DIGITAL CONTENT PLAGIARISM IN ELEMENTARY AND SECONDARY EDUCATION
Nuno de Almeida Alves
CIES, INSTITUTO UNIVERSITÁRIO DE LISBOA, Lisboa, Portugal
Abstract: The widespread use of ICTs in elementary and secondary education curricula brought new resources for teaching and learning processes, and some new challenges also. Computers and the internet are valuable resources to teach with illustrative examples, to develop autonomous digital educational content adapted to teachers’ and students’ needs and respective technical skills and, especially, to search for information in order to expand the in-class knowledge obtained. ICTs are also priceless tools to develop individual and team work, to present and disseminate the digital content produced to schoolmates or even larger audiences (parents and family, students in other schools).

However, with the increasing use of digital content, another educational problem emerges: the omnipresent practice of digital plagiarism by students of information and content retrieved from internet websites (including authored documents). Teachers are aware of this situation and try to prevail over it in a pedagogically oriented fashion, signaling the dishonesty of the procedure, as a theft of other’s ideas and texts. This kind of plagiarism (different from the traditional cheating/copying processes) emerged through the influence between two different streams: the integration of ICT use in the curricula; and the progressive inclusion of some research activities in the elementary and secondary curricula, in an attempt to overcome the excessive use of memorization and rather reproductive and bookish manner of traditional learning.

How do learners discern, thus, between the allowed memorization and reproduction of a textbook in an exam and the unacceptable copy and paste of an excerpt in an essay? How does the notion of plagiarism and students’ perception of it evolve through the progression of education grades? And how does the punishment for the same behavior change over academic life?

The answer to these questions will lie on empirical evidence acquired through two ongoing research projects covering the use of ICTs in elementary and secondary education in Portugal, both using surveys and interviews to teachers and students.

EDUCATION AND SOCIAL COHESION - DOES HIGHER EDUCATION MAKE IT A DIFFERENCE?
Maria Saudade Baltazar, Conceição Rego, António Caleiro
Dep Sociology, CESNOVA/UNL e UNIV ÉVORA, Dep Economy, CEFAGE/UE - UNIV ÉVORA, Évora, Portugal
Abstract: The education level that characterizes the population of a certain country is intrinsically linked to its level of economic and social development, such that there are generally significant positive correlations between those factors. From a generational point of view, the education system is primarily a responsibility of families. Thus, investment in education is of inter-generational nature, being evident that the benefits of education, for the current generation, will only be reflected in the future, when children and young people reach the job market.

The prospect of higher wages linked to academic training, influence the decision making of families, assuming that it will pay off the ‘opportunity cost’ of making people to attend the education system. This ‘opportunity cost’ is smaller in times of economic recession, as the extent that the likelihood of young people access the labour market is smaller. However, when economies are in crisis and unemployment increases, the ability of families to continue to support the education of their children diminishes.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
In Portugal, the higher education system experienced profound changes in the last 3 decades. From an elitist system, geographically and socially concentrated and attended only by a limited stratum of the population, particularly by males, higher education is now widespread throughout the country, with scattered locations, currently being attended by an overwhelming majority of students finishing secondary school. This development led to changes at various levels in Portuguese society, first of all by the economic and social impacts of higher education institutions (HEI) in the territory, but also by the change in qualification structure of the Portuguese population.

The paper intends to achieve 2 objectives:

1) check out how the higher education network installed in Portugal contributed to the promotion of social cohesion in the country, namely trying to verify how the existence of HEI scattered throughout the territory decrease the asymmetries in the ‘concentration’ of qualified workers in various parts of the country, for that using a cost-benefit analysis in order to understand the whole effects of the existence of a particular HEI in geographic location;

2) seek to verify the existence of some evidence regarding the effects of the economic crisis.

(paper is under the project PTDC/CPE-PEC/103727/2008)

THE PROBLEM OF AWARENESS AS ONE OF THE BARRIERS TO THE IMPLEMENTATION OF INCLUSIVE EDUCATION IN MOSCOW

Elena Novikova 1, Igor Zadorin 1, Elena Kolesnikova 1

1Laboratory of monitoring researches, MOSCOW STATE UNIVERSITY OF PSYCHOLOGY & EDUCATION, Moscow, Russian Federation

Abstract: The law “On education of people with limited health abilities in the city of Moscow” was adopted at a meeting of the Moscow City Duma on April 28, 2010. This law is to solve some urgent problems of people with limited health abilities connected with their education and professional activities. An inclusive education system has become a basis for educational program for children with limited health abilities.

The inclusive education program has been implemented in Moscow and other cities for several years already. More and more “inclusive” schools are being opened in Moscow every year, comprehensive and special schools are being reconstructed, the school program is being modernized. Nevertheless, an important component of the implementation process is still behind the scenes – namely, the perception and reflection of this idea in the minds of the affected groups who are direct and indirect participants of the inclusive education. The study is dedicated to this aspect.

The object of the study were direct participants of the inclusive education introducing process:

- Teachers of secondary schools;
- Teachers of inclusive schools;
- Teachers of special schools and resource centers;
- Parents of children without limited health abilities;
- Parents of children with limited health abilities and disabled children;

The main method of the study was a sample questionnaire of representatives from the listed above groups of respondents from different types of schools. The selection includes schools from all Moscow administrative districts.

The subject of the research were:

- target groups’ awareness, perception, and attitude of the specific model of inclusive education;
- target groups’ potential behavior during the implementation of inclusive education;
- factors influencing on awareness, perception, attitude and potential behavior of target groups during the implementation of inclusive education;

The report presents some results of this study.

SOCIO-PEDAGOGICAL MEDIATION IN SCHOOLS: TWO CASE STUDIES ABOUT NEW SOCIAL ACTORS IN SCHOOLS

Ana Neves Vieira 1, Ricardo Neves Vieira 1

1cid - Centro Investigação Identidades e Diversida, IPL - INSTITUTO POLITECNICO DE LEIRIA, Leiria, Portugal

Abstract: Evermore, there are multifarious functions that are demanded from the teachers. It is expected that teachers have the role of educators, good transmitters of knowledge and values, instructors, animators, mediators, etc.

It’s a fact that nowadays more social than pedagogic solutions are required from the schools. And is the teacher able to handle all of them?

Even if there is a will to embrace it all, it seems doubtful to be humanly possible to perform all those functions with quality and efficiency. Even if the teacher voluntarily dedicates more than is obliged by law, the truth is that they have somewhat specific functions that also demand specific training and consequently may not be viable to be performed by only one teacher, for however global, glocal, multifunctional and multifaceted it may be.

The question is: who are the teachers that have taken on these multifarious roles? How do they do it? Why do they do it? Probably, it’s an impossible mission to teachers without social workers to help in this tasks. What can be, in this context, the role of the Socio-pedagogical mediators and in school? What lessons can we obtain from the experiences and educational projects that contemplate already social mediation and social work in the schools we study in?

we want to present a comparative study, between educational projects of 2 schools where the social work and the social mediation, together with the traditional education, is notorious, to evaluate the potentialities, successes and failures of these projects, so as to study the possibilities for the creation of posts in the schools to the social Workers, teachers and others, as social mediators between school and families, school and communities.

ACCESS TO VOCATIONAL TRAINING IN GERMANY – IN CALM, DYNAMIC, AND TURBULENT TIMES

Paula Protsch 1
Abstract: We currently observe a growing segment of preparatory programmes outside the regular vocational training market in Germany. This so-called “transition system” often serves as a waiting queue – especially for school leavers with lower school degrees (Hauptschulabschluss). Such early discontinuities in careers can have strong negative life course consequences. The regular training market is segmented not only according to gender but also according to school leaving certificates. Mostly, young people with lower school degrees only have access to occupations in the lower segment of the training market. By contrast, those with intermediate degrees (mittlerem Schulabschluss) have access to the whole spectrum of occupations. If school leavers holding the highest degree (Abitur) who are in fact eligible for university choose to pursue an apprenticeship, they normally do so within high status occupations. This paper analyses whether, how, and why access to training in specific segments of the training market has changed for different groups of school leavers over a period of nearly 50 years in (West-) Germany (1954-2002). This period was characterized by massive educational expansion and other cohort-specific developments. Do we find evidence for a real “Upskilling” of occupational demands or do we see a formal “Upgrading” of entrance requirements? To address this question, quantitative analysis employing the “German Life History Study” (GHLS) and the recently completed data set “Working and Learning in a Changing World” (ALWA) is combined with a qualitative content analysis of changes in the federal training regulations including curricula outlines for selected occupations.

EMOTION WORK AND MANAGEMENT IN TIMEOUT SCHOOLS

Susanne Brüggen¹, Carmen Kosorok Labhart²

¹Forschung, PÄDAGOGISCHE HOCHSCHULE THURGAU, Kreuzlingen, Switzerland

Abstract: From a traditional structural functionalist approach schools serve as socializing agency in the life of children and adolescents (Parsons 1981; Dreeben 1980). In school they face universal norms and values, while emotions and affective relations are primarily subsumed to the family system. This perspective seems to be challenged with regard to a new type of special education program called Timeout classes, which has recently become very popular in Switzerland. In Timeout-schools teachers work with students who were referred due to severe behavior problems. We present findings from a recent study that point to a changing role of schools in the modern society.

A recently conducted ethnographic study in Timeout classes demonstrates that emotions and emotion management (Russell Hochschild 1979) play a decisive role in pedagogical settings. Teachers deal with feelings of fear, shame, anger, frustration or other signs of hospitalism. Moreover, the characteristic features of this program are functionally diffuse relations between teachers and students and different types of emotion work (Strauss et al. 1980). “Cooling out” (Goffman 1952) refers to the way in which teachers help new students to cope with the situation, offering them a new framework to redefine themselves and attain a new status. Closely related to that is another strategy that can be called “rectification work” (Strauss et al. 1997: 139f). By that teachers help students (or sometimes even parents) “picking up the pieces” and/or to “recapture poise”, as in the case of resignation, after insults by other teachers or rejections during job search (Strauss et al. 1997: 140). A complementary type of work can be called “degradation work”, including verbal and non-verbal practices of the teachers intended to humble students and give them a hard time. “Biographical work” is done when the teacher collects data from the student’s past, his family life and leisure time in order to set goals and measures (e.g. therapies) for the time of attendance. Trust work is often used with students as well as with parents that are to cooperate. Opposed to that, however, one finds also the open demonstration of mistrust. Aspects of the students’ “emotion management” in Timeout-schools will be presented.

REFLEXIVITY AND PERSONAL AGENCY IN EDUCATIONAL CHOICES: DEBATE AND EMPIRICAL EVIDENCES IN ITALY

Maddalena Colombo³

³SOCIÓLOGIO, UNIVERSITA’ CATTOLICA DEL SACRO CUORE, MILANO, Italy

Abstract: Issues related to educational choices have become recently updated because of the growing incapacity of people to preview and construct satisfying life paths since the earlier ages. From the one side, the wide opening of the set of opportunities enlarges aspirations and investments; from the other side, the decreasing legitimisation of educational supports leads young people and their parents to under-evaluate the importance of a rational choice in education for incorporation into the active social life. The paper deals with the social representation of the topic, drawing from the Italian situation, which is characterized by: - high influence of family background and regional discrepancy on school choice and school selection; - increase of students attending Lyceums and decrease in preferences for Technical Institutes; - gender differentiation in educational motivations and, at some extent, gender segregation in school choices; - gendered trend in school failure and early school leaving; - low rates of attendance in MT&S courses/degrees. Then the paper provides a profile of social actors facing educational choice in turbulent times: uncertainty, reversibility, multiple-choice rationality, contradictory thinking, autonomy-heteronomy dialectic, are their main features. Different sociological perspectives design typical patterns of the decision-making in educational field: structural, not intentional, limited-rationality and reflexivity approach. The paper is developed entirely within the framework of the reflexive approach to social identity (Dewey, 1933; Mead, 1934, and for recent debate Archer, 2007; Donati 2009, Joas 2009), which stresses the individuals’ capacity of making sense of his or her action and decisions. A recent study in Italy carried out on a sample of adolescents and their parents/teachers in five cities provides the basis for empirical evidence on how educational choices are changing nowadays according to new forms of constraint and new degrees of freedom/autonomy which limits or expands the set of opportunities to be caught by young people and their families. Analysis of qualitative data is focused on personal agency that is underpinned to the decision-making, both from the side of youth and from that of their significant adults.

RISKS AT THE TRANSITION FROM VOCATIONAL TRAINING TO EMPLOYMENT

Tanja Buch⁴

⁴INSTITUTE FOR EMPLOYMENT RESEARCH, Kiel, Germany
Abstract: In Germany, the dual system is the most important form of vocational education. It is quite unique to German-speaking countries and was held responsible for low youth unemployment in international comparison and the overall good employment prospects of graduates for several decades. In recent years, however, the vocational training system (VTS) has been confronted with problems at the transition from vocational training to labor market like increasing unemployment rates and an increasing share of young people who start their working biography with an atypical employment like temping – a relatively new phenomenon of labor market entrance that has yet not been a subject of transition research. If graduates have no smooth transition into the labor market this can lead to far-reaching adverse consequences for their further employment history.

Who is confronted with these relatively new uncertainties? Departing from Spence’s signaling theory I conjecture that low schooling and bad grades in the final VTS exams contribute to unemployment and early temping. Unemployment as well as early temping is in turn expected to have negative long-term career consequences. To test these assumptions I use unique data providing information on apprenticeship training and the employment biography of several cohorts of German VTS graduates. The dataset is generated by merging the Integrated Employment Biographies (IEB) of the Institute for Employment Research and information provided by the Chamber of Crafts and by the Chamber of Trade. The IEB include information on periods of (un)employment as well as on individual and establishment characteristics. With data of the chambers, it is supplemented by information on schooling and the quality of vocational skills, including final VTS grades. The results of multivariate regression analyses show that graduates with lower schooling and those with bad grades are at a high risk to become unemployed or to temp after completing their vocational training. I find that those graduates suffer from several disadvantages like low wages or repeated unemployment spells. I conclude that in times of ongoing economic structural change graduates with low productivity in particular have increasing risks at the transition to labor market – even if they are formally well educated. Special needs should be discussed in order to provide those slow learners with better signals.

HIGH SCHOOL PUPILS’ CHOICE ABOUT COLLEGE IN ROMANIA

Valeriu Frunzaru 1, Nicoleta Corbu 1, Remus Pricopie 1, Loredana Ivan 1

1Faculty of Communication and Public Relations, NUPSPA, Bucharest, Romania

Abstract: Romania faced in the last 20 years a dramatically economic change from centralized economy based on heavy industry to an open market economy, in which the tertiary sector has increasingly gained ground. The economic crisis in the last years created the social context in which the choice of a college after high school graduation became a very important career issue.

We focused on three main aspects of this career choice: criteria high school pupils use when they decide to go to college, the advice they take for their decision, most popular fields of education pupils choose for their future.

We conducted a sociological survey on a representative sample (N=2654) of high school pupils from Romania. Findings showed that family, if compared to professors, friends or colleagues, is considered the most important partner to consult, when pupils decide about college choice. The most important criteria when choosing college are: if the college field is generally perceived as career success guarantee, if the academic program includes interesting subject matters of study, low tuition level, and if the college is part of a public university.

Pupils who decided to go to college (65,7%) are especially oriented to the fields of economics, social and political sciences, medicine and low. As a second and third choice, the hierarchy of education fields shows a constant orientation towards economics, social and political sciences, with a new option for humanities.

Gender plays a role in college choice: boys are more interested in exact sciences, engineering and sports, and girls are more interested in humanities, social and political sciences, and medicine.

To sum up, high school pupils from Romania decide their education path taking into consideration what they think to be mainly pragmatic reasons. Nevertheless they choose fields in crisis (i.e. medicine), with an excess of graduates on the market (i.e. low), or which respond to their social or emotional needs (i.e. humanities).

LEARNING FROM MEETINGS AND COMPARISONS: A CRITICAL EXAMINATION OF THE POLICY TOOLS OF TRANSNATIONALS

Sotiria Grek 1

1Centre for Educational Sociology, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: This paper will utilise a political sociology approach for the analysis of the processes and impact of international comparative assessment in the field of education governance in the European Union.

Despite, or perhaps because of ‘subsidiarity’ (the exclusion of education from any harmonization of the laws and regulations of the Member states) (Pepin, 2006), education policy has become the primary field of action assisting in crafting the narrative of Europe, and thus the commonalities of its cultures and its market. This ‘field’ in the Bourdieusian sense, is significant, as it has been one of the prime engines in the project of Europeanisation, albeit lacking the usual descriptors that EU government of other, more mainstream, policy areas would entail. It is a field, where actors compete for power and persuasion –actors that assume different identities and technologies depending on their place, position, professional career, educational background and socialisation. Ultimately, their movement between places, which are real and physical, creates a new space, a ‘European’ education policy field, inhabited by the emergence of a European class of (education) actors.

The paper will focus on an analysis of this ‘field’, by exploring the development of the OECD Programme for the International Assessment of Adult Competencies (PIAAC). The OECD has been a prime mover of education governance in Europe, mobilizing a number of policy makers, experts, research agencies and ‘users’ in the building of international comparative assessments with an explicit objective to inform new policy directions in the OECD countries/ EU member states. Although the European Commission has been endorsing the OECD work in the past, the development of PIAAC has seen a far more enthusiastic collaboration between the two international organizations, translated in both substantial financial backing but also the sharing of expertise. How has this come about and what does it mean for the analysis of Europeanisation?
CERTAINTY AND UNCERTAINTY IN ACCESS TO HIGHER EDUCATION THROUGH THE PORTUGUESE M23: TRAJECTORIES AND LIFE PROJECTS

Sara Mónico Lopes

1Research Centre for Identity(ies) and Diversity(ies), POLYTECHNIC INSTITUTE OF LEIRIA, Leiria, Portugal

Abstract: In times of uncertainty across Europe and the world, is emphasized increasing skills in the context of lifelong learning, knowledge is the key for the development (Toffler, 1995). The need of the European population to increase their academic qualifications to promote a more competitive, more developed society (European Commission, 1995), led to adoption of some policy measures by some European Union member states, as was the case in Portugal. At the beginning of the century, Portugal has introduced new programs to increase the qualifications of your adult population: New Opportunities Program, Technological Specialization Courses, and enabled new public access higher education through new entrance exams, Over 23 years old, prepared by each institution of higher education, where in addition to the scientific knowledge they have to show, the experience has become an important factor in evaluation.

The bet has focused, thus, on lifelong learning, recognizing and validating skills, knowledge of life.

Based on the PhD research on social trajectories of students who enter higher education through the tests Over 23 years at the Polytechnic Institute of Leiria, we intend to present the views of some students, adults, on their return to school after more than a decade away from the banks of the school, and understand how these uncertain times interfered with his decision to return and what they project for the future, he also uncertain, after graduating.

"It was an adventure, because I went out in the bottom of pots and pans, which is the term, for a test well for higher education." (Madalena, 2010)

"I got a lot going on here without knowing what it was, what I expected. Today I am really enjoying the course. It changed me a lot. I think when I joined here was a child at 42 years old, still attached to repressions, the frustrations, grievances, the course helped me a lot, there was much matter, many things I learned, I’ve read that helped me grow as a person, even in dealing with others, helped me a lot!" (Angela, 2010)

FROM EDUCATIONAL SUCCESS TO GETTING OUT OF THE GHETTO

Adriana Aubert 1, Emilia Aiello 2, Ana Vidu 1

1Sociological Theory, UNIVERSITAT DE BARCELONA, Barcelona, Spain
2Business Economics, UNIVERSITAT AUTÓNOMA DE BARCELONA, Sabadell, Spain

Abstract: Nearly 16% of European population is at risk of poverty. After the economic recession this situation has been worsened for many people, and at the same time effectiveness of many traditional anti-poverty actions has been questioned. In this context, the EU 2020 Strategy sets as one of the main goals to decrease down to 20 million less people at risk of poverty. Many of this people live in areas placed in the outskirts of most of the European cities, neighbourhoods known as ghettos that contain high concentrations of poverty and an intersection of other factors of social exclusion.

Education is considered to be one of the most important driving forces behind change. However, data reveals that despite having been awarded with significant financial resources through funding programmes, these types of neighbourhoods have rarely managed to reverse their situation of exclusion. Reproductionist perspectives in Education have denied the capacity of school to reverse this situation. Currently, great progress has been achieved both in research as in concrete experiences that prove how Education can contribute to break the vicious circle of poverty. The European Commission has recognised the importance of improving the efficiency and the equity of the educational systems in interaction with other economic and social interventions to promote social inclusion. This paper will present some results from INCLUD-ED, the research project of the highest scientific rank and with most resources dedicated to the study of school education in the Framework Program of the European Union. It identifies the successful socio-educational actions which can contribute to overcome poverty in communities within a context of social exclusion. Through the paper we will deepen into the case of a highly socially degraded neighbourhood in Spain where the socio-educational actions that have been implemented are proving to have a positive impact on the reduction of poverty in the area. To end with, we intend to point out the possibility of transferring the identified successful actions to other disadvantaged areas in Europe.

STUDENTS’ LIFE VALUES IN FRANCE AND RUSSIA. THE PLACE OF EDUCATION IN THE VALUE HIERARCHY.

Elena Stepanova 1, Galina Saganenko 2, Alex Geger 2

1Baltic State Technical University “VOENMEH”, 2Institute of Sociology of the Russian Academy of Sciences, Saint-Petersburg, Russian Federation

Abstract: The current situation and the future perspectives of the society depend on the basic values which the younger generation cultivates in itself. However the problem of revealing the values and their measuring consists in that the standardized approach is usually used, which shows very similar results with the passing years, as well as in the values pack of different social groups. We offer a more relevant method constructed on the independent answers of respondents.

The method. The study method is one based on the system of open-ended questions. This type of research represents a qualitative-quantitative technology. Here the respondents due to answering give to the researcher “a partial conceptualisation” of the social object under study. Then the researcher examines and receives the substantial elements of the objects, their “weight” in comparative context and degree of their importance.

Our data base. Here will be represented the results of our empirical qualitative study on students’ life values which was conducted in 2009-2010 among the students of French and Russian universities. For better comparison we took a sample of students of two departments – History of Arts and Informatics – in two Russian and two French Universities.

The used technique gives three types of results:

1. Revealing the most relevant values for any social groups, for people from different living conditions (or even different points of social time);
2. Revealing different senses of the same named values for respondents due to their explanation;
DIVERSITY AS AN EMPHASISED VALUE IN THE EUROPEAN HIGHER EDUCATION AREA

Idilko Hrubos

1 Institute of Sociology and Social Policy, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: Because of changes that have taken place in the 20th century in the European higher education systems, differentiation and diversity have received special attention. This has appeared in the social composition, motivation, previous education, living conditions of students, in the demands of the labour market and in the expectations of the society. Higher education reacted to this challenge in many areas: the institutional network, the professional profile of institutions, the declared mission, character of educational programmes becomes heterogeneous. Parallel to diversification homogenisation has taken place. The implementation of the accreditation system, the project-competition system and the creation of the European Higher Education Area (EHEA) was in the background of this phenomenon. Theoretically the EHEA affected in the direction of homogenisation, causing further differentiation at the same time. Actually the EHEA counsels differentiation as a special value, while the interpretation and handling of the new situation demands solutions that were not known before. The paper deals with the theoretical and methodological aspects of the problem. It presents the Hungarian research that leads to the mapping of higher education systems according to the European mapping system. The European project map's higher education institutions in 14 dimensions based on 30 indicators. It is largely based on objective data that are available in official data bases. A further source is the homepages of institutions, and in last case scenario we question the institutions. The most problems accrued in the case of so-called third package of missions, because this does not have enough traditions yet (regional activities, responsibilities, cultural and social services).

GOVERNING AND GOVERNANCE IN HIGHER EDUCATION IN TURBULENT ENVIRONMENTS

Magalhães António, Amelia Veiga, Filipa Ribeiro

1 CIPES, UNIVERSITY OF PORTO, 2 AIES, 3 CIPES, CIPES, Porto, Portugal

Abstract: Governance as a research field has been hijacked by managerial perspectives and separated from broader sociological analytical frames. This paper aims at contributing at looking at governance instruments beyond the technicality that the dominant approaches assume in this field (e.g. New Public Management, Network Governance, New Governance). It intends to do so by analysing the regulation impact of governance reforms on the autonomy of universities with regard to funding and curricular reorganization. Two levels of analysis are considered: the European Union (EU) efforts towards the European governance aiming at providing more coherence and convergence in European higher education and the national agendas dealing simultaneously with these efforts and their domestic issues related to institutional autonomy of universities.

The regulation efforts undertaken at EU and national level reflect a trend towards meta-governance, i.e. the process of steering developed governance processes. Institutional autonomy was widely assumed as a regulation instrument to political steer public systems and institutions, aiming at implementing governance models that might adequately respond to competitive, ever moving and turbulent environments. While there is a wide consensus about the attribution of autonomy to universities and the need to increase self-governance, governments need to ensure that their goals are actu-
ally pursued, enhancing their regulation frames. The main question in this paper is how European reforms, namely the funding and curricular reforms, interact with the national contexts of the select-
ed countries participating in the Eurohesc -TRUE project (France, Germany, Italy, the Netherlands, Norway, Portugal, Switzerland, and UK) and how these reforms might condition or enhance the autonomy of universities.

In the funding reform there are national variations and meta-
governance efforts inducing common institutions’ performance and organizational behaviour. As to the curricular reforms there is also the reinforcement of the mechanisms of meta-governance while favouring the autonomy of HEIs. Under the framework of Bologna the changes in the degree structure is an opportunity to understand how far these contradictory forces operate in the selected coun-
tries with regard to institutional autonomy.

REFORM OF HIGHER EDUCATION: BETWEEN THE REAL AND THE PROPOSED
Gordana Dragomir Vuksanovic

Abstract: The reform of higher education is one of the prerequisites of both more extensive and more contentful communication with international community, as well as of surpassing economic insta-
\ldots\end{quote}

Is it possible to realize the mentioned tasks in the existing socio-
economic context of The Republic of Serbia? The reform of higher education is realized together with two significant processes: a) ownership transformation of economic and educational system and b) adjustment of educational institutions to market economy. As one of the consequences of economic transformation, there ap-
ppears the increase in the number of the unemployed. Analysis of
\ldots\end{quote}

The goal of the paper is to point to possibilities, from the students’ viewpoint, of innovating the curricula and syllabi, that is to: a) the inclusion of students into the reform; b) the influence of financial possibilities of the students, their families and institutions of higher education on the quality of the reform of higher education; c) the level of professors’ and assistants’ competence for the reform of higher education.

The basic source of data is the empirical research carried out in the period from 2006/2007 to 2009/2010 academic year among the students of sociology at The Faculty of Philosophy in Novi Sad. The data were collected using the semi-structured interview, near the end of each academic year. The application of a longitudinal re-
\ldots\end{quote}

search enabled to get a comprehensive insight into the attitude of the students to the innovated curriculum and syllabus.

GRADUATE EDUCATION IN FRANCE. CHALLENGES AND POSSIBILITIES FOR NEW DOCTORS
Judith Perez-Castro 1, Anita Hirsch 2

1Department of Education and Arts, JUAREZ AND AUTONOMOUS UNIVERSITY OF TABASCO, Villahermosa, Tabasco, 2Institute for Studies in University and Education, National and Autonomous University of Mexico, Distrito Federal, Mexico

Abstract: The paper presents the result of a research whose main interest was to analyze doctoral programs and their impacts on the professional trajectory of young researchers. Our theoretical framework was based on the sociology of education with authors such as: Musselin (2001), Galderisi (2007), Beaud (2007), and Jourde (2007) among others. As part of our paper, we want to dis-
cuss the following aspects:

a) The consequences brought about by program integration process carried out by French higher education system. Especially, the gradual disappearance of intermediate levels (1st and 2nd cycle) that represented professional options to students before reaching the doctorate.

b) The problems introduced to graduate programs, because more people want to be enrolled in a master or doctorate, even though, institutions do not have appropriate and enough conditions to re-
\ldots\end{quote}

d) Finally, we have the problem of financial support. Resources have had to increase not only for facing the growth of students’ demand, but also because the graduate formation, especially the doctorate, needs financial support for maintaining the program., paying the salaries and employment benefits of a tenured and high-
y productive staff, fostering the mobility of doctorate students towards other higher education institutions and sectors, and the sponsorship for preparing the thesis.

In short, we can say that the reorganization of the higher education has placed the French system in a stronger and more open position compared to some of its associates from the European Union. But, at the same time, this has caused several problems inside the insti-
tutions and the opposition of those participants or groups who have been more affected by these reforms.

EDUCATION ON THE MOVE: SCIENCE, TECHNOLOGY
AND THE AMBIGUOUS ROLE OF RESEARCH
Stefan Klein 1, 2*

1UNIVERSIDADE DE SAO PAULO, Sao Paulo, 2IFG, Formosa, Brazil

*Corresponding author
Abstract: This presentation focuses on the interaction between higher education and science, trying to critically assess the problem posed by the science & technology (or research & development) discourse when it enters concrete institutional organization. I depart from the viewpoint that the connection between the type of qualification and (economic) development has been increasingly emphasized, usually on a twofold argument: that society as a whole needs better prepared working force while at the same time countries should seek a scientific trajectory to foster technological progress and subsequently or simultaneously achieve socio-economic development. The way has been led especially throughout the increasing importance of innovation in the process of scientific practice, evaluation and funding, virtually detaching discussions surrounding the relationship of “basic” (pure) science and what became known as its “applied” form.

The biggest issue I shall concentrate on is how (national or regional) educational systems respond to these demands: in Brazil there has recently been created a new hybrid institution called “Federal Institute of Education, Science and Technology” (Instituto Federal de Educaçao, Ciencia e Tecnologia), that is responsible for all levels of education, departing from upper classes of basic schooling up to post-graduate titles, steered towards technological preparation and teacher education; parallelly in Europe we are able to see some effects of the Bologna process aiming a similar strategy by arguing favorably to the central part played by knowledge aside lifelong learning and flexibility in present society, stressing quantity by contrast with quality. My hypothesis to be discussed in this paper is that the broader role of education as formation of the individual and socialization is being pushed aside by this immediate and rather instrumental approach, making a significant part of universities and institutes unfit for both, since a scientific (i.e. questioning and rigorous) viewpoint is fundamental to any serious reflection.

ADJUSTING HIGHER EDUCATION TO GLOBAL EDUCATIONAL DEMANDS: A DISCUSSION
Jonas Stier1
1Department of social psychology, MÅLARDALEN UNIVERSTY, SKÔVDE UNIVERSITY, VÄSTERÅS, Sweden

Abstract: Globalisation, the internationalisation of academia as a whole, and the Bologna-process have recently placed European higher education in a state of change. By critically reading the discourse, three intrinsic internationalisation ideologies (idealism, instrumentalism and educationalism) in higher education have been identified. By drawing from the objectives and ideals of these ideologies, and using concrete examples, this article argues for a shift in focus and also identifies desirable outcomes of internationalised education – where special attention is paid to different aspects of intercultural competence. It is concluded that a somewhat new approach to internationalised education will further enrich higher education, contribute to students’ self-development and enable them to acquire adequate intercultural competencies for the future.

Keywords: Higher education, internationalization, ideology, intercultural teaching, intercultural competence

TROUBLED IDENTITIES IN TURBULENT TIMES: DOCTORAL STUDENTS UNDER “BOLOGNA”
Lea Sgier1
1Political science, CENTRAL EUROPEAN UNIVERSITY, Budapest, Hungary

Abstract: Under the influence of the Bologna Agreements and of an increasing international competition, the European universities have been undergoing rapid changes that affect students at all levels. This paper looks at the experiences of doctoral students: they are exposed to increasing, and increasingly conflicting, requirements. They are supposed to ‘perform’, deliver and publish, whilst also diversifying their portfolio of competences, be flexible and mobile, and actively engage in a variety of activities – all within ever tighter deadlines, and without necessarily benefiting from adequate supervision and financial support. The paper interrogates the situation of PhD students in the social sciences from their own perspective. It aims to shed light on the tensions that characterise their grappling with new professional and (old) social constraints, their socialisation into young professionals and their evolving identity and social status. Through their testimonies, I will question the current changes in opportunity structures and academic norms of “excellence” as to their consequences for academic freedom, gender equality and equality of opportunities, both within and across institutional and national contexts.

The article is mainly based on a series of texts written by doctoral students in social sciences from a variety of countries who participated in a summer school in England, and on a smaller series of similar texts written by PhD students in Hungary. Subsidiarily, it draws on the author’s extensive experience in training, advising and supervising graduate and doctoral students in Western, East Central and South-Eastern Europe.

DIVERSITY VERSUS EQUALITY? EXPERIENCES IN TERTIARY EDUCATION IN EUROPE
Agnes Földhazi1
1HETS - HAUTE ECOLE DU TRAVAIL SOCIAL, GENEVE, Geneve, Switzerland

Abstract: How do educational systems react to turbulent times, with regard to burdened social relations? We observe that in the era of globalisation, also characterized by a major economic crisis, institutions of tertiary education may serve as a laboratory for a new paradigm of equality, taking into consideration diversified and heterogeneous populations, among both students and staff.

This paper is based on a research project currently carried out under the auspices of the Gender Equality Committee of the Office for Professional Education and Training, itself part of the Federal Department for Economic Affairs in Switzerland. The project analyses the diversity policy in tertiary education, especially the case of selected universities throughout Europe who have extensive experience in developing and implementing diversity policies. The research investigates and documents diversity legislation, policies and practices in Switzerland, Germany, the UK and Norway, completed by findings from France. It uncovers a gap between the applied policies (mainly aiming - especially in Switzerland - at gender mainstreaming) and the personal sensibilities of the concerned decision makers.

What categories of diversity (or, to put it differently, of discrimination) are to be considered? How to combine the objectives of gender equality and diversity? How to develop a potential integrative solution, incorporating key elements of diversity management...
while respecting the (historical) role of gender equality? To answer these questions, we will tackle different possible responses from Europe, highlighting the important impact of distinct socio-historical backgrounds.

HIGHERCultEDUCATION AND THE CRISIS OF THE KNOWLEDGE ECONOMY: IMPLEMENTATION OF THE BOLOGNA PROCESS IN TURKEY

Funda Karapehlivan Şenel
1Sociology, MARMARA UNIVERSITY, Istanbul, Turkey

Abstract: While the Bologna Process has aimed to create the European Higher Education Area by making academic degree standards and quality assurance standards more comparable and compatible throughout Europe, in particular under the Lisbon Recognition Convention, its implementation has taken several forms at the national level. The national implementations of the Bologna principles, such as mobility and the comparability of student performance and qualifications and providing better chances for the graduates within the labour market, often has the opposite effect to that intended. Turkey has become a party to the Bologna Declaration in 2001 and thus started its implementation process. This paper is going to discuss the impacts of the Bologna process on the universities in Turkey and the increasing hierarchization between the central and the newly established peripheral universities. One of the aims of this paper is to question the consequences of this hierarchization on the labour market and youth unemployment.

EDUCATIONAL STRATEGIES AMONG DANISH UNIVERSITY STUDENTS FROM ACADEMIC AND WORKING CLASS BACKGROUNDS.

Jens Peter Thomsen1, Martin Munk2, Misja Eiberg3, Gro Inge Hansen4
1RUC, Roskilde, 2CMR, AAU, 3KU, 4DPU, CPH, Denmark

Abstract: A number of recent European studies show that while overall access to higher education (HE) remains unequal (albeit diminishing), participation has widened in certain types of universities and fields of study. At the same time qualitative studies show that working class students tend to be more risk averse when it comes to job security and the economic costs of studying. They lack a sense of belonging to HE, and they identify with their working class heritage.

We investigate these differences in Denmark; an interesting case because HE students receive government grants, have no tuition fees, and because of the historical dominant discourse of a social democratic welfare regime where the notion of equality in the education system holds a central place.

As part of a larger research project addressing widening participation in Higher Education, we asked the question: how and to what extend are Danish students’ choice of HE, their educational strategies and sense of belonging classed? We interviewed 60 students from six different HE programs, focusing on students with different class backgrounds.

We find that the rather explicit accounts of class identity apparent in many studies, are given more subtle expressions in the case of the Danish working class students. Further, risk assessments addressed only the utilitaristic value of the programs studied, and if they lead to secure and well-defined job positions – economic obstacles (either in upbringing or in the present situation), did not seem to play any role for HE choice for any of the student profiles – working class or academic.

An important part of this study has also been to point to the importance of differing between HE programs. Education strategies vary significantly between programs, and it is of central importance to analyze how different class background intersects with choice of specific HE programs in unique ways. Differing not only between class backgrounds, but also between HE programs, allows us to see how class reproductive strategies work in a Danish context, and it allows us to see what characterizes the programs that appeals to working class students – ultimately pointing to policy initiatives for widening participation in HE.

MATURE LEARNERS IN IRISH THIRD LEVEL EDUCATION

Bernadette Brereton1
1Department of Humanities, DUNDALK INSTITUTE OF TECHNOLOGY, Dundalk, Ireland

Abstract: The global economic crisis resulted in Ireland’s economic and financial security being eroded in late 2008 when a decade-long financial boom built upon property price inflation and low interest rates was blown apart. Ireland must now implement EUR15 billion in budget cuts over the next four years to attempt to repair the damage caused to the public finances by an on-going banking crisis which culminated in November 2010 with a EUR85 billion international rescue operation.

While some EU countries (e.g. France and Spain) are facing this period of uncertainty by increasing their funding in education, almost half of the countries in Europe (10 of a total of 21 countries) have implemented cuts in education as a result of the crisis. These cuts are in most cases as a consequence of declining tax intake and reduced government spending in particular areas of education, both in terms of infrastructure and human resources (Maes, 2011, EUA Report 2011). In Ireland, cuts in education have taken place at all educational levels with a 9.4% cut in 2010 to be followed by a 7% cut in universities’ grant for 2011. In addition, the capital grant has been halved for 2011 which will greatly reduce the amount of funding available for infrastructure maintenance (EUA, 2011). Pay roll costs, administration costs and capital costs have all been reduced in 2010 with the result that Ireland now has a lower than average investment in education compared to other OECD countries (4.6% of GDP compared to an OECD average of 5.8%). (Conway, 2010)

Perhaps most damaging of all is the fact that such cutbacks are occurring at a time when the economic crisis has increased demand for third level places. Overall, applications for higher education places has shown a marked increase with applications by mature students up by over 30% (Education Policy Committee Report, Department of Education and Science, 2009). Deteriorating opportunities for jobs are a significant contributory factor in the educational choices being made by learners with an increase in the demand for postgraduate training places. This paper examines the effects of such large increases in the numbers of mature students participating in third level education in Ireland, considering the nature of the learning experience of the students themselves and any changes to the learning environment which may result from the increased presence of mature students in third level education.
THE PUBLIC UNIVERSITY IN TURBULENT TIMES: EFFECTS OF THE ECONOMIC CRISIS ON FACULTY AND STUDENTS AT CALIFORNIA STATE UNIVERSITY NORTHRIDGE

David Boyns, Amy Denissen, Alexandra Gerbasi

1Sociology, CALIFORNIA STATE UNIVERSITY NORTHRIDGE, Northridge, CA, United States

Abstract: This study investigates the impact of the 21st Century economic crisis at California State University Northridge (CSUN). CSUN is the 4th largest university in the 2nd largest public university system in the USA, with 1,600 faculty and 36,000 students annually. The study focuses upon the ways that faculty and students have been affected by the economic crisis at CSUN (25% reduction in its operating budget), and how the budget cuts have changed how the CSUN community perceives the public university and its future. The local impact of the economic crisis is considered in relation to long-term, international trends in the funding and governance of public universities (like the recent ethos of “deliveryology”). The study examines faculty and student perceptions of declining public support for higher education, trends toward privatization and corporatization, and the impact of these changes on educational access and quality.

Based on qualitative focus groups (N=36) and quantitative questionnaires (N=1248), the study examines how CSUN faculty and students have interpreted and experienced the budget cuts. Overall, the budget crisis has had a profound impact on the members of the CSUN community. The paper identifies four primary themes. First, faculty and students believe that public higher education in California is adopting a corporate model of education. Second, many raised issues of procedural justice about how the budget cuts were planned and implemented. Third, faculty and students agreed that the cuts had a negative impact on the quality of education. Fourth, the cuts were perceived as making the university less affordable and accessible, particularly for underrepresented students.

This investigation points to a clear concern among faculty and students about the long-term nature of the university and their perceptions of an institutional shift in the CSU system. Further, faculty and students feel they have little agency in institutional decision-making and administration. In addition, they perceive waning public awareness of the university that coincides with the decline in financial support. The impact on the quality of education is reflected in their concerns about larger class sizes, fewer course offerings, and higher tuition. In general, respondents fear that the public university in California has become less accessible, less affordable, and less public.

THE STRATEGIES OF BUSINESS EDUCATION STUDENTS AS A PREDICTOR OF INDIVIDUAL PERCEPTIONS OF SUCCESS AND OF BUSINESS ETHICS (CASE OF RUSSIA)

Natalia Soboleva

1Sociology, NRU HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: Nowadays society is rapidly changing leading to amounting uncertainty in many spheres of life including relevance of education to changing labour market demand. Knowledge and skills tend to get obsolete very quickly; hence, the concept of life-long learning becomes of increasing importance. This trend is worldwide and Russia is not an exception. Moreover, in Russia market transformation initiated radical shifts in labour demand making obsolete a large amount of accumulated human capital and exacerbating shortage of modern managerial skills. The shift in demand provoked rapid expansion of MBA programs. Today many people go for MBA to retain labour market competitiveness and improve career prospects. The objective of this paper is to reveal relation between students’ strategies in business education, on the one hand, and their perceptions of business success and business ethics, on the other. A survey of MBA students (222 persons) I have conducted in three well-known business schools serves as empirical base. I embark from ‘plethora of capitals’ concept. In this framework, business education is regarded as investment in different forms of capital (human, social, symbolic). Variation in individual investment strategies (preferred capital mix) is an indicator of differences in overall motivation for doing business. With the help of cluster analysis, six groups of students were pointed out. ‘Multi-investors’ are mostly inclined to invest into human capital but other forms of capital are also of interest to them. ‘Professionals-careerists’ are characterized by orientation on human and symbolic capital and lack of interest in social capital. ‘Sociable professionals’ tend to contribute to social and to human capital accumulation but not to symbolic. They do not believe MBA diploma as such would improve labour market chances. ‘Flexible professionals’ look at MBA as a means to diversify human capital stock in order to change their field of activity. ‘Careerists-pragmatists’ look for improving overall labour market competitiveness. ‘Sociable pragmatists’ are mainly concerned with social and symbolic capital and with improving chances in the labour market. In the paper the socioeconomic characteristics determining group belonging and intergroup differences in perceptions of success, attitude to business ethics and socioeconomic characteristics are analyzed in detail.

VARIETIES OF CAPITALISM AND HIGHER EDUCATION GRADUATES’ COMPETENCIES IN INTERNATIONAL COMPARISON

Michael Hoelscher

1Max-Weber-Institute of Sociology, UNIVERSITY OF HEIDELBERG, Heidelberg, Germany, 2Department of Education, University of Oxford, Oxford, United Kingdom

Abstract: The hypothesis of the presentation is that differences in national higher education (HE) systems can, at least partly, be explained by recourse to the Varieties of Capitalism-approach (Hall & Soskice 2001) with its notion of “complementarities” between different societal subsystems.

Starting from a description of the economic systems of Britain (Liberal Market Economy) and Germany (Coordinated Market Economy), a first step will be the deduction of hypotheses of how the HE systems of the two countries should differ in their “educational output”. In a second step these hypotheses will be tested with empirical data from the REFLEX-project on study experiences and competencies of graduates. The findings show that graduates of the two countries in fact have strengths in those skills that match the needs of their respective variety of capitalism.

A third part of the presentation will discuss implications of these findings for the Varieties of Capitalism-approach, comparative research in HE systems, and for current HE reforms.
P.S. This presentation might also be relevant for the RN09-Economic Sociology, but I would prefer to present in RN10-Sociology of Education.

NEW ORGANIZATIONAL FORMS OF HIGHER EDUCATION IN RUSSIA

Svetlana Dushina¹, Nadezda Ashcheulova¹
¹Centre for Sociology of Science&Science Studies, RUSSIAN ACADEMY OF SCIENCES, IHST, St. Petersburg, Russian Federation

Abstract: The paper will analyze new forms of research work and teaching arrangement, which are practiced in the higher education nowadays. The theme is exceptionally pressing and controversial. Application of these new forms is aimed at growth of quality of teaching as well as entrenchment of unified educational standards required by Russia’s entrance into the Bologna Process.

Among new forms of higher education arrangement the following should be listed:

- Firstly, differentiation and integration of universities. Peculiar features of national and federal research centers will be demonstrated in course of the presentation. Nowadays Russian universities should combine not only educational activity but also research work and innovating;
- Secondly, active use of bibliometry. Citation index and number of publications in general of scientific works indexed by the base Web of Science are recognized as the key criteria of scientific efficiency. By the end of 2010 rating of the scientific and publishing activity of Russian higher educational institutions has been elaborated. The base for the Russian index of scientific citation (RISC) has been created. Degree of the high school research workers adaptation to the new working conditions will be stated and analyzed in the paper based on the research conducted by the Centre for Sociology of Science of IHST of Russian Academy of Sciences;
- Thirdly, alteration of science policy with regard to scientific intellectual mobility. The report will present programs prepared by the Ministry of Education and Science of the Russian Federation and aimed to intensification of intellectual mobility and formation of pendulum mobility. The Federal Program “Scientific and scientific-pedagogical personnel of the innovative Russia (2009-2013)” will be handled with particular care. Action item 1.5 is entitled “Pursuance of research by research teams under the supervision of visiting fellows”. It’ll be shown that this Program forwards integration of Russia into European system of education and scientific research and solves important problem of bringing up young scientists of “next generation” involved in global scientific networks.

In conclusion efficiency of new forms of research work and teaching arrangement in Russian universities will be estimated and some suggestion in the field of educational management will be enunciated.

HIGHER VOCATIONAL EDUCATION IN RUSSIA: QUALITY PROBLEMS DURING THE TRANSFORMATION PERIOD

Irina Vorobeva¹
¹sociology, RUSSIAN STATE UNIVERSITY FOR THE HUMANITIES, Moscow, Russian Federation

Abstract: In the last decade in Russia has increased demand for higher education. Meanwhile, exactly what higher education is becoming more affordable, the development of the education market, competition between universities actualize quality problems in Russian education.

That is why universities before the difficult task of training, not only has a wide range of skills, range of knowledge and skills, but also the ability to bring perceptible results of their work future employer.

In this regard, questions arise. Can a traditional university education to prepare specialists to meet such high demands? How does the inclusion of the Bologna process and the transition to new educational standards for the quality of education? And that, ultimately, will determine the quality of training?

Quality of vocational education multifaceted category in which are reflected according to educational regulations and standards, a focus on the desired outcome of education, the requirements for level of training, etc. We believe that an integral index of quality specialist can perform a comprehensive assessment of vocational education in the following areas:

1. Qualitative characteristics of students. The level of training of students (pre-university level, school education, motivation for learning and a focus on educational and professional activities, developing social skills, adaptability, mobility).
2. The quality of educational services, the education system as a whole. (Qualification and level of training of teaching staff, the quality of the forms and methods of training and education, the quality of the resource to ensure the educational process, the level of scientific research institution).
3. Effectiveness of education. Relevance of professional education with modern requirements, norms and standards of the profession, the degree of mastery of studying the necessary competencies.
4. Subjective assessment of quality of higher education students and their parents, satisfaction with the educational process.
5. Evaluation of the quality of vocational education on the part of employers, the demand for graduates in the labor market, professional achievements and success of graduates.

PUBLIC ENGAGEMENT OF HIGHER EDUCATION INSTITUTIONS: EVALUATION METHOD AND CRITERIA

Andrea Vargiu¹
¹Dipartimento di Economia, Istituzioni e Società, UNIVERSITÀ DEGLI STUDI DI SASSARI, Sassari, Italy

Abstract: Higher Education Institutions (HEIs) play a key role in society through teaching and research. It is often said that the combination of both shall converge towards a "third mission" which results in a strong contribution to society’s welfare. In "turbulent times", such a mission becomes crucial and therefore calls for greater and more effective engagement of HEIs’ activities with social problems and needs.

The paper will present results from an ongoing project funded under the 7th Framework Programme named PERARES – Public Engagement with Research and Research Engagement with Society.
A review of instruments for evaluation of different types of public engagement in science and technology developments will be shortly undertaken.

Based on that review, a framework for evaluation of HEIs’ publicly engaged activities will be discussed, with a particular focus on effectiveness and equity. Criteria and indicators of effectiveness will mainly concern public influence on the development and application of research and educational activities. From the perspective of equity, the discussion will consider, among other things, the forms of interactions between relevant stakeholders and HEIs.

On such basis, the paper will present a scheme of indicators for evaluation and draft guidelines for HEIs’ publicly engaged activities evaluation.

COMBATING ETHNIC DISPARITIES: DIFFERENT APPROACHES OF EXTRACURRICULAR ACTIVITIES AT ALL-DAY SCHOOLS IN GERMANY

Alexa Meyer-Hamme1
1BIGSSS (UNIVERSITY BREMEN & JACOBS UNIVERSITY), Bremen, Germany

Abstract: This PhD-project seeks to explore if and in how far extracurricular activities at German all-day schools benefit disadvantaged migrants in terms of social and cultural capital. Compared to traditional half-day schools, all-day schools are expected to better reduce social and ethnic disparities by integrating students in extracurricular activities (e.g. lunch, leisure time programs, supervision offers) and providing them with specific elements of social and cultural capital that they lack in their (often) unstable family setting and peer group. Nevertheless, there is only little evidence for the normative and compensatory function of all-day schools.

Two underlying questions are being addressed in this research: (a) How do all-day schools conceptualize and implement extracurricular activities, in particular with regard to disadvantaged groups (e.g. students with a migration background)? And (b), how do disadvantaged students with a migration background perceive and evaluate the extracurricular offers at all-day schools, especially with regard to their set of social and cultural resources? By this means, this research also aims to better understand the interplay between institutional concepts and the students’ perceived impact.

To provide an answer to the first research question (at the institutional level), an analysis of mission statements and interviews with the heads of school of the entire population of all-day schools in Bremen (N=27) have been conducted. Second, the students’ perception will be captured by 40 semi-structured interviews with students in the 6th grade from diverse social and ethnic backgrounds (maximum variation sampling) and from four schools (sampled on predefined criteria). The focus is on the perceived quality of the schools’ offers and on the acquisition of social capital (peer group formation across social/ethnic origin) and cultural capital (e.g. social skills, cultural knowledge and teamwork abilities).

Within the presentation I plan to emphasize on empirical results of both the school analysis and the student interviews.

SCHOOLS AS INTERETHNIC MEETING PLACES? THE IMPACT OF ETHNIC SCHOOL DIVERSITY ON STUDENTS’ SOCIAL LIFE.

Jannick Demanet 1, Orhan Agirdag 1, Mieke Van Houtte 1
1Department of Sociology - Research group CuDOS, GHENT UNIVERSITY, Gent, Belgium

Abstract: Growing immigration and ethnic diversity is a worldwide phenomenon and our schools provide increasing opportunities for contact between individuals from different ethnic groups. Scholars from different fields focusing on the consequences of such increased ethnic diversity either advocate a contact perspective - suggesting that contact between people from different ethnic backgrounds results in more cross-ethnic familiarity - or a conflict perspective - stating that increased interethnic contact yields inter-ethnic conflict.

Recently, a third perspective was proposed, namely the constrict theory, which states that increased ethnic diversity in a context does not result in more relations – be it conflictual or friendly - between individuals from different ethnic groups, but in fewer relations in general. It is stated that ethnic diversity reduces social solidarity and interpersonal bonding, and yields more social withdrawal from both in-group and out-group members. Although research at the neighborhood level seems to support this line of thinking, the question remains whether constrict theory is applicable to all levels of analysis: choosing a higher or lower level of context might imply different results. Yet, the theory remains to be tested in a multitude of other contexts.

In our contribution, we provide a first analysis of the validity of the constrict theory in the school context, expecting that ethnic school diversity yields fewer friendships, lower peer attachment, and more social withdrawal. Moreover, we investigate whether these results differ for natives and immigrants, and whether the associations hold when controlling for the school’s socioeconomic situation. Multilevel analyses on data from the Flemish Educational Assessment, consisting of 10,500 native and 1,259 immigrant students in 83 Flemish schools, suggest that there are differences between natives and immigrants. For immigrants, school ethnic diversity did not impact students’ number of friendships, peer attachment, or social avoidance behavior. For natives, on the other hand, ethnic diversity yielded fewer friendships and peer attachment. However, further analyses suggested that this was due to the school’s socioeconomic composition. As such, we find no evidence that eventual ‘constrict’ behavior by students would hinder the role of multiethnic schools in integrating students from different ethnic groups.

SEPARATE AND DIFFERENT: STUDYING NGOS PROGRAMS OF INTERCULTURAL EDUCATION IN PUBLIC SCHOOLS IN MADRID

Eva Martín Coppola 1
1Centro de Estudios Avanzados en Ciencias Sociales, INSTITUTO JUAN MARCH DE ESTUDIOS E INVESTIGACIONES, Madrid, Spain

Abstract: How do education systems react to migration? The concentration of foreign students in public schools provides scenario for the emergence of new institutional and social problems -stigma and discrimination of foreign students-, new models of socialisation in young people -relationships between minorities-, and new educational challenges -educational equality of opportunity in a multicultural society -. The schools facing these new problems to a greater extent have arisen as a major concern and accordingly become social laboratories.
The lack of social cohesion in schools created by this new juncture has led to new measures, among which the implementation of NGO-driven intercultural programmes. The involvement of these social actors in school life, heretofore relative outsiders of public education, appears as a new phenomenon, and an interesting socio-political experiment, namely, the progressive social construction of ethnic categories in schools by non-state actors. Why are NGOs intervening in schools? What are they doing? What results do they obtain? This study proposes to address some of these questions based on qualitative data conducted by extensive fieldwork in different schools in the city of Madrid with high levels of foreign students (>70%). By engaging in participant observation in collaboration with an international NGO involved in the implementation of an Intercultural Program funded by public institutions, I aim to better understand the interplay of actors, meanings and actions.

**VET TEACHERS’ REPRESENTATIONS OF MIGRANT STUDENTS: CATEGORIZATION AND STEREOTYPES**

Barbara Pfister Giauque¹, Elettra Flamigni¹

¹R&D, SFIVET, Lausanne 16 malley, Switzerland

**Abstract: Topic**

This proposal focuses on the representations and stereotypes that vocational schools’ teachers develop towards migrant students. Our aim here is to gain knowledge of teachers’ awareness and consideration about this category of students, and this for a better understanding of their attitudes and practices towards them.

**Data**

The results presented here are based on semi-structured interviews conducted with vocational school teachers and staff (N=16) and on-site observations in classrooms. Teachers’ interviews and on-site observations were conducted in two different vocational schools (in the French part of Switzerland) in the fields of hairdressing and painting, which are characterised by considerable cultural diversity. Teachers’ interviews were fully transcribed and coded and a qualitative thematic content analysis was carried out with deductive and inductive approaches.

**Analysis overview**

Teachers interviewed have a quite negative perception of the students with migratory background. They mainly focus their attention on difficulties these young people may encounter or generate, but rarely on competencies and strengths these students may provide. Moreover, they have a strongly stereotyped vision of the students concerned: young Italians are described as extroverts and charmers, boys from former Yugoslavia as aggressive and ‘machos’, and girls from Muslim cultures as victims of family oppression.

Analysing the interviews, we also observed a recurrent structure in teachers’ discourse, that unfolds itself into three phases: 1) denial of migrants’ specificities (norm of equality); 2) mention of specific (and stereotyped) cases where students with minority profiles encounter difficulties (individualisation of difficulties); 3) based on these “cases”, validation of ethnic stereotypes (generalisation and naturalisation of specificities). Minorities’ difficulties are “essentialised” and therefore no more considered as contingencies that have to be taken into account by the teachers and the school. What we found revealing is that the “essentialisation” step is very common in the discourse of teachers who have no academic background and a less in-depth pedagogical training (technical branches’ teachers), and is quasi-absent from the discourse of teachers who have knowledge over social, economic and structural factors underlying immigration status.

**WHY ARE RACIAL AND ETHNIC MINORITIES SUCCESSFUL IN EDUCATION?: A CRITICAL SYSTEMATIC LITERATURE REVIEW**

Lore Van Praag¹, Peter A.J. Stevens¹

¹Vakgroep sociologie, UNIVERSITEIT GENT, Gent, Belgium

**Abstract: Due to historical and ongoing immigration processes societies worldwide face a challenge of having to integrate racial/ethnic minorities into their educational systems. Failure to realise this has lead many researchers to focus on the nature and causes of ‘educational underachievement’ of racial/ethnic minority groups in society. Less attention has been paid to high achievement and educational success. In the academic literature, success determinants are often seen as the reverse of factors and processes that lead to failure, however, success and failure factors are not necessarily the same. In conducting the first critical, systematic review of literature to date on the determinants of success and their relationship with each other, this study builds on a rich tradition of research race/ethnic inequalities in education.**

This study adopts a systematic review methodology, using a comprehensive and well defined protocol which allows for the findings to be more reliable, transparent and replicable. Subsequently, starting from the ecological model from Bronfenbrenner, studies are organized according to the system they occur in, the settings within these systems and distinguishing distal and proximal factors. The findings show that most studies concentrate on the macrosystem as they are based on Ogbu’s cultural-ecological theory or Fordham and Ogbu’s oppositional culture theory, and the microsystem including many different settings and often referring to social capital. In addition, individual characteristics, such as racial or ethnic identity, individual religiosity, attitudes, future goals and school instrumentality, have been highlighted as factors associated with educational success for racial/ethnic minorities.

Although many studies start from Ogbu’s theory, the study of structural barriers and collective problems that minority youth has to face in relationship to success has been given relatively little attention. The motivation of success, the variation between and within different migrant groups, social capital and the relationship between the different (micro, meso and macro) systems and its influence on educational success needs further examination. The purpose of this study is to integrate studies and their study domains with each other in order to indicate possible pathways to educational success by ethnic or racial minority students and map out future areas of investigation.

**CONSTRAINTS FACED BY THE TRIBAL ADOLESCENTS IN THEIR EDUCATIONAL DEVELOPMENT**

Raj Pathania¹

¹Human Development, CSK HP AGRICULTURAL UNIVERSITY PALAMPUR, Palampur, India

**Abstract: Scheduled tribes form one of the most backward sections of India. Though there has been a gradual increase in their literacy...**
rates since independence in the year 1947, yet many efforts are needed. On an average, the difference between the literacy rate of the general category and that of the Scheduled tribe has been around 20%. Due to difficult geographical locations, the tribals settled in hills, far off places could not change themselves at par with others. There are number of such tribes spread over all the states of India including the Indian State of Himachal Pradesh. The present study was undertaken to know the constraints faced by the tribal adolescents in their educational development. The investigation was carried on 150 males and 150 females selected from Kinnaur, Lahaul and Spiti districts and Bharmaur sub division of Chamba district. The tribal communities representing these districts were Kinnaur, Bhot and Gaddis. The findings portrayed that educational achievement of the respondents was mediocrite. More males than females were both high achievers as well as low achievers. The findings of the study further revealed that the Bhot respondents perceived home, school, and personal and community constraints more than Gaddi and Kinnaura respondents and were significantly different from other two communities. Non-significant differences were observed in constraints among high, medium and low income respondents except in teacher’s behaviour, stress and fear experienced at school and in community constraints, high income group respondents perceived these constraints more than the respondents belonging to low and medium income group. As regards the respondents belonging to different family size, the significant difference was observed in their academic achievement, perception about teacher’s behaviour and in community constraints whereas non-significant differences were observed on other constraints by the respondents belonging to small and large family size. Age-wise distribution on constraints depicted that significant differences were found in academic achievement, home constraints, in school and in community constraints.

SOCIAL ORIGIN OR STATISTICAL DISCRIMINATION OF MIGRANT PUPILS IN THE PRIMARY SCHOOL? A REANALYSIS OF THE STUDY BY CORNELIA KRISTEN ENTITLED ‘ETHNIC DISCRIMINATION IN PRIMARY SCHOOLS

Michael Beck¹, Rolf Becker²

¹Department of Educational Sociology, UNIVERSITY OF BERNE, Bern, Switzerland

Abstract: This replication of a study by Kristen (2006) deals with the question, whether the penalties of migrant children in the German school system could be explained by both the statistical or the “ethnic” discrimination. By employing an alternative data set, the ELEMENT study, (Longitudinal Survey from the City of Berlin) and by utilizing identical and alternative statistical models (logistic and linear regressions), the results found by Kristen have been confirmed. There is no indication that migrants are to be disadvantaged by the teachers’ assessment of their achievements as well as by their recommendations for allocation into the several tracks in the secondary schools. Compared to the German pupils’ situation, the migrants’ relative disadvantages could be explained mainly by their social origin and initial preconditions. Finally, we find that early investments in participation in preschool education and in learning of the German language are more effective for their opportunity of education while additional arrangements in the primary school are rather ineffective.

GYPSY AND TRAVELLER FAMILIES: SCHOOLS, RISK AND UNCERTAINTY

Martin Myers³

³Sociology, THE OPEN UNIVERSITY, Walborton, United Kingdom

Abstract: Since the 1967 Plowden Report the UK state has ostensibly worked to improve access to schooling for Gypsy and Traveller students within an agenda that promotes education as a cornerstone of ‘citizenship’. Gypsy students have generally faced racism and intolerance in schools and measures to tackle this have included the creation of Traveller Education Services to act as advocates for families; race relations law and guidance; and, the inclusion of Gypsy and Traveller ethnic categories within national schools data collection. Despite such public measures, findings from all research in this area documents continuing discrimination in schools. This paper argues that discriminatory practices towards Gypsies in schools today merely mirror the discriminatory practices faced by Gypsies in the UK for the past 600 years. Notions of risk and uncertainty that seem novel for the majority population reflect the norm in terms of Gypsy families’ experiences of both accessing schooling and providing an education for children. This paper considers firstly how Gypsy families adapt towards changing conditions and deal effectively with risk. Secondly it considers how and why the perceived ‘risk’ of Gypsies should continue within overarching liberal political agendas such as ‘citizenship’. It argues that whilst in the UK ‘citizenship’ stemmed from a mid-twentieth century desire to lessen risk (e.g. Beveridge, 1942; Marshall, 1950), it is increasingly a root of social division that identifies and excludes marginal groups considered to pose a risk to the majority population.

IMMIGRANTS’ SCHOOL ACHIEVEMENT IN PUBLIC SCHOOLS

Teresa Seabra ¹, Patrícia Ávila²

¹Sociology, ²Métodos de pesquisa social, ISCTE-IUL, Lisbon, Portugal

Abstract: We present the results of a research which main objective was, on one hand, to know the relationship between social conditions and ethnicity with the school achievement and, on another hand, to find the school effect, i.e., schools that do better with the same population profile. We analyze the results obtained in national exams by pupils of the 4th and 6th grades who have done evaluation tests in the Lisbon metropolitan Area (AML) in 2008/09 which totalize 45 000 pupils. The databases result from the link between two Ministry of Education databases and, in addition to the school and the grade obtained in the tests, they include sex, place of birth and nationality of the pupil and the social characterization of their families (profession, professional situation, schooling, place of birth and nationality of each parent).

The study revealed that although the school performance of immigrants’ pupils tends to be lower than that of native Portuguese pupils, i) the difference in the results of the two groups is smaller if the social conditions of their families (and particularly the mother’s schooling) is homogenized; ii) moreover, when they all belong to families with less schooling, the results of the children of immigrants can reach the same level, or exceed, those of native Portuguese pupils; iii) the variation in the results pupils of immigrant origin obtain in national exams is directly related to their families’ level of contact with Portuguese society. We found schools that obtained significantly distinct results (considering the average and the standard deviation of the grades in Portuguese Language and
Mathematics), even though their school populations have similar social conditions (parents’ schooling and social class and countries of origin).

**BEING POOR AT SCHOOL: WHY DO POOR CHILDREN DO NOT LEARN AT SCHOOL?**

Aina Tarabini, Xavier Bonal

1Sociology department, AUTONOMOUS UNIVERSITY OF BARCELONA, Bellaterra- Barcelona, Spain

Abstract: In recent times, education has become a kind of “universal solution” for social and labour problems. It has been argued that it is a crucial investment for increasing labour productivity, enlarging social cohesion and reducing poverty and inequality both at a national and a global scale. And, of course, education has powerful benefits that go beyond the individual benefits of schooling. Nevertheless, it is crucial to understand what the conditions for these benefits to be fulfilled are. That is, whether and how is education able to generate the benefits that are expected? What are the requirements for individuals to take advantage of the educational investment? Is it possible to educate in any context? What is the minimum level of social equity to guarantee the success of educational practices? In order to answer these questions it is crucial to take into account the complexity of the relationship between education and poverty. Moreover, it entails, above all, to reverse the assumed order of this relation (that is, the effects that education generates in poverty reduction) and to explore the multiple and diverse effects that poverty generates on education. The objective of the paper is to analyse the conditions and the experience of poverty of students who live in the context of Brazilian favelas, exploring the effects of these conditions in the development of their educational experience, practices and opportunities. In order to do so, the paper presents the results of a research based on an intensive qualitative fieldwork that contains more than 100 interviews with poor and extremely poor students, their families and their teachers. The results of the research project define different “scenarios of educability and ineducability” that show the numerous expressions of poverty and its multiple consequences in educational terms. It also demonstrates the need to reduce poverty (in all its dimensions and expressions) if education is aimed to work as a tool for social cohesion, equity and inclusion.

**IMPACT OF FAMILY SOCIO-ECONOMICAL STATUS ON THE EDUCATION OF CHILDREN IN DISADVANTAGED FAMILIES IN LATVIA**

Ieva Karklina, Aleksandrs Aleksandrovs

1Institute of Philosophy and Sociology, UNIVERSITY OF LATVIA, Riga, Latvia

Abstract: Although the Constitution of Latvia and education policy documents set that basic education in country is free, parents are forced to buy textbooks, workbooks and school supplies for their children, as well as to pay for lunch and transport. Besides, a large part of informal educational activities is available only for fees. Providing children with necessary things required for schooling turns out to be an almost impossible mission for poor families with insufficient financial resources.

Analysis of semi-structured in-depth interviews (n=35) with respondents from poor, large or single parent families, which was conducted within the research project supported by the European Social Fund «Causes and duration of unemployment and social exclusion,» provides insight into restrictions caused by complicated financial situation in Latvian poor families: their limited possibilities to provide children with learning resources, and their anxiety about children’s further education.

The discourse of family as a determinant factor for students’ educational achievements was raised by researchers more than fifty years ago when well-known American sociologist James Coleman stressed out the three angles of family impact: importance of family economic capital, human capital, and family’s social and cultural capital. Results of several international comparative education research projects reflect the very strong segregation of students’ educational achievements according to the level of urbanization. It is concluded that achievements of rural students are significantly lower than their peers in urban areas; in addition, they are directly related to fact that rural schools have the higher proportion of pupils who come from relatively lower socioeconomic status families. These figures are regarded as critically significant indicators of the significance of factor’s influence on the overall quality of education in Latvia.

**PYGMALION GOES TO ORGANIZATIONAL-LEVEL: A MULTI-METHOD STUDY ON THE MEDIATING ROLE OF SELF-FULFILLING PROPHECIES IN EXPLAINING THE IMPACT OF SCHOOL SEGREGATION**

Orhan Agirdag, Mieke Van Houtte

1Research Group CuDOS, Ghent University, Ghent, Belgium

Abstract: Regarding the sociological research on the academic performances of pupils, there are few topics that received more attention than the consequences of school segregation and the impact of teacher expectations. However, virtually no study has integrated these two research approaches in an empirical study. Consequently, we do know little of how teacher expectations are influenced by compositional school features and how these expectations in turn might affect pupils’ academic achievement. The main purpose of this multi-method study is to overcome this research lacuna.

The research questions will be examined using a mixed-method approach. Quantitative data is collected of 2845 pupils (aged10–12) and of 706 teachers in 68 Belgian (Flemish) primary schools. Qualitative, in-depth interviews are collected with 26 teachers and principals in a sub-sample of 5 primary schools. Using the qualitative data and multi-level analysis, we will investigate whether teachers’ individual and collective expectations are shaped by the ethnic and socioeconomic make-up of schools and whether these collective teacher expectations in turn influence academic achievement. The qualitative data will be used to investigate through which processes the compositional characteristics of the school shape teachers’ beliefs about pupils and how these beliefs are communicated to the pupils.

The quantitative analysis reveals that a higher share of low-SES and immigrant pupils at school are both related to lower teachers’ teachability expectations. The collective teachability expectations of teachers are in turn indirectly related to academic achievement of pupils: collective teachability expectations are associated with pupils’ beliefs of having no control over academic success (sense of futility) and the latter has an effect on pupil’s academic achievement. The analysis on the qualitative data shows that the associa-
tion between school composition and teachers’ expectation of teachability are largely due to the language use and linguistic backgrounds of pupils in these schools. Our results indicate that teachers perceive the use of the mother tongues of bilingual students as a barrier to educational success. These low teachability expectations are in turn communicated to the pupils by both explicit encouragement of Dutch monolingualism and formal punishment when immigrant bilingual pupils speak their mother tongue.

WHY ARE TEACHER RECOMMENDATIONS AT THE TRANSITION FROM PRIMARY TO SECONDARY EDUCATION SOCIALLY BIASED?
Simon Boone¹, Mieke Van Houtte¹

1Department of Sociology, GHENT UNIVERSITY, Gent, Belgium

Abstract: In recent years, EU policy has heavily stressed the role of education in facing the challenges posed by an increasingly globalised economy. To keep up with rapidly developing third world economies, it is deemed necessary that Europe’s human capital potential is fully exploited. In order to do so, European educational systems are to be organised in such a way that pupils are effectively allocated to the educational pathways that match their academic potential. However, research in leading European economies like France and Germany has shown that working class children are more frequently oriented to less demanding educational alternatives in secondary education than middle class children with a comparable achievement background. Besides the fact that this runs counter the widely shared ideal of equal opportunities, such a situation also means a potential loss of talents. Research that inquires into the causes of these differentials in educational recommendations is virtually inexistent. The aim of this study is to examine whether teachers’ educational recommendations at the transition from primary to secondary education in Flanders (Northern, Dutch-speaking part of Belgium) can also be shown to be socially biased and if so, what causes these differentials in advice. To do so, we use a mixed methods design combining survey data gathered from 1339 parents of pupils in their last year of primary education in the months of May and June 2008 in 53 Flemish primary schools and qualitative data from 2 focus groups with primary school teachers. Our findings corroborate the evidence found in Germany and France: pupils stemming from low SES backgrounds are more frequently advised to enrol in less prestigious and less demanding educational options than pupils stemming from high SES families, even if they achieved equally well. Analysis of both focus groups suggests that primary school teachers tend to unwittingly evaluate pupils from low SES backgrounds less positively, due to their emphasis on specific pupil characteristics like self-reliance, planning capacity, punctuality—which are more characteristic of middle class pupils. We think that teacher training programmes should pay more attention to all potential sources of social bias in daily educational practice.

DROP OUT FROM HIGHER EDUCATION: SOCIAL CLASS AND PERFORMANCE IN FRENCH EDUCATIONAL SYSTEM
Karin Darin¹

1CURAPP, UNIVERSITY OF PICARDIE JULES VERNE, Amiens, France

Abstract: Research has found that students with higher social origin generally perform better than do students with lower social origin. This line of studies tends to look at students across different fields of education, and thus knowledge about the performance of students within specific fields of education is still scarce. The purpose of this study is create further understanding to how students with lower social origin perform in fields of education where they are less frequently represented, as well as in fields of education where they are more frequently so. Two fields of education are studied: Law and the Humanities. The study focuses primarily on dropout rates as indicator of performance.

In France, the baccalauréat (degree awarded at the end of secondary education) is the only prerequisite for admission to the university. The fact that access to university is rather open creates larger groups of first year students at the universities. It is well known that larger groups of students drop out during the initial year, while others drop out later on and some complete their studies altogether. This study will analyze at the social origin of those dropping out at different stages of their education. Although research has shown that students with lower social origin generally perform weaker in higher education, research on minority groups in working life has found that individuals who to some extent are stigmatized within their context tend to perform better than the majority. The latter suggests that we could expect to find differences in dropout rates and dropout behaviour among students with lower social origin in the two fields of education.

The population consists of students enrolling for the first time at Universities in France in 2003. The data allows us to follow this cohort of students during a limited number of years (2003 to 2009), and thus enable a study of the performance of students the years that follow their enrollment. Empirically, this study is based on data delivered by the National Institute of Statistics and Economic Studies. Specific Multiple Correspondence Analysis, which is a kind of Geometric Data Analysis, is used as main statistical technique. This method is well suited to capture relations between a large numbers of variables simultaneously, and thus to understand the relation between social characteristics of students and performance in higher education.

WIDENED PARTICIPATION AND UNEQUAL ACCESS TO HIGHER EDUCATION IN DENMARK
Martin David Munk¹

1Centre for Mobility Research, D of Political SC., AALBORG UNIVERSITY COPENHAGEN, Ballerup, Denmark

Abstract: Martin D.Munk and Jens Peter Thomsen

A number of recent European studies show that while general access to higher education remains unequal but less so, and participation has widened in certain types of universities and fields of study. This addresses two fundamental questions in the WP debate: A. has access to HE as a whole widened (the vertical level), and B. if access have widened, has this been a process of channelling of first-generation students into specific types of HE, or has access to all HE programmes in fact widened (the horizontal level)? We focus on access to HE and specifically on social differentiation in HE. We use Danish register data and a recent 1984-cohort survey database including information on educational choices and a rich set of measurements on household cultural resources, preferences, non-cognitive capacities, and school variables at different ages. We investigate choice of education level and university choice/field of
study, and draw on literature stressing the importance of transmission and accumulation of capital in childhood, in different educational settings, and the significance of habitual (cognitive and non-cognitive) dispositions. Some studies suggest that factors not related to traditional variables like parents education, occupation, and income have become more important in trying to explain intergenerational educational mobility. We find that traditional variables such as cultural capital of the family and income matter, but also that the students cultural orientation, taste for education, risk aversion attitudes, school work, preferences for specific educational pathways and future job opportunities matters, and that these factors vary significantly with choice of university institution and field of study.

WORKING CLASS STUDENTS IN THE UNIVERSITY: DO THEY THINK THEY BELONG?

Helena Troiano \(^1\), Marina Elias \(^2,3\), Albert Sánchez \(^4\)

\(^1\)Sociology, UNIVERSITAT AUTÒNOMA DE BARCELONA, Cerdanyola (Barcelona), \(^2\)Sociology, UNIVERSITAT DE BARCELONA, Barcelona, Spain

Abstract: The widening access to university all over Europe has had as a result the increasing numbers of “non-traditional” students, among them, working class students.

Research about how these new students have done has enlightened the difficulties they experience in relation to diverse issues; the most important: the pronounced perception of risk of failure, the felt debt to the supporting family, the necessity to combine studies with remunerated jobs, the stress associated with high costs (and, as a consequence, the preferences to much vocational oriented studies). In short, often they feel they are in the university against the odds.

The work here presented deals with these issues but tries to focus on the social relations that students contribute to in the university.

The communication will show the results of one part of a larger piece of research about the factors that have an influence on the learning results of students. The survey is carried out among students in the four Public Universities of Barcelona. The 10 chosen courses cover all areas of study.

Two complementary methodological approaches are used. The first one, based on qualitative research methodology, consists of an interview addressed to one academic responsible for each of the 10 degrees selected, to two teachers (20) and to 8 students (80) in every degree, as well as the gathering of secondary data. The second approach, based on quantitative methodology, involves handing out a questionnaire to a sample of students from each of the degrees when they are at the middle of their studies (the second or third year of enrolment). This questionnaire has been elaborated taking into account the information collected in the first qualitative part of the research.

The aims of this communication are two:

1. To test if the main difficulties for working class students reported in previous research are relevant for the sample here studied or otherwise middle class way of life and thinking are much more widened that previously thought.
2. To explore the degree of integration of these students, that is to say, their social and academic participation within the institution and their identification with the prevalent norms and values of the institution. In other words, to try to answer the question: do they behave and feel like they belong?

SUPRISING EFFECTS OF AN INCREASE OF THE EDUCATIONAL LEVEL IN POLAND

Marta Agnieszka Zahorska \(^1\)

\(^1\)Institute of Sociology, UNIVERSIY OF WARSAW, Warsaw, Poland

Abstract: Since 1989, which marked a breakthrough in the Polish political, economic and social life, the education system has also undergone substantial reforms.The structure of the education system has changed, as well as the rules of financing and management. One of the most underlined objectives was activity on behalf of equalization of educational opportunities between the rural and urban youth, which have been traditionally very diversified in Poland. The compulsory education period has been extended to 10 years (11 years at present), and grammar schools were separated from elementary schools. From the perspective of analysis of quantitative indexes, the reform was a great success. Most graduates of grammar schools (about 80%) each year go to secondary schools, and the majority of graduates of these continue education in post-secondary schools and universities. This is an enormous leap in popularization of higher levels of education, particularly considering that only 20 years ago, less than 40% graduates of elementary schools finished secondary schools, while about 10% of graduates went to university. Most analyses of educational inequalities comprise quantitative research. It shows an impressive increase in the access of the youth from various social strata to universities. However, popularization of education has other, less optimistic aspects as well. A visible segmentation of the education market has taken place. The graduate’s position on the labor market is determined not by any certificate or diploma – what counts is a diploma that proves graduation from a “good school”. It is still very difficult to get enrolled in such school for children and youth with a low SES. Inability to enter the path of education thus results in a threat of marginalization, which is greater than in the previous generations, when it was easier to function without a certificate confirming the level of knowledge. The problem of inequality has not disappeared, it requires additional qualitative research to complement the quantitative analyses. My paper presents a qualitative research project on functioning of the school and its importance for minimization or preservation of educational inequalities.

IMAGES OF EDUCATIONAL CHANGE IN TURBULENT TIMES: AN EXAMPLE FROM SERBIA

Dejan Stankovic \(^1\), Rajka Djevic \(^1\), Sonja Andjelkovic \(^1\)

\(^1\)Institute for Educational Research, Belgrade, Serbia

Abstract: The aim of this research was to provide a critical understanding of the educational reform process in Serbia from the perspective of key stakeholders. For this purpose we analyzed multiple perspectives on educational change in Serbia that occurred during the last decade, a period characterized by political instability and resulting radical discontinuities in the national educational strategic directions, policies and practices. We explored images of educational changes held by different stakeholders – teachers, students, parents, principals, experts and decision-makers – with the aim of synthesizing the lessons learned that could serve as a basis for more effective future changes. Broader research question, also

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
relevant outside the Serbian context, pertains to the attitudes and mutual perceptions of different educational actors that emerge in a particularly unstable policy environment. Data was collected through focus groups and interviews, and was analyzed using the methods of the grounded theory. Results show that perspectives on the decade of educational changes are much contested with a clear lack of shared meaning and ownership over basic ideas, goals and promises of these changes. Changes were seen as being too chaotic, not sufficiently inclusive and followed by negative mutual perception between key stakeholders. Apparently, all this had rather destructive impact on the overall effectiveness and efficiency of the systemic developments. In conclusion, we emphasize the need to invest into the more inclusive envisioning of the desired futures and shared responsibility for its realization.

LEADING SCHOOLS IN CONTEXTS OF INEQUALITY AND SOCIAL EXCLUSION: THE ‘TEIP’ PROGRAM EFFECT IN THE ORGANIZATIONAL DIMENSIONS OF SCHOOL CLUSTERS IN PORTUGAL

Inês Baptista1

1ISCET - University Institute of Lisbon, CIES-IUL, Lisboa, Portugal

Abstract: The ‘TEIP’ Program, Priority Intervention Education Zones, was established in Portugal during the second half of the 90s, aiming to support projects in contexts with persistent inequality and social exclusion. Having been re-launched in 2006, this measure now covers more than 100 public school clusters, operating primarily in the failure, school leaving and indiscipline, seeking to achieve objectives of inclusion and social peace, while the management of conflicts and social tensions are transferred to the local level.

The innovation of this program leads us to question the effects that have been produced in the concerned territories, especially at a time when not only the educational goals expand, but also the economic crisis sets in, leading to new social challenges that unquestionably affect the educational realities.

Based on the analysis of three case studies in school clusters and using mainly qualitative information (document analysis, interviews, focus group and field notes), we propose a more focused (and comparative) analysis on the organizational dimension of three ‘TEIP’ schools, also taking into account the articulation of this Program with other policy measures, such as the structural reorganization of the school management, with the introduction of role of Head teacher. Specifically we intend to analyze the leadership in these schools, addressing especially to the Head teacher and the local ‘TEIP’ project management team, since the achievement of the program goals involves significant changes in the school organization. The main concepts of the proposed analysis are, therefore, leadership, power relations and power structures, as well as the dimensions: project work, strategic planning, pedagogical innovation and networking, but also changes in internal school working structures, in relationships with other ‘TEIP’ schools and engaging with the local community. Leadership in ‘TEIP’ school clusters may assume, therefore, a significant preponderance, as these actors do admin a specific work dynamics, partly because they are under a program with innovative features, but also because they work in contexts of social inequality and exclusion, which present, in the current juncture new and consecutive challenges.

NEW POINTS OF SOCIAL CLOSURE. CATHOLIC SCHOOLS’ IMPACT ON EDUCATION SYSTEM IN POLAND.

Magdalena Smak Wójcicka2

2Institute of Sociology, University of Warsaw, Warsaw, Poland

Abstract: My research aims to answer the question how catholic schools contribute to the social closure processes? Are those schools exclusive social clubs or, on contrary, they endeavor to minimize the social inequalities?

Exclusionary practices may arise because of the obstacles in realization of the educational expectations of the middle class parents. Such parents, dissatisfied from the performance rates in public schools, decide to transfer their children to private sector, looking for a better performance quality and better plausible group less exposed to risky behaviors of youngsters. This influences the education system making public schools a second best market (which is a new phenomena in Poland), with lesser accountability and minor performance and professional standards. However considering the school fees, catholic schools in Poland are far cheaper that the private sector ones. For that reason the economic capital is not the most distinctive factor among those who participate in catholic schools. Nor is the religiosity, there are not believer families as well. The most distinctive factor is the higher education of parents. Therefore catholic schools do not follow the standard divisions into the rich, and the poor, but rather create enclaves of conservative families, engaged in the process of education of their children. The distinctions are not equal with those on: ‘good’ and ‘bad’ families – among catholic schools’ students many come from single parent families, divorced households, patchwork families. Facing such situation the school plays a compensatory role in social capital transmission. The Catholicism promoted in those schools focuses on being a community and helping others, not on the restrictions of church’s rules, encourages building bonds not only among children, but also between parents and teachers. And that generates trust.

Using Coleman terms and theory of social capital creation, but realizing the critique of his works as disregarding the contextual data I use case study method. Qualitative methodology enables to be sensitive to local varieties, but in the same time not to lose the perspective of school as a social system.

SCHOOL CONTEXT AND THE GENDER GAP IN EDUCATIONAL ACHIEVEMENT

Joscha Legewie1

1Department of Sociology, COLUMBIA UNIVERSITY, New York, United States

Abstract: Today, boys generally under-perform relative to girls in schools throughout the industrialized world. This article extends research on the effect of schools and asks whether and how the school context shapes the gender gap in education. Building on theories about gender identity and reports from prior ethnographic classroom observations, I argue that the school environment channels the conception of masculinity in the peer culture, and thereby either fosters or inhibits the development of anti-school attitudes and behavior among boys. Girls’ peer groups, in contrast, do not vary as strongly with the social environment in the extent to which school engagement is stigmatized as “un-feminine.” As a consequence, boys are more sensitive to school resources that create a
learning oriented environment than are girls. I evaluate my argument with a quasi-experimental research design using reading test scores as an outcome variable and the SES composition of the student body as the treatment variable. This design is based on within-school variation across classes using the so-called ELEMENT data from one German state. In contrast to the US, the lack of performance-based tracking in Berlin elementary schools and the smaller extent of parents’ influence on classroom assignment makes it plausible that student assignment to elementary school classrooms in Berlin is almost random. In order to develop a detailed understanding of the actual selection process, I examine the official school regulations, provide statistical evidence from simulation analyses, and conduct qualitative interviews with school principals. The results suggest that randomness indeed plays an important role in the assignment process, but also point at potential sources of bias, which I address statistically with targeted sensitivity analysis. The results support my central hypothesis, and other analyses support my proposed mechanism as the likely explanation of the gender differences in the causal effect.

THE OLD BEomes NEW? LEARNING SPACES AND POLITICS OF EDUCATION.
João Sebastião¹, Luisa Veloso¹, Alexandra Duarte¹, Joana Marques¹
¹CIES-JUL, INSTITUTO UNIVERSITÁRIO DE LISBOA (ISCTE-JUL), Lisboa, Portugal

Abstract: In the current times of ‘uncertainty’ and economic crisis, the Portuguese Ministry of Education launched an ambitious and unprecedented program to improve secondary schools’ buildings and their learning conditions as a structural element for the extension of compulsory schooling to 12 years. This process includes the diversification of educational alternatives, namely with professional training offer in nearly all schools, together with particular educational policies which strive to bring back to school the under qualified generations of adults. Secondary schools are now increasingly facing these new dynamics and diversity of publics, resulting in the political perception of the need to adequate spaces and learning conditions.

The Secondary School Modernization Program (SMP) started in 2008 and aims to cover a total of 332 schools in a seven-year period, a unique case study in the current scenery of education policy in Europe. The scale of the program raises the interest for a study on the complex impacts that such a policy initiative can have in political, educational and social terms.

The presentation will discuss the impact of the process of the refurbishing of the buildings in everyday life of schools, looking at it as a complex process of negotiation. We are interested in the ways in which agents, from central educational services, architects, school boards, teachers and students, and other members of the local community, become active players, facing not only the construction process, but essentially tackling the political and pedagogical options clearly presented into the national specifications.

The research focus on a sample of 13 case studies selected from the 30 schools participating in the pilot and 1st phases of intervention. The methodological strategy includes interviews to the architect responsible for each school design and to the schools’ principals; a questionnaire to students and other to teachers; and a set of focus groups on each school with community members.

Some preliminary results of the study will be presented comparing how the attitudes towards school design and educational options of architects and school principals represent different readings of the national specifications and express spatially contradictory views about the ways learning models and practices contribute actively for the reduction of unequal opportunities in education.

A SOCIOLOGICAL APPROACH ON EDUCATIONAL EFFECTIVENESS OF THE TEACHER IN THE PROCESS OF LEARNING SCIENCE
Paulo Dias¹
¹CIES-JUL, ISCTE - UNIVERSITY OF LISBON, Lisbon, Portugal

Abstract: We analyse in this paper, in sociological terms, in an approach close to the methodology of process-product, the extent to which certain fundamental characteristics of the teacher, determine the strategies for study of its students and their achievement in science.

We worked with a sample of twenty-four teachers and their 651 students, representing the schools of the Municipality of Olhão - Algarve, in Portugal. This is a growing community with severe social and economic problems. The basic question we tried to answer was: How can a teacher help these social disadvantaged students so that they can attain good results in science?

The results indicate that the kind of relationship that teachers establish with their students is fundamental to understand their results, with the highest levels of relationship producing the most beneficial results from the students. The relational dimension however, is insufficient per se to establish an effective pedagogical practice. In fact, disciplinary regulations are fundamental and, somehow, they constitute a pre-condition in order to become an effective teacher considering this specific community of students. Guaranteed this relational and normative context, brainstorming in the classroom, with extensive participation of students, is another key element to be mentioned in relation to teacher effectiveness.

GLOBAL EDUCATION IN STATU NASCENDI - SOME REFLECTIONS ON POLAND
Katarzyna Jasikowska¹, Jędrzej Witkowski²
¹Institute of Sociology, Jagiellonian university, Cracow, ²Centre for Citizenship Education, Warsaw, Poland

Abstract: The main thesis of the paper is that efforts of mainstreaming global education in Poland may be analyzed as an effective pursuit of transnational advocacy networks operating within the educational realm, and, maybe even more importantly, as an attempt to make the globalised world less “uncertain” and “unknown” to Poles. In other words, mainstreaming global education not only fulfils the need for better understanding of complicated issues but also gives stimulus for ethical action in a more and more consumer Polish society.

We assume that global education in Poland has been adopted as a part of development agenda from the EU and global level. This situation makes the field of global education a good arena to observe how the European policies and international agreements are being adapted and implemented in a homogenous society.
In 2010, as an initiative of Grupa Zagranica, representatives of 29 different institutions of all sectors started a structured dialogue on mainstreaming global education in Poland. The dynamics of these “cross-sectored debates” on global education in Poland suggests that there is a potential for fostering global education, but it can only be realized with a clear division of responsibilities and a stronger co-ordination in the field of global education.

To sum up the realm of education seems to be receptive to “news” emerging both from above (the European networks of organizations and institutions) and from below (Polish non-governmental organizations). The state who serves as a middle man cooperates. However, the final outcome seems to depend neither on decision makers, nor better school curriculum but on dedicated teachers understanding the “uncertainty” of today’s world and eager to explain it to their pupils.

CHANGE IS NOT ALWAYS PROGRESS; EDUCATION - A SOCIAL PROBLEM OR A KEY TO RESOLVING OTHER SOCIAL PROBLEMS?

Lekë Sokoli¹

¹Department of Sociology, MARIN BARLETI UNIVERSITY ALBANIA, Tirana, Albania

Abstract: In an effort to investigate the correlation between education and poverty in Albanian reality we found that in about 500 families of Roma Community in two villages (Levan-Fier and Morava-Berat), children of parents (40-60 years old people) with some level of education (at least with 4-8 years of school), were themselves illiterate. Two decades of Post-Communist transition represented in itself a “turbulent time”. If we have to express this transformation in a single word, it would be “change”. But the above “simple” fact indicates that change is not always progress. Drastic transformations are made in the field of education. Based on a 2010 national survey data set (n=1364) this paper seeks to examine the correlation between Education and Poverty. A strong correlation is evident between these two variables, something like ‘a chicken-and-egg’ dialectical relationship. Half a century ago, on 14 December 1960, UNESCO’s General Conference adopted the Convention against Discrimination in Education. Yet children and adults remained deprived and discriminated of educational opportunities first of all as a result of poverty. From the national survey results that (1) the quality of education not only is considered a “social problem”, but even ranks first in the hierarchy of social problems at the moment; (2) the public concern index in regard to poor education, is higher than public concern index for many other social problems; (3) a number of other social issues are perceived to have a direct, or indirect connection with the schools and teachers; (4) teaching is gradually becoming “an abandoned profession” (only 0.8 percent of 2010 graduates have selected “teaching” as first preference for university studies); (5) education is likely to enter into a cycle with detrimental consequences for the future of Albania, its sustainable development and the prospect of its European integration. But the situation in Albania is not unique: it reflects also the problems of other countries. This paper concludes with some specific suggestions on how to improve the current state of education in Albania.

RUSSIAN EDUCATIONAL SYSTEM AND PROBLEMS OF SOCIAL INCLUSION

Irina Olegovna Tyurina¹

¹INSTITUTE OF SOCIOLOGY RAS, Moscow, Russian Federation

Abstract: Among the most important factors mediating typical for post-reform Russia social inequalities are educational inequalities which have at the least two interrelated units. The first one are limitations of access to high-quality education. This unit of educational inequalities could be characterized as cumulative one: springing up at a level of elementary school above inequalities tend to develop in secondary and then consolidate in the upper school. Scholars are sure that incredible increase in socio-economical inequality generates in Russia two educational systems: the first one for well-educated and well-to-do (mainly urban) families and the other for less-educated poor (mainly rural) families. It’s significant
that above tendency may be observed both at a level of secondary and high education. As long as a choice of a concrete university and, consequently, of future profession is predestined by a concrete type of educational institution, in which entrant was educated earlier, typical for the developed western countries model «Education – Profession – Income» is transformed into «Income – Education – Profession», in which education loses its role of an ascending mobility factor. The second dimension of social inequalities in educational sphere is of a protracted character. The case in point are abilities to use those advantages which has or should have an individual with some certain level of his (her) human capital’s development. In present-day Russia above abilities and advantages turned out to be greatly differentiated among the representatives of different social groups and strata. Disabilities to use advantages of being well-educated are predetermined under modern Russian conditions by tendencies of social exclusion, especially evident if the matter concerns poor, needy and underprovided strata of the society as the main «victims» of increasing social differentiating processes. All this is ridiculous against a background of a fact that education is especially valued in present-day Russia. Suffice it to say that the overwhelming majority of those surveyed (82%) states that getting a high-quality education is one of their most important life plans. At the same time level of actual achievements of Russians seeking after getting good education turned out to be lower: only 50% of those feeling like this manage to do it.

CHANGE OR PARADIGM SHIFT IN THE SWEDISH PRESCHOOL?
Ingrid A. Jönsson, Ingegerd Tallerg-Broman, Anna Sandell

Abstract: Is there a paradigm shift taking place within the Swedish preschool? The paper will explore whether this is the case by discussing the development of the Swedish preschool since the 1970s departing from Hall’s (1993) requirements of a paradigmatic shift.

Since the establishment of the Swedish public preschool in the 1970s, education and care became integrated and the expansion was related to gender equality, increased female labour market participation, the wellbeing of children as well as to the psychological development of children. Over the following decades, the number of places has been expanded although the demand of places was not satisfied until the 1990s. The goals of the pre-school have been adjusted and reformulated over the years and although ‘educare’ is still the foremost characteristic of the Swedish preschool, new trends are noticed, e.g. a larger emphasis on life long learning, extended inclusion of groups of children and a larger incorporation of parents into pre-school activities. In the paper, we will explore these recent trends with the aim of identifying changes in goals, policy instruments and settings by studying the impact of international actors, changes in official documents and possible effects on everyday life in pre-schools. The latter will be discussed in relation to an explorative study of two pre-schools situated in the southern part of Sweden.

CHANGE IS NOT ALWAYS PROGRESS; EDUCATION - A SOCIAL PROBLEM OR A KEY TO RESOLVING OTHER SOCIAL PROBLEMS?
Lekë Sokoli, Egjantina Gjermeni

1Department of Sociology, MARIN BARLETI UNIVERSITY ALBANIA, Tirana, Albania

Abstract: In an effort to investigate the correlation between education and poverty in Albanian reality we found that in about 500 families of Roma Community in two villages (Levan-Fier and Mora-va-Berat), children of parents (40-60 years old people) with some level of education (at least with 4-8 years of school), were themselves illiterate. Two decades of Post-Communist transition repre- sent in itself a “turbulent time”. If we have to express this transformation in a single word, it would be “change”. But the above “simple” fact indicates that change is not always progress. Drastic transformations are made in the field of education. EDUCATION AND TELEVISION IN GREAT SHAPE
Janicke Andersson

1Linköping university, Linköping, Sweden

Abstract: Contemporary society may be described as a “learning society” in which citizens are educated, from childhood, to reflect and evaluate their performance and features. In elementary school, this is done through regular performance reviews, in working life through performance appraisals and health checks and in everyday life through TV and tests in magazines or for that matter newspaper knowledge tests. Mass media has become an increasingly common tool to produce and promote knowledge about health and lifestyle. Experts and coaches who will help us to change our lives for the better in so-called “lifestyle program”, or programs that are catego- rized as “entertainment” are familiar features of everyday life. My contribution will be drawing on the program “Toppform” (great shape) broadcasted on Swedish television. Toppform is one of the health and lifestyle programs that use coordinated communication channels to interact with its viewers. While the program is broad- cast on television, it is also represented with material on the Inter- net. This study concentrates on the material on the website of the program which contains material also used for teaching in school.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
settings. As such the material represents an interesting encounter between entertainment, school education and public health education which makes it interesting to study. Theoretically, I adopt a discourse analytic approach in which management principles are the focus.

THE UNIVERSITIES OF THE THIRD AGE AS A SPECIFIC ACTIVATING SECTOR IN THE ADULT EDUCATION SYSTEM. THE POLISH CASE.

Paulina Świątek¹, Małgorzata Rakoczyny²
¹Department of Sociology and Social Anthropology, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Cracow, Poland

Abstract: Over the last decades, most European countries have had to face the new demographic challenge, the escalating population ageing. According to the UN statistics, at the beginning of the 21st century every tenth person is 60 years old or more. This process is particularly clear in the developing countries - according to the Eurostat estimates, in 2060, Poland will be demographically the oldest country in the EU. This new type of demographic structure, in which elderly people constitute over a quarter of the whole population of the nation, implies significant changes in almost all spheres of social life.

One of the conditions to be met to help European societies to cope with this kind of challenges is to promote the active ageing. This task can be fulfilled by the relatively young educational institutions, Universities of the Third Age. The UTAs are an important and specific element of the adult education system. In fact, their goal is not to prepare for a new career or to broaden the professional skills. Instead, their task is to keep seniors active. They are an important form of continuing intellectual and social activity after the withdrawal from the labor market.

The aim of the paper is to present the specificity of this institution in comparison to other adult education institutions. It will also attempt to answer question about UTAs’ real potential of seniors’ activating.

Empirical data were gathered through the in-depth individual interviews with the UTA students and lecturers, participating observation and data analysis. The overview of the market of educational services provided by various Polish UTAs and the comparison of their offers will be made on the example of Krakow - a largest concentration of such institutions in Poland.

CONTRADICTIONS OF MODERNIZATION OF THE RUSSIAN SYSTEM OF PROFESSIONAL EDUCATION

Irina I. Kharchenko³
³Social problems, INSTITUTE OF ECONOMICS & INDUSTR. ENGINEER. SB RAS, Novosibirsk, Russian Federation

Abstract: In order to study a state of the system of professional education (higher, secondary special and primary vocational ones), analyze changes that took place in it in the last decade, and evaluate efficiency of its functioning - “two-waves” sociological research was conducted. First survey took place in 2001 (2450 senior students of professional education institutions of Novosibirsk region were asked by questionnaire, also experts were interviewed) and second – in 2007-2008 when 3600 senior students (including 1945 in universities) were asked and experts also. Official statistics and documents also were used.

The Russian system of professional education of 1990-s was characterized by functioning in conditions of insufficient resources (financial, physical and personnel ones). Anyway higher educational system in these conditions demonstrated an extensive growth. This fact has predetermined low efficiency of the system functioning and poor performance of tasks that were expected by society to be fulfilled by professional education.

Results of our study show that in observed period positive changes in higher educational system took place. Universities changed their strategies from survival to active behavior on the market of educational services according to their comparative advantages. Currently primary and secondary vocational education subsystem is in considerably worse conditions (particularly in Novosibirsk region). While higher education develops in a stream of modernization (however considerable problems are still remain), vocational education is still being reorganized and is in a search of its model in a general system of education in society with market economy.

Anyway comparisons of 2 surveys’ data show that students’ satisfaction with conditions and arrangement of process of study has grown in all types of educational institutions. However, obtained data show that real change of quality of education is not so noticeable. Students’ estimations about quality of obtained knowledge remain the same. Besides, we see substantial gap between considerably high students’ valuation of theoretical knowledge, general and specific competence and their skills to use these competence and knowledge for resolving particular tasks. Universities’ subsample shows that there is still low part of students (34%) who have research competence (experience of participation in a scientific research).

STUDYING AND WORKING WITH ICTS IN SECONDARY EDUCATION

Carla Ferreira Rodrigues¹
¹ISCTE - University Institute of Lisbon, CIES-IUL, Lisbon, Portugal

Abstract: In a context where the spread and diffusion of information and communication technologies (ICT) is increasing in virtually all social dimensions, their role in education becomes more crucial.

In most countries, governments have been investing in technology infrastructures for equipping schools. In Portugal, the Educational Technology Plan, which involves a thorough modernization of elementary and secondary schools with the creation of modern communication networks, allowed 100% of secondary schools to be equipped with computers connected to the internet.

If access to computers and internet seems no longer a problem, at least theoretically, the question now is the way in which they are being integrated into the curricula and used in the classrooms by students and teachers. Ultimately, what is more important to find out is ‘what skills are secondary students acquiring and developing with the integration of ICT in their lessons?’; ‘Are they implementing these skills in their own study strategies?’; ‘Do they use internet for their school work?’; ‘How do they use it?’; ‘Is it more related to their schools context and conditions or to their family background?’

Based on an ongoing study about Learning with ICT, it is intended to present some preliminary results from a survey applied to 3000
students and 300 teachers, in 12 secondary schools spread throughout the country. The main focus of this analysis will be given to the way secondary students use computer and internet as tools not only for their personal and social life, but how they are incorporating them in their work and study strategies, at school and at home.

**PRESENTATION OF THE RESEARCH PROJECT:**

**DEVELOPMENT OF RELATIONAL COMPETENCE AND MANAGEMENT CLASSROOM IN CONTEXTS OF SUPERVISION - THE CONTRIBUTION OF TEACHER EDUCATION**

Maria do Ceu Ribeiro¹, Isabel Freire²

¹Department of Practical Pedagogical Supervision, POLYTECHNIC INSTITUTE OF BRAGANÇA, Bragança, ²Curriculum, Didactic and Teacher Education, Education Institute - University of Lisbon, Lisbon, Portugal

**Abstract:** The international and national literature has shown the importance of organization and management of the classroom to prevent disruptive behaviors, crossing this problem with teacher education. In this sense, the aims of this study are: (i) understand the representations of the student teachers about disruptive behaviors and the pedagogical relationship; (ii) understand the representations of the student teachers about the relational competence and classroom management; (iii) understand the impact of a collaborative and training process, in the development of relational competence and classroom management toward the construction of a preventive attitude face to disruptive behaviors and; (iv) understand the supervision processes involved in the student teachers training.

**Methods:** The research focuses on a process of supervision and training with characteristics of action research based on the assumptions of clinical supervision/collaborative. The investigational focus is characterized as a Case Study Holistic, centered on a group of 18 student teachers who formed six groups of three elements, in each group was assumed as a case. The research is divided in five stages: Stage 1 - Negotiation (September 2009); Stage 2 - Diagnosis (October / November 2009) - a questionnaire composed of open questions; Stage 3 – Action planning and development (December 2009 to May 2010) - use of reflective texts, individually and in groups, field notes and questionnaires of closed questions (adapted from Amado & Freire, 2009) applied cyclically, minutes of the reflection meetings, classroom observation grilles, registers critical incidents and audio recordings; Stage 4 - Evaluation / reflection; Step 5 - Follow-up Meeting (May 2011) - Semi-structured interviews. Throughout the process, and by 2014 will be conducted the analysis, data interpretation and theoretical research and production of the text that will lead to the doctoral thesis.

**HOW MANY SCHOOLS FIT IN EUROPE? EDUCATIONAL SYSTEMS PROFILES AND SCHOOLING PATTERNS**

Susana Cruz Martins¹

¹CIES-IUL, Lisboa, Portugal

**Abstract:** The current proposal identifies, from the perspective of a macro-structural analysis, the main educational systems profiles, relating them with educational patterns and with socioeducational dynamics in the European space, and, in a comparative way, characterizes some conditions that shape the schooling paths of enrolled individuals in different education systems. For the construction of the profiles (and their classification) the research has taken into account the dominant characteristics of education systems of the European Union, namely the various institutional morphologies, the weight of enrolled by type of teaching institution and by educational sector, their social origins and the financing of these systems and students.

This study (concerning may PhD), of which I now intend to present some results, is based on an extensive methodology, more specifically on the handling of statistics from several sources, those harmonized, compatible and disseminated by international agencies, as well as those produced by international collaborative studies (in particular by the joint implementation of national surveys). Towards the identification of a typology of educational systems, we proceeded to a cluster analysis, having identified distinct and socio-logically interpretable educational profiles, using its projection on topological spaces constructed previously (obtained through the multiple correspondence analyses). These results relate not only to an effort of classification of the educational systems of the European Union, taking into account the dimensions of analysis described above, but also to the several types identified with the main achievements from the point view of the qualifications of the population (presenting also a typology of schooling patterns). As its points of reference it took socio-educational and politico-institutional indicators, problematized by reference to national and supranational units of analysis.

“A FOOL TO KEEP STAYING” – BATTERED WOMEN LABELLING THEMSELVES “STUPID” AS AN EXPRESSION OF GENDERED SHAME

Viveka Enander 1,2

1The Västra Götaland region Competence Centre on Intimate Partner Violence, 2Department of Social Work, UNIVERSITY OF GOTHENBURG, Göteborg, Sweden

In this qualitative study with women who have left abusive heterosexual relationships, the informants labelling themselves “stupid” was investigated. “Stupidity” was found to be a recurrent theme in the material; i.e. informants recurrently spoke of feeling stupid and/or described themselves in those terms. Several different meanings ascribed to “stupidity” were found, with feeling stupid for “allowing” oneself to be mistreated and for staying in the abusive relationship as main themes. Four frames for interpreting the findings were presented:

Abusive relationship dynamics. Batters’ verbal insults of their partners’ intelligence and abilities is a well-documented part of psychological abuse and it was proposed that victimised women may feel stupid due to internalisation of such abuse and of negative attitudes to battered women.

Gendered shame. Self-appraisals in terms of being stupid have in previous literature been connected to shame. Further, abuse, sub-ordination and stigmatisation have been described as shame-inducing. Women in violent heterosexual relationships are subject- ed to gendered violence, and their shame – in this case their sense of being stupid – was interpreted as gendered shame.

The Nordic Context. The Nordic countries are distinguished by strong ideologies concerning gender equality, and in Sweden there is a widespread consensus that a victimised woman should “leave at the first slap”. The advocated solution to the man being violent is thus that the woman should leave. This invites the interpretation, by victims and others, that not leaving equals having accepted living with violence; which was proposed to make victimised women prone to feel stupid for not having left their abusers immediately.

(Leaving) process perspective. Women negative self-labelling in terms of being stupid was interpreted as a reflection of processes of violence, in which women internalise their abusers derogative view on them. Further it was suggested that battered women’s leaving processes are related to and may influence what women label as stupid: staying or leaving.

THE RESEARCH METHODOLOGY AS ADVANCEMENT OF SOCIAL TIES

Aurora Minetti Zavaritt 1

1scienze della formazione, UNIVERSITA’ DEGLI STUDI DI BERGAMO, Bergamo, Italy

Abstract: The most part of the research paths that I have undertaken in recent years has developed within contexts inhabited by fragility-Nursing Homes for the elderly, by agony—the so called ‘Hospital encounters’, by the departments that receive cancer terminally ill patients and by those who are appointed to deal with them, the socio health carers. In this sense, my interest has been primarily directed towards the communities strongly affected by situations of high distress or cognitive physical downfall, settings that could reveal unexpected representations of life. In these places, the relationship between those receiving care and those giving it not only consists of sets of techniques acquired or to be acquired and their acceptance by the patient, but a space where listening, understanding, waiting, words, gestures and emotions compete in the definition of a reciprocal process of care.

The sites of disease, as well as the places of death, paradoxically, are the spaces where we can humbly linger to listen to life itself. Wherever care, through its joint expression, can set itself against vulnerability, as a new condition, far from being just a powerful healing practice. If conceived in this way, treatment can also be seen as one possible form of human understanding, in which to develop a dialogue, a “Socratic thinking” between knowledge, skills, people and the countless performances that derive from.

Especially in the field of health and illness, today, the social research tends to follow trajectories already set in advance by needs, or positions, no matter whether they provide for a socially useful outcome and the studies remain mainly oriented to the achievement of objectives statistically representative (in terms of correspondences between economic and social needs) or the construction of reflections on the effectiveness and efficiency of services. Polarities certainly important, which, however, in my opinion, need to be completed by the perception and emotions that citizens have of them and the meanings they attribute to them. The introduction of the perceptions and emotions of citizenship, as essential variables of a method of social research, is crucial: not just an array of epidemiological data and views. And they must be validated by their interwining with the meanings attributed to them by those who use the services.

THE THERAPEUTIC ENCOUNTER IN A PUBLIC ARENA - AN INVESTIGATION OF THE CHALLENGING EXPERIENCES AND EMOTIONAL WORK PERFORMED BY COMPLEMENTARY AND ALTERNATIVE THERAPY STUDENTS IN THE CLINICAL SETTING.

Alison Marie Fixsen 1, ALISON Marie FIXSEN 2,2

1University of Westminster, London, 2LIFE SCIENCES, UNIVERSITY OF WESTMINSTER, LONDON, United Kingdom

Abstract: This presentation will focus on emotional work and coping strategies reported in the study and discuss their implications for education and practice.

Background: The rise in prominence of complementary and alternative medicine has led to growing numbers of students training in this field, yet the emotional work performed by professional and student practitioners of Complementary and Alternative medicine (CAM) have gone largely unreported. Understanding and helping to reducing the effects of stress on healthcare students and professionals is important in avoiding “burnout” and other consequences for practitioner and patient.
Aims: The aim of this research project was to investigate the challenging experiences of a group of final year students studying different CAM pathways undergoing supervised clinical practice at the University of Westminster polyclinic, to gain a better understanding of their nature and range.

Methods: Individual semi structured interviews were chosen as the best means of eliciting first hand, in-depth information on the experience from student’s perspective. Sampling was both purposive and quota. Participants were pre selected on the basis of their participation in third year polyclinic, with subgroups chosen to represent different pathways. An interpretive analysis was used, with expressions and language of participants suggesting a markedly dramaturgical element to their experience.

Results: A wide range of feelings was reported by the students, both in response to being publicly watched and judged, and as a result of encounters with patients. The initial consultation in clinic was viewed as a pivotal emotional experience, suggesting its function as an emotional ‘rite of passage.’ However during the transition from student to professional, participants learned to manage the impressions made on others, with repetition of experience and emotional desensitization viewed as part of the transformation process from student to ‘professional self’.

Topics covered in the presentation will include; Research rationale, background, dramaturgical interpretation of data, emotional work as part of a ‘therapeutic performance’, and the implications of the findings for education and practice.

WHEN EMOTIONS IMPOSE CAPTIVITY: BATTERED WOMEN MAINTENANCE OF VIOLENT CONJUGAL RELATIONSHIPS
Sara Dalila Aguiar Cerejo

Abstract: This proposal represents an attempt to deepen knowledge within the thematic of gender violence from the sociology of emotions perspective. The objective is to shed light on some questions such as the perpetuation of violent situations, while carefully analyzing the victim’s reaction: why they never tried to separate from the aggressor, reasons for the continuity of the violent conjugal relationship, why they never reached out for help from qualified institutions, amongst others. Several projects, that the research team from Universidade Nova de Lisboa developed, showed that most women demonstrate a seeming “passiveness” towards the violent acts that they suffer.

This paper aims to present some new interpretations and results, collected from 60 in-depth interviews to women who experience(d) domestic violence situations, and to deepen knowledge on the importance of specific social emotions in the experience of violent situations, particularly within conjugal ties and the way that those emotions can, eventually, conditioning social action. Our hypothesis was that some social emotions can inhibited an explicit reaction towards the acts of violence. We used shame and guilt as two specific indicators to understand battered women’s passiveness.

Women’s passiveness towards the acts of violence they suffer, and the maintenance of the violent relationship, can be explained as the willing to correspond within a normal pattern is always present in the social agent, therefore, when a person perceives that «identity behavior is not meeting normative expectations or that behavior is failing to realize that values imposed by cultural frameworks, this individuals will experience negative emotions, particularly embarrassment, shame and guilt» (Turner & Stets, 2005:119). Thus, the shame and guilt that a battered women might feel, can be induced by her perception that the failure to correspond to a normative conjugal relation. Scheff & Retzinger also consider «shame to be the basic engine of repression - the cause of complete inhibition» (2001, xix).

Hence, an approach from sociology of emotions, allowed us to understand how women’s reaction in specific contexts of domestic violence, are conditioned by particular social emotions.

‘NO SEX UNDER MY OWN ROOF’: COMPARING TEENAGE SEXUALITY IN THE USA AND THE NETHERLANDS
Cas Wouters

Abstract: ‘No sex under my own roof’ is a oneliner addressing teenage children in an attempt at reinforcing abstinence of full sexuality until they move from home. In the Netherlands since the late 1960s, a new rule developed, allowing teenagers to have sex at home, provided they ‘feel strongly for each other’ and are ‘ready’ for it. This paper describes and compares developments in the USA and in the Netherlands since 1880, focusing on the social regulation of teenage sexuality, and based mainly upon sexology studies and manners books, the latter sources representing the dominant codes of the established classes and their good societies. The paper proposes an explanation of the two trajectories from national differences in the functioning of good societies, particularly their regulation of social competition and social mobility.

The rise in the USA of a highly competitive dating system and a complicated sexual morality indicates a smaller decline of power differences between classes, genders and generations, which partly explains the persistence of the old rule. Further explanation is found in America’s lower level of social integration and more open competition between various centres of power and good societies. The build up to the rise of a new rule among Dutch parents was an informalization of ‘getting engaged’, the diffusion of verkeren (going steady) and of parental policies to stay ‘in the scene’, indicating higher levels of social integration and larger declines of power differences between classes, genders and generations. Yet, the long preservation of a homogeneous good society created a widening gap between a facade of decency and backstage realities. When this gap was washed away in the 1960s Expressive and Sexual Revolutions, one of the novelties springing up was the conditional ‘sleepover’.

BULGARIAN MASS MEDIA: MAIN TENDENCIES IN DOCUMENTING THE PRESENT SITUATION
Stefania Dimitrova

Abstract: The research aims to identify the leading tendencies in documenting the present situation in main Bulgarian newspapers and TV channels during the period of six months. Different dia-
grams show the objective and subjective dominants as well positive and negative discourse in mass media. Topics provoking emotions of anxiety and fear as well of hope and opportunity are specified. Availability heuristics manipulating the public opinion is made known as a correlation between subjective perceptions of the media-created reality and actual facts.

**EMOTIONS AND THE RETRO-TREND IN FASHION AND DESIGN**

Katharina Scherke

1University of Graz, DEPARTMENT OF SOCIOLOGY, Graz, Austria

Abstract: In the sphere of fashion and design, an ever growing interest in aesthetic forms of past times can be noticed in recent decades. This interest is characteristic for different diagnoses of the present, it shows in illustrated books and commercial articles, which try to explain the retro-trends, but might also contribute to increase them. For a sociological explanation of the retro-trends a micro-sociological explanation is necessary in order to cope with the way how people come to develop aesthetic judgments. Emotional dispositions have to be taken into account in this matter. Furthermore the influence of the media has to be analyzed closer, because the media may act as amplifiers for specific emotions in respect to aesthetic forms. The paper will describe some of the emotions which fit in with an explanation of the "retro-phenomena" and will have a closer look at them in connection to the media which may have taken part in raising them.

**RUSSIAN MEDIA AND EMOTIONAL COMPONENT OF PUBLIC DISCOURSE ON EVALUATING THE SOVIET PERIOD OF RUSSIAN HISTORY**

Nataliya Repina

1Department of Social Management, Russian State Social University, Moscow, Russian Federation

Abstract: In the paper we intend to explore the theme of the influence of Mass Media in Modern Russia on the emotional component of public discourse on evaluating the Soviet history of Russia. First of all, we will seek to demonstrate the phenomenon of growing public interest in this period of history basing on an analysis of the most significant publications in the press, popular television projects, televised debates, talk-shows and other programs. Second, we will focus both on the content and style of acrimonious debate, revealing the emotional component of evaluating history of the Soviet period as well as on the reaction from the public provided in the interactive viewer voting, internet voting, discussion forums, readers' letters. In the paper we put forward the arguments for the following statements:

- any kind of debate on the Soviet period is accompanied by high emotional incandescence and assumes the character of acute emotional controversies sometimes tending to escalate into a confrontation;
- positive assessments of the Soviet past (contrary to expectations of the authors, leaders, and experts of many projects) are shared by an overwhelming majority of Russian people. The emotional shift in public attitudes to Soviet history is obvious now: from a sense of shame and guilt about the past up to pride and regret the lost. Thus means that Russian media are no longer able to form unambiguous-ly negative attitude to the Soviet past, as they did in the late 80’s in the process of “Perestroika”.

The paper presents several models to explain changes in public sentiment and gives their critique on the basis of the key provisions of sociological theory. We are trying to answer the question: how does resentment against the modern Russian reality causes so deep public sympathy for the Soviet past?

Key words: emotions in evaluating history; emotional shift, public discourse, resentment

**THE EMOTIONAL CULTURE OF MEDIA REPRESENTATIONS OF THE FINANCIAL CRISIS**

Christian Von Scheve 1, Sven Ismer 1, Veronika Zink 1

1Institute of Sociology, Freie Universitaet Berlin, Berlin, Germany

Abstract: Economic and financial crises derive part of their impact by how they are perceived and evaluated by economic agents, whose consumption and investment decisions are both, affected by prevailing economic conditions and future prospects as well as affecting the current economic situation. The way subjects perceive and evaluate the economy is to a large part determined by what is reported in the media. In turn, media reports on the economy in general and on financial crises in particular consist of factual information as well as of patterns of interpretation of what a crisis is, what caused it, and how it will most probably develop. Naturally, both parts of the coverage tend to represent and elicit feelings and emotions on the side of the recipients. Usually people don’t experience complex economic interdependencies through cut-and-dried statistics. The media propose basic explanatory models for the understanding of possible causes and systemic processes underlying the decline of the economic system. While offering a framework for the perception of the crisis, news media negotiate and thereby tend to objectify different emotions evoked within this process. In this contribution, we argue that the language used by the media in reporting on the financial crisis 08/09 is first and foremost a “language of emotion” systematically shaping the feelings of its audience. We present initial results of an empirical study of the coverage of a German newspaper on the first year of the financial crisis to substantiate our claim. Using qualitative and quantitative content analyses, we reconstruct the affective dimension of the coverage and its development over the course of one year. Employing a number of affective dictionaries, we sketch the systematic use of certain emotions words over time and highlight the prominence of specific emotions in the media discourse. Using statistical analyses, we also track the affective connotations of 3,000+ words used in the media coverage on the crisis. Finally, in an interpretative approach, we analyse attributions of responsibility for the crisis disseminated in the media and relate them to different kinds of emotions.

**EMOTIONAL MAPPING OF MEANINGFUL MEANINGLESSNESS: THEORETICAL AND EMPIRICAL ANALYSIS**

Maria Deeva

1THE HIGHER SCHOOL OF ECONOMICS (HSE), Moscow, Russian Federation
Abstract: The way emotions are marking social life may be called a center of sociological analysis and discussions. But a zero point of indifference is mainly stated as mark of meaningless of social situation. At the same time, some authors underlined close connection of some emotions not only with meaning, but also with meaninglessness. For example, J. Barbalet analyzed boredom as a mark of meaningless of social situation.

To our mind, it is necessary to analyze more carefully meaning mapping as resource of emotion theorizing: advantages, perspectives of development and limitations. In particular it is necessary to pay attention to mapping of meaninglessness, which needs to be defined as meaningful meaninglessness when connected with emotion.

There are also particular question: potential flexibility of already marked borders among meaningless and meaningful social situations. Conventionally used dichotomy of boredom and interest, despair and hope also needs to be examined.

The second objective of our research is to understand empirical advantages and constrains of emotional mapping theories. Concerning this objective, we proposed to discuss one of our research cases. It gives possibility to analyze flexibility of borders when routine operations and communication are challenged and extended by virtual ones.

There is investigated a process of building and implementation of big company internal web portal. Such a web portals, so called “Intranets”, are usually implemented as alternative/support of routine operations and communication, having also many features of global Internet.

On the first stage workers are asked to review their experience, including emotional one, of web searching, communication via social networks, forums etc. Emotions connected with last global web experience and future local web expectations (including boredom vs. interest and despair vs. hope) are in the focus of analysis.

The second stage of research (which is planned now) will be done after web portal implementation. Flexibility of meaningless/meaningful border will be analyzed on the base of users’ feedback and their communication within portal.

Research result is firstly targeted on analysis of emotion theorizing perspectives, in particular more deep understanding of idea of “emotional mapping of meaninglessness”. But it also may extend our knowledge of both individual and collective emotions in Internet.

THE SOCIAL CONSTRUCTION OF HAPPINESS

Ana Roque Dantas

Abstract: This paper analysis the structural, sociocultural and individual dimensions that influence happiness in order to explore the social processes related with the construction of the idea of happiness, namely the identification of values, expectations, meanings and feelings that guide social action and individual life projects.

The vast majority of people wants to be happy and identifies happiness as a life goal but find it difficult to explain what it means or why to pursuit it.

Most happiness studies discuss the results of subjective measures of well-being, but that doesn’t tell us what happiness means to individuals, and how important it is in their lives. The construction and pursuit of the idea of happiness, involve different interrelated dimensions and their social processes. So it is important to know why does happiness influence action (the quest for a happy life) but also what influences happiness.

For Damásio (2003) happiness is a feeling, and feelings and social emotions, besides having a physiologic base, incorporate knowledge and support decision making and action orientation. He states that the search for happiness is a self-preservation strategy.

Averill and More (2000) explain that happiness, like other emotions, can last days, months and years; and is not related to a specific object, event or explicit behavior. Happiness is compatible with a variety of activities and bears difficulties.

In this context it is important to understand how and why happiness motivates social action and conditions actor’s practices and behaviors.

The paper presents an analysis model that relates several dimensions and the various possibilities of action that arise in the frame. Accomplished results were obtained through a research methodology combining a statistical data analysis with the study of the actors’ individual trajectories (sociological in-depth interviews), linking macro and micro levels of happiness. Results show that happiness is subject to evolution, transformation and fluctuations and is influenced by several conditions of social actor’s life: social relations, work, financial situation, friends and family and life styles as well as social actors’ reflexivity of their own life circumstances.

WHAT CAN WE SQUEEZE OUT FROM PEOPLE’S STORIES ABOUT HAPPY MOMENTS?

Dorota Rancew Sikora 1, Bogna Dowgialło 2

1Department of Philosophy, Sociology adn Journalism, University of Gdańsk, Gdańsk, 2Department of Philosophy, Sociology and Journalism, University of Gdańsk, Gdańsk, Poland

Abstract: What can we squeeze out from people’s stories about happy moments?

Among positive emotions happiness seems to be more personally and less socially governed than pride so it is relatively less often a subject of sociological investigation (see Shott, Kemper, Barbalet, Scheff). In contrast to this there is a rich tradition of lay knowledge about what makes people happy which is rooted in different social and cultural contexts.

It is methodological problem how to go beyond conventional knowledge and to catch happiness as an interactional process and lived experience (Kaheman). In our research we try to go beyond shared knowledge and talk patterns toward an analysis of lived experience while placing detailed descriptions of happy moments in social interaction contexts.

LOVE, HUMOR, INTIMACY – THE PUBLIC PLAY WITH INTIMATE BOUNDARIES

Isaac González-Balletbo 1, Natàlia CANTÓ-MILÀ 1, SWEN SEEBACh 2

1ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: The webbing of social bonds in late modern society is crucially related with expressing emotions and confessing intimate secrets publically. This has led to a blurring of boundaries between the private intimate and the public sphere that has contributed to transform the social relations webbed on the basis of this formerly crucial distinction. The most paradigmatic social relations based on the distinction public/intimate are love relationships. Having a partnership has been crucially related with the establishment of an intimate sphere wherein lovers try to create a world based on magic, liminality and rules different from other social relationships.

In answering the question about how couples in love deal with the changes of meaning between intimate and public spheres we have discovered humour as a crucial dimension that helps to establish an intimate moment in public space, thus following the call for confessing the most intimate but without unveiling it, without transforming it into a mere public object. Is humour shared in public a form of agency of people in love against late modern discourses? Is this humour a moment of liminality by which the rules of the intimate and the public are jointly opposed, reinforcing the meaning of the social bond of love webbed by the lovers? Is it a climax, a moment of transgression that frees the couple from its public pressures? Or is it the new discursive form of confessing even more intimate details, of being seduced by the illusionary effect of superiory to tell even more secrets? Does a couple learn by using humour publically to manage emotions and desires? What happens when humour becomes a compulsive expression of a couple’s intimate life?

For answering these questions we have carried out 70 autobiographical interviews with people in love relationships in Barcelona and Berlin.

SOLIDARITY AND SOCIAL MINDEDNESS IN FAMILY: AN EPISTEMOLOGICAL PROPOSAL
Anna Maria Leonora¹

¹Dipartimento di Processi Formativi, UNIVERSITY OF CATANIA, Catania, Italy

Abstract: The problematic condition affecting a huge part of the late modern society translates the global crisis into the family experience and in the daily life dimension of socialization and social reproduction of society. This critical awareness - linked to the macroscopic changes in the economic and social climate of the last decade - has been rooted into this work concerning the micro-macro link in social reproduction processes.

The relationship between values and social competences can predispose the individuals to promote integration and “sense of community”: an experience that primarily and predominantly takes place into family. This assumption was “forced” to turn a precise path to the definition of solidarity and social mindedness as operative concepts. Moreover, this research emphasizes the social dimension of emotions needing to consider solidarity as a sentiment: a criterion for “social minded action”.

The study considers the specific practices into the inter-generational transmission of solidarity and social mindedness in the daily-life experience in family. Underlining in particular the heuristic importance of a mixed method research design I decided to use semi-structured interviews to parents and a survey for children. I briefly show the main results of a fieldwork conducted in Catania, the second main city in Sicily, that is the territorial context of this work.

Evidences showing the complex relationship between a set of values and a specific social attitudes permit to express same methodological suggestions to investigate emotions and sentiments avoiding social desirability dynamics.

SUBJECTIVE REASONS OF NEGATIVE AND POSITIVE EMOTIONS

Tetyana Vladimirovnna Ivanova¹

¹Sociology, Political science and Psychology, SUMY STATE UNIVERSITY, Sumy, Ukraine

Abstract: The purpose of this study was to investigationsubjective reasons of negative and positive emotions. A total of 600 people participated (women - 322 men - 276). The study was conducted in the Sumy region, Ukraine. Method of research - questionnaire with the use of open-type questions. Analysis was performed using content analysis.

The main source of positive emotions for respondents is the family (belonging to the family, the success of family members, interaction with family). Women are much more likely (41%) experience positive emotions associated with family relationships than men (26%). A second source of positive emotions, for both women and men, are relationships with friends (female - 14% male - 18%). The third most important cause of positive emotions for women is good weather, the possibility of being in nature (11%). The third largest source of positive emotions for men is the holidays, entertainment, and leisure time (15%). Other causes of positive emotions - Work (female - 5%, male - 8%), getting money (female - 6%, male - 8%), purchase, other acquisitions (female - 5%, male - 5%), surprises, pleasant surprises (female - 4%, male - 2%), well-being (female - 3%, male - 2%).

Family is also a major source of negative emotions. In particular, 28% of cases among women negative emotions associated with various events connected with family and relationships with family members. A second source of negative feelings for women are external events (poor performance of public services and utilities, unpleasant behavior of other people) - 23%. A third reason for the negative emotions of women are different forms of damage (breakage, loss, etc.) - 14%. In men, the main source of negative emotions are external events (the poor performance of government and president, injustice, corruption) - 27%. A second source of negative emotions is a family - 23%. In third place, as women are various forms of damage - 16%. The remaining causes of negative emotions - work (female - 8%, male - 10%), lack of money (female - 7%, male - 6%), bad weather (female - 5%, male - 1%), malaise (female- 2%, male - 1%).

TEENAGE LOVE AT THE DAWN OF THE 21ST CENTURY. HOW THE ICTS AFFECT CLOSE RELATIONSHIPS AMONG TEENS

Wojciech Kowalik¹

¹Department of Management, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: Information and communications technologies (ICTs) have changed not only the way we work or play but also the way people
build their relationships. Phenomena such as falling in love, flirting, having an affair, or even online sex are becoming part of modern way of living and love. It is worth pointing out however, that ICTs have impact also on offline relationships. Changes in expression and understanding of emotions as a result of the spread of computer mediated communication (CMC) can be seen especially among the younger generation. These phenomena can be observed also in Poland, where over 90% of teenagers were using the internet as well as mobile phones in 2009. The aim of the following paper is to present the results of qualitative analysis of posts submitted by polish teenagers on the teen advice and discussion forum. Young people are looking there for help with relationship, emotional, family problems etc. Based on analysis of almost 900 posts submitted in 2009, I strive to deal with the issues pertaining to how ICTs affect close relationships among teenagers. In particular, I would like to reveal the role of ICTs in shaping and sustaining those relationships.

**TRANSFORMATION OF FUNCTIONS AND VALUES OF ANXIETY IN MODERN SOCIETY**

Maria Vitkovskaya²

¹Sociology, PEOPLES’ FRIENDSHIP UNIVERSITY, Moscow, Russian Federation

**Abstract:** The issues of social security (insecurity) of the population are particularly important for Russia as a transforming society. In the reform period living conditions are rapidly changing and levels of radical reforms determine the degree of variability in living conditions. Any changes in social system are a sort of extreme factors in the development of society. Additionally modern societies are characterized by an increasing number of risks, threats, crises and disasters. Under such circumstances the population of the country does not always have time to adapt for new conditions. Therefore the problem of effectiveness of adaptation processes is so important.

One of the indicators of effectiveness in adaptation processes for Russia’s population can be social frustration (inner emotional tension, depression, anxiety, etc.) as an indicator reflecting response to the existing conditions of population. Social frustration is an indicator of individual and social risks for population. Successful adaptation to new conditions depends on the level of public exposure to frustration processes.

In this regard monitoring of spheres of threat and fear sources within various social groups acquires its particular importance. Apprehensiveness is the foundation of natural protective mechanism of individual. In mass consciousness anxiety is recognized as a threat or expectation of catastrophic shifts, ranging from local threats to regional, national and planetary ones. Epistemological significance anxiety increases: anxiety allows to identify real and potential objects, “problem areas” in society functioning.

Fears and concerns of population are actively studied by means of mass survey, but changes in ontological and epistemological status of fears make actual the need in identifying “a list of fears” for different groups that often go beyond consideration. The “set” of fears varies depending on the type of group.

**PARTICIPATORY METHODS: FACILITATORS OF THE RELATIONAL PARTICIPATORY PROCESS?**

Victoria Jupp Kina²

¹School of Health Sciences and Social Care, BRUNEL UNIVERSITY, Uxbridge, United Kingdom

**Abstract:** Over recent years it has become increasingly recognised that participatory processes require the recognition of subjectivity of all involved. This paper will explore the role that participatory methods can play in the recognition of this subjectivity. Using doctoral research this paper will discuss how the use of participatory methods and the experience of participating in a participatory research process can offer insights into some of the challenges of personal development and change central to the transformation of subjectivities. Directly addressing the ‘tyranny of techniques’ critiques within debates on participation (see Cooke and Kothari, 2001) this paper will propose that whilst participatory methods alone cannot create a participatory process their role is to facilitate the personal and relational aspects of the process. While the objective of the doctoral research had been to explore the complexities of children and young people’s participation through joint reflection and discussion with both practitioners and young people, what emerged was that the participatory action methodological framework had an extremely personal impact for some participants. During final reflections participants described how the research had an emotional impact and they reported personal changes that they felt enabled them to participate more effectively. It was as a result of these final reflections combined with my own observations of changes in behaviour amongst participants that I began to explore how the use of participatory methods can facilitate the process of changing subjectivities through addressing and providing space for the emotions.

**MEASURING THE DYNAMICS OF ELEMENTARY EMOTIONS IN EVERYDAY LIFE BY MONITORING THEIR PHYSIOLOGICAL EXPRESSION**

Georgios Papastefanou¹

¹GESIS LEIBNIZ INSTITUTE FOR THE SOCIAL SCIENCES, Mannheim, Germany

**Abstract:** In an interdisciplinary approach emotion covers a syndrome of neural, endocrinological, skeletomotorical, physiological, cognitive and affective responses to socio-physical events and stimuli. Only part of this compartmental responses are accessible by self-report and self-monitoring, because emotional processes are basically – at least in a first phase – are unconscious. Beside the automaticity, reactivity of peoples’ emotional mind makes it difficult to monitor emotional trajectories over time by self-report instruments: Asking people to answer the same questions repeatedly over some time, means to lead their attention to the emotional issues. The measuring itself would modify the emotional dynamics. A way of this dilemma might be to rely on one of the facets of the syndromic emotional response, namely physiological changes, which are closely connected to neuro-affective appraisals of stimuli. Biopsychological research as well as Human-Computer-Interaction (HCI) studies have shown, that multimodal analysis of physiological changes in cardio-vascular, respiratory and electrodental activity systems, provide high accuracy of recognizing elementary emotions. More and more ubiquitously and unobtrusively applicable devices get available, which opens up a promising way for objectively monitoring emotions in natural settings. The price of this approach is its focusing on some few elemental emotions like fear,
anger, distress, joy, relaxation and tiredness. Implications for a sociological understanding of emotions are discussed by referring to own studies on media consumption and on diurnal subjective quality of life.

THE EMOTIONS IN RESEARCH: A CHALLENGE FOR SOCIOLOGY?

Paolo Corvo

1UNIVERSITY OF GASTRONOMIC SCIENCES, Brescia, Italy

Abstract: The study and analysis of emotions represent a double challenge for social sciences: on the one hand there’s the difficulty of identifying the most appropriate methodology and to find new models that allow to understand in depth the emotional dimension of behaviour and attitudes of community, social groups and individuals; on the other hand, there is a problem of ethics, in reference to quality of relationship established with the social actor object of research, when emotions and feelings prevail over a rational action.

These circumstances become particularly significant in the case of in-depth interviews and biographical narratives: the social scientist must stop, respecting the privacy and personality of the interviewed, or he must continue and analyze the motivation of emotion? And as to understand if the social actor has real emotions or whether prevals a representation (as writes Goffman), that must be interpreted correctly? (it may be a reality rationally little communicable, or instead to hide the truth that cannot be said so openly)

The papefrties to answer to these questions from the experience of coordination of social research and field work, showing some typical cases which may contribute to the discussion and the creation of good practices on theoretical, methodological and empirical plane in a particularly sensitive area of sociology.

ASSESSING THE ROLE OF EMOTIONS IN POLITICIZATION PROCESSES: THE MOBILIZATION OF FRENCH JEWISH IDENTITIES AND THE ISRAEL/PALESTINE CONFLICT

Brigitte Beauzamy

1Centre for Research on Ethnic Relations, SHSS, UNIVERSITY OF WARWICK, Coventry, United Kingdom

Abstract: The Israeli/Palestinian conflict is the subject of much public debate and mobilization in France, where the media usually – and wrongly – distinguish between a “pro-Israeli” and a “pro-Palestinian” camp. The “pro-Palestinian” sphere is very heterogeneous, since it includes organisations working directly with Palestinian actors – primarily nationalistic and secular ones -, Muslim organisations in relations with Islamic political actors, as well as a strong leftist anti-imperialist movement involved chiefly in protesting against Israeli security and defence policies and the role of the US administration in the Middle East. Paradoxically, the “pro-Israeli” side is much less discussed, since it is roughly equated with the French Jewish community in the form of its communitarian organisations. It is true that most institutional Jewish organisations in France strongly support the defence policies of the Israeli government especially since the Sharon era, yet a close look at this constellation shows that attitudes are much more diverse and nuanced, and that a strong pro-peace sensibility can also be observed in the Jewish community. In a public sphere characterized by the simplification of the issues at stake and the vilification of the “other” side – as was materialized by the mass demonstrations staged by both camps both in 2002 and in 2009 -, such political position is hardly audible in the public sphere and tends to materialize in concrete initiatives in Israel. The heated character of debates regarding the Israel/Palestine conflict and its potential spill-over in France has led to increased displays of emotions in political discourses concerning French Jewish mobilizations.

One may argue this prevalence of the Israel/Palestine conflict in French political debates leads to an ethnicization of French Jews by inducing a diasporic turn of Jewish organizations, in which the orientation towards Israel is reinforced as the integration within the French polity is increasingly subjected to reinterpretation. This paper will study the role of emotions in bringing about this diasporization of French Jews by examining how the emotional construction of emancipated/integrated French Jewishness in public discourses has been recently replaced by new patterns drawing from imaginarries of activism and militancy in the Israel/Palestine conflict.

COLLECTIVELY PRAISING THE OTHER – ANALYZING THE EMOTIONAL DYNAMICS OF CHARISMA

Veronika Zink

1Cluster "Languages of Emotion", FU Berlin, Berlin, Germany

Abstract: Approaches within the sociology of emotions have mostly been concentrating on the interplay between other-demeaning emotions and the processing of collective identities. Beyond that, other-praising emotions should also serve a key function in explaining affective dynamics (re-)constituting social groups.

Charismatic others and sacred figures prompt positive other-praising emotions like reverence, awe, and adoration. While – on a surface level – other-praising emotions seem to foster a dyadic relationship between adored person and adoring subject, they also provide a binding unit within an adoring community. Experiencing the sacred due to outstanding figures of social life evokes feelings that are typically associated with cultic action tendencies and expressive joint activities in order to collectively praise majesty. This unleashes powerful collective emotions and serves to strengthen the actor’s affiliation with the sacred and his identification with the community.

Although the community-binding effect of charismatic figures has constantly been underscored, the underlying socio-emotional mechanisms are far from clear. What is specific about those emotions that motivate individual agents to participate in joint activities? And in turn, how can we describe the emotional climate that fosters acts of worship and evokes shared emotions among group members? The presentation will focus on the vivid interplay between emotion and joint action in order to shed light on the socially relevant dynamics arising from the engagement with the sacred.

Within the presentation, sociological theories concerning emotions within charismatic groups and psychological approaches regarding other-praising emotions will be mediated. The theoretical framework serves as a guideline for the empirical analysis. Empirically, I will concentrate on other-praising emotions evoked in religious and ‘pop-cultural’ communities. Participatory observations and interviews with group members serve as a basis for the development of a Grounded Theory. The reconstruction of specific forms expressing
and negotiating other-praising emotions within the social sphere lies at the core of my analysis. This will give insights into processes transforming subjective emotional experiences into collective emotionality.

DIVIDED BETWEEN LOYALTIES YET GUIDED BY LEADERS: MORAL AND POLITICAL CONFLICTS FACED BY SUPPORTERS OF ISLAMIC PARTIES IN TURKEY

Gürcan Koçan 1, Ahmet Fazıl Öncü 2

1Humanities and Social Sciences, İSTANBUL TECHNICAL UNIVERSITY, 2Faculty of Management, Sabancı University, Istanbul, Turkey

Abstract: Divided between loyalties: moral and political conflicts faced by supporters of Islamic parties in Turkey

This paper argues that politicized Islam has rendered a large portion of the population in Turkey place loyalty to their particular community of faith over and above their identity of citizenship. What distinguishes loyalty is that it is deeply affective and not primarily rational. Loyalty is a kind of social attachment to collectively shared feelings that make persons give themselves to the active service of a given cause. Causes, be they religious, political, or social demand loyalty. Religious loyalty should be thought of as consisting of psychological, social and political components. The voice of community is accepted as a moral and political authority.

Leaders of Islamic political parties have gained the support of an ever increasing number of voters by acting out as the political representatives of certain Islamic communities, which have demanded from their members absolute vertical and horizontal loyalty to charismatic leaders, affiliates and causes. This exclusivist political loyalty has been communicated sometimes openly, sometimes clandestinely but always legitimated by reference to religious views. Contrasted with this form of political loyalty resting on one’s faith in and devotion to their religious community, the notion of the citizenship legally used and exercised by the Turkish state calls for a kind of disinterested political loyalty. The latter generates a set of obligations to the nation conceptualized as the collectivity of individuals who “feel attached to the state as citizens.”

Those who are more loyalty to Islamic communities are prone to make their political choices by adhering to the causes of their moral authorities. Because of this, they are situated in a position of conflict between their duties to their particular community and more general obligations ensuing from their being the citizens of the state. Given that their multiple loyalties and diverse relations with a swathe of individuals and groups within their networks are significant bases of political divergence from the norms and rules of constitutional citizenship, there exists a need for a universal morality to lay down the ground rules for telling citizens what is permissible and what is forbidden in the pursuit of well-being through political action.

THE POLITICS OF VICTIMHOOD IN ISRAEL: A DESTRUCTIVE EMOTION CULTURE

Ruth Amir 1

1Department of Multi-Disciplinary Studies, THE MAX STERN ACADEMIC COLLEGE OF EMEK YEZREEL, Haifa, Israel

Abstract: The Zionist ethos unfolds a dramatic narrative of serial destruction followed by redemption. In particular, the post-Holocaust Israeli ethos espouses a Manicheaistic worldview in terms of actual or potential victims and perpetrators. In recent years, the emphasis of this emotion culture shifted away from the heroic sentiments of the formative stages, towards an increased sense of victimhood.

This paper explores the politics of victimhood in Israel as a strategy and a tool of power in Israel’s relations with its Others. I argue that victimhood is used for at least three interrelated purposes. First, it is used as an integrative tool which constructs, legitimizes and sustains the collective amid Others threatening to destroy it. In this victims’ community, suffering and the struggles surrounding it are endowed with virtue.

Second, the victim/perpetrator dichotomy is in fact transposed as the victims’ community uses preemptive measures in order to control and dominate those perceived as a threat to the integrity of the collective and the State. This proactive use of implicit or explicit power is reproduced in the domestic field. Thus, it not only targets Palestinians, “the Arabs” or “the world” at large, but it is also applied to work migrants, asylum seekers, Palestinian Israeli citizens and even peripheral groups within the collective.

Finally, this strategy of dominance from below throws the victim community into moral dilemmas, and invokes feelings of guilt and shame. These give rise to coping mechanisms such as projection and introjection, and techniques of neutralization of guilt. The sense of victimhood is maintained through the projection and attribution of the destructive impulses and aggression to the Other. Victimhood is further intensified as the innocent victim-turned-perpetrator is allegedly coerced into acting contrary to its virtue. This Manicheaistic worldview and the emotion culture it invokes are destructive. They create a vicious cycle of violence in which the victim becomes perpetrator in order to prevent further atrocities.

The paper holds three parts. The first will deal with the Israeli ethos; the second will concern the strategic uses of victimhood for the perpetration of injustices on various “Others”; finally, I will discuss the dilemmas and coping mechanisms employed in order to reconcile the inconsistencies invoked by these strategies.

THE SOCIAL FUNCTION OF SELF-CONSCIOUS EMOTIONS: BEYOND SYMBOLIC INTERACTION

Vessela Ivanova Misheva 1

1Department of Sociology, UPPSALA UNIVERSITY, Uppsala, Sweden

Abstract: The proposed discussion, which sets off from an examination of the current dominance of psychological and individualistic approaches to self-conscious emotions, proposes a sociological socio-psychological approach to an analysis of the social function of shame. The theoretical framework used for tackling this issue is symbolic interactionism, which is here understood as comprising the most important socio-psychological perspective within sociology. It is grounded in the work of Ch. H. Cooley and represented by the work of G. H. Mead. The fact that symbolic interactionism has so far been unable to prove itself an appropriate theoretical framework for the study of emotions is explained in reference to the profound difference between Mead’s and Cooley’s approaches to self, which sociology (Blumer) has failed to account for.

The paper introduces the concept of indexical interaction as a specific type of interaction which exists alongside the symbolic interaction that Mead identified as responsible for the emergence of subject/object social selves, thinking (speaking to oneself), and social
cooperation. While symbolic interaction necessarily requires language and the emergence of symbols as arbitrary signs which have the same meaning for all participants in the interaction, indexical interaction is based on the universal ability of people to read emotional expressions as signs of attitudes and physical states. Shame is regarded as distinct from all other emotions since it is accompanied by a physiological reaction, namely, blushing, which, unlike the expressions of other emotions, cannot be imitated or played. The social significance of shame is thus to be found in the fact that it is the only feeling with a true index, that is, blushing.

The investigation argues that shame as a self-conscious emotion and shame culture as a culture of indexical interaction play an indispensable role in the process of primary socialization. They are responsible for the transformation of the self into an object to itself and, consequently, for the emergence of the modern Meadean self.

**THE SOCIAL STRATIFICATION OF LANGUAGE-BASED AFFECTIVE MEANING**

Jens Ambrasat¹, Gesche Schauenburg¹

¹Cluster of Excellence “Languages of Emotion”, Institute of Sociology / Freie Universität Berlin, Berlin, Germany

Abstract: Affect Control Theory (ACT) argues and has demonstrated empirically that emotions are systematically associated with specific social actions. According to ACT, knowledge of the relation between social action and emotion is usually disseminated using language, which makes emotions and affective meaning socially shared phenomena. In this perspective, language serves as a collective knowledge repository about what kinds of emotions and corresponding actions are typically experienced in specific social situations. Consistent with this view, there is robust evidence that the affective associations of words differ significantly between cultures and societies. In this contribution, we argue that the affective meaning of certain words also systematically varies within societies, in particular across different social strata. This social differentiation should be most pronounced for words representing key dimensions of sociality, above all those denoting social cohesion and disintegration. We report work from an ongoing project which analyzes socially differentiated affective connotations from the semantic fields of “authority” and “community” in the German language. We discuss initial results from a representative survey (N=1.500) in which we measure ratings of words from these two semantic fields using the semantic differential technique and a multitude of socio-demographic data that allows the stratification of our sample along the lines of, for instance, age, gender, income, education, and job status. We are especially interested in discussing our data concerning those words for which these criteria of differentiation are most pronounced.

**UNDERSTANDING EMOTIONS - TOWARDS REFLEXIVE METHODOLOGY**

Irena Szlachic²

²Department of sociology, University of Wroclaw, Wroclaw, Poland

Abstract: Sociology of emotions has emerged and gained importance in the 1970s. Nowadays it presents a range of various theoretical schemes and the research programmes. It poses questions about the methodological foundations of the sociological analysis of emotions and the development perspectives of the new research approaches.

Thorough the forming of sociology as a science discipline, the rational aspects of behavior and social processes were the main interest of sociology. Therefore the emotional dimension of the problem is often neglected or even ignored. In this particular context, it is even more important to redefine the research subject and the evaluation of the methodological instrumentarium which determines the sociological cognition.

In the continuously developed field of the emotion research microstructural perspective is the dominant one, and thus there is a need to search for broader references and to place the subject of study in the context of structural and cultural variables. What are the directions of research determined by theoretical models of the contemporary sociology? Which methodological problems have to be identified, which research approaches should be applied to broaden the scope of sociological research of emotions?

In my paper I would like to discuss the following issues:

- what are the methodological consequences of the theoretical assumptions the researchers make?
- what can be acknowledged as the data?
- why the operationalization of the emotion remains so problematic programme of sociological research?
- what does the process interpretation mean and on which levels it is introduced?
- does the interpretation reflect the primal meaning and denotation of the experience, or does it encompass also the unexpressed researcher’s attitude?

**HOW DO BULLIES CONTRIBUTE TO THE BULLYING PROCESS?**

Charlotte Bloch¹

¹sociology, COPENHAGEN UNIVERSITY, copenhagen, Denmark

Abstract: The present study is part of a qualitative investigation of bullying as an interactional process between victims, witnesses and perpetrators. Analyses of how victims and witnesses contribute to the bullying process have already been done. In the present paper the focus is on the perpetrators. Research on workplace bullying has focused on the link between organisational features and individual effects. However, the focus has been on the effects on the victim and when it comes to qualitative research the focus has been on how the victims experience the perpetrators and their acts in terms of negative acts. Thus our knowledge of perpetrators/bullies experiences is very limited amongst other because individuals in general avoid negative self-attribution or they do not experience their behaviour as bullying. The purpose of the present presentation is to give voice to the perpetrators and thereby to show how the perpetrators contribute to bullying as an interactional process. The study is based on qualitative interviews of 17 employees, defining themselves as bullies of primarily colleagues. The analysis has been based on an abductive approach, characterised by a switch between empirical data and theoretical concepts drawing on interactional and emotional theories (Goffman, Becker, Clark, Scheff, Barbalet and Collins).
The results of the analysis of the perpetrators experiences have been summarized in four analytical themes:

1. Moral classification of the victim as rule-breakers (of norms and values in the workplace; the bullies position)

2. Aroused emotional patterns in terms of controlled feelings (anger, rage, vengeancefulness); explosion of feelings of rage but also empathy becoming transformed to resentment.

3. Actions toward the victim in terms of different types of ‘negative acts’ containing different potential for restoring or destroying social bonds.

4. Perpetrators ways of legitimate negative actions towards the victim.

I present the results of my analysis. I also discuss how the perpetrators experiences, emotions and actions contribute to our understanding of bullying as process on the workplace.

HUMILIATION AND SHAMING OF INTSITUTIONALIZED HELPER INTERACTIONS

Åsa Wettergren

Abstract: In this paper I outline an emotion-sociological framework for understanding the shaming and humiliation processes involved in institutionalized helper interactions. By institutionalized helper interaction I mean an interaction that involves a front line worker with resources who helps a client in (often long term) need of these resources. By resources I mean concrete resources as well as emotional resources such as recognition, respect and sympathy. Departing from theories of shame, humiliation, and sympathy I suggest that institutionalized helper interactions are analogus to sympathy interactions in the micro-setting, but differ from these by being structured to implicitly humiliate the client. The function of structural humiliation and shaming is to regulate and discipline welfare receivers by associating the use of welfare services to a potentially painful emotional cost. The argument is exemplified by material from a qualitative study on the reception of asylum seekers. Through the examples, the contingency of a person’s sympathy biography and sympathy account become evident but also mechanisms such as expulsion-humiliation and reinforcement-humiliation. The emotion work and emotional processes involved are discussed from both the viewpoint of the frontline and the migrant/asylum seeker. It is argued that both are locked in their respective positions of giving and receiving help/humiliation, but that a resentful frontline may use the bureaucratic position to ‘rub it in’ vis-à-vis the subordinate client; and that the migrant develops a humiliated habitus that may protect against shame and cover up for secondary arrangements.

„RATIONAL CONTROL” OR „EMOTIONAL DISHONESTY” – HOW SOLDIERS DEAL WITH EMOTIONS

Jens Oliver Zinn

Abstract: This paper bases on results from an small study on British ex-servicemen’s management of risk and uncertainty (British Academy Grant SG-46091, 5/2007-11/2008). While the original research is much broader (Zinn 2010) this article focuses on the question how soldiers deal with their emotions when they engage in behaviour which is commonly seen as ethically problematic. The assumption is that war is an exceptional context where soldiers engage in activities usually seen as inappropriate, distasteful or criminal in civil life. While, for example, killing of other soldiers seems acceptable the killing of women and children contradicts common norms. A small explorative study with British veterans showed that soldiers develop different strategies to deal with their emotional response to such issues. The article argues that their strategies refer only partly to their professional training but are deeply rooted in their biographical experiences before they became a soldier. The article presents two case studies. One shows the control of emotions by shifting the responsibility to the task or specific mission they have to fulfil or to their supervisors. The other case shows that the need for emotional justification of activities leads to systematic contradictions and can trigger a re-evaluation and re-assessment of experiences.

RURAL SCHOOL TEACHERS AND THE EMOTIONAL PRESSURES OF COMMUNITY LIFE: LOCALISTIC AND COSMOPOLITAN COPING STRATEGIES IN MID-20TH CENTURY FINLAND

Erkko Tapio Anttila, Ari Väänänen

Abstract: The paper discusses rural school teachers’ relationship to the local village community in mid-20th century Finland, as well as the different strategies by which school teachers coped with the emotional pressures of community life. The paper makes use of historical-qualitative data that consists of articles published in the Finnish elementary school teachers’ professional journal in 1937 – 1939 and 1948 – 1950. In the period under study, Finnish rural teachers were typically very public figures in their local community. Their professional functions were not limited to the school work, but they were expected to assume moral leadership in their local community and to act as model citizens who would set the standards of virtuous behaviour for others. This is why their lives and behaviour were under constant scrutiny by the villagers, a situation which greatly limited teachers’ privacy and also caused them emotional stress. To deal with the pressures of their public position school teachers resorted to different coping strategies which can be divided into two categories on the basis of how they affected teachers’ orientation towards their social environment. The first, ‘localistic strategy’ entailed that teachers adapted themselves to the social demands of community life and strived to make themselves more skilled players in the social field of the local community. The second, ‘cosmopolitan strategy’, on the other hand, manifested itself in teachers’ efforts to build themselves an identity basis that was independent from the local community. This was achieved, for example, by establishing private counselling relationships with colleagues, or by making use of the possibilities opened up by school teachers’ paid summer holiday. Hence, school teachers’ emotional experiences and their coping strategies reflected a more general social change where traditional community ties were gradually displaced by modern individualism.
PSYCHOSEMANTIC METHODS APPLIED TO THE STUDY OF “LONELINESS”

Zhanna Puzanova

1Sociology Chair, PEOPLES’ FRIENDSHIP UNIVERSITY OF RUSSIA, Moscow, Russian Federation

Abstract: We conducted an empirical study on “loneliness” among university students using our own research framework. We proceeded from the assumption of two-level structure of loneliness: the emotional (affective) level and the reflexive (cognitive) level. The research framework comprised two blocks: the unfinished sentences technique and the semantic differential.

To develop the second part of the research framework we started with an association experiment in the course of which the respondents named adjectives describing various feelings associated with loneliness. As a result, 37 adjectives were obtained. The “ambiguous” adjectives were removed from the list so that the scales would be neither blurred nor ambiguous and require no additional explanations. Thus, 19 pairs of adjectives were obtained which formed the initial space of attributes.

The correlation matrix was built based on scaling category similarity which afterwards was subjected to factor analysis procedure (the varimax method of rotating factors was used). The criteria of quality evaluation are the high values of the selected scales and the high explanatory potential of the model. The factorization of the scales made it possible to highlight 4 factors (which provide 68 % of the explained dispersion) constituting the semantic space of “loneliness” phenomenon perception (factor weights exceeding 0.4 are presented in the table).

The first factor (which explains 22% of total dispersion) describes the positive attitude to loneliness (according to our assumption, it is semantically associated with the concept “solitude”). The second factor (20%) is described by adjectives “deep”, “sad”, “closed”, “regular” and is associated with the psychological state of loneliness. The third factor (15%) describes the time axis (“constant”, “frequent”), the fourth (12%) – the intensity of experience (“deep”, “simple”).

The loneliness semantic space elaboration has revealed the existence of “dualism” as far as loneliness is concerned, while the positive ratings can be found side by side with the negative ones.

As a result of semantic differential method application the respondent does not have to switch his perception from the affective level to the cognitive one, which appears as a definitive advantage in the study of such a sensitive subject as loneliness is.

EMOTIONS IN WAR: WHAT CAN WE LEARN FROM AUTOBIOGRAPHIES AND FICTIONAL PROSE? A COMPARISON OF NARRATIVES OF THE FIRST WORLD WAR

Sabine Alexandra Haring 1 Helmut Kuzmics 1

1Sociology, KARL-FRANZENS-UNIVERSITÄT GRAZ, Graz, Austria

Abstract: Collective violence, in particular violence in war, is still underrepresented in the perspective of sociology. The same goes, with few exceptions (Collins 2008), for the sociology of emotions. What people (mostly men) emotionally experience as members of military collectives in peace and war, is, strangely enough, only rarely object of closer scrutiny. Our contribution addresses emotions and sentiments of officers and common soldiers as they are, on the one hand, mirrored in novels, as reports on the “treatment of extreme experiences of reality” (Löschning 2004). Our sources embrace works of British (Sassoon’s "Memoirs of an Infantry Officer", Graves’s “Goodbye to all that"), French (Chevallier’s “La peur”), German (Jünger’s …In Stahlgewittern", Remarque’s “Im Westen nichts Neues”), Austrian and Slovenian (Kuhar/Voranc’s "Dobrodo") origin. On the other hand, we analyze material from about 40 autobiographies written by Habsburg officers and "common" soldiers, by interpreting it in a sociology-of-emotions perspective in order to find out both about ruptures and continuities in what shaped their “affective household” (Elias).

Contrasting both kinds of sources, we want to know how well they mirror emotions and sentiments felt during the war. Where do these sources converge, where do they differ in their emphasis they put on emotions as fear, anger or boredom? Do different …narratives” of the same experiences emerge? Do members of different groups and classes give voice of their emotions differently, also according to the kind of source (novel, diary) they use? How can we solve the related methodological problems of under- or non-representation of certain emotions in the various narratives? Are novels better suited to tell about emotions than nonfictional ego-documents?

THE STUDY OF EMOTIONS IN BUREAUCRATIC ENCOUNTERS: THE CLIENT-AGENT-SOCIOLOGIST TRIANGULAR INTERACTION

Alberto Martin Perez 1

1Dep. Sociology and Analysis of Organizations, UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: The study of the emotions raised in bureaucratic encounters usually focus on the client-agent interaction. Although these emotions are often unearthed trough participant observation methods, the ‘participant’ side of such research practice is rarely taken into account in analysis. It seems like sociologists do not consider seriously their actual influence over the scene they are observing. Conversely, a more critical vision of research practices shows that sociologists not only observe, but participate actively in the shaping of the interactions they study. Therefore, they influence other actors’ expression of emotions, and these actors also play a crucial role in the emotions that emerge through the practice of research.

The paper follows the example of recent research in bureaucratic institutions. By taking into account practitioners’ participation in the institutional interactions they observe, the comprehension of clients’ and agents’ emotions seems to be improved. The analysis must then focus on three-party experiences: first, the emotions of those who are to be served by the institution (clients) when interacting both with agents (the ‘traditional’ client-agent relation) and with the observer (this one needs to justify his/her presence in the scene). Second, the internal complexity of the emotions raised by the agents of the institution when serving clients (their “double body”, both as individual citizens and institutional agents), and when accepting the presence of an external participant (as “objects” of a sociological experience). And third, the emotions raised by the researcher while interacting with other actors (especially when trying to justify their role in the scene), as well as those emotions that come within the research experience itself. These three sets of emotions are deeply connected to one another and would...
help us complete the map of emotions in complex institutional interactions.

NOT OUR CROSS TO BEAR: JEWISH FEELINGS ABOUT THE CHRISTIAN SYMBOL

Annamaria Orla-Bukowskia

1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Kraków, Poland

Abstract: Two lines intersecting perpendicularly are a phenomenon as old as the history of man. An intersection on a map, a geometrical or graphic design, a letter of the alphabet, a mathematical or chemical sign, a trademark, or a religious symbol – the “cross” has always been infinitely present around the globe. So ubiquitous, it is (paradoxically) less visible for the Christian-affiliated for whom it tends to blend in with the sociocultural landscape, and more so for the non-Christians for whom it delineates the territory of the Other.

Religious symbols are highly emotive and act as signs of ethnoreligious, as well as racial or national belonging. In a world in which not only communities, but individuals imagine and construct themselves, performance of religiosity (including a- or anti-religiosity) is a component of highly public identities. More than anyone, minority groups are cognizant of and feel the tenuousness of their position on the power-powerlessness spectrum.

For going on a second millennia, Jews have lived predominantly in Christian-dominated societies. Over the centuries, a wide variety of intuitive responses as well as calculated strategies has been directed – collectively or individually – by Jews towards not only Christians but things Christian. The rationale for these tactics has encompassed everything from literally physical protection of the lives of members of the group to social preservation of the collective identity of the group.

Therefore, fear of the political and social power held by Christian societies over them and upon whom they have been dependent – rooted in tangible historical experiences of extreme prejudice and discrimination – leads to a strong emotional reaction by Jews towards the symbol they read as representing that Other. The cross in whatever form is seen as representing inter alia Christian perpetrators in the past, potential persecution in the future, and minority status in the present.

Nevertheless, Jewish responses to the cross go beyond plain cultural practice “against” the Other, a “Hee or flight” response. Rarely enacted in public and generally directed towards an envisaged audience in action-readiness mode, the negative emotions have positive consequences. This paper will sketch out the emotional dynamics of the Jewish relationship with the cross, the relationship between a subgroup with the symbol of the superordinate.

PAID WORK AND MONEY AND THEIR POTENTIAL EMOTIONS: OF INTEGRATION?

Jocelyn Florence Pixley

1SOCIOLOGY, MACQUARIE UNIVERSITY, SYDNEY, Australia

Abstract: This paper suggests types of emotions in processes of integration in the abstract world of money and the ever thinner performative and less secure ties of paid employment. I look at possible emotions between and towards the personal-impersonal, using my research on money, and earlier work that linked employment with citizenship (Pixley 1993; 1997). That partly drew on Axel Honneth. His distinctions between forms of recognition: individual, political and social, suggest, to me, that whereas paid work widens the ‘social world’ from primary to secondary webs of ‘affiliation’, employee-employer ‘ties’ are rarely in institutionalised forms of simpatico. Often, at worse, hatred prevails; unemployment is maybe worse: isolating, ‘depressive’ and so on. Simmel also stressed the highly impersonal yet social nature of money. Money is increasingly abstract, as is employment, in face of the 20th century expansion of huge corporations, banks and bureaucracies, and their secret use of populations as statistics for further manipulation (Craig Calhoun).

This is not a world of strangers (only); impersonal dependencies on money and work can bring joy and pleasure through to vague anxieties, suspicion, distrust and cynicism, even corruption. It is difficult to accord credit or blame – Banks? – Corporations? – Governments? – so political discord and anger are often evident. Sources of recognition and security are also fraught. Integration in today’s hard-to-define ‘social whole’ through money alone, whether through guaranteed forms of state income (unemployment/welfare payments), or unearned money market income, is more fragile, isolated and more liable to bitter social conflicts, I argue, than the world of paid work with its potential for ‘belonging’, however fragile these days.

THE COLLECTIVE GESTURES OF MEMORY

Alexandra M. Lozinskaya

1MEMORIAL INTERNATIONAL, Moscow, Russian Federation

Abstract: The main exploratory intention of this study is to suggest alternative to the conditionally «Durkheimian» approach to the sociological analysis of the emotional attitudes to the past. I oppose the concept of “collective gestures of memory” to the “practices of commemoration” concept for this purpose.

Once the sociologist of emotions turns to the study of memory, he or she is sort of forced to follow the frames of the Durkheimian tradition. He or she admits the popular interpretation of the “Elementary forms of religious life”, under which emotions arise as a result of coordinated communications committed by individuals. Thus, the next force is to focus on the production of emotions through the practices of commemoration. Herein the “practice” concept dates back to the Durkheimian “ritual”, which includes physical co-presence of individuals for some time.

The efficiency of such a problem definition and a conceptualization-imply several limitations.

The scholar is forced to investigate the contemporary laicized rituals of the anamnesis, meanwhile individual acts of public expressing emotional attitudes to the past, which are much more of frequent occurrence, remain irrelevant.

An opportunity to take such an act into account is rooted in the writings of another classic of the sociology, George Herbert Mead. Developing Mead’s argument enables one to grasp the transitory public expressions of the emotional attitudes about the past, which could be defined as the “collective gestures of memory”.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
APPROACHING THE THOUGHTS AND FEELINGS OF CONSCIENCE WITH QUALITATIVE AND QUANTITATIVE METHODS

Sylvia Terpe, Helmut Thome

Abstract: Conscience is a rarely covered topic in present-day sociology. This neglect is surprising in light of the numerous sociological diagnoses concerning the problematics of moral integration in modern societies. Conscience seems to be a somewhat out-dated concept which can be left to theology, philosophy or psychology.

In contrast, our research project is intended to explore from a genuinely sociological perspective how conscience functions and expresses itself in everyday situations. We treat conscience as a capacity to guide and judge our past, recent, or prospective behaviour (and thoughts?) according to certain, mainly (exclusively?) moral, standards or ideals, and we ask: what are the specific situational settings which activate, neutralize or silence our conscience; what are in fact the standards applied in such cases; what are the emotions (shame, guilt, regret ...) involved in this? Our study will proceed in several steps applying different methodological approaches.

In our pre-test survey (with a sample of people working at our university) we will combine qualitative and standardized methods. Open-ended questions are used to identify situations, in which the interviewees remember to have “experienced” their conscience; we will ask them to report in detail on the specific circumstances given in and the consequences that have emerged from these situations, as well as the thoughts and feelings that went along with them. In the standardized part of the questionnaire we will employ commonly used scales to measure moral attitudes along with two other scales that have been used in social psychological research to measure a person’s disposition to feel (specific types of) guilt and/or shame.

In our analysis we will address the question of how the dispositions of guilt and shame measured in this way are related to the openly reported experiences of conscience. To what extent do the results produced by these two approaches converge or diverge? Do the scales’ underlying concepts of guilt and shame match those feelings and thoughts reported in response to the open questions? One aim of our analysis at this stage is to evaluate the scales’ usefulness to indicate reliably a person’s propensity and specific ways to experience and reflect upon his or her conscience. Further insights in this respect will be gained from in-depth interviews we plan to conduct with some of the questionnaire-respondents.

DIALOGIC INTROSPECTION: A METHOD TO SURVEY EMOTIONAL EXPERIENCE AND ITS METHODOLOGICAL ADVANTAGES AND DISADVANTAGES - AN EMPIRICAL TEST ON THE EXAMPLE OF RELIGIOUS COMMUNITIES

Jenny Weggen

Abstract: Empirically, it constitutes a difficulty to collect emotional data - the established survey methods frequently encounter their limits. A new method offers expanded opportunities: the method of dialogic introspection. It focuses particularly on the empirical documentation of experience - and experience is always emotional experience.

The dialogic introspection uses individuals’ self-observations and self-perceptions and obtains its dialogic character by applying to a group-based method. The same applies to the claim of intersubjectivity.

The method tests a special research subject in groups of 4-12 people, guided by a supervisor. Each participant introspects individually and reports the experiences to the group - followed by another round of introspections, influenced by the others’ presentations. The data are recorded on tape and transcribed afterwards.

The practical application of the method shows that data can be collected which provide important clues to emotions. Furthermore, there are several methodical advantages and disadvantages.

Using an investigation into emotions in religious communities to revise the practicality of the dialogic introspection, the paper discusses how to improve the method and evaluates the necessary steps.

EMOTIONS IN UNTERTAKER’S JOB: ABOUT SOME SOCIOLOGICAL THEORIES

Julien Bernard

Abstract: For my PhD of sociology[1], I have worked during one year as undertaker in two enterprises of funeral services in France. I wanted to understand how funerals are organized by undertakers in reference to the emotions of the customers – people in mourning – and with the probability for themselves to be affected in their work situations. The fieldwork leads me to participate at almost 150 funerals. The description of these circumstances from the undertaker’s point of view engaged me theorizing the place of emotions in this job. With the following perspectives, I finally would like to defend a pluralist socio-anthropological paradigm in sociology of emotions.

• How ethnography can show the expression of emotions and the reactions of others in the situations, the way emotions appear, are authorized or canalized; how professionals control their emotions and consider the emotions as data of their job.

• How symbolic interactionism is useful to understand interactions between undertakers and families. During the first interview (preparing the ceremony), everyone try to overpass the “social drama of work” (Hughes)[2] even if professionals and families have sometimes to mark their places (Clark)[3]. During the ceremonies, undertakers try to make a “dignified” ceremony and try to go at the family’s pace.

• How ritual analyses explain the dynamics of emotions during the ceremonies; how durkheimian theory can be reworked more dynamically.

• How anthropological analyses show the cultural variation of experience and expression of emotions. French funerals have to be dignified and sad at the same time; that is a sort of double bind.
• How historical perspective is necessary to understand emotions in funerals today; personalization of funerals can be seen as the result of the liberalization of funerary market.

HOW SHOULD (RELIGIOUS) EMOTIONS BE SOCIOLOGICALLY STUDIED?
Regine Herbrik

1Institut für Soziologie, TU BERLIN, Berlin, Germany

Abstract: Within the past few years, emotions have become an important research object for European sociology in almost the same manner as they have been for decades in the United States. However, the growing importance of the subject does not necessarily mean that there are fixed research programs, or methodological and methodical canons as yet. The question, how should emotions be sociologically studied, has hitherto not been fully answered, and it is not clear, which methodological issues should be taken into account. Certainly, the way in which we approach emotions depends on our theoretical background as well as on the particular topic of interest. Therefore, there are currently many different research methods in existence; from standardized paper-and-pencil tests and survey research based on large numbers of cases, to qualitative approaches working with data corpuses generated via narrative interviews.

Strikingly, as previously remarked by several different scholars of human emotions, observational methods have not that often been used as the nature of the subject might suggest. Despite widespread consensus amongst interdisciplinary contributors on the discourse of emotion research regarding the importance of the expressive dimension of emotions, the main focus of this research field is still located in the exploration of one dimension, namely, subjective feeling.

The paper suggests and introduces a special combination of methods, that meets the specific requirements for analyzing emotions sociologically, including several dimensions of the subject. This combination entails, firstly, the participative observation of performances, which encompasses the spoken, gestural, mimic, sung and danced expressions of emotions. Secondly, it includes video-analytical methods for scrutinizing any type of audio-visual data representing emotional expressions. Thirdly, supplementing approaches via sequential analyses of interview data will also be introduced.

The application of methods will be demonstrated with the example of a study on new emotional styles in the field of religion. This study compares newer Christian congregations with a pentecostal or evangelical orientation to more conventional Christian parishes affiliated with the Evangelical Church in Germany or the Roman Catholic Church. By doing so, the increasing relevance of researching the emotional dimension for the sociology of religion will be illuminated.

A SOCIOLOGY OF EMOTION: RESENTMENT
Stefano Tomelleri

1Dipartimento Scienze della persona, UNIVERSITÀ DI BERGAMO, Bergamo, Italy

Abstract: Resentment inheres simultaneously in the social structures and relationships in which social actors are embedded. Beginning with a critical examination of F. Nietzsche and M. Scheler’s account of individualistic and vitalistic resentment, this paper considers the emotional patterns of resentment in daily interactions, in social inequality and in relation to the institutional evolution that has occurred with modernity. Social actors at the moment have many possible choices, but they are unable to promote the conditions of equal opportunity required in order to achieve them. An increasingly ambitious and mimetic desire clashes with a selective and competitive reality. Resentment is a feeling experienced by social actors when an external agency denies them opportunities or valued resources (including status) that otherwise would be available to them. Arising from social relationships, resentment depend on the wider set of relations which constitute the social framework in which the agent plays an active part. This analytic perspective puts forward the hypothesis that resentment is always situated and therefore has a context. It does not live inside of social actors but among them.

Key words: Social theory, emotion, resentment, social relations, inequality.

Bibliography

FORGIVENESS AND RESENTMENT IN THE AGE OF TRAUMA
Nicolas Demertzis

1DEPARTMENT OF COMMUNICATION AND MEDIA STUDIES, UNIVERSITY OF ATHENS, ATHENS, Greece

Abstract: Various therapeutic discourses on trauma claim that a successful working through of a traumatic experience amounts to forgiveness and the victim’s reconciliation with the past. Recently, several voices have been raised against this claim arguing that refusal to forgive is a sort of moral dignity, a defence of the victim’s integral subjectivity and a moral protest against unjustifiable evils and wrongdoings she has suffered. Among the emotions the victim is left with after the traumatic experience and after her reluctance to forgive the perpetrators and go along with life is of course anger, hate, indignation, depression, humiliation and shame. According to some authorities (e.g. Améry, Smith, Brudholm) an additional and far more complex emotion that characterizes the post traumatic experience is ressentiment. Yet, it is not always obvious what one
means with ressentiment and what it feels for someone being-in-ressentiment. Not only is it crucial for ressentiment to be differentiated from resentment, but one should keep in mind that the conceptualization of ressentiment is not an easy task even among those endorsing the nietzschean origin of the term.

This paper discusses forgiveness and ressentiment as moral stances against evils and traumas. Its basic tenets are: (1) the link between agency, forgiveness and memory; (2) the moral nature of ressentiment as a schelerean concept which not only parts company from resentment (qua moral indignation) but also from grudginess and envy; (3) the dismembering of forgiveness and ressentiment premised not on the subject’s resistance to deal with the past or her moral hypermesia, as is usually thought, but on the process of ‘transvaluation’, inherent in ressentiment, which places forgiveness beyond her hermeneutic horizon.

PHANTOM-PAINS OF POLAND: A POST-TRAUMATIC REACTION TO THE LOSS OF JEWS CAUSED BY HOLOCAUST

Julia Maria Koszewska1, Yechiel Weizman 2*

1Institute of Applied Social Sciences, University of Warsaw, Warsaw, Poland, 2Hebrew University of Jerusalem, Jerusalem, Israel

Abstract: The post-traumatic stress disorder have been studied from several perspectives: historical and psychological aspect of transmission of trauma. However in all studies it has been presented in relation to the direct victims and their descendants. The authors present new perspective of post-Holocaust trauma. The trauma of Polish society who because of Holocaust has lost its Jews. Usually the researches don’t realise that the loss of the Jewish part of polish society is not only a lost for the history of Jewish nation but also a lost for Polish society. The departure point is that the collective trauma can affect also non-direct victims, this paper aims proving that this trauma can affect also non-relatives of direct victims but also influence broader consciousness of polish society who still (or only now: after the transformation of 1989) feels and is ready to speak out the loss. This ‘group of memory’ feeling is being compared to the the R. Melzack’s concept of ‘neuro-matrix’ and to the pain syndromes such as the phantom-pains. This paper applies this medical concept to the social milieu: the loss of the Jewish presence is being internalised by Poles today and often expressed as something they can feel. The paper presents also several solutions by the Polish society in order to face the loss and cure the pain: the good-practices of regaining the ‘local knowledge’ (after M. Foucault) about the lost limbs: Polish Jews. The metaphor of “phantom-pains” is used here as a departure point for understanding how the polish society is dealing with the trauma of the loss of the Jews and finds the answer on: how is it possible for Poles who didn’t experience the actual trauma and were born into “Poland without Jews”, to feel those “phantom pains”?? The uniqueness and innovation that this paper brings lays also in diverse perspectives the subject is studied: using terms of neuro-psychology, sociology and memory studies, but also from several points of view by the authors. Both authors were born in same year – as the third generation in families who survived the Second World War. Yechiel Weizman – young researcher, born in Israel to the Holocaust Survivors’ family, and Julia Koszewska – young researcher and activist, born in Poland to the family of activists of the polish resistance movement during the WWII. Their personal lenses reflect in broadening the perspective on the examined issue.

EMOTIONS, NARRATIVE & SOCIAL CHANGE: THE CASE OF IRELAND.

Jonathan G. Heaney 1

1School of Political Science & Sociology, NUI GALWAY, Galway, Ireland

Abstract: The 20th century can be viewed as a sustained period of turbulence for the peoples and countries of Europe. This has been particularly true for the Republic of Ireland, which came through a colonial past, a revolution and a bitter civil war in the early decades of this century to emerge as a “new” nation-state in control of its own destiny. As a nation, it has undergone an exceptionally rapid modernization process, particularly since the 1950’s, which has had profound effects on individuals’ lives and social relations. This has been explored and explained by a host of social scientists, from a myriad of positions, yet no one has yet done so from an emotional perspective. This paper discusses the relationship between emotions, narrative and social change in late modernity, with particular reference to theRepublic of Ireland. It begins with a brief discussion of the process-relational theoretical framework on which the wider PhD project rests (Emirbayer, Elias, Bourdieu), before engaging with the core concerns of this paper: the relationship between narratives and emotions, and how both relate to, and can be understood in light of, profound structural changes in a society. In addressing this I engage with the sociology of emotions literature in particular, and social theory in general, as I deploy and develop the concept of emotional habitus. The core question guiding the research is: how do such profound changes in society affect the emotional habitus of the individuals of that society. The argument will be supported with reference to a series of qualitative interviews, which employs the Biographical Narrative Interpretive methodology (BNIM). The participants for this study have been chosen from four birth cohorts in Irish society: 1929-34, 1949-54, 1969-74 and 1989-94, and thereby includes individuals reaching adulthood in the crucial decades of Ireland’s social history, i.e. the 1950’s (a period of socioeconomic decline), the 1970’s (initial modernisation), 1990’s (the so-called “Celtic Tiger” era) and those coming into adulthood now. It is argued that within these life histories, or processes of becoming, that the shifts in social and emotional habitus may be gleaned.

OUT OF PLACE? YOUNG PEOPLE’S SENSE OF BELONGING IN MARGINALISED NEIGHBOURHOODS

Peter Van Der Graaf 1

1Social Futures Institute, TEESIDE UNIVERSITY, Middlesbrough, United Kingdom

Abstract: There is also much research evidence documenting the marginalisation and social exclusion of young people in a range of areas concerning transition to adulthood and independence (MacDonald 2005, 2009). However, much less is known how this affects their sense of belonging. How does marginalisation and social exclusion affect their emotional attachment and hence their ability to get on and by in life?

For many young people, their sense of identity and community is shaped by where they live and young people often display strong territorial affiliation based on tensions that exist between them and groups of young people from neighbouring communities (Shildrick 2006). This is particularly the case in marginalised neighbourhoods where young people more often choose to live locally, in spite of
Lack of services, employment and opportunities, and are likely to spend much more time within the public spaces of their neighborhood.

This paper will look at what makes neighborhood and community important for young people’s constructions of identity and how do these constructions relate to other scales of belonging. The paper will utilise existing survey data on citizenship in the United Kingdom and Europe (Eurobarometer 60.1, 2003; and Citizenship Survey, 2003-2007). How do young people feel at home at different spatial levels, such as their neighbourhood, local area, country or even Europe? And which predispositions of residents contribute to different feelings of belonging?

Key words: sense of belonging, place attachment, young people, marginalised neighbourhood

RITUAL, EMOTIONS, AND THE DYNAMIC STRUCTURES OF NATIONAL IDENTITY

Sven Ismer

Abstract: “How do people become national?” once was asked by Catherine Verdery. Within the presentation this question will be approached by connecting classic trains of thought like Emile Durkheims notion of collective effervescence with contemporary debates in cognitive sociology and the sociology of emotion.

I will argue that football is central for the dynamic (re-)construction of national identity in Germany since it provides outstanding possibilities to experience collective emotions. Football constitutes a framework for collective rituals which produce feelings of belonging. Predominantly, these feelings embody the imagined community of the nation in a very basic sense. In addition, states of high collective arousal promote an emotional atmosphere in which cognitive information about the in-group as well as the out-group is more likely to be integrated into the symbolic universe (Berger & Luckmann) of knowledge about the group.

In a second step, the outlined theoretical background serves as framework to approach empirical data. TV-coverage about big football tournaments provides a rich database to analyse this symbolic universe and in doing so, the dynamic structures of national identity will be exposed. Examples from the FIFA World Cup 2006 in Germany reveal the power of the ritual media (Lardellier) to (re-)construct national identity.

THE ROLE OF AFFECT IN SUPPORT FOR EUROPEAN UNION

Monika Verbalyte

Abstract: Even though many voices concerned with the European Union (EU) advocate for a more emotionally charged concept of it, there are hardly any theoretical or empirical works addressing the role of emotions in, e.g. European identity formation or support for the EU. This contribution aims at overcoming both of these shortcomings: it provides an explanation of how people’s emotions towards the EU may influence their level of EU support and tests underlying theoretical assumptions empirically.

Usually, we rely on our emotions while making judgments. Emotions convey the perceived value of the object they are directed at: positive affect promotes a reliance on the information related to that object, whereas negative affect invalidates this information and motivates a more accurate analysis of it. Different effects of emotions also apply to political attitudes. Positive affect strengthens favorable attitudes towards the political objects and thus has a positive effect on them. Negative affect, on the contrary, calls for a critical examination of these attitudes, attentiveness to new information regarding the emotion object and change of attitudes towards it, if the gathered information is sufficiently disapproving one’s former attitudes. In general, negative affect fosters the search for new information about the object, but does not determine the results of cognitive elaboration on this information. Negative affect thus exerts negative influence on the evaluation of the object, but this effect is weaker than the one of positive affect, which backs favorable attitudes without any additional constraints.

To illustrate these effects, I will present an empirical analysis of data from the Eurobarometer indicating the substantial influence of emotions on EU-related attitudes. My analysis confirms that positive affect increases the level of support for the EU, whereas negative affect has diminishing, but much weaker effect on it. The results, however, do not provide evidence for hypothesis that negative affect increases the information level about the EU. This does not discard theoretical assumptions regarding the functions of negative affect, but rather reveals problems related to the EU as political actor. Even if the EU is a target of European citizens’ emotions and these emotions influence their attitudes towards it, the EU does not play a sufficiently critical role in citizens’ lives to initiate actions based on these emotions.

CAPTURING, DISTRIBUTING AND FRAMING THE ACTS OF VIOLENCE: HUMILIATION AND UBQUITOUS MEDIATING TECHNOLOGY

Henrik Furst

Abstract: It is time to go beyond the idea of the Internet and its social media as solely bound to computer-mediated-communication (CMC). The potentially ubiquitous and abundant character of mediating technology reconstitutes conditioned possibilities for action, for example, through handheld capture devices for depicting, reproducing and distributing “social life” as it unfolds. I argue that this aspect of the mediating technology alters the structure of social life, such as power balance, for example, by bringing in non-present others and performing a moral framing of the situation of action. The distribution and re-presentation through video sharing sites causes the framing of violent acts to take yet another contextualization. A moral order is negotiated through such a framing, a process where the role of humiliation plays a crucial part. To be in control of the distribution of the precarious event is also to be considered as an act of (symbolic) violence.

The material for this study comes from the video distributing channels, such as YouTube. The distributed video clips are embedded in an interactional nexus of situational influences, both in the immediate situation of the acts but also with respect to their livelihood on the Internet. These influences will be studied and the clip will thus be conceptualized in a broader situation of action.
GRIEF 2.0 - EXPLORING VIRTUAL CEMETERIES
Nina R. Jakoby¹, Simone Reiser¹
¹Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland
Abstract: Secularization and technological progress as well as the individualization and emotionalization of death are developments that have shaped the history of the cemetery. These processes are closely connected with the survivors’ wish to preserve the memories of their loved ones and mourn the loss. Media support remembrance and preservation and therefore play an essential role in expressing grief. The Internet, as a medium of recollection and a driver of social and cultural change, influences burial customs and offers virtual cemeteries as a new platform for grieving. In the online world, we can observe sociological processes and theories in an ideal-type manner, which has led scholars to call the Internet a “methodology lab” (Geser 1998). Hence, it offers ideal conditions for reviewing theories in the sociology of emotions, especially symbolic interactionism and the assumptions it makes in regard to grief and grieving. The strength of symbolic interactionism lies in creating awareness for the numerous rules governing the emotion of grief, in particular, by distinguishing between socially legitimate and illegitimate losses and identifying the specific rules for “proper” grief, which derive from the psychological model of “normal grief.” Can we identify these social rules of grief, or do we find a new representation of grief on the Internet? Based on content analyses of web memorials, we will investigate how the absence of physical parameters in the online world, such as space, time, and matter, affect how grief is expressed and experienced.

ONLINE AND OFFLINE LOVE: AN ANALYSIS OF INTIMATE RELATIONSHIPS IN VIRTUAL WORLDS
Amaranta Cecchini¹
¹Institut de sociologie, Université de Neuchâtel, Neuchâtel, Switzerland
Abstract: While most research on online intimacies focuses on dating websites, other electronic spaces (such as forums, chatrooms or virtual worlds) also allow people to meet and eventually fall in love. However, these spaces remain relatively unexplored from this perspective. Based on a qualitative investigation of love relationships on the virtual world Second Life, my presentation aims at contributing to a wider understanding of online intimacies.
First, I will examine the role and influence of the media in the construction of individual experiences and couple’s relationships. Notwithstanding, this inquiry will not be restricted to one specific online space (Second Life), but according to the users’ different communication practices on- and offline. The hypothesis of a link between different communication practices and specific forms of love relationships will be considered by examining how online love experiences become part of people’s daily lives.

Further, several researchers have investigated the characteristics of virtual environment and conclude that these allow different degrees of social presence. Considering immersion as a phenomenon supported by technological and sociocultural mediation, the role of emotional involvement in a relationship as a support for experienced presence will also be discussed.

Finally, assuming that the emotion of “love” is socially constructed and as a consequence of rejecting a dualistic vision opposing online and offline experiences, there is a need to examine the wider social and cultural context in which online love relationships are lived. The understanding of these relationships in Second Life can therefore be improved by considering wider sociological theories on contemporary love issues.
Keywords: love, virtual environment, presence, technological and social mediation

SEND ME A MESSAGE AND I’LL CALL YOU BACK – THE LATE MODERN WEBBING OF EVERYDAY LOVE LIFE
Francesc Núñez-Mosteo¹, NATÀLIA CANTÓ-MILÀ¹, SWEN SEEBAH¹
¹ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain
Abstract: New technologies of communication are playing an increasingly important role in the everyday webbing of love relationships. Lovers use their mobile phones, email accounts, and webcams to communicate with each other in the most diverse situations and circumstances, and for the most varied reasons: the shopping list, the nanny’s phone number, or the most intimate confessions – those, which would cause great embarrassment without the possibility to hide behind the coded words … all these different types of messages are channeled by these same new forms (possibilities and/or obligations) of communication. The possibilities to remain in touch despite the distance, the possibilities to create ‘artificial’ distance by chatting from the bedroom to the living room, to carry on arguing in the tube on the way to work, or to discuss the latest movie seen together whilst sitting at the desk at work, are, this is this paper’s thesis, webbing new forms of partnership, and possibilities of commitment.

To be always there for each other now does not only mean to stay together. Potentially it means being there for each other in every minute, every second, 24 hours, wherever one is, for there is always a possibility of ‘being in touch’. It also means to perceive the beloved other increasingly through written words and sent images; the same way as we perceive our colleagues, or old friends from school.

In order to research the forms in which quotidian love relationships are webbed today, strengthening or weakening the social bond (and their subsequent commitments) webbed between lovers, we have realised 70 autobiographical interviews with people in love relationships in Barcelona and Berlin. The results of the analyses, regarding their discourses on love, on that which relationships are and should be, their daily practices, their conflicts, hopes, problems and forms of communication will be presented within this paper.

THE ROLE OF EMOTIONS IN FORMING AND CONSOLIDATING DEVIANTE SUBCULTURES: THE DEVELOPMENT OF COMMUNITY IN ANIMAL RIGHTS GROUPS
Catriona Roberts¹
¹Scienze Politiche e Sociali, Instituto Universitario Europeo, Florence, Italy
Abstract: A common issue for animal rights activists is the dissonance that exists between themselves and mainstream society. Their philosophy is based on problematising that which is widely accepted as a basic fact of our existence: our use of and dependence on animals. The enormity of the gap between what they strive
for and the current situation creates many disadvantages for them; they are often perceived as crazy and face difficulty convincing others of their ideas, the hope of achieving their goals appears slim, and they are often involved in dangerous and sometimes illegal methods of activism. The subculture that develops among these activists must compensate for all this, and provide support and affirmation. The emotional component of this is very important. Drawn together by common ideals, bonds are developed and strengthened through the risky and unpleasant tasks they undertake together. Living with other activists, their views are echoed back to them and so become stronger and more extreme. There must be a positive emotional culture for them to continue with their activism; solidarity, friendship and moral righteousness are the fuel that keeps the fire burning. This paper is based on fieldwork I undertook in London among activists belonging to SHAC (Stop Huntingdon Animal Cruelty) and ALF (Animal Liberation Front), and presents an ethnographic report of the groups community and a theoretical explanation of the different ways in which the emotional components of the subculture helped to sustain it.

THE ROLE OF EMOTIONS IN POLISH MEN’S MOVEMENTS
Katarzyna Małgorzata Wojnicka

Abstract: The issue I would like to explore in my presentation concerns phenomena, which contemporary sociology calls ‘men’s social movements, which are the type of new social movements focused on gender identity. I would like to examine 3 types of men’s movement: pro-feminist movement, spiritual movements and father’s rights movement, since these types are the most popular in Poland.

The aim of my presentation is the analysis of a role of different emotions in constitution of certain types of men’s movements which are present on Polish social life. Therefore, presentation will be divided into four main parts where I will try to deal with detailed topics such as:
1. A connection between men, masculinity and emotions
2. Role of emotions in social movements
3. Polish men’s movements – an introduction
4. Between love and anger: the case of Polish men’s movements and the role of emotions of their actors

My research is based on a variety of sources: sociological interviews with Polish participants of number of organizations and associations which constitute the most important part of contemporary men’s movements. The case studies of the following Polish associations has been provided: Mężczyźni na Rzecz Równości (Men for Equality), Centralne Stowarzyszenie Obrony Praw Ojca (Central Father and Children Rights Association), Stowarzyszenie Obrony Praw Ojca (Capitol Father and Children Rights Association), Fundacja Akcja (Action Association), Męski Krąg (Men’s Loop), Mężczyźni Świętego Józefa (Saint Joseph’s Men). I have gathered sufficient materials from several Polish cities: interviews, newspapers articles and also numbers of opinions from specific websites or discussion groups created by men connected with specific type of men’s movements.

SELF-HELP LITERATURE AND EMOTIONS MANAGEMENT
Fernando Ampudia De Haro

1Instituto de Historia Contemporânea (IHC), UNIVERSIDADE NOVA DE LISBOA, Lisbon, Portugal

Abstract: The aim of this communication is to analyze self-help books using an analytical approach based on the civilization process theory of Norbert Elias. According to these texts, it is possible to reconstruct the code for the management of emotions, here referred to as the ‘reflexive civilization code’. The study of the code involves a presentation of its contents as well as a statement of the arguments used to support advice and precepts regarding the regulation of emotions. Finally, I propose a characterization of the social bases of the code taking the theoretical contributions of the so-called neo-foucaltians and their works on governmental and political rationality.

SELF-HELP GROUP MEETINGS AS INTERACTION RITUALS: EMOTIONS AND RECOVERY
Yulia Prozorova

1SOCILOGICAL INSTITUTE OF RAS, St. Petersburg, Russian Federation

Abstract: This paper explores how the interaction process modifies the emotional states of the participants of the 12-step group meetings and what role it plays in recovery and acceptance of the program principles. The paper focuses on the analysis of emotional changes and emotional correction as one of the principal outcomes of the regular attendance of group meetings and as one of the key factors of personal transformation. The interaction ritual theory (R.Collins) served as a conceptual frame in the case-study of the Families Anonymous group. The interaction ritual model was applied to explain how the group meetings work. The study of meetings based on participant observation revealed that their organization includes components necessary to create a successful interaction ritual. The group meeting as an intentional interaction ritual is an important mechanism that stimulates emotional correction, identity transformation, internalization of program principles and interpretational frames. Co-dependents enter the meeting usually experiencing shame, anger and despair. Meeting interaction reduces these emotions by providing an opportunity for relieving speaking, support and new frames of the situation. Focused interactions affect members on the both emotional and mental levels that are interrelated. On the one hand, the positive emotions promote the formation of emotional energy that is bound with the cognitive symbols and their actualization. On the other hand, an access to the “charged” group symbols facilitates emotional correction. The most important functions and resultant of the group meeting are: the transformation of mood and emotional “leveling”; the production of the emotional energy, enthusiasm and motivation to work according to the program; the sense of solidarity of participants that have a common problem and are united by the fight with a disease; the mutual support and empathy; the actualization and the emotional recharge of group symbols (the 12 Steps, program principles, slogans etc.) A cultural determination of emotional experience of co-dependents was also revealed. Culturally constructed view on motherhood is interpreted as an obstacle in accepting the principal idea of personal life boundaries and autonomy. This view implies that a mother (as most part of FA members are mothers of chemi-
cal dependents) has to sacrifices her life and “has to suffer” if her child is suffering.

**WORK STRESS AS A MODERN EMOTIONAL REACTION: A HISTORICAL STUDY OF SCIENTIFIC DEVELOPMENT**

Ari Väänänen, Jussi Turtiainen, Erkko Anttila, Pekka Varje

1 Work Life in Transition Team, Finnish Institute of Occupational Health, Helsinki, Finland

Abstract: During the latter part of the 20th century, work stress became an important societal issue, and a huge amount of scientific attention was dedicated to studying it. Research analysing the associations between risks at work, stress, and indicators of ill health can be seen as manifesting and defining the links between the environment, negative emotions, and the body. The aim of the paper is to examine the process of crafting and defining the phenomenon of work stress in the occupational health sciences and in work psychology from the 1960s to the early 1990s. We mainly focus on the most hectic period of defining and conceptualizing the notion in the 1970s and 1980s. The material of the study consists of 105 scientific articles, book chapters and congress presentations which were analysed using content analysis. The results of the paper are analysed by applying frameworks of historical sociology, sociology of emotions, and critical psychology. Based on our findings, work stress as a life-structuring concept spread and matured in the sciences (and in lay understanding) in the late 1960s and 1970s when the fundamental changes toward democratic and human-oriented work organizations and collective values of solidarity took place. However, as time passed, the active social reformist voices among the researchers weakened, while the voices emphasizing the apolitical occupational health aspects of work stress became stronger. The psychologically orientated researchers started to emphasize efficient coping mechanisms and other micro-level characteristics as factors affecting work stress, while the health-oriented epidemiologists turned to the study of specific occupational stress models which departed from the original ideals developed in the 1960s and 1970s. Overall, during the last quarter of the 20th century, work stress research moved away from the collective political movements and focused more on individual reactions and protests linking the emotions and the bodies of employees in a new way.

**COLLECTIVE FEELINGS AND METHODOLOGICAL INDIVIDUALISM**

Werner Binder

1 UNIVERSITY OF KONSTANZ, Konstanz, Germany

Abstract: This paper deals with the concept of collective emotionality, which is frequently used but still undertheorized in the sociology of emotions. Among the sociological classics only Emile Durkheim addressed the collectivity of emotions specifically. Already in his division of labor collective feelings are used to account for the integrative force of punishment and scandalization; in his late writings, collective effervescence refers to similar emotional effects of rituals. However, the collectivity of emotions as well as Durkheims more general term, collective conscience, remain theoretically underdetermined and ambiguous – not only in Durkheims oeuvre, but also among contemporary sociologists. I will deal in my paper with the following questions: In what sense can collective feelings be collective? Is collective emotionality in a strict sense possible or can shared feelings always be reduced to individual feelings? Can a strict concept of collective emotionality ever be compatible with methodological individualism? And what are the methodological implications of such a concept? The answers to these questions are not only of interest for the sociology of emotions as there are analogous problems regarding our understanding of collective action and beliefs. What distinguishes a collective belief from the individual beliefs accidentally shared by actors? Is there a distinction at all? Even though collective forms of action and shared states of mind should be of eminent interest for most sociologists, there hardly was any sociological attempt to address these problems. However, in the last fifteen years the status of collective intentionality became a hotly debated topic among social philosophers. The philosophical use of the term “intentionality” refers not only to the intention to act, but also to the content of mental acts such as believing, desiring or feeling. Starting from the extreme positions of the debate, I will discuss John Searle’s and Margaret Gilbert’s account on collective beliefs and actions. I will adopt their insights to develop a concept of collective emotionality in the strict sense that is nevertheless compatible to methodological individualism. I will discuss the methodological implications of these theoretical insights by examining the public reaction to September 11, 2001, and the disclosure of Abu Ghraib abuses in 2004.

**THE FUNCTIONS OF COLLECTIVE EMOTIONS IN SOCIAL GROUPS**

Mikko Salmela

1
EMOTION AS MEANS OF MEDIATION AND PRODUCTION. TOWARDS A SOCIO-ANTHROPOLOGY OF COGNITION

Florent Gaudet

1EMC2 - Laboratoire de Sociologie de Grenoble, UNIVERSITÉ PIERRE-MENDÈS-FRANCE (GRENOBLE 2), GRENOBLE cedex 9, France

Abstract: With his expression “A ten-fingered civilization”, André Leroi-Gourhan insists upon the idea that the hand leads thought or leads to thought. However, he also reminds us that, if the hand reaches for the brain, it is also because the brain is eminently manual. It is not simply about “communicating”, but rather about “producing”. “Not having to think with ten fingers is equivalent to missing a part of one’s normal thought process, phylogenetically human” or, in other words, is the equivalent of finding oneself outside of “cultural production” and nearer to the barbaric or the animalistic.

To speak about the brain, to take into account the body and emotions; these domains are not solely the monopoly of the neurosciences and, this being so, cannot merely be reduced in a simplified manner to a cognitive preconception. That is why to ignore the importance of these aspects and these links is to give free reign to the hegemony of a trend. In proposing a socio-anthropological perspective on the conditions of the possibilities of such an approach, this paper intends, here and now, to launch a counter-attack.

At a time when a certain type of “cognitivism” is on the verge of academically saturating the field of the explanation of action and production, this paper aims to (re)affirm the fertility of a socio-anthropological approach of matter, and to prepare the groundwork for such an approach.

EMOTIONS OF HEALTH PERSONNEL IN FAMILY’S CONSENT REQUEST FOR ORGAN DONATION

Thomas Madonia

1Department of Sociology and Political Science, UNIVERSITY OF FLORENCE, Firenze, Italy

Abstract: Organ transplantation raises ethical and public dilemmas. This presentation focuses on the phase of procurement and consent. My aim is to investigate the interaction and communication among physicians, nurses and family, in particular how physicians and nurses manage their emotions in addressing the family donor for consent to organ donation.
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

Moving away from a dualistic mind-body conception, this study aims to show how decision-making process strongly depends on embodied and embedded choices rather than on a priori, abstract and universal ethical principles. In other terms, once a relational approach to ethics has been endorsed, this presentation shows that the interaction among actors is bodily situated. Specifically, during the consent request, the interaction between the health personnel and the family is strongly affected by spatial and environmental conditions, as well as verbal and non-verbal communication. Also deserving attention is understanding how the construction of space has changed over the last few years in order to establish both effective and person-centred communications. Furthermore, this interaction is a typical case of negotiation as “invention”, based on judgement, learning and improvisation and it deeply changes according to the following variables: the kind of death, the age of the dying person and the emotional reactions of the family.

In making this argument, I draw on the literature about organs' procurement and on my ongoing ethnographic research at the "San Giuseppe" hospital in Empoli in collaboration with the local Committee for Donation of Organs, Tissues and Cells.

ATTITUDE TOWARDS IMMIGRANTS IN RUSSIA
Antonina Noskova 1, Elena Kuzmina 2
1 Sociologist, Moscow State Institute of International Relations, 2 Sociologist, Moscow State University, Moscow, Russian Federation

Abstract: Russia has faced the intensive immigration streams rather recently, at the beginning of 1990-s. The sharp turn from “closure” of the frontiers to their "openness" has led to some consequences. Now Russia has a leading place in the European countries rating on the quantity of foreign immigrants. At the same time, we see now the growth of xenophobia and hostility to the immigrants.

In our study, there are analyzed some results of the sociological research, which is dedicated to the characterization the Russians attitude to the immigrants. This research has shown the growth of the xenophobia in Russia. Based on the results of a European Social Survey, the conclusion is made that Russians like Europeans (but sharper essentially than they) feel the treat to their culture and way of life from the immigrants. This often results in the xenophobia to immigrants and in the aspiration of Russians to put a barrier to penetration of the alien cultural values, norms, traditions and modes of behavior.

The following research point is addressed to the factors that promote the negative emotions to ethnic immigrants in mass-consciousness of Russians. These factors are: the scales of migratory streams; the cultural distance between immigrants and indigeneous population of host country or cultural compatibility; the state policy system on the migration regulation.

The next point is that, despite the general growth of the xenophobia, Russians show the tolerance and even sympathy to some groups of ethnic immigrants, for example, to the immigrants from Moldova. The results of the empirical research «The Moldavian immigrants in Russia in the conditions of world financial crisis: migratory mood and value orientations, the problems of work and employment, the social protection and adaptation» (2009-2010) have testified that Moldavian immigrants feel themselves in Russia comfortably enough. They adapt well, solve their problems, enrich themselves culturally and emotionally. So, 81.3 % of the interrogated immigrants from Moldavia noticed that the work in Russia had helped them to improve the living conditions for their families.

In the conclusion, there are analyzed the state measures, which are recently accepted in Russia, for the regulation of the migratory streams, socio-cultural adaptation and integration of immigrants.

EMOTIONAL GEOGRAPHIES OF EXCLUSION AT A MULTICULTURAL SCHOOL
Michailinos Zymbylas 1
1 Open University of Cyprus, Strovolos, Nicosia, Cyprus

Abstract: While emotions have always been acknowledged as important components of discussions about racial and ethnic matters, there have been a few sustained investigations of how and with what implications emotions are constituted through school practices and discourses in relation to perceptions of ‘race’ and ‘ethnicity’. More importantly, emotions have remained in the margins of discussions about the socio-spatial dynamics of racialisation and ethnification processes in schools, or at best, are regarded as epiphenomena rather than constitutive components in students and teachers’ lives.

This presentation highlights the idea that we need to look more carefully at how school practices and discourses are entangled with emotion in relation to perceptions of race and ethnicity. More specifically, the focus is on how emotional geographies are manifest in the formation and maintenance of particular racialisation and ethnification processes within a multicultural school in the Republic of Cyprus. The uniqueness of this school is that both Greek-Cypriot students and teachers (the majority) and Turkish-speaking students (the minority) are enrolled; this interaction takes place in the background of the long-standing political and ethnic conflict between Greek Cypriots and Turkish Cypriots.

My analysis shows that attending to how emotional geographies come alive offers a promising avenue through which to understand the insidious power and tenacity in certain manifestations of racialisation and ethnification processes in schools. The important intersection of emotion and race/ethnicity is seen in the constitutive role emotions play in the formation and maintenance of particular racialisation and ethnification processes, both historically and socio-spatially, in these processes and spaces, emotions work to make various categorizations that include some students and exclude others. The ethnic division of Cyprus is resealed down to classroom and school life through the creation of toxic and politically charged emotional geographies. This is not to suggest that all emotions (e.g. those related to nationalism and racism) are simply responses to external occurrences or forces; rather, the emotional geographies of exclusion show how racism and nationalism maintain its pervasive presence in certain social interactions and spaces in which they occur.

‘IT IS NEVER GOING TO CHANGE’. DECONSTRUCTION OF THE FEELING OF BELONGINGS OF ARGENTINEAN MIGRANTS IN MIAMI THROUGH THE STUDY OF ANGER, TRUST AND HOPE.
Cecile Verme 1
1 Sociology, Universite Paris Descartes, Vincennes, France

Abstract Book
Abstract: Between 1999 and 2003 Argentineans lived an economical, political and social crisis, which reached its catharsis during the Corralito in 2001. During this period, the unemployment rate was more than 25 percent and 57.5 percent of the population fell below the poverty line. The unbearable social situation, the indignation, deception and frustration lead to a fragmentation of Argentina as imagined community. For some Argentineans, collective action was one of the possibilities to reduce the uncertainty. Others chose to migrate, mainly to the United-States and to Spain. There are few studies on Argentinean migration and even less those taking into account the subjectivities of migrants. The aim of this study was to analyze the deconstruction of the feelings of belonging of Argentineans migrants in Miami through the study of trust, anger and hope. In depth interviews and participant observation were conducted in Miami among Argentineans who migrated in couple. All the interviewed had migrated with their children or had children after migration. Findings show that migration was not only due to economical difficulty. Argentineans express a strong rejection of their country. They express anger in front of the failure of social fantasies of Argentina as a country of the first world, which respects human’s rights and where everyone may pretend to upward mobility. They do not trust anymore Argentinean politicians and institutions and do not see a possible future in their country. Migration is for them an act of rejection of Argentina and the possibility to offer a future to their children. It is thus an act of hope in Miami fantasies.

CONSUMER EMOTION MANAGEMENT IN CONSUMER-PROVIDER INTERACTION IN THE CASE OF COMPLAINTS

Paul Eisewicht

Depar tement of Sociology, KARLSRUHE INSTITUTE OF TECHNOLOGY, Karlsruhe, Germany

Abstract: Buying products online is an advantageous way of buying for the customer (as well as selling for the provider) by a more standardized, regulated and rationalized issue-related process of service. In lieu of the face-to-face situation with a service personal in an ‘offline’ situation the customer finds himself in a face-to-face interaction situation. But the advantages of online shopping turn-over when the customer is disappointed with one or more aspects of the product and when he wants to express this disappointment combined with a claim towards the specific provider. Due to the subjective perceived cause of the complaint and the absence of the defective object in the situation for the counterpart the controlled expression of emotions gains a higher relevance in complaints which are being expressed online. The active customer not only de-neutralizes the situation but also searches for alternate ways to express his frustration towards the provider.

The presentation focuses on how emotionality influences organizational pr e-shaped patterns of action in the context of online modes of communication. Services therefore are to be conceived as constituted in the interaction between customer and provider. In this understanding the presentation seeks to contribute to the understanding of the relation between (provider) organization and individual (customer).

The presentation builds on an empirical research project about barriers of social action in customer complaints due to online shopping funded by the German Research Foundation since April 2008. The empirical basis of the research consists of focus interviews, documents, self-reports and protocols of participant observations.

EMOTIONS ON CMC AND FACE TO FACE INTERACTION: A COMPARATIVE ANALYSIS OF WOMEN’S PEACE ACTIVISM IN ISRAEL

Tova Benski

behavioral sciences, THE COLLEGE OF MANAGEMENT ACAD EMIC STUDIES, Rishon Lezioni, Israel

Abstract: Analyses of the reactions of the public to protest events are rare. Analyses of talk-backs to protest are non-existent. Yet both mediums represent two types of public spaces of contention and debate. Former analyses of women’s peace activism in Israel showed the harsh, angry and violent nature of the responses of the public, composed of private citizens, to the vigil of Women in Black, on the street, in real time, while the protest was being performed. The question addressed by this paper is whether talk-backs that are posted on the net, in response to newspapers articles reveal similar emotional fervor, are more heated or perhaps reveal different emotional processes. Exploring the main differences between face-to-face interactions and written responses that are anonymous and lack embodiment, do we need to readjust our theoretical assumptions of emotional processes that are based on interactional processes and dynamics? The paper will draw on data from ethnographic field study and from talkbacks to relevant newspapers articles concerning women’s peace activism in Israel.

INTERNET-TALK-BACKS: EMOTIONALIZING THE NATION.

Dieter Dieter Reicher Reicher

Sociology, GRAZ, Graz, Austria

Abstract: The paper is based on the analysis of internet-talk backs (internet-fora) concerning migration. Thus, there will be a comparison between sport-related talk-backs focussing on migrants playing in national football-teams and other talk-backs focussing on general (non-sport-related) topics of migration. Following the conversations are lines of arguments of these talk-backs, one gets not only information of the blogger’s opinion about migration. Further, these talk-backs reflect we-images, ideals and feelings about the nation in general.

Unlike literature, pamphlets or novels written in the context of organized national movements such internet-talk-backs enable the access to spontaneous emotions and affects connected with national identity. Therefore, this analysis helps to understand nationalism from the viewpoint of emotional sociology. The findings reveal that: …master-emotions” (Scheff) like shame and pride are central we-feelings. Above all, one can see that conversations in sport-fora are quite different. Here migrants who are athletes or football-players are perceived as „comrades in arms”. They are helping to defend the nation or helping to win for the nation. Sport - in the eyes of the internet-blogger - thus, constitutes „inter-ethnic-alliances” and transforms ethnic bound national we-images.

THE POLITICS OF PITY: WIKILEAKS, TRAGEDY AND THE DEMOS

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
**EMOTIONS AS A ‘PERFORMATIVE’ ACT IN THE GOVERNANCE PROCESS: THE CASE OF A NHS FOUNDATION TRUST**

Humera Manzoor ¹, Manuela Nocker²

¹Entrepreneurship & Innovation Group, Essex Business School, University of Essex, Southend-on-Sea, United Kingdom

Abstract: This paper is drawn from a doctoral study exploring the lived experience of emotions in the specific context of governance and board decision making in the public sector. Here, the boardroom is conceptualised as a dynamic ‘social space’. In such space, emotions are not only lived, but are also used ‘strategically’ as a ‘performative’ act in the board meetings and ‘beyond’, as the ‘rational’ actors of governance try to negotiate and renegotiate their interactions during strategy making. It will thus become visible how board members have constructed a ‘illusion’ of rationality, through the suppression of their emotions under their ‘masculinity’, thereby creating a lack of understanding of the human dynamics in the boardroom. This ethnographic study has been conducted in one of the largest public sector organisations in UK- the NHS Foundation Trusts (FTs) with a particular focus on the observation of regular meetings of directors and governors. Data has been collected from two different cases of NHS-boards by observing the board-in action both private and public, over a period of seven months, followed by in-depth interviews to understand both the lived and the reported experience of the actors- directors and actors involved. The subsequent narrative analysis of performed emotions shows that actors do leak out their emotions, both in embodiment and language, during strategising. These actors often use figurative language to ‘stage’ their emotions as they shift them dynamically with ‘twists and turns’ in many situations and interactions, inside and outside the board meetings. Finally, the analysis of the narratives, reveal the actors’ sense-making about emotions and their struggle to persistently maintain their ‘image’ as rational actors.

**PRIVATE IMPLICATIONS OF PROFESSIONAL WORK WITH EMOTIONS – AN ACTOR’S CONUNDRUM**

Stina Bergman Blix¹

¹Department of Sociology, Stockholm University, Stockholm, Sweden

Abstract: Studies on emotional labour to a large extent focus private consequences that originate from handling emotions in professional life. This paper focuses on the long range implications that result from stage actors’ work with emotions. The long range implications generated by the actors’ use of themselves as instruments are mainly associated with the actors’ ability to swiftly move in and out of emotions. This ability can be used to dramatize communications in private life. It also clears the way for emotions to be allowed, expected, and not fussed over in everyday life. However, the de-dramatization and decoupling of emotions from private communications can create problems in the actors’ intimate relationships. Actors slip easily into emotions, because it is part of their professional training. The experience of an emotion may be strong in the moment, but its interpretation may be trivialized if emotions that...
commonly are restricted to the private, intimate sphere are continuously expressed in professional contexts, leaving the emotions worn out and devoid of intimacy or exclusivity for persons in their private lives. Furthermore, the continuous and deliberate use of double agency; i.e. our ability to act and to monitor our actions simultaneously, can lead to a fear of losing one’s spontaneity. Emotional experiences and expressions in many ways become volatile and less associated with a sense of personal identity.

**THE ROLE OF TEACHERS’ EMOTIONAL WORK IN THE PROCESS OF BUILDING THEIR AUTHORITY AMONG PUPILS IN PUBLIC SCHOOLS AND REFORMATORIES.**

Beata Joanna Pawlowska, Piotr Chomczyński

1The Sociology of Organization and Management Department, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: The main goal of our paper is to investigate teachers’ emotional work that lie under the process of building their authority and discipline among pupils in primary schools both types: “normal” (public schools) and those located in reformatories (reformatory schools) for juvenile delinquents. We decided to look at this problem from the interactionist standpoint to focus on some symbolic dimensions of mutual interactions between teachers and pupils and their consequences for gaining respect the last ones. We were trying to examine, distinguish and characterize some basic emotional strategies employed by teachers to gain respect in both types of schools. We are focused on answering some questions: how much and to what extent the type of school differ teachers’ emotional strategies of building authority among pupils/inmates? What kind of emotions appear among teachers in result of their interactions with pupils/inmates? How do teachers used to manage with their emotions to build authority? What are the main problems with emotions management and their consequences in the context of authority building? What conditions lie under mistakes made by teachers’ in their emotional work?

Our findings base on the qualitative approach to research directly connected with interactionist perspective applied by us. We used the technique of participant observation in six institutions (four observations in semi-opened reformatories – two for boys and two for girls and two observations in public schools). Totally we have spent 35 days doing observations in the institutions of all types. We also employed semi-structured interviews carried out among teachers and directors in the mentioned institutions (25 interviews in reformatories and 12 interviews in public schools). We have also carried out 14 interviews with juvenile delinquents in all types of reformatories. The collected empirical material gave us opportunity to answer the questions mentioned above and come to conclusions about the emotional work done by teachers to obtain respect and authority among pupils/inmates.

**AFFECTIONS OF ANIMAL RIGHTS ACTIVISM: SUBJECTIVITY, SENSE AND SENSIBILITY**

Niklas Lars Magnus Hansson, Kerstin Jacobsson

1Centre for Consumer Science/School of Business, ec, UNIVERSITY OF GOTHENBURG, Göteborg, 2Department of Sociology, Södertörn University, Huddinge, Sweden

Abstract: We wish to place our article in a longer tradition of research on social movements, collective identity and activist subjectivity. Formally our study is focused on the contribution of emotions to activist subjectivity construction and the importance of theorizing the relations between body, brain and culture in activist activities. This subfield within social movement research has been properly introduced by Jasper in the article Emotions and Social Movements: Twenty Years of Theory and Research (forthcoming, 2011) where he traces the roles of emotions within social movement theory. At the end of the article Jasper suggests (and foresees) that in future research on social movements, radical politics and activism, emotions will play a significant part of the explanations and understandings of social movements and activist subjectivities. We place our study of animal rights activist subjectivity formation in this gap and theorize on the relation between the social and the somatic (including emotions) co-constitution of activist subjectivity. Since emotions without doubt are partly grounded – some might even argue they are hard wired - in the body, we include notions of an embodied as well as embedded activist subjectivity. The paper is primarily a conceptual elaboration that rests on empirical material collected on the theme of “vegan animal rights activist-subjectivity” and persons active in Swedish animal rights groups. It is mainly based on qualitative semi-structured interviews with self-proclaimed activists, and supplemented with material collected from occasional accompanying observations, web-, film-, media- and video material, and movement documents. Empirically, this paper aims at a detailed study of the ways in which animal rights activism impacts on the formation of subjectivity, sense and sensibility, including the role of social, technological, biological and cultural environments. Our aim for this study thus becomes the study of emergent subjectivity as the ground material then being mobilized and sustained activist subjectivity doing the actual political work. Focus then shift from actors that do things, acting for change in the world, to the study of formation processes; formation of political cognition, affect and subjectivity-bodies.

**EMOTIONAL DIMENSIONS OF SOCIAL MOVEMENT IDENTITY**

Helena Flam

1Institute of Sociology, UNIVERSITY OF LEIPZIG, Leipzig, Germany

Abstract: In my presentation I would like to focus on the concept of collective movement identity. In this area of study empirical research suggests that typically a hippie movement is all about love or an anti-nuclear movement is about fear, while a women’s or a gay movement is about transforming shame into pride&anger. It can be discussed to what extent these emotions are real or discursive, and also whether indeed some movements are centered around a single emotion (love or grief or fear), while others exhibit swing emotional identity (from shame to pride/anger). Drawing on Cooley, Arendt, Ricoeur, Foucault, Wiley and Archer, among others, I would also like to suggest a way in which we could address collective movement identity in terms of (i) its self-oriented emotions (ii) the emotions directed towards the movement’s opponent (iii) the emotions directed towards its objects of concern or advocacy, (iv) the emotions related to its potential allies, and, finally (v) the emotions directed towards its own past, present and future. In so doing I am merging Touraine with the feminist perspective on what movements are constituted by. Time permitting, I would also like to address the emotions involved in the relationship between the individual members identity and the collective identity.
A CULTURAL SOCIOLOGICAL PERSPECTIVE ON TURKISH MUSIC IN GERMANY

Ali Türünz

Sociology, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: Music plays a significant role in the lives of the Turkish migrants in Germany. Most of the academic works on the topic thus far have utilized perspectives from the sociology of culture. Moreover, their ideological overtones and a seemingly unending fascination with the anti-hegemonic undertones within Turkish working-class music culture leave almost no space for social actors’ actual meanings. The sociology of culture, whose arguments are dependent on the economic base, cannot explain themes such as “symbolic ethnicity” in musical fields, “emotions” in music or the “therapy effect” of music. However, cultural sociology, which focuses on the processes of meaning-making, offers an important alternative perspective that can bring such themes to light.

EMOTIONS, ETHNICITY AND SENSE OF BELONGING AMONG THE CHILDREN OF IMMIGRANTS: THE ITALIAN CASE

Paola Rebughini, Silvana Greco

department of social and political studies, UNIVERSITY OF MILAN, Milano, Italy

Abstract: The paper and presentation will be focused on the emotional contents of the sense of a plural belonging among the children of immigrants. The paper is based on several years of research on identifications patterns and feelings of belonging among adolescents with immigrant parents living, studying and working in Milan. The need to articulate self-identifications and belonging to the context in a complex way is an imperative for the children of immigrants. This require specific skills, but it is not just a capability to adapt oneself, it is more a capability to mediate among different references and the emotions connected to them. Ethnicity is not purely expressive, instrumental or characterized by rage and claims. Plural belongings are connected to different emotions according to different contexts. However, this does not mean that the connection between emotions and ethnicity are a pure immanence. Ethnicity is also the result of a genealogy of emotions rooted in childhood, family experience and in the deep core of personal identity.

MULTICULTURAL IDENTITY AND EMOTION OF INTEGRATION: EXPERIENCES OF THE IMMIGRANT WOMEN WORKING AS DOULA & CULTURE-INTERPRETER IN SWEDEN

Zaira Jagudina

UNIVERSITY OF SKOVDE, Gothenburg, Sweden

Abstract: This paper analyses the relationship between multicultural identity and emotion of integration in the majority society in the experiences of the immigrant women working on the freelance basis as Doula & Culture-Interpreter. The study is based on the semi-structural interviews with women of different ages and different countries of origin, living permanently in Sweden. Doula & Culture-Interpreter is a project-based freelance work, created by the initiative of a voluntary organisation advocating for woman’s right for natural birth-giving within the frame of the modern healthcare institutions. Doula, “woman caregiver” in Greek, is a trained labour companion. In the case of the immigrant woman working as Doula, she is assigned a task of assisting the newly arrived immigrant woman, who not talk Swedish and/or lacks social support from her own network.

Participation in the activities of the voluntary organisation creates for the immigrant women opportunities of ‘feeling included’ in the majority society through the paid work and a morally elevated position of caregiver. However, it might also reproduce a gendered and ‘ethnicized’ positioning of women in the labour market due to the uncertain and underpaid character of the working occupation. This study aims to explore the ways in which emotion and emotion display rules associated with women’s integration and multicultural identity are constructed in this particular social setting.
RN 12 Environment and Society

A PERFECT STORM? ENVIRONMENTALISM IN TURBULENT TIMES

Christopher Rootes

Abstract: The environmental crisis continues, but is environmental concern eclipsed by the economic crisis and the recrudescence of acute social and political conflict? Are environmental NGOs (ENGOs) sidelined as economic and social issues return to centre stage? Have the concern with climate change and efforts to mitigate it been subordinated to economic and social concerns? In this paper I will evaluate evidence from surveys and opinion polls from several countries (notably the UK, Australia and the USA) and will draw on observations and interviews with ENGO personnel and environmental activists in an attempt to understand the place of environmentalism in the present constellation of interests and conflicts.

CLIMATE CHANGE, ECONOMICS AND THE SOCIAL

John Urry

Abstract: It is ironic that the varied sciences of climate change have made it utterly clear that ‘human behaviour’ is essential to the causes and to the impacts of so-called ‘global warming’. Climate change is far too important to be left to the physical sciences, those sciences themselves reveal. But the discipline that mainly represents and models such human behaviour is Economics. But its account of ‘humans’ is partial and likely to produce policy recommendations which will not deal effectively with the scale and the urgency of such climate changes. Economists assume that what the market decides is the cost of energy is what its contribution is to each economy. But we now know that carbon–based energy is a unique bundle of commodities that are both non-renewable and generates ‘externalities’ on a historical and geographical scale that might change long-term climates.

Overall this paper shows how society matters since many different social processes are central to high carbon lives and also to potential low carbon lives. Most of the time, most people do not behave as individually rational separate economic consumers maximising their individual utility from the basket of goods and services they purchase and use, given fixed preferences. People should be rather seen as creatures of social routine and habit, but also of fashion and fad. It would seem that low carbon systems and lives will only become significant if they become matters of new fashion, a new globalisation.

This paper draws upon CLIMATE CHANGE AND SOCIETY (Polity Press, Cambridge, 2011) where the ‘social’ is positioned at the heart of the analysis of why climates are changing and of assessing alternative futures. This book especially demonstrates the importance of social practices that over time are organised into powerful ‘socio-technical’ systems.

LUHMANN’S ECOLOGICAL COMMUNICATION AND ENVIRONMENTAL CONFLICTS IN ITALY

Ferdinando Spina, Mariano Longo

Abstract: The theme of ecological risk is one of the most relevant in the political agenda nowadays. It has both a local and national relevance, as well as a global one. Yet, the great amount of public discourses about pollution and correlated risks has hardly produced political effective decisions. The difficulties of international summits to find plausible solutions the greenhouse-effect are explicative of such impasse. So, one of the main problems of contemporary society seems unable to produce political strategies on the global scale.

A possible explanation of such paradoxical situation may be given by the way Niklas Luhmann has discussed the question of ecological hazard within his theoretical background. What Luhmann suggests is that much of the public discourse about ecology is rhetorical, in so far as it furnishes the political system with a theme which may have a strong public impact, regardless of the fact that it may produce effective policies. If we assume the system theory approach as a theoretical guiding-light, we notice that ecological problems may be solved only in so far as each social system (law, polity and economy in particular) assumes ecological questions as themes of their self-referential communication. By adopting Luhmann’s standpoint, sociological analysis of ecological problems may gain in realism, in so far as it may observe the actual way in which social systems thematise, within their own operations, the theme of the environment as relevant.

The above sketched theoretical background is not to be understood as a way to deny environmental problems as relevant, on the local and global scale. Indeed, we may not underestimate the consequences of environmental problems on contemporary society, the only society whose activities may result in a process of systematic destruction of the environment, hence of itself.

Our paper aims at a twofold task: on the one hand, we would like to stress the relevance of Luhmann’s conception of the environment and of the way in which environmental problems may be faced within each social system starting from the form of their communication; on the other, we will propose Luhmann’s theory as a theoretical tool to analyse environmental conflicts on the national scale, assuming Italy as a relevant case study, in order to test the empirical potentialities of a theory which has often been accused to be too abstract and generalized.

SCIENCE, UNCERTAINTY, AND THE PROBLEMATIC MANAGEMENT OF THE RISKS OF CLIMATE CHANGE AND ENERGY DEPLETION

Raymond Murphy

Abstract: This paper first analyses the nuances of uncertainty. It then examines how uncertainties and risks are being created by
contemporary societies. It probes several models of environmental decision making, notably the free market model, the market-state partnership model, for example, the state imposing a charge on carbon to incentivise the market to mitigate the risk of global warming, and the state regulatory model. It also brings into consideration a related but rarely thought-out risk, namely the exhaustion of non-renewable energy. The paper then explores whether claims of uncertainty concerning the risks of climate change and energy depletion have paralyzed environmental decision making with respect to the management of these twin risks, leading to the risks being defined as acceptable. Such paralysis is manifested by the atmosphere becoming increasingly carbonized as a result of human activities and by the growing amounts of energy combusted in order to acquire energy. The paper argues that the paradox of the public understanding of science is that it consists of a blind faith that science will bring timely solutions to environmental problems, yet it relegates science to a back-of-the-mind worry when it indicates risk requiring significant social change for safety and sustainability.

THE MANY WORTHS OF NATURE(S); OR: WHAT QUALIFIES AS ECOLOGICAL IN POLITICAL ECOLOGY?

Anders Blok¹

¹Department of Sociology, COPENHAGEN UNIVERSITY, Copenhagen, Denmark

Abstract: If political ecology designates the intersection of humans and non-humans in practical political philosophy, then the seminal work of French sociologists Luc Boltanski and Laurent Thévenot seems characterized by a productive ambivalence as to the worths of non-human nature(s). Should we consider the rise of late-modern environmentalism a sign of the institutionalizing of a new ‘green order of worth’, build around notions of eco-system sustainability (see Thévenot 2000)? On the contrary, might ecology designate a break away from the ‘common humanity’ of Western political philosophy, suggesting a ‘green city’ build on entirely new ‘post-humanist’ principles (see Latour 1998)? The only thing certain about such ethical questions is their importance: how we qualify the worths of nature(s) matters equally in the interconnected worlds of social science and ecological action.

This paper attempts to render both of the above interpretations plausible, by exploring three different domains of ecological action, in terms of their value attachments. First, the case of carbon markets in transnational climate politics is taken to represent an inherently unstable market-industrial-green ‘compromise’ (Boltanski & Thévenot 1991/2006), casting doubt on the independent standing of green worth. Second, the case of biodiversity concerns surrounding whales as ‘charismatic megafauna’ is interpreted to involve a Latourian relaxation of ‘common humanity’ — but one that routinely slips beyond justication and into worlds of affective love and violent non-equivalence (Boltanski 1998). Third, the case of a worldwide travel of urban sustainability ‘best practices’ is taken to illustrate a green inflection of the new project-driven spirit of capitalism (Boltanski & Chiapello 2005), one organized around common values of innovation, mobility and connectivity.

Two generalized theoretical points may be gathered from such a juxtaposition. First, rather than one situation-independent green worth, sociologists should be researching the multiple worths of nature(s) across temporal and spatial contexts. Second, and importantly, such a comparative research agenda can only be sustained by invoking an underlying integrative model of political worth(s) — thus pointing to the immense importance (worth) of Boltanski and Thévenot’s sociology of justification and critique to environmental sociology.

THEORY LINES OF A NATURE-INCLUSIVE SOCIOLOGY

Kris Van Koppen¹

¹Social Sciences Department, WAGENINGEN UNIVERSITY, Wageningen, Netherlands

Abstract: Building on previous theoretical work, this paper outlines theoretical principles for an environmental sociology that takes nature into full account. Using Foucault’s concept of episteme, Serge Moscovici’s notion of natural state, Merleau-Ponty’s phenomenology of perception, and Schatzki’s theory of practices, I argue that the natural and the social are mediated in embodied social practices. Natural science, then, is the result of a specific set of very successful, highly standardized practices. While becoming a dominant set of practices in terms of claims to knowledge, it has developed a certain distance and abstraction vis-à-vis the set practices in which we deal with nature in daily life. In theorizing about nature and society, sociology has to take into account the robust insights of both sets of practices. Not by bracketing them, as social constructivists would have it, but by incorporating them where they are relevant for sociologists’ empirical and theoretical claims. The paper ends with giving some more concrete illustrations of what this means for environmental sociology.

VISIONS OF HUMAN NATURE AND DE-GROWTH

Ernest Garcia¹

¹Sociology and Social Anthropology, UNIVERSITY OF VALENCIA, Valencia, Spain

Abstract: This paper returns to the relationship between sociology and evolution, presenting some aspects of the conceptual framework of the research project Scientific-technical information, public participation and effects of sustainability in socioecological conflicts (CSO2008-00291/SOCI), included at the Spanish National R+D Programme. The paper returns to this issue in a specific context: that of the current debate on natural limits to growth and the perspective of a way-down era, a de-growth one. First of all, it comments some basic differences and similarities between evolution and history, and then introduces on this basis the notion of social evolutionism. Next it maintains that social evolutionism is based on a fallacy, consisting of the assertion that the conditions which require taking into account the evolution (the existence of strong environmental constraints) apply to all technological, institutional and cultural changes, whatever the conditions in which they occur. Following it, it is assumed that humanity is entering a phase of economic and demographic de-growth, as a consequence of having unnecessarily accelerated the entropic degradation of the environment, exceeding thus the limits to growth: a phase, therefore, strongly conditioned by environmental constraints, where evolution could again be relevant. Different visions of the de-growth phase are then summarized. And it is argued that the way to define evolution as well as human nature is crucial to assess these visions. Visions of human nature are linked to different ideas about sustainability, good life and the debate about historical collapses. In conclusion, the paper states that an evolutionary perspective supports that there are some potentials for conscious social change, but it does
not justify the belief in a particular only line of history (this belief is itself social evolutionism, but it has nothing to do with biological evolution).

**THE POLITICS OF CLIMATE CHANGE – STRUGGLING WITH IDEOLOGICAL FANTASIES**

Anders Danielsen¹, Bjarke Frydenberg¹

¹Department of Society and Globalisation, Roskilde University, Roskilde, Denmark

Abstract: The paper examines the dominant political rationales of Danish climate politics and to what extent they are challenged by different ideas from parts of the Danish civil society that are engaged in the climate issue. The study is empirically based on a case study of the public debate over the report from the Danish government’s ‘Commission on Climate Change Policy’ and a mapping of the public climate change activities from Danish civil society organizations and networks in 2010.

We argue, from a theoretical departure in the late Foucault’s governmentality study of neoliberalism and Slavoj Zizek’s examination of ideology and ideological fantasies that the dominant political rationales of Danish climate politics must be understood as grounded in a neoliberal governmentality. We also show that the political rationales are structured as neoliberal ideological fantasies that prevent global warming from undermining the dominant neoliberal governmentality’s ability to deliver political solutions to the challenges climate change poses to the Danish society. By doing so the fantasies produce a post-political framework where global warming is not regarded as a challenge connected to the every day practices of citizens or to the structural and institutional dimensions of Danish society.

Climate change policy thus becomes an issue of enhancing a wide distribution of climate-friendly technology, where every political initiative must be legitimized as something that benefits the competitiveness of Danish national economy in the global competition. The policies are furthermore based on the assumption that Danish citizens engage in the climate issue from a strictly economical-rational perspective.

We argue that the civil society initiatives only partly produce ideas and concepts, which challenge the dominant ideological fantasies. Some of the climate initiatives sustain and legitimize the neoliberal fantasies by reducing the climate issue to an individual ethical responsibility, where the subject can act on climate change without having to relate to the underlying social and political implications. Other civil society initiatives approach climate change as a political issue where it is necessary to debate how the state governs and how people govern themselves, and they provide practices for developing alternative principles for different lifestyles and forms of organization that are less carbon intensive.

**EUROPEAN ECO-CITIZENSHIP IN THE XXIst CENTURY: A PATCHWORK OF NATIONS AND SOME REASONS OF THIS DIVERSITY**

Jean-Paul Bozonnet¹

¹Political Studies Institute, Grenoble, France

Abstract: We the People of the European Union, have decided to consider us as the greenest nations in the World, and that is the way we present us in the onusian arenas as Copenhagen, Cancun or elsewhere. Yet is this self-greening as justified as we would like? We intend to check the reality of this ecological reputation, thanks to the European Values Survey of 2008 (EVS 2008).

First of all, we will display the eco-citizenship variations according to different European countries and the indicators used to measure it. For example, in Eastern Europe, environmental membership is low but donation is high, while that in Germany or France we find the reverse situation, and that in the Nordic countries both indicators show high scores. Why such large differences between European countries?

Furthermore, in order to explain this diversity, we will test three hypotheses thanks to data from the EVS 2008. The first of these is related to the political culture, liberal or state (Badie, 1995, Bréchon, 1995): cultivation of individualism is rooted in the Protestant origins in the North, the Catholic institutions in the South, and the Orthodox tradition in Eastern Europe. A second hypothesis invokes the different degrees of modernization (Inglehart, 1997) in these European societies: some of them in northern Europe are considered as very advanced, while others in the South East will be seen at the stage of industrialism. Finally, a third hypothesis will be tested: the importance of social capital (Putnam, 1993). Some countries, particularly in Northern Europe, have a large supply of “bridging” capital, which could promote the citizenship of the environment through the production of altruism, rather than other Mediterranean countries are assumed to have only “bonding” capital, unfavorable to citizenship and environmentalism in general.

Key words: eco-citizenship, Europe, European Values Survey, political culture, postmaterialism, social capital.

**STAKEHOLDERS PARTICIPATION ANALYSIS FOR PLANNING POST-MINING REHABILITATION AND DEVELOPMENT OF SÃO DOMINGOS MINE IN THE SOUTHERN OF PORTUGAL**

Idalina Maria Dias Sardinha 1, Daniela Craveiro 1, Sérgio Milheiras1

1SOCIUS/ISEG, TECHNICAL UNIVERSITY OF LISBON, Lisboa, Portugal

Abstract: This paper deals with stakeholders’ participation analysis applied for planning of rehabilitation and development of a post-mining abandoned area. This is part of an ongoing 2.5 years project REHMINE, funded by the Portuguese Foundation for Science and Technology, dealing with the environmental, socio-economical and cultural values potentially generated by the local rehabilitation and further development of a post-mining area, according to sustainable local development principles. The success of a brownfield rehabilitation and further development benefits from the commitment of stakeholders associated with the processes. A problem, however, is how to strengthen stakeholders’ involvement and commitment in these processes considering they have conflicts of interest. The first insights of the REHMINE project are associated with stakeholders’ participation. The area studied is located in southeast Portugal, in Mina de São Domingos, abandoned for decades following the end of extractive activities in the late 1960’s. The approach includes: a) local stakeholders’ mapping; b) semi-structured interviews done to relevant stakeholders and content analysis to learn about problems, potentialities and expectations of local rehabilitation and development; c) an experts workshop to discuss with stakeholders innovative narratives for local development; d) and a workshop with stakeholders for scenario(s) development. After the two first
phases of the stakeholders analysis, we found, that even after decades of abandonment the local community and the former mining complex still maintain respectively social-cultural and environmental legacies which are both problematic and potentially valuable; problematic given abandonment and marginalization; valuable given potential use of social-cultural and environmental landscape as a source for tourism and other forms of socio-economic development. Until now considerable insight has been gained concerning local problems, potentialities and expectations from stakeholders for future local development. The value of our approach in this initial phase lies in the enhancement of stakeholders’ auscultation and involvement creating potential commitment with future development of post-industrial areas that have been lying abandoned for long time.

THE ROLE OF NETWORKED PUBLICS FOR PARTICIPATORY SUSTAINABILITY COMMUNICATION.

Daniel Schulz

Abstract: The increasing diffusion and adoption of information and communication technologies in society and especially services and platforms following the web 2.0 paradigm have created new opportunities for citizens to raise their voice on political issues, take part in discussions online and mobilize support as well as to convert communication into action. This is also the case for actors in the field of sustainable development, who are trying to tap into the potential of online participation by integrating interactive features into their web-presence, engaging in online-campaigns or offering specialized platforms to facilitate public communication online. Although scholars have emphasized that technical innovation does not automatically lead to revolutionary changes in communication patterns, interactive online media are seen as promising for participatory sustainability communication.

In the paper I examine the role of these web-based communication spaces for sustainability communication by considering them as part of an (environmental) public sphere. From this perspective it is possible to distinguish between different levels of public communication including also the occasional encounter of citizens, events such as speeches, protest, demonstrations, town-hall meetings and communication mediated through mass media. Based on a review of literature in the fields of (new) media, participation and sustainability communication I argue that the emerging networked publics will not replace mass media or face-to-face interaction but rather offer a new quality of communication which might prove useful for engaged citizens during turbulent times.

TROUBLED WATERS: A CRITICAL RESPONSE TO THE PROMISE OF SUSTAINABILITY

Patrick Bresnihan

Abstract: The seas of the European Union have been defined as a ‘common maritime space’. This space is not subject to any single voice or authority. It is part of a shared heritage between different regions, industries and cultures. From this starting point ecosystems management, marine spatial planning, co-management and other tools for consensus building are being rolled out across the region. At the same time struggles over this vast and vital resource look set to become part of the political and social landscape of the future. My paper looks at how such conflicts are to be contained by a liberal, democratic model of inclusion and consensus.

My work focuses on a community of fishermen and their own experiences and claims on the sea. Their struggle to remain viable in the face of global economic competition and increased regulation has been going on for years. Despite the promise of a greater say in their fisheries, and the hope of differentiated markets in which to sell their sustainably caught fish, many are disillusioned. Some have been forced out of the industry already. Those that remain have to ‘adapt’ to the changing economic and ecological futures already being mapped out.

In this paper I draw on my fieldwork to question the gap between national and European policy aspirations and the experience of those people being affected. Drawing on contemporary political theory I question the democratic and ecological promise of sustainable development policy. I also examine the apparent inability of academic and critical thought to address these problems. This, I argue, stems from an unquestioned faith in the motivations and assumptions of consensual democracy which lie at the heart of sustainable development.

ECONOMIC CRISIS BRINGS FORTH TECHNOCENTRIC WORLDVIEWS: A CASE OF LITHUANIA

Audrone Telesiene, Egle Butkevičiūnė

Abstract: The paper is based upon results of a representative survey conducted for the project “Monitoring of social problems: implementation of International Social Survey Program (ISSP)”, funded by a grant (No.SIN-10206) from the Research Council of Lithuania. Project aims at implementing internationally approved survey modules “Environment”, “Social inequality” and “Health”. Additional module on social politics is also added.

Within this paper, the results of the research on Lithuanians’ environmental worldviews and attitudes are presented (the research module “Environment”).

The main thesis to be defended during the conference is that economic decline in Lithuania brought forth materialist value orientations and technocentric worldviews. Several years before the economic crisis Lithuanians showed greener environmental consciousness and more ecocentric worldviews (data from Eurobarometer surveys and other surveys conducted in Lithuania before 2009). The survey conducted in the end of 2010 shows that Lithuanians became technological optimists, show high rates of trust in science, low trust in NGO’s, rank economic priorities higher than environmental ones, have moderate/poor environmental knowledge, self-reported environmental behaviour shows low rates of active environmental involvement, moderate rates of involvement in passive environmental activities.

On one hand the findings show relative strengthening of technocentric worldviews. On the other hand results also show that high environmental awareness is still present. This can be explained using the double-risk society thesis. In turbulent times environmental as well as some other post-modern value orientations step aside and give way for concerns about economic security and stability. This does not necessarily mean that environmental awareness sig-
nificantly decreases; it only means that collective consciousness is
coupled with several simultaneous risks – one day giving priorities
to economic safety, the other day giving priorities to environmental
cancerns.

FEAR OF THE FIRE. THE UNEASY CONNECTION
BETWEEN ENVIRONMENTAL CULTURE AND SOCIETY
IN WASTE MANAGEMENT IN ITALY
Giuseppe Tipaldo
Social Sciences Department, UNIVERSITÀ DI TORINO, Torino, Italy
Abstract: Arising from some of the main results of a 3-years re-
search conducted on the social impact and possible NIMBY-effect of
the under-construction co-incineration plant in the city of Turin, the
paper is first of all concerned on how contemporary advanced soci-
ties deal with environmental risks, when local communities face
troversial plant and infrastructure settlements with a heavy
ecological impact. The topic is one of the most discussed and press-
ing one at the moment in Italy: according to the ultimate surveys,
there were public opposition to almost 300 infrastructure and plant
programs for in the country during 2010. The expression “Nimby
syndrome” has been applied to the self-serving and local interests
that lay behind this type of opposition. Indeed, experts and other
institutional entities (local politicians, industrial lobbyists and mass
media) often mischaracterize this public opposition as an unjustifi-
able and irrational fear of technoscientific products and lack of civic
culture. They believe that, were the opposition to be more literate
about technical and scientific issues and more endowed with social
capital, they would conclude that the experts are correct, and that
their risk perception, being skewed, is not based in reality. Is that
actually the case, or (as held in this paper) is that an oversimplifica-
tion of a complex and highly structured phenomenon? Using a mul-
ti-technique approach, the paper present a wide variety of collected
data that seems to partially controvert the hypothesis local protests
against the so called “megaprojects” are driven by lack of civic cul-
ture and poorness of environmental care.

MEDIA, ENVIRONMENT AND SOCIETY: MAIN
FEATURES OF THE REPRESENTATION OF
ENVIRONMENT IN ESTONIAN PRINT MEDIA FROM
1995-2010
Maie Küssel
Institute of Journalism and Communication, UNIVERSITY OF
TARTU, Tartu, Estonia
Abstract: My presentation contributes to media analyses that study
the development of the representation of environmental issues in
print media, such as Mazur (1998), Lyytimäki & Tapio (2009), Po-
deschl (2007) and Burtscber (1993). The presentation is based on
the content analysis of two Estonian dailies within the years of
1995, 2000, 2005 and 2010; and covers all kind of text content,
which partly or entirely refer to the relationship between the hu-
an and the nature (except ads). The analysis is still in progress,
but will be finalized by May 2011. The aim of the presentation is,
firstly, to schematize the main changes from 1995 to 2010 in the
way print media reflect on environmental issues and, secondly, to
offer hypotheses to explain reciprocal changes between print me-
dia and all kinds of agents (current and foreign politics, environ-
mental events and accidents, civic movements, dominant values in
society, development of modernization...). The presentation will
outline the main evident features of the analyses: the changes in
environmental issues, the amount of the coverage which reflects on
environmental issues, the value orientations that dominate in the
rationalization of environmental issues as well as the changes in the
agents (act on/ are blamed for/ are expected action in regard of
environmental problems).

REPRESENTATIONS ON ENERGY USE AND SAVING
PRACTICES: GENERATION AND GENDER GAPS AND
CONTINUITIES BETWEEN PARENTS AND HIGH SCHOOL
STUDENTS
Ana Horta, Luisa Schmidt, Susana Fonseca, Augusta Correia, Margarida Rebelo, Marlucí Menezes, Silvia Almeida
Instituto de Ciências Sociais, Universidade de Lisboa, Laboratório Nacional de Engenharia Civil, Lisboa, Portugal
Abstract: In 2008 Portuguese households were responsible for
nearly 17% of the total energy consumption in the country (DGGE,
2008). This consumption is affected both by structural and techno-
logical factors and by social representations and practices. Yet,
studies on energy consumption have been mainly focused on tech-
ical or economic approaches and the analyses of social factors
have been neglected. Very little knowledge has been produced on
the representations and practices of the Portuguese towards energy
consumption (Schmidt, Horta and Fonseca, 2010).

This paper intends to contribute to an understanding of how high
school students and their parents relate to energy use and saving
practices, grasping the articulation between household’s habits and
school education on energy issues. Youngsters’ dispositions to per-
ceive and act are influenced by their parents, peers and social net-
works, and also by the media and the knowledge on energy issues
they are taught as part of the school curriculum (Bartiaux, 2009). In
this paper we question in what extent are practices and representa-
tions of energy use passed down from parents to school students
and from the school to households. We therefore examine genera-
tional differences and similarities in practices, representations,
beliefs, and values related to energy use and savings of high school
students and their parents.

The paper is based on the comparison between the results of two
surveys conducted in Portugal. The first survey was applied to stu-
dents enrolled in grades 7 through 11 of a public school in Lisbon.
Then, these students were placed into one of six strata (social class
and school level) and their families were randomly sampled. A total
of 731 students and 300 parents completed surveys.

Results indicate significant gender gaps. Although feminine stu-
dents and their mothers reveal less accurate knowledge on energy
issues, they are more careful with the energy they use and talk
more often on saving energy. A relevant generational gap was also
found, indicating that parents take more actions to save energy.

CLIMATE SCIENTISTS AND THE PUBLIC: INTERACTIONS
AND KNOWLEDGE EXCHANGES
Ana Delicado
Institute of Social Sciences, University of Lisbon, Lisbon, Portugal
Abstract: Raising public awareness of climate change is crucial for
transforming individual behaviours and amassing support to policy
measures, which may threaten prosperity and comfort levels that came to be expected in affluent societies. Scientists are one of several agents involved in public communication of climate change and trust in these experts is of the utmost importance if citizens are to be persuaded of the severity of a problem that so far they cannot see nor feel.

However, other environmental risk and controversies have taught us that communication must be a two-way street and the public needs to be engaged rather than enlightened. Also, the public possesses its own experiential knowledge that can provide valuable contributions to the production of science.

This presentation aims to discuss these issues by drawing on the case of Portuguese scientists that work in the area of climate change (a wide-ranging field that spans such disparate subjects as meteorology, geophysics, biology, agriculture, health and even the social sciences). What has been their contribution to knowledge dissemination and improving awareness of climate change? How are they involved in public engagement activities? How are they responding to citizens’ perceptions and experiences? And how does this vary by scientific discipline or research object?

This work is integrated in an on-going research project and it is based mainly on document analysis and in-depth interviews to Portuguese climate scientists, as well as observation in public events.

E3 MODELS AND BOUNDARY OBJECTS: CLIMATE CHANGE POLICY AND PARTICIPATION
Paul Haynes1
1Department of Land Economy, 4CMR, CAMBRIDGE UNIVERSITY, cambridge, United Kingdom

Abstract: In assessing climate change risk there is much of consensus. The IPCC, the accords emerging from the Copenhagen and Cancun COP events, the Committee on Climate Change, the Stern Review and many national and regional assessments state the need for rapid decarbonisation, in particular the need to change the way we generate and consume energy, the need to change transport, land use, housing, manufacturing, and undertake conservation practices. The gap between the aspirations they express and existing policies aimed at achieving these objectives is huge; there is therefore a need to implement new policies and behaviour changing strategies.

This paper will conceptualise the output from E3 (Environment-Energy-Economics) models as a type of boundary object with which to assess the gap between existing policy and required policy, develop change making strategies, support appropriate social movements and identify the interdependencies of entities subsumed within the climate change mitigation assemblage. The paper concludes that E3 models (such as E3MG) could play a significant role in reducing carbon emissions if they produce boundary objects appropriate for the coordination of the entities that enable successful mitigation strategies to be developed and implemented.

LIVING WITH ENERGY: PRACTICE, BIOGRAPHY AND THE LIFECOURSE

SOCIETY OF ELECTRICITY MARKETS AND FEED-IN TARIFF LAWS: THE TRANSITION TO THE CLEAN ENERGY SYSTEMS OF THE 21ST CENTURY
Xavier Lemaire1
1Warwick Business School, UNIVERSITY OF WARWICK, COVENTRY, United Kingdom

Abstract: Due to the massive use of polluting fuels like coal, electricity plants are one of the main sources of CO2 emissions in the world and these emissions are increasing dramatically, notably in emerging and developing countries. But actors from the electricity sector do not ignore the issue of climate change anymore. Actually, a rapidly growing number of countries are adopting policies promoting clean energy, notably feed-in tariff laws that have proven to be extremely successful in the massive-scale diffusion of renewable energy technologies.

This paper analyses why these laws are spreading around the world and how they are shaking up the electricity sector. Feed-in tariff laws go with the mobilization of a whole set of new and well-established actors around new technologies like wind or solar. Referring to a social embeddedness approach, we will examine how electricity markets are re-institutionalized by these laws. The contrasted cases of the United Kingdom, Germany and South Africa will enable us to understand the policy-making process which leads to the implementation of such feed-in tariff laws and how actors from the civil society can play an important role in the design of feed-in tariff laws.

WHO PAYS THE COSTS OF CLIMATE FRIENDLY ENERGY IN ROMANIA? THREE PROFILES
Laura Nistor1
1Social Science, SAPIENTIA UNIVERSITY, Cluj-Napoca, Romania
**Abstract:** Climate change governance constitutes a multi-level arena in which national and international political, economical institutions, scientific think tanks and NGOs work together for developing strategies and practical approaches for climate change mitigation. The role of citizens is usually taken for granted. The presentation explicitly focuses on the individuals with the aim to establish those individual level factors which increase the likelihood of financial support for climate change mitigation in the case of Romania, a country which usually appears as a European laggard in terms of eco-consciousness.

The analysis builds on the databases of the 2008 and 2009 Special Eurobarometer on Europeans’ Attitudes towards Climate Change, from where it takes as dependent variables the willingness to pay for climate friendly energy. Results suggest that in both years, appreciatively one third of the Romanian respondents declared willingness to pay, which is significantly below the European average. Moreover, Romania provides one of the highest percent of indecisive respondents, a finding which motivated an in depth analysis of the profile of respondents opting for don’t know answers.

Models of binary and ordinal logistic regression analysis as well as structural equation modeling suggest that education, information about climate change and the perception of climate change as a serious problem are the strongest predictors of the willingness to pay for climate friendly energy and these are also the most important variables which increase the likelihood of avoiding don’t know responses. Economical resources play an important role in increasing the average amount respondents would be willing to pay for climate friendly energy.

Findings confirm previous hypotheses about the sociodemographical sources of environmental concern, but in the meantime raise important problems in terms of climate change campaigns which main challenge seems to stand in the winning of those citizens who possess less knowledge and resources to financially support climate change mitigation.

The paper ends with some epistemological and methodological considerations and criticism about the role and relevance of contingent valuation in environmental sociology.

**ENVIRONMENTAL REPRESENTATIONS AND YOUTH PARTICIPATION: A STUDY WITH ITALIAN ADOLESCENTS**

Sonia Brondi

1Department of Sociology, UNIVERSITY OF PADOVA, Padova, Italy

**Abstract:** According to recent studies, the majority of Italian citizens considers environmental threats as one of the most relevant problems and thinks that they are a responsibility of every person. In particular, adolescents perceive environmental issues more salient if compared with adults’ main concerns. Moreover, in the last years, citizens’ participation in debates about the environment is required by political institutions and adolescents’ contribution to the promotion of changes in the territory could be significant. This contribution - following a social constructivist approach - examines youth participation in the Chiamo Valley (North-East Italy). The territory presents serious problems linked to air pollution and industrial waste management. Previous research with adults has shown growing levels of disengagement from processes of public participation organized by the local institutions in order to manage environmental threats. This contribution focuses on adolescents who live in the Valley. The theory of Social Representations (SR) was chosen as theoretical framework. In the present study we explore how youth construct and frame the SR of the environment in which they live; it means to examine if and how these SR are socially shared and to observe if and how they assume different features and voices depending on characteristics of different groups. Therefore, aim of the study is to investigate the relationship between the SR of the Chiamo Valley and social psychological constructs such as local identity processes, social well-being, pro-environmental activism, perception of - and envisaged solutions to - environmental threats. Participants were 14-19 year-old high school students (N=229) from two distinct schools. The considered constructs were explored through a pencil instrument including scales and open questions. Moreover, a free associations task in the form of ‘What comes to your mind to the term Chiamo Valley’ was requested to explore different SR of the environment in which participants live. Coherently with literature, results show that high levels of local identity lead young residents to perceive their own territory in less negative terms. Moreover, social well-being plays a central role fostering - or hindering - participation. Results will be discussed also considering differences due to participants’ social and personal characteristics (school, age, gender...).

**GREEN CITIZEN-CONSUMERS, REBOUND EFFECTS AND DYNAMICS BETWEEN NICHEs AND REGIME**

Mikael Klintman1, Johannes Strippel2, Lena Hiselius3

1Research Policy Institute, 2Dept. of Political Science, Lund University, 3Dept. of Technology and Society, Faculty of Engineering, Lund University, Lund, Sweden

**Abstract:** Within social research of environment and citizen-consumers, there is a strong tradition of studying one sector - or part of sector - at a time. For instance, people’s modes of travel to work or choices of eco-labelled vegetables, are often studied in isolation from the possible interdependencies of these choices and other ones in people’s daily lives. Clear delimitations are of course exemplary from the perspective of scientific rigor. Still, to be able to draw wider implications in terms of transitions, and regimes that go beyond single, partial sectors, factors such as rebound effects and spillovers from one part of our daily lives to others need to be elucidated. By examining three cases of household-related climate mitigation –Mobility Management, preferences for climate offsetting and climate labelled food products – the aim of this paper is to analyse the roles of rebound effects as well as positive spillovers between one climate-sound action and other actions in daily life. Rebound effect here refers to how climate mitigation in one action, for instance by people changing from car to bike use for work trips, may lead to money savings, which in turn may lead to negative climate impact, through, for instance, further flight trips on the holidays. Spillovers, on the other hand, here refer to the positive climate awareness that may lead to reduced climate impact in several sectors of our daily lives. The paper combines theory on green consumerism with certain ideas and concepts of transition theory. The paper draws conclusions how researchers as well as practitioners in companies or public agencies may get a better understanding of rebound effects and spillovers in efforts towards green transitions, in research as well as policy making.

**LOCAL GOVERNANCE AND LOCAL SUSTAINABILITY IN PORTUGUESE MUNICIPALITIES**

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Joao Guerra

Social Sciences Institute, UNIVERSITY OF LISBON, Lisbon, Portugal

Abstract: Getting greater public awareness and social significance in the late 1980’s, sustainability and governance are sharing basic purposes and characteristics and, consequently, overlapping their main potentials.

Based on some particular results of a survey applied to Portuguese municipalities, this paper will discuss present conditions for public participation in local sustainability. The results show some vital elements for success, viability and continuity of such initiatives: 1) the commitment and involvement of political authorities with necessary legitimacy to share decision-making with the public; 2) clear information and transparent procedures to make certain that decision-making processes take into account the results of public debate.

In the Portuguese case, and in spite of the persistent lack of a concerted national framework and/or reliable funding policies, incontrovertible advance has taken place in recent years. The results of this dynamic, however, is still irregular, remaining in the field some misconceptions and unsustainable practices, but within municipalities we can find the most successful LA21 initiatives, both the local authorities and residents recognise that such processes increase the level of confidence and contribute to local development.

PRACTISING ‘ENVIRONMENTAL CITIZENSHIP’ IN ENERGY-RELATED COMMUNITY PROJECTS

Anna Schreuer

1IFZ, Graz, Austria

Abstract: Transition processes that are taking place in the energy sector towards more sustainable systems of energy provision not only include the diffusion of new technologies but also open up new forms of social organisation. In particular, multiple roles have now emerged for individual end-users or ‘the general public’, e.g. as active consumers, deliberately choosing the utility company they purchase energy from, as energy providers in micro-generation at the household level or in energy cooperatives, as financial investors buying shares of renewable energy companies or as initiators of local or regional energy projects (Devine-Wright 2007; Walker and Cass 2007).

Against this background the paper briefly reviews different conceptions of active citizenship in energy issues, in particular looking at concepts of ‘environmental citizenship’ and ‘energy citizenship’. The paper critically examines what these concepts imply about the role of (collective) citizen action in relation to other spheres of action, in particular the state and the market, about the forms of action involved in ‘practising environmental citizenship’ and about the institutional and personal resources required to enable these forms of engagement.

In a second step the paper introduces two case studies of local citizen initiatives in energy issues in Austria, a green electricity trading platform and an ‘eco-region’ (an association of committed citizens of six villages with the main goal to contribute to climate protection in the region). The paper explores the forms of action involved in these initiatives, the understandings people have of their engagement as well as the motivations and resources for engagement on the basis of semi-structured face-to-face interviews as well as focus groups and qualitative content analysis.

This is used for a critical discussion of the potentials of local citizen initiatives, also pointing to the possible problems, limitations and contradictions that may arise in this context. Furthermore the paper also returns to the concepts examined before and provides an empirical valuation of the concepts of ‘environmental / energy citizenship’.

THE BATTLE BETWEEN OIL AND WORLD HERITAGE IN THE BARENTS SEA

Allan Sande

1faculty of social sciences, UNIVERSITY OF NORDLAND, Bodø, Norway

Abstract: In the high north, the Barents Sea has large undiscovered resources of petroleum and sustainable populations of capelin, herring and cod. The exploitation of petroleum exposes ecosystems to the risk of pollution and damage. The national states of Norway and Russia, who manage the Barents Sea jointly, have ratified UN conventions on biodiversity conservation. This challenge of implementing the convention and at the same time managing international competition of exploitation of natural resources in the Barents Sea, has been solved by the Norwegian government by making a large scale ecosystem based national management plan for Barents sea and the Norwegian sea. The national goals are both sustainable use of fishery resources and conservation of the ecosystem. These goals are implemented by the designation and planning of the Lofoten islands and adjacent areas of the Barents Sea as a World Heritage site. These designated areas are the spawning ground for cod and herring and the most promising areas for exploitation of petroleum on the Norwegian continental shelf. In the paper, I will present an empirical case study of the Norwegian national decision making in ecosystem based management of the Barents Sea and nomination of the Lofoten islands as a World Heritage site. I will discuss the social effects of the new environmental policy and environmental institutions in Norway. The question is: is government based eco-system management planning the institutional framework for solution the conflicting interests within the Norwegian society?

WHAT MEANS BEING A SUSTAINABLE CITIZEN IN CALIFORNIA?

Nathalie Marthe Ortzar

1LET, ENTPE, Vaulx-en-Velin, France

Abstract: At the core of the challenges raised by the climate change and the need to build a more sustainable society is the need for citizens to change behavior and daily routines. Change of behavior is never an easy thing. In order to understand it a research has been lead in the Bay Area in California in order first to understand what means sustainability to the people, second what kind of routines do they have that they think are sustainable, how did they achieve them? and third what kind of information do people have access to when they buy appliances, which raises the question the access to usable information about energy and of the lack of information given by the energy star program. People are also untangle in a system of beliefs, values and routines that drive their everyday behavior.

The research undergone looks at those questions through ethnographical field-work as well as through interviews about daily rou-
tines and more specifically the life cycles of goods through the house.

In this presentation I will specifically deal with behavior impacting energy uses. How do people change their routines concerning energy? Which kind of resistance do they encounter and to which type of structural problems are they confronted? which routines are easier to change? are the questions that are going to be dealt in the presentation.

CLOTHING CONSUMPTION: CONSUMERS’ ENVIRONMENTAL ATTITUDES AND ACTIONS

Kirsi Laitala 1,2,*, Ingun Grimstad Klepp 1, Casper Boks 2

1 NATIONAL INSTITUTE FOR CONSUMER RESEARCH (SIFO), Oslo, 2 Department of Product Design, Norwegian University of Science and Technology, Trondheim, Norway

Abstract: Clothing consumption has increased rapidly in the Western societies. The resulting massive textile material stream creates environmental problems during the different life cycle stages. In addition to the problems related to production, transportation and waste, many life cycle assessments document that the use period is the most resource demanding phase due to maintenance. Therefore, consumers play significant role for the environmental consequences. We have studied consumers’ environmental attitudes, knowledge, and actions concerning clothing consumption, including the acquisition, use, and disposal periods. In particular, what is the relationship between knowledge, attitudes, and actions, and what is the level of environmental consciousness in different processes?

This paper is part of an on-going research project ‘From textile waste to material resources in a grave to cradle perspective’. Quantitative information of consumers’ experiences, habits and opinions concerning clothing consumption was collected through a survey in Norway. The questionnaire included questions about maintenance routines of clothing and environmental attitudes. In addition, a strategic sample of 16 households was composed for a qualitative study to collect more detailed information through in-depth interviews and wardrobe studies.

Respondents’ environmental awareness is mainly related to the end of use period and is present only to a lesser degree during acquisition and maintenance. If the respondents considered environment during acquisition, they mainly discussed selecting second-hand or ethically produced clothing. Very few consider the environment during the clothing maintenance. Nevertheless, some actions with positive environmental consequences were taken. The reasons were usually economic such as mending the clothing, or saving electricity by selecting eco-program, lowering the washing temperature, or avoiding tumble-drying. Some examples of non-economic reasons were to save the clothing by washing it more seldom or repairing a garment because it was a favourite. When it comes to clothing disposal reasons, poor fit, changes in clothing appearance, and taste-related issues dominated, in addition to other reasons such as having too many similar garments. Most respondents had positive interest towards environmental issues, but lacked the knowledge when it comes to clothing consumption.

ECOLOGICAL VALUES: CHANGES IN THE ATTITUDES OF THE LATVIAN PUBLIC

Iveta Briška 3

3 Postgraduate Studies in Sociology, RIGA STRADIŅŠ UNIVERSITY (RSU), Riga, Latvia

Abstract: Latvia has a very ancient history which underwent quite a complicated development. Today Latvians are one of the two “living” Baltic nations. The developments of identities, value system, and mental features of the Latvian public have been historically influenced by a rich cultural and social heritage and various political and economic processes in the world. For example, even long before the birth of Christ ancestors of the Latvians believed that natural forces, phenomena, and environment influenced the consciousness and existence of people. Despite the occupation in the last century, as well as the times of German, Swedish, and Polish rule during the previous centuries, the Latvians managed to preserve cultural and social heritage, though in a transformed form, till these latter days.

Today the supported belief in Latvia is that the quality of life should be improved without any damage to the environment, which requires a balance between the activities of the industrial society and real environmental resources. This is possible only in case of a strong environmental consciousness of the society.

Various studies – both in Latvia in 2006 for the Ministry of the Environment and world values surveys – allow perception social mechanisms and factors influencing ecological thinking and the formation of ecological values. The questions asked in the world values survey enable evaluation of changes in the public opinion, conception of values and worldview in different countries. Unfortunately, participation of Latvia in this survey was not regular; therefore, it is difficult to appraise, for example, the dynamics of the Latvian ecological discourse.

Therefore, speaking about ecological values of the Latvian public in the 21st century, the results of the studies on environmental issues in Latvia performed by the research centre SKDS in 2006 for the Ministry of the Environment will be presented. Within the framework of this research the opinion of the Latvian public on the evaluation of environmental situation, definition of problems, assessment of environmental values, environmental protection, activities of the public in relation to minimizing of environmental problems etc., have been explored. To enable comparative analysis and to consider the changes in the opinions of the Latvian public in evaluation of ecological values over a period of several years the study was repeated in 2010 and 2011.

FACTORS DETERMINING TRAVEL MODE CHOICE IN THE AUSTRIAN CITY OF GRAZ. A STATISTICAL ANALYSIS OF SURVEY, GIS AND ROUTING DATA

Jürgen Fleiß 1,2*, Eva Bravc 1,3*, Hans-Georg Frantz 4

1 Social Work, FH JOANNEUM, 2 Statistics and Operations Research, 3 Sociology, University of Graz, Graz, 4 Energy, Transport and Environmental Management, FH JOANNEUM, Kapfenberg, Austria

Abstract: Our contribution examines to which extent various factors determine travel mode choice. We use three types of data: survey data, data collected using a geographic information system (GIS) and route calculations for public and individual transport.

The standardized survey was conducted 2010 in six living areas in the city of Graz as part of the interdisciplinary research project “Ecotopia” (German: “Ökotopia”). The selection of the living areas
was based on the built environment and the average education level of the areas’ residents.

Among other topics the survey included the participants’ travel mode choices to work/education and to carry out personal commercial activities (e.g. shopping for articles of daily use). Furthermore data on the participants’ lifestyle, their environmental awareness and indicators of social stratification (e.g. age, gender, education and income) were collected. Participants were also asked to evaluate costs, duration and comfort of different modes of transport to work.

In addition to the “subjective” data of the survey we used official electronically available transport routing information. This allowed us to collect “objective” information on the availability and quality of public transport and the trip duration with different travel modes like driving a car, walking, cycling and public transport. The different durations of trips using different modes of transport can thus be evaluated. This information is expected to be important for the explanation of travel mode choice.

We also used a geographic information system (GIS) to gather data on the density of shops and services in the living areas and included the distance to the nearest public transport station.

Thus we will combine both “subjective” survey measures and “objective” data in our statistical analysis of travel mode choice. Based on the three data origins we are employing a promising approach to explain the factors determining the travel mode choice.

INFLUENCING TRAVEL MODE HABITS BY APPLYING SOFT POLICY MEASURES IN BIOGRAPHICAL CHANGES: THE CASE OF CHANGES IN PROFESSIONAL LIFE

Julia Schuppan 1, Sylvia Harms 1
1Environmental Politics, HELMHOLTZ-CENTRE FOR ENVIRONMENTAL RESEARCH, Leipzig, Germany

Abstract: In western societies, travel behavior is dominated by car use whose use continues to increase. Although the benefits that cars offer are well known, we are simultaneously aware of the environmental and social harm that traveling by car entails (e.g. greenhouse gas emissions, energy consumption, loss of urban quality of life).

Attempts to influence travel behavior towards a more sustainable goal are known as Travel-Demand-Management-Measures, and they aim to either restrict unsustainable or stimulate sustainable travel behavior. Whereas restricting travel behaviour is often considered as unfair and a limitation of personal freedom, stimulating measures are normally welcomed by people, but are at the same time less efficient. One reason for this lack of efficiency may be based on the fact that individuals often do not use conscious reasoning for their behavioral decision-making and succumb to the force of habit.

Research has shown that during times of biographical changes, e.g., residential relocation, birth of a child, habits can be disrupted and considered to be inappropriate to the new context, and thus might become open to change.

The theoretical background of this study is the theory of planned behavior as a rational decision-making concept into which we have integrated the habit discontinuity hypothesis. We present a current quasi-experimental study being conducted in Hanover, Germany.

We examine the behavioral effects of soft-policy interventions based on information about alternative means of transportation and incentives to use those alternatives. Additionally, a two-wave quantitative questionnaire survey is provided to the participants. Two career-related biographical changes are being studied: the first professional employment and the transition from employment to retirement.

We hope to improve our understanding of the relationship between the occurrence of important biographical changes and habit weakening processes related to travel mode choice. We expect to develop recommendations for planning highly effective information-based soft-policy campaigns in the future.

YOUTH’S UNDERSTANDING AND ATTITUDES RELATED TO CLIMATE CHANGE

Jan Skalík 1
1Department of Sociology, FACULTY OF ARTS / CHARLES UNIVERSITY, Prague, Czech Republic

Abstract: The links between climate change awareness of Czech youth students, their attitudes and level of environmentally friendly behavior are being explored. The paper identifies particular aspects affecting Czech youths in comparison with Great Britain, summarizes and interprets available surveys and theoretical concepts.

Sample of 872 university and grammar school students from Brno (CZ) and UK was asked in structured questionnaire. They were asked about knowledge, information sources, attitudes and socio-demographics. Three main hypothesis of the survey were then processed. Firstly, the relation between faith in science, personal effort to make an opinion and awareness of the respondents, was described. Then the influence of post-materialism and global overview to awareness and scarcity of the climate effect was tested. Finally, the dependency among feeling of personal responsibility, personal consumerism and awareness was mentioned.

The survey underlined critically low level of student’s knowledge. Strong tie between amount of accessed information and evaluation of seriousness of climate was found. Faith in science data and effort not to rely only at one source of information does correlate with respondent awareness. Students, who well understand climate change are more often post-materialists. On the other hand, informed students do not feel more scarcity and are not more globally orientated than others. Even there is no clear relation between awareness and level of consumerism, the more are students informed, the more they feel their personal responsibility. Even females are not in their average better informed, their feeling of personal responsibility is much higher than in case of males.

The results of the survey show that some Czech politicians denying the seriousness of climate changes are not trustworthy for the students. Oppositely, the most reliable are seen scientists, NGO’s and family. With reference to the comparison of influences in the British and Czech public space we can say that extending of climate change related education, above all in high schools, and a wider discussion on climate change initiated by Czech experts could play a crucial role in increasing the climate change awareness and feeling of own responsibility.
AT THE CROSS-ROADS OF GLOBAL AND LOCAL VILLAGE: PUBLIC ATTITUDES TOWARDS CLIMATE CHANGE IN LITHUANIA

Leonardas Rinkevicius
SOCIETY, KAUNAS UNIVERSITY OF TECHNOLOGY, KAUNAS, Lithuania

Abstract: This paper is aimed at exploring climate change-related societal attitudes and public discourse in Lithuania. Research questions deal with the ways in which public perceives the causes and possible mitigation strategies and measures of climate change. The empirical evidence presented in this article is based upon the representative public opinion surveys and media in 2007-2010. The Lithuanian survey data are enriched and contrasted with the data of Eurobarometer survey results (2008). Some of the framings in the Lithuanian questionnaire are enriched by the questions corresponding with the Gallup climate change-related poll conducted in the US (Dunlap, 2008). The Lithuanian public opinion surveys identify a relatively poor public knowledge of the major international treaties and events related to climate change. How could this public ignorance be interpreted? Does it reflect the low or marginalized environmental awareness of Lithuanian society at large? However, some other empirical evidence points to almost the opposite conclusions and interpretation, - especially as reflected in environmentalism as the major driving social force behind the collapse of the Soviet regime in the late 1980s – early 1990s. Exploring where, when and in which contexts are the messages regarding climate change placed in Lithuanian mass media and ranked in the public opinion polls clearly indicate the tendency that global warming is at best an exotic theme reaching the “local village” of Lithuanian mass-audience from abroad, rather than becoming a socially internalized issue. Climate change remains a minor issue of concern both in public perceptions and in mass media discourse. Why the key contemporary issue – climate change – is diffusing so slowly in the “local village” of Lithuanian society? Why the messages of global warming are so marginally echoed in Lithuanian mass media? These and other research questions are addressed in this paper, pointing to the interpretation of the state of society inter alia as undergoing a “double-risk” (Rinkevicius, 2000) or “all encompassing risk” (Yanitsky, 2000) character and period of transformations.

CLIMATE CHANGE - PERCEPTION AND RESPONSES IN EVERYDAY LIFE BY DIFFERENT SOCIAL GROUPS: AN EXPLORATIVE STUDY

Hanna Krapf
artec | Forschungszentrum Nachhaltigkeit, UNIVERSITY OF BREMEN, Bremen, Germany

Abstract: In recent years research results have pointed to an increased effect of climate change and its debate on consumer decisions. Thus large parts of the German population express their willingness to preferentially respond to offers and services targeted at climate protection and to further reduce direct consumption of natural resources. Based on these results a one-year explorative study by the Research Centre for Sustainability Studies (artec) at Bremen University aimed at researching whether climate change affects private consumption behavior and its relevance for sustainable consumption. Special focus was put on the everyday perception of climate change as well as on the interviewed consumers’ actual responses with respect to the consumption areas of energy, mobility and food.

Methodically the study was based on focus groups as well as face-to-face interviews and it was conducted among members of three different social groups: The first included members of an environmental organisation with a presumably heightened interest in environmental topics. The second included people who were affected by a particular high risk of poverty while the third was not subjected to any sort of preconceptions.

PRACTICES AND CULTURES OF ADAPTIVE GOVERNANCE FOR RAPIDLY ERODING PORTUGUESE COASTLINES

Luísa Schmidt, Pedro Prista, Tiago Saraiva, Carla Gomes
Institute of Social Sciences, UNIVERSITY OF LISBON, ISCTE-IUL, Lisbon University Institute, LISBOA, Portugal

Abstract: Portuguese coasts, which are among the most energetic and eroded coastal stretches in Europe, have experienced intense urban and tourist pressure over the last decades. 80% of the coastal population and 85% of GDP are concentrated on coastal stretches. 50% of the urban areas are located within 13 km of the coastline, and coastal erosion reaches retreats over 220m in the last 50 years.

While coastal change dynamics led by human occupation and erosion occur at fast pace, the legal framework and political actions have been very slow. According to all scenarios, coastal erosion rates will only accelerate in the coming decades in a situation in which the management of coastal zones is trusted to a chaotic maze of public entities, raising serious accountability problems. Any planning for adaptive sustainability must also consider the present context of the Portuguese financial crisis, as well as the forecast reduction of European Union (EU) funds after 2013. All these factors combine to make the Portuguese coastline an unmatched laboratory for testing new designs for adaptive governance for sustainability in a hostile economic atmosphere.

We identify two possible current coping tactics that generate unsustainable options arising from these contradictions: a calamity coast adaptation, with the existing coastline protected at all costs through top-down decision making, and a faustian bargain adaptation, where politicians, planners and developers demand ever more elaborate coastal protection in order to safeguard their investments.

This paper deals with: 1) scenarios of possible future coastal erosion and flooding based on the best scientific estimates available; 2) how these scenarios are interpreted in coastal policy making and planning, and 3) how the Portuguese society is responding to the opportunities offered by adaptive governance for sustainable coastlines.

These findings will be based on evidence from a series of interviews with key-actors involved in coastal policies and decision-making, as well as local stakeholders in 3 case study locations. All of them are critical sandy stretches, with heavy urban growth, raising sharp questions on sustainability, justice, public policy and scientific awareness. Participation seems to be a central issue in forthcoming adaptive social processes.
TRANSFORMATIVE INNOVATION - THE SOCIOLOGICAL CHALLENGE OF THE TRANSITION TO A LOW CARBON SOCIETY.

Fred Steward1,2
1Policy Studies Institute, WESTMINSTER UNIVERSITY, London, United Kingdom

Abstract: There is a widespread view that significant innovation is essential to achieving a successful transition to a low carbon society. But there are widely differing concepts of innovation, with a bewildering profusion of analogies citing past examples of radical novelty. Some are technological calls for green versions of the ‘Apollo Program’. Others are social or moral appeals for a green ‘New Deal’. This diversity represents the complexity of the climate change challenge but it also reflects contrasting and often confused ideas of innovation itself. This paper argues that innovation policy can only make a real difference through a more reflective and grounded discourse. It draws on new thinking about innovation in relation to delivery of transformative change and its relevance for policy actors in many arenas working on climate change or other agendas requiring social, technical and institutional change. In particular it discusses whether there is a convincing alternative to the prevailing orthodoxies of economic incentives or psychological persuasions. Both rest on a duality between ‘society/economy’ and ‘individual’. It argues that there is a new set of concepts from the sociology of practice, and from sociotechnical network studies which do offer a different approach. Drawing upon empirical research conducted on sustainability and innovation it is suggested that there is growing evidence to support such an alternative and also that the scale of the contemporary challenge of climates change and sustainability requires it.

AGRICULTURE AND BIODIVERSITY IN THE BRAZILIAN SOCIAL SCIENCES: A POSSIBLE STATE OF THE ART SCENARIO

Maria José Carneiro1, Thais Danton Coelho1
1Developement, Agriculture and Society, RURAL FEDERAL UNIVERSITY OF RIO DE JANEIRO, Rio de Janeiro, Brazil

Abstract: The present article intends to reflect upon what lies in the intersection between two premises: a) that science, and in particular, the social sciences, can contribute towards informing both decision making and the formulation of public policies, aiming at improving the welfare of people in the planet, and, b) that the role of agriculture in the conservation of biodiversity is an extremely relevant contemporary issue, hence the need to study it in greater depth. The relationship between agriculture and biodiversity has been subjected to recent questionings, both in society and in the realm of public policies, as a result of growing concerns about the environmental changes caused by anthropic action. However, despite the increase in number of studies on family-based agriculture, and on biodiversity in Brazil, the research funding available for researching the relationship between those two broad themes is still incipient. Against this backdrop, we shall pursue two main objectives with this study: 1) to investigate how this issue has been approached by the Social Sciences in Brazil; 2) to elaborate an inventory of the knowledge available on this issue in order to test a methodology for a comprehensive literature review to help decision makers involved with public policies as it is suggested by the evidence-based policy approach. As conclusions we can say that: 1)The problem raised by policy-makers cannot always be transposed to the academic field and vice-versa. The formulation of questions to be synthesised in order to satisfy policy-makers should be done collectively, with the participation of scientists and politicians, given the incoherence between the need of politicians and the questions approached by researchers; 2) the construction of the criteria for the literature review will be conditioned to the existing search tools, availability and selection of production targeted

Key-words: Family-based agriculture; biodiversity; Brazilian environmental sociology; scientific communication; state of the artevidence-based policy.

ENVIRONMENTAL ACTIVISM AND SCIENTIFIC KNOWLEDGE IN SOCIO-ECOLOGICAL CONFLICTS

Mercedes Martinez-Iglesias1,2
1Sociology and Social Anthropology, UNIVERSITY OF VALENCIA, VALENCIA, Spain

Abstract: The presentation expose some results of the research project Scientific-technical information, public participation and effects of sustainability in environmental conflicts (CSO2008-00291/SOCI), included at the Spanish National R+D Programme. It also shows some results ofa survey about environmental activists which have been participants in environmental conflicts.

The project aims to produce new knowledge about social movements or collective actions that are produced from social conflicts built around environmental problems or greatly connected to them. It will develop, through the study of a substantial number of cases, different issues that the analysis conducted so far has raised in this matter.

The survey examines opinions of environmentally concerned citizens about the social role of science and the experts, social participation, the effects of conflicts, etc. It is based on a representative sample of people involved in Spanish environmental movements.

ENVIRONMENTAL CITIZENSHIP: CASE STUDIES FROM TURKEY

Cigdem Adem1
1THE PUBLIC ADMINISTRATION INSTITUTE FOR TURKEY AND, Ankara, Turkey

Abstract: Environmental citizenship contributes to the debates on the ways to attain sustainable society and it is considered as improving the possibilities of democracy to produce sustainable outcomes. It brings a new challenge to four features of the general
architecture of citizenship: the debate over rights and responsibilities, the issue of membership, what counts as ‘citizenly activity’ and the determination of the political space within which citizenship takes place. It frames the argument from a critical starting point to globalisation while discussing ecological footprints and virtues.

This paper will discuss post-cosmopolitan citizenship comparatively with liberal, civic republican, feminist and cosmopolitan citizenship theories and it will explore environmental citizenship which is an interpretation and example of post-cosmopolitan citizenship. The criticisms against environmental citizenship will also be analysed as well. The criticisms can be grouped into three as feminist approach, environmental justice and the transfer of the duties of the states to the citizens to reach targets determined by international treaties. Furthermore, the paper will evaluate Turkish Constitution and climate change debates in Turkey from an environmental citizenship perspective. Environmental citizenship focuses on rights rather than responsibilities. Within this context, the paper analyses articles related with the environmental rights and duties of the State and the citizens of the 1982 Constitution of Turkey. Further, the study evaluates the role and importance of these articles in trials against environmental degradation and destruction. Taking environmental cases to the court is one of the most frequent used tools of the Turkish environmental movement. For Andrew Dobson (2003), one of the institutions that derive sustainability is schools. Hence, it is significant to analyse how environment is dealt with in the citizenship curriculum. The textbook of Citizenship and Human Rights Education taught at secondary schools in Turkey will be analysed accordingly.

THE POLITICAL MEANING OF ENVIRONMENTAL DELIBERATIVE FORUMS

Luigi Pellizzoni

Abstract: Environmental governance represents a privileged site of experimentation and diffusion of deliberative forums. The latter are often defined ‘hybrid’, in that they collect different types of agents: experts, policymakers, firms, ‘lay’ citizens, stakeholders – for some, even non-human agents play a role therein.

The success of hybrid forums can be easily explained according to at least two interlinked reasons: (a) environmental issues often take the shape of intractable controversies, where the articulation of values and facts proves especially tricky; b) such controversies often resist alignment with traditional political and interest divides and forms of representation. Beck and many others have argued that it is the very character of environmental change that asks for new forms of political engagement. However, the political meaning of hybrid forums remains controversial.

Environment-focused and the broader literature on public deliberation has been and still is mostly interested in ‘process’ issues (who participates, on what, in what ways, how decisions are taken etc.). Minor, yet still considerable, attention has been devoted also to ‘policy’ issues (rationale and effects of deliberative forums vis-à-vis the policy process). The political meaning of deliberation (rationale and effects on political relationships), instead, has been dealt with to a far lesser extent. Here one can analytically distinguish between the ‘politics’ of deliberation, drawing attention to power struggles that involve also, or are primarily focused on, environmental resources, and a more profound dimension where the term of reference of deliberative forums – their implicit or explicit premise and addressee – is the ‘polity’, i.e. the configuration of the political community.

The paper aims at critically analysing the emergent debate on this latter issue. Different streams of literature will be considered, namely post-Marxism, Foucauldian studies, Actor-Network Theory, sociology of critical capacity and STS. These literature problematize the emancipatory meaning of public deliberation in a different way to mainstream discussions over the procedural technicalities of hybrid forums, pointing to more fundamental questions. Though based on theoretical reflections and literature review, the paper will benefit also from evidence offered by an ongoing study of an environmental controversy.

CHANGE YOURSELF TO CHANGE THE WORLD? VALUES CHANGE AND SUSTAINABLE DEVELOPMENT

Piotr Matczak, Ilona Otto-Banaszak

1 INSTITUTE FOR AGRICULTURAL AND FOREST ENVIRONMENT, Poznan, Poland, 2 PIK, Potsdam, Germany

Abstract: While the need for sustainability is growing, sustainable development still involves several problems, both conceptual and practical. The transformation into the sustainability, within the literature on the environmental policies is seen through the three pathways: a) legal restrictions imposed on behaviour; b) economic (dis)incentives; c) communication/education. Within this view behavioural change is in the centre of interest, and individuals are motivated by external stimuli to change their conduct. Less attention has been given to the internal factors leading to sustainable behaviour: needs, believes, and values. Analysing flood management in the Tisza River Basin (Hungary) and public participation in designing environmental policies in Poland suggests that internal factors play important role in the process of behavioural change. The paper proposes a conceptual analysis of the possibilities to values change as a source or an element of transition to sustainability. Firstly, several “layers” of values are distinguished, from the use values justified in objective, technically inter-subjective evidence, to worldviews requiring no objective proof. Secondly, dynamic aspect of values is analysed. Distinction between durable, long lasting values and values changeable in a short run are presented (following O.Williamson). Thirdly, the idea of deliberation is presented, with assumption of possibility to achieve mutual understanding (consensus) if proper deliberative process takes place. Two views are confronted: (a) Habermas’ formulation of the rational, argumentative process, which assumes possibility for individual and social learning – through acquiring new knowledge, and information; (b) a view including also emotional aspects (Gutman and Thompson 1996). Empirical evidence show that even in the situation of non-resolvable conflicts a consensus can be reached, although not necessarily within the postulated deliberation framework. Moreover, consensus is often based on the recognition of differences and acceptance of a solution which is inclusive for different points of view. Change of the attitude and values is observable in groups where views differ moderately (Wesolowska 2010). In the conclusions we discuss how far and what kind of values change is required in order to achieve sustainability, understanding sustainability as a process of transition.
**EFFECT OF ENVIRONMENTAL CONCERN ON ENERGY-SAVING CURTAILMENTS AND INVESTMENTS: A MULTI-COUNTRY STUDY**

Jan Urban 1, Milan Ščasný 1

1Environment Center, CHARLES UNIVERSITY, Prague, Czech Republic

**Abstract:** The primary objective of this study is to examine the effect of environmental concern on energy-saving curtailments and energy-saving investments of households in multi-country settings. The study exploits data from a household survey conducted in 10 countries (Australia, Canada, Czech Republic, France, Italy, South Korea, Mexico, Netherlands, Norway, and Sweden) and representative of each of the countries (N=cca 1000 in each country). The survey captured several indicators of energy-saving curtailments (switching off the lights when leaving a room; turning down AC or heating when leaving a room; economic use of the washing machine and dishwasher; turning off unused appliances) as well as some energy-efficiency investments (purchase of energy-efficiency-rated appliances, low-energy light bulbs, installation of thermal insulation, efficient heating boiler, and renewable energy sources). Further, the survey captured also several indicators of environmental concern and several background variables characterizing respondents, their households and their dwellings.

We use WLSMV estimator to estimate and test structural model with categorical outcomes. First we test structural model that posits the effect of environmental concern on both curtailments and investments controlling for background variables in each country, without assuming measurement invariance and invariance of structural parameters across the countries. Our data do not reject country-specific measurement models, implying that variance in specific curtailment behaviors and efficiency investments can be accounted for by two underlying latent factors. Testing of the structural model reveals that environmental concern has only effect on energy-saving behavior and not on efficiency investment. Indeed, our data do not reject effects of background variables (such as dwelling ownership, household income, and energy metering) on curtailment and efficiency investment, as found in previous empirical studies. In the second step, we tested measurement invariance across the countries. Our data reject the measurements invariance. Thus we can conclude that although similar effects of background variables and environmental concern on efficiency investments and energy curtailments can be observed in the 10 countries, the proportion of specific activities that constitute curtailment behavior and efficiency investments varies across the countries.

**EXTENDING CLIMATE SCENARIOS AND STRATEGIES WITH PARTICIPATORY METHODS IN THE PROJECT WATERISK**

Zsuzsanna Marjainé Szerényi 1, Erzsébet Novák 2, Helga Veigl 1*

1Department of Environmental Economics and Technology, 2Futures Studies Department, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

**Abstract:** In the project Waterisk an integrated water management decision support system is developed that allows water management interventions, strategies and impact analysis in a user-friendly way. Scenarios and development strategy are outlined based on a complex approach that includes participatory methods as well. The IPCC climate model is the starting point for the forecasting software. The climate scenarios are extended amongst other variables with attitudes that affect the possible adaptation strategies to different climate futures.

A survey was conducted in three pilot areas, and it consisted of three main parts: general attitude questions, questions on willingness-to-pay and questions referring to the future attitude and thinking. Surveying the future attitude and future orientation of laymen support of each climate scenarios is explored: what are the possible weaknesses of the realization of scenarios and what possible changes and decisions would be supported by laymen. The majority is aware of and share environmental values, however that is not associated with activity and future orientation. Questions also revealed differences between preferable and probable futures, related to environmental issues. Based on results of participatory methods we articulate possible development strategies as well.

**INVESTIGATING THE INFLUENTIAL FACTORS OF OUR TIME DISCOUNTING BEHAVIOR**

Andrea Tabi 1

1Environmental Economics and Technology, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

**Abstract:** In recent times the need for sustainable policies has constantly increased. Social Cost-benefit analysis as a decision-support tool is designed to measure the social and environmental impacts of a project on society. One of the most crucial points to consider when utilizing CBA is the social discount rate.

This study presents the results of an investigation into stated time preferences through pair-choice decision situations for various topics and time horizons. It is assumed that stated time preferences differ from calculated time preferences and that the extent of stated rates depends on the time period, and on how much respondents are financially and emotionally involved in the transactions. The question concerns how the gap between the calculation and the results of surveys can be resolved at all, and how the real time preferences of individuals can be interpreted using a social time preference rate.

The survey is based on a 1000 element representative sample which captures the discounting patterns of Hungarian people through the use of different questions, including personal and community profits, life savings and the future costs of climate change. It also attempts to reveal how income level, environmental attitudes, happiness and life satisfaction influence temporal discounting behavior.

Results indicate that there were no significant differences in the domains of money and climate costs with a delay of 10 years, but health (saving lives) was discounted least at all time horizons, than for the other domains. For the case of environmental risk (flood) a very wide range of responses were given, which upholds our assumption and the findings of other authors that environmental risks do not seem to be discounted by individuals.

For the study described, time discounting behavior had no connection with gender or age and was also very weakly connected with qualification, happiness and life satisfaction. Regarding time discounting patterns, the strongest relationship after clustering was discovered between income levels and the five attitude questions concerning the environment.
DISTRICT OR FILIERE PATTERNS FOR THE GREEN ENERGY OF RURAL ITALY?

Giorgio Osti1

1Dep. of Political and Social Sciences, UNIVERSITY OF TRIESTE, Trieste, Italy

Abstract: In Italy in the last years power plants fed with renewable sources have increased a lot because of generous subsidies of the government. With the partial exception of solar energy, that has a diffuse character, the other power plants are located in the rural areas. Wind turbines and power plants using biomasses need open and low density spaces. Even vast photovoltaic panels systems are installed in the arable land! Such impetuous growth has created some concern in the Italian public opinion.

Two patterns are invoked for interpreting the diffusion of renewable power plants in rural Italy: somebody talks of a possible “district” development, following an experimented industrial model (=spatial proximity and integration of different firms); someone else sees a “filiere” development, whose character is the integration of power plants, energy companies and developers (a sort of intermediaries) without spatial proximity. That means main actors scattered in a vast area, which sometimes overcomes the national borders. Arthur Mol’s boundless biofuel hypothesis is near the filiere or chain pattern.

The prevalence of one or the other pattern has different consequences for the environment, for the local industrial system, and for the people involvement. Also the follow-up in terms of energy saving measures is probably different. The two patterns of renewables diffusion in the space are analysed at theoretical and empirical level. Some renewables power plants, located in the fertile Po valley, are taken as exemplary cases. It will be difficult to arrive to a conclusion, even if the filiere pattern seems dominant, while the district one works as an ideological covering.

ENERGY-EFFICIENT RENOVATION’S PRACTICES IN THE RESIDENTIAL SECTOR. RESEARCH FINDINGS AND POLICY CHALLENGES FROM FIVE EUROPEAN COUNTRIES

Elena Battaglini1

1Research Area on Environment & Sustainable Develop, ECONOMIC & SOCIAL RESEARCH INSTITUTE (IRES), Rome, Italy

Abstract: The ‘consumption turn’ in social sciences put the stress on the ‘critical consumer’ as the decisive agent for environmental-friendly consumption patterns. Private consumption like energy-efficiency retrofitting in households, however, cannot be adequately understood as a matter of ‘personal choice’. Individual behaviours approach do not take into account the complex socio-technical dynamics underlying consumption and its dependency on ‘rules and resources’ and, thus, on ‘systems of provisions’. Within this interpretative perspective, the paper would analyse the empirical findings on 28 study cases selected among energy-efficiency retrofit fitted houses in the private sector. Based on a study run in five European countries (Germany, Switzerland, Italy, Spain and France), the paper therefore will explore the question how far practice approaches can also be meaningful for energy efficiency policies orientations in the household sector.

EU CRITERIA FOR ‘SUSTAINABLE BIOFUELS’: ACCOUNTING FOR CARBON, PROMOTING NEW MARKETS

Les Levidow1

1DPP, OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: EU targets for ‘renewable energy’ stimulate a significant market which otherwise would hardly exist, in the name of environmental aims (among others) which are regulated by sustainability criteria. This policy links several types of accounting: accounting methods for GHG emissions (direct and indirect), and the accountability of EU policy for its potential effects.

In particular, the 2009 EC Renewable Energy Directive set statutory targets for transport fuels to come from renewable energy (10% by 2020); in practice the main source will be biofuels. For new installations after 2017, the requirements for GHG savings will become more stringent and could be fulfilled only by Brazilian sugarcane bioethanol or else by 2nd-generation biofuels. Their commercial development is a high-profile aim of both the EC targets and of substantial R&D funds for biofuel innovation.

According to EU policy, these measures are necessary to generate ‘competitive, sustainable biofuels’ – so that future biofuels will link economic, social and environmental sustainability. Current ‘conventional’ biofuels, coming mainly from edible biomass which is increasingly imported from the global South, have generated societal conflicts – over land use, intensive monoculture and enclosure of commons. Future novel biofuels are meant to overcome those sustainability problems, e.g. by increasing efficiency, converting non-edible biomass, using ‘marginal land’, etc. Indeed, these future expectations help to justify EC targets promoting and expanding markets for conventional biofuels, despite their harmful effects.

Controversy has also focused on the prospect that biofuel production could stimulate indirect land use changes (ILUC), especially as the EU’s biofuel usage rises above approx. 5%, thus significantly undermining GHG savings from biofuels. When the European Commission sponsored expert reports to clarify this scenario, global models necessarily made various assumptions – e.g. about the future mix of energy sources, commercial success in future biofuels, transport infrastructure, etc. These assumptions in turn became a focus of further expert disagreements. In this way, contentious issues about the EU’s responsibility for global damage have been translated into expert debates over modelling methods, distant from experiences of environmental harm in the global South.

FUTURE SCENARIOS IN THE ENERGETIC TRANSITION: THE EUROPEAN ADOLESCENTS PERSPECTIVE

Silvio Scanagatta1, Barbara Segatto1, Francesca Guarino1, Francesca Settifi1

1Department of Sociology, UNIVERSITY OF PADUA, Padua, Italy

Abstract: Aim of the paper is to outline future life scenarios (desired and expected), with regard to environmental aspects, that European young people foresee in their own transition to the future. The economic and social exuberance of the late 60s need to be rethought, considering the limits that the environmental crisis places as a global problem. For that reason a “post-carbon society” is the chosen way that European Community have suggested (Seventh European Programme/Pact – Pathways for Carbon Transition) to
refers explicitly to the historical change from a society completely based on fossil energy, and often taken for granted, to one that takes into account the uncertainty of resources and try to find alternatives.

The survey covered 42 schools with 187 classes involved in a large number of EU countries: Austria, Belgium, Luxemburg, Denmark, France, Germany, Italy, Romania, Slovenia, Spain, United Kingdom.

Beside the identification of the future life scenarios, a role in the discussion will be destined to the influence played from SC (Social Capital) and HC (Human Capital) as well as to other specific sociocultural variables that can be useful to explain different perceptions and attitudes toward the energetic transition inside our sample.

Keywords: young people; european research; energy transition perception; human capital; social capital.

LOWER CO2 EMISSION- WE CAN’T AFFORD THAT! Social awareness of the poles on the subject of climatic changes in the context of press discourse on CO2 emission.

Maria Świątkiewicz-Mośny 1, Aleksandra Wagner 1

1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Kraków, Poland

Abstract: The subject of carbon dioxide emission has become very popular in recent months in Polish media, especially the press. Only in one of national papers as many as 56 articles were devoted to this subject in the last six months. As a result of this dynamic development of the discourse, the problem of co2 emission has been reflected in surveys monitoring subjects which are perceived as important social problems by the Poles. Results of the surveys are sometimes surprising as the Poles are more often worried about the condition of natural environment in the world than its condition in Poland. Only a minority of them notice alarming signals of climatic changes in their environment. On the other hand, they mention just climatic changes caused by co2 emission as the most serious threats of contemporary life, next to poverty, exclusion ad unemployment.

We argue that the way of problematizing social phenomena in the media, their description, constructing the context and connecting it with different phenomena has a significant impact on the emergence of social representations of the problems. The present paper aims at presenting the ways of constructing Social Representations related to co2 emission. On the basis of media content analyses conducted by our team from the point of view of presenting energy problems, and semantic field analysis of co2 emission in press articles, we present principal ways of problematizing this issue.

We shall discuss the heuristic power of a theoretical model based on Hans Kepplinger’s theory of problematisation of the social phenomena by the media and the theory of Social Representations by Serge Moscovici. Referring to concrete examples from Polish press we shall consider the mechanisms of anchoring and objectification. Also, we will reconstruct operational defining of the problem of co2 emission in Polish media and we will look at key metaphores, comparisons, associations etc. used in this area. A wide theoretical framework for us will be the perspective of media story telling which treats narration as a way of structuring and consolidating the social world. Referring to critical theory, particularly represented by Pierre Bourdieu, we are going to point at the ideological context of co2 emission issue. Conclusions will underline attempts of expro-priating the area of social debate by interests of the field of economic and political power.

TRANSFORMATIONS IN URBAN ENERGY INFRASTRUCTURE – DEVELOPMENT AND ROLE OF LOCAL NICHES. A CASE STUDY IN BERLIN

Pia Inari Rosemarie Laborgne 1,2

1IWAT, TU DARMSTADT, Darmstadt, 2EIFER, Karlsruhe Institute of Technology (KIT), Karlsruhe, Germany

Abstract: Energy production and usage patterns are regarded as socio-technical systems fulfilling societal functions and containing different components like physical artefacts but also organizations, specific knowledge structures, laws (Hughes 1987). The basis of the work is the approach of the multi-level-perspective (referring to Geels in social science innovation theory. It analyses transformations as interplay of three different levels: landscape, regime and niches. Research done in this field includes studies on transformations of the energy sector, but a still neglected factor in MLP research is the relation to spatial structures and local contexts. Recent studies based on the MLP (e.g. by Hodson and Marvin and Späth and Rohracher) point out the importance of local communities and regions for a sustainable transformation of the energy regime. The empirical basis on how transformations develop locally and how local experiments potentially transform the regime needs to be enhanced. In this framework, the presented PhD work focuses on the development and role of local niches, i.e. local experiments.

In the paper, two central questions will be discussed: how is the scope of action for the local level regarding energy, what strategies are developed? What role for local niche development, i.e. local experiments? Two such local experiments are regarded in detail: a specific contracting approach in public buildings and local “climate protection contracts” with enterprises.

The thesis is that challenges regarding energy are met very differently in different local contexts and that niches are developing locally emanating from windows of opportunity on the landscape level but also from specific local constellations.

BEING GOOD WHILE BEING UNJUST: RESILIENCE ETHICS, TRAGIC WISDOM AND ACT-TRAUMA REDUCTION IN DEGRADING SOCIAL-ECOLOGICAL SYSTEMS

Steven Richard Mather 1

1Rural Sociology, UNIVERSITY OF ALBERTA, Edmonton, Canada
Abstract: Social survival in environmentally, marginal circumstances, can necessitate the direct or indirect killing of other humans. In such circumstances, modernist, rights-based notions of social justice are incapable of providing moral guidance or social sanction and succour. This is unsurprising because these models of justice are based on modest scarcity that can be reconciled through negotiations, or abundance. As such, these models are ill-suited for promoting an ethics of resilience in social-ecological systems.

Resilience refers to the adaptive capacity of a system to maintain its form and structure while undergoing significant disturbances. The ability to absorb disturbance is a function of ecosystem productivity.

Resilience ethics embodies the principle that the materially possible (ecosystem productivity) sets the parameters for the socially and morally possible (ecosystem drawdown). Resilience ethics govern systems of social relations to protect the resilience of the productivity of the sustaining ecosystems.

In degrading social-ecological systems, this entails a drawdown of social goods as a means to bolster ecosystem resilience. This might entail each receiving less of the pot of natural and social goods. It might entail a loss of existential capital for some individuals, groups, or systems. For example, abortion, infanticide, geronticide, and socially-sanctioned forms of suicide are all practised as means of population control by societies who have geared their ethical structures to promote resilience.

Importantly, committing harmful acts, against people who have not earned harm, is not only unjust; it is potentially traumatizing because it compromises the “goodness” of the actor’s character. In other words, unjustly harming others is itself an act that harms resilience, because it can harm the actor and, thus, society.

Conceptualizing resilience ethics in social-ecological systems, therefore, involves considering resilience in its various nested forms, while aiming for overall resilience. It allows for the possibility of sacrificing the resilience of some for the resilience of others. Socially, and within this context, it must provide the means for people to maintain their social goodness while acting unjustly. It must provide social sanction and succour for acts that harm, either or both, ecosystems and people, when actors lack the means to provide justice to those they harm, including themselves.

(UN)SUSTAINABLE EXCLUSION: SOCIAL VULNERABILITY AND LIFESTYLES IN THE LOMBARDY REGION.

Marianna d’ovidio

Abstract: Within the field of sustainability, both in the academic world and in politics, there is an increasing focus towards the sphere of daily life and the promotion of lifestyles which respect environmental resources and do not harm environment or people. A rather flourishing stream of literature stresses the relation between social exclusion, vulnerability and the difficulty (or impossibility) of having an environment-friendly lifestyle. This literature often associates with the concept of environmental justice, linking the environmental science to debates around citizenship rights, social justice and equity. Dealing with issues as the distribution of environmental goods or damages, these streams of literature discuss who bears harms and who is responsible for creating, in both a practical sense but also in terms of policy decisions.

Within this broad framework, the paper aims at assessing the correlation between social exclusion (in broad term) and unsustainable lifestyles in Italy, focusing on one of the wealthiest region, Lombardy, where polarization increases and conditions of extreme deprivation are juxtaposed to situations of high level of prosperity. The paper will answer the following questions: to what extent are disadvantaged people (in economic, relational, cultural, infrastructural terms) able to have sustainable lifestyles? What aspects of their lifestyles put both the environment and their health in danger? What dimensions of their un-sustainability are more correlated with their deprivation? In order to answer these questions, individual survey data[1] are analysed and correlations between lifestyle and social exclusion examined. An important methodological step which is a relevant research result itself, is the development of a

CITIES, GLOBALIZATION, AND THE ENVIRONMENT THROUGH THE LENS OF URBAN POLITICAL-ECOLOGY: TOWARDS A MORE INTEGRATED UNDERSTANDING OF SOCIO-ECOLOGICAL POWER DYNAMICS

Nicolas T Stahelin

Abstract: The intensity of urbanization and the preeminence of urban areas in the future of human organization demand that we examine their ecological dimensions. Contrary to a common narrative that posits cities as anti-nature, cities actually provide a rich and fertile subject with which to examine solutions to contemporary environmental crises. However, this involves reconceptualizing city-nature interactions as nested socio-ecological systems that are increasingly interconnected. Cities should be seen as hybrid constructs where nature and society are conceptually integrated rather than dichotomized, and where a critical reading of urban metabolisms involves not only a multiscalar analysis of geographic components and material transactions, but also an understanding of the discursive and symbolic dimension that have been traditionally excluded from environmental concerns given the duality between nature and society in modern western scientific worldviews. Along these lines, the emerging literature on urban political-ecology engages the political implications of socio-ecological challenges linked to cities, where social struggles are an integral component of the urban metabolism’s impact on nature. Capturing the intensely contested political dimension of environmental problems has become key as the dominant discourse of sustainability continues to be presented as a technical challenge that can be overcome merely with sufficient resources or managerial talent. Although ecological economics may advance certain goals of sustainability, it does not account for key governance issues and thus will not by itself advance our quest for social justice. If social justice is a key ingredient of true sustainability, an urban political-ecological approach is necessary to reveal the power dynamics underlying the unequal distribution of social and environmental burdens exacerbated by neoliberal globalization. This type of critical analysis reveals not only how powerful forces dominate on the stage of global cities, but also how powerful forms of resistance are enacted. Only by complementing ecological accounting with critical political analysis will we be able to understand that sustainability is fundamentally a matter of government and equity, and not merely proper measurement or adequate technology.
robust definition of the concept of sustainable lifestyle, which is necessarily multidimensional. This is done not only through a deep literature analysis but also through roundtables with local actors, practitioners and policy makers. The paper concludes with a list of recommendation to policy makers resulting both from data analyses and different rounds of discussion with practitioners.

[1] Istat, indagine Multiscopo Comportamenti e stili di vita 2009 and other individual data sources

V. I. VERNADSKY ABOUT NOOSPHERE HUMAN DEVELOPMENT

Muslumat Gazieva Akhmedova

sociology, RUSSIAN STATE SOCIAL UNIVERSITY, Moscow, Russian Federation

Abstract: V. Vernadsky affected a scientific thought not with dream and with game of imagination. He launched a completely new understanding of organic life. Staying on the ground of science, V. Vernadskiy admits, that nowhere and in no any events that occur or are ever occurring in the Earth’s crust is found traces of spontaneous generation of life. Every living organism occurs from another alive organism. But this relationship is not that deep natural process, constant and necessary for life. Using the mind, man changes the environment. Guided by reason, people consume all substances surrounding him, for its public life. For the first time he calls the human mind space force, i.e. the phenomenon of nature, which enters like a living substance, to the structure of the universe.

Development of the noosphere from the Biosphere, V. Vernadsk has a natural phenomenon, which is deeper and more powerful in its base, than the human story.

Modern scientific knowledge mostly has deal with knowledge, which is useful for the manipulation and the manipulation with nature is almost inevitably lead to manipulation with people.

We need a radical shift in economic and technological systems based on the use of recurring resources and attention to the human dimension. The key idea should be a nonviolent economy, such, that will be more collaborate with nature, rather than exploit it. The importance of the human dimension, sustainable economy must be based on sound environmental principles and technology with a human face.

It is necessary to have fully updated system of thinking. The economic thinking is obsessed by unmanaged growth. Economic expansion was the main purpose of all modern communities, and any increase of the gross national product is considered to be a success. Although, the growth is an important feature of life, however, all kinds of economic growth should be analyzed. Something needs to grow; something needs to smaller and not have to have a special insight to realize that an infinite increase of the material consumption ultimately is impossible.

Humanity in its dialogue with nature should be provide a soft, consistent variation of nature and man, and an organic unity of man and nature. Elaboration of such way is a precondition of transition to the noosphere.

COEXISTENCE: A COMPROMISE SOLUTION AS A CAUSE OF CONFLICT

Beate Friedrich, Jedrzej Sulmowski, Daniela Gottschlich

LEUPHANA UNIVERSITÄT LÜNEBURG, Lüneburg, Germany

Abstract: Agro-biotechnology can be seen as a test of democratic accountability for societal choices. The invention and release as well as the commercial use of genetically modified organisms (GMOS) in agriculture have given rise to numerous conflicts in different arenas and on different levels in the political multilevel system. One possible answer to the question “GMOS – yes or no?” is coexistence. This concept, introduced by the EU in 2002, promises to answer “yes” and “no” at the same time by enabling both the cultivation of GM and non-GM crops. We argue that this concept of coexistence and its proposed implementation have failed to resolve the existing conflicts while new conflicts and problems have been generated through the individualization of choice. This concept does not only comprise the coexistence of GM and non-GM crops, but also that of farmers with different positions and interests and, finally, the coexistence of different types of agriculture and society. We see the debate over agro-biotechnology as much more than a mere conflict between those who are in favour of or against GMOS. In our presentation we discuss the kind of natural and social order that is co-produced through the use of the concept of coexistence.

LEGITIMACY ARGUMENTATION OF STAKEHOLDERS ON AGRI-BIOTECHNOLOGY: THE GMO DEBATE IN HUNGARY

Réka Matolay

Department of Decision Sciences, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: This paper aims at exploring the stakeholder discourses on GMO-s in Hungary. Our longitudinal research (2004-2010) provides an analysis of the organisational field of agri-biotechnology, highlighting the legitimacy and de-legitimacy argumentations of various stakeholder groups, and their changes over time. Some of the specific features of Hungary from a GMO point of view: it is one of the biggest corn producers in Europe, and on of the first European countries introducing a ban on GM seeds.

In our research first the organizational field has been mapped. Identification of the various and diverse agents, speakers, stakeholders of GMO-s in Hungary has taken place providing not only an enumeration of key and marginal actors but also a rich picture of the power relations of the stakeholders impacted.

Then the legitimacy and de-legitimacy discourses and activities of the key members of the organizational field have been analysed. Representatives of most of the stakeholder groups have been interviewed. In addition to the series of semi-structured interviews focus group discussions and document analysis helped to explore stakeholder argumentations.

In Hungary legitimacy discourses on agri-biotechnology are mirroring international tendencies with local flavours. Local discussions are mainly driven by researchers (natural scientists in biology, genetics, etc.) and the changes of the institutional/legal background (e.g. EU regulations internalized by Hungary, 2004; implementation of the safeguard clause. i.e. moratorium on importing and sowing GM corn since 2005; regulation on co-existence, 2006). Diverse directions and waves of the debate have been identified and analysed through the lenses of the literature on legitimacy. A special
focus on agri-biotechnology companies helped us understand corporate approaches of various kind aiming at legitimizing GM seeds.

**RE-EMBEDDING AGRICULTURE THROUGH MULTIFUNCTIONALITY? AGRI-ENVIRONMENTAL GOVERNANCE AND SUSTAINABLE RURAL DEVELOPMENT**

Michiel De Krom1

1Social Sciences Unit, INSTITUTE FOR AGRICULTURAL AND FISHERIES RESEARCH, Merebeke, Belgium

Abstract: The concept of ‘multifunctional agriculture’ (MFA) articulates the notion that agriculture should be assessed and valued not only for its contribution to food production, but also to wider socio-economic, environmental, and cultural amenities. Framed in opposition to agro-industrial practices that are largely detached from other rural practices, wider society, and local ecologies, the (potential) contribution of MFA to sustainable rural development through a social and ecological re-embedding of agriculture is an important theme in current rural sociological literature. This paper explores if and how one specific form of MFA—the deliverance of agri-environmental services—contributes to a socio-ecological re-embedding of agriculture, and which governance arrangements such a re-embedding suggests and requires. The paper discusses in-depth case studies of three Flemish (Belgian) agri-environmental schemes, involving governance arrangements that correspond to three analytically distinct modes to facilitate agricultural re-embedding: (i) devolving governance functions to local/regional levels; (ii) re-connecting places of production with places of consumption through information—e.g. by labelling; and (iii) re-creating producer-consumer relations in situations of co-presence. With the help of qualitative analyses of grey literature and semi-structured interviews with farmers and other stakeholders (governmental agents, food supply chain actors, NGOs, citizen-consumers, non-agricultural companies), the paper discerns to what extent and why the schemes contribute to rural economic, social, cultural, and ecological capital. Moreover, combining theories of ecological modernisation with theories of practice, the paper reflects on how the different governance arrangements enable or constrain an internalisation of environmental rationalities in farming practices and a (re-)establishment of socio-cultural relations between farmers and other stakeholders.

**SOCIAL SUSTAINABILITY OF AGRI-FOOD PRODUCTS. POLIEDRO: A MULTIFACETED INDEX FOR FOOD SUSTAINABILITY.**

Luca Savoja1

1Departement of Social Sciences, UNIVERSITY OF TURIN (ITALY), Torino, Italy

Abstract: Poliedro is a self-assessment instrument to measure the sustainability of agri-food products (traditional products, mainly) and is based on the multifaceted idea of sustainability in the weak sense of the term.

The research is carried out by researcher from 3 Italian Universities and the objective is the creation and testing of an index called Poliedro. Different aspects of sustainability are considered: environmental, social, anthropological, economic and sensory.

This paper analyzes the “social sustainability” of food products.

Starting from specific LCA, some measurable dimensions of social sustainability have been identified. Social sustainability is intended as the acknowledgement of the legitimate rights of various stakeholders and the theoretical basis is the concept of “reflective justice” defined by J. Rawls.

In particular, the paper is focused on 3 stakeholders: local community, employees, consumers.

When production is based on and implies local identity, the residents and employees cannot be excluded from the benefits generated. Traditional products are such only if they are part of local patterns of consumption. The dimensions analyzed are: participation in production/distribution processes, degree of belonging of the products to the normative models of local culture, their familiarity in local consumption patterns.

The analysis of consumers' behaviors is focused on their priorities with regard to sustainability. The dimensions of analysis are: transparency of the information found on labels, ethical quality of commercial communication supporting the products and value of tradition.

The central matter is connected to the need to internalize the cost of using the tradition of the product's area of origin (that is a positive quality that increases the value of the product).

Tradition is not an intrinsic quality of products and is not a private property of producers; it is a collective good that is “property” of the local community and has to be considered as such.

This aspect is central in defining social sustainability and the paper will present the indicators identified to measure it.

The main aspects that have been identified are: accepting local cultural models as a guide for consumption, fair compensation for the use of collective goods, respect for the use of local community, refusal of the logic of selling/buying according to the best price, limiting the consumption as a plus for the consumption experience.

**SUSTAINABLE DEVELOPMENT AND ENTERPRISES CHOICES IN WINE INDUSTRY: A CASE-STUDY IN THE ITALIAN CONTEXT**

Isabella Crespi 1, Alessio Cavicchi 2, Cristina Santini 3, Valentina Andriani 4

1Dept. Education, 2Dept. of Studies on Economic Development, UNIVERSITY OF MACERATA, Macerata, 3Università Telematica San Raffaele, Roma, 4UNIVERSITY OF MACERATA, Macerata, Italy

Abstract: The emerging interest on sustainability in wine industry is shown at least by 3 patterns: a) a growing body of the academic literature on this research issue, b) the rise of new academic journals and scientific communities in social science fields, c) the birth of many university research centres and institutes for a joint evaluation of costs and benefits especially in the so-called New World wine countries. Thus wineries owners and managers wonder about the effectiveness of sustainable practices and if it is worth to be sustainable oriented. Talking about sustainability opens to a multitude of research issues, especially in wine, where being sustainable is often misunderstood with being organic or biodynamic. From the literature it emerges that one of the key questions research should answer to is "under what conditions sustainability happens?". This is strongly related to the awareness and the attitudes towards envi-
rnent and sustainable development by the most attentive managers in the wine chains. The wine industry is particularly suitable for research on this issue and the stream of research about firms’ internal and external dimensions of sustainability needs to be explored in depth. In particular in this paper the focus is on the intersections among structural (external drivers), cultural (internal drivers) aspects and the agency (enterprise choices) played by enterprises in their strategies of action. The aim of this paper is to investigate managerial attitudes and norms toward sustainability in a group of Italian “green” wineries. According to Theory of Reasoned Action and to the concept of “agency” a semi-structured questionnaire has been developed and in-depth interviews have been carried out with 8 wine entrepreneurs and managers. Results show the possibility for a responsive set of choices by managers mainly determined by cultural values of the company and of the social context too.

WHY INDIAN FARMERS ADOPT A NEW TECHNOLOGY? - A CASE OF BT COTTON IN INDIA

Puran Mal 1, Philib M. Musyoka 1, Sadika Haque 1, Siegfried Bauer 1

1Project and regional planning, JUSTUS LIEBIG UNIVERSITY, Giessen, Germany

Abstract: Agriculture still plays an important role in India’s economy with 60 percent of the rural people directly or indirectly dependent on the sector for their livelihoods. Agricultural development in India especially during the Green Revolution was spurred by adoption of new technologies mainly high yielding varieties coupled with increased use of fertilizers and pesticides. Cotton was among the beneficiaries of Green Revolution and afterwards became a major cash crop accounting for 9.4 Million hectares and production soaring to 4.39 million tonnes. However, the sector is facing several challenges including attack of pests and diseases which constraint efforts to increase productivity. There are about 166 species of pests which attack cotton at different stages of growth. Bollworms are the main pests that pose greatest challenge to the cotton sector and led to considerably low yield in India. To prevent the cotton from bollworm, genetically modified (BT) cotton was introduced in India in 2002 and the rate of adoption is higher than other countries. This study aims to determine the factors that are responsible for adoption of BT cotton in India. Haryana and Punjab states were selected as study area due to progressiveness in agriculture. A sample of 200 cotton farmers (BT and Non-BT) were selected randomly and data were collected through structured questionnaire. Logit model was used to assess the factors that influence adoption. Results indicate that economic factors, such as less expenditure for insecticide and less health cost influence farmers to adopt of BT technology in India. Social factors, such as, farm size, education, social network, access to information sources also play an important role. While health cost and education are the key factors to adopt BT cotton in Haryana state; area under cotton, insecticide cost, credit and information sources are the main motivational factors in Punjab state. The study recommends policy interventions geared towards improvement of information access concerning BT cotton, improving farmers’ education through extension, and promotion of social networks.

DO CONSUMERS CARE FOR FARM ANIMAL WELFARE? EXPLORING TRUST AND CONSUMER AGENCY.

Pekka Jokinen 1, Saara Kupsala 1, Markus Vinnari 1

1UNIVERSITY OF EASTERN FINLAND, Joensuu, Finland

Abstract: Consumption behaviour is a strengthening public arena of activism. Along the increase in demand for ecological and local products animal issue has appeared a central theme in the politicisation of food consumption. Consumer trust in the mainstream food production system seems to have declined because of various food scandals. Yet, trust is a multi-dimensional notion and there are various social scientific conceptualisations of trust, which theorise the formation of trust in different ways.

This paper investigates citizen-consumers’ perceptions of trust and consumer agency in the case of farm animal welfare. It also explores what kinds of groups of citizen-consumers can be identified in relation to the production animal issue. Our research material consists of data derived from a nationwide survey carried out in 2010. The survey was based upon a random sample of 18-75-year-old citizens in Finland, with a response rate of 47.5 percent (n=1,893). Besides using descriptive statistics, we analyse data with multivariate methods.

Earlier survey studies have shown that Finnish citizens tend to express high levels of trust in conventional livestock production and, correspondingly, a low concern about animal welfare issues. According to our results, indeed, the majority of Finnish consumers express high levels of trust in the domestic food chain. Yet, the strong trust does not basically refer to a carefree trust in judicial institutions and administrative systems.

Our results also indicate that the majority of Finns do not consider the domain of consumption a major political arena, although we can also identify a group of active consumers taking a more political role. It seems that there are some discrepancies between respondents’ ideas of “good animal farming” and actual consumption intentions. We conclude the paper by reviewing this gap in the light of the politics of behaviour change.

ENERGY RENOVATION PRACTICES IN DANISH HOMES: THE INFLUENCE OF ENERGY LABELS ON HOME RENOVATION PRACTICES

Toke Haustrup Christensen 1, Kirsten Gram-Hansen 1, Afi Adjei 2, Marjolein de Best-Waldhober 1

1Danish Building Research Institute. AALBORG UNIVERSITY, Harsholm, Denmark, 2Building Research Establishment Ltd., Watford, United Kingdom, 3Energy Research Centre of the Netherlands, Petten, Netherlands

Abstract: Heating of dwellings represents a major policy challenge for the transition to a low carbon society. In Denmark, heating of dwellings represents about 25% of the total Danish final energy consumption and about 13% of the total CO2 emission. The majority of this is related to heating of older dwellings, and as the rate of replacement is low, the main potential for energy saving is to improve the energy efficiency of the existing dwelling stock through energy renovation.

This paper understands energy efficiency home renovations such as insulating and replacing windows as an integrated part of home owners’ continuous renovation activities, which include many other considerations than energy efficiency alone. Therefore, the first part of the analysis focuses on home owners’ renovation practices in general: How can home renovation practices be described? And what does it mean to renovate a house in Denmark? The second
We have recently bought a detached or semi-detached house with an energy label (in most cases 2-3 years before the survey/interview).

INDICATORS FOR SUSTAINABLE CONSUMPTION
WITHIN THE FRAMEWORK OF THE PRECAUTIONARY PRINCIPLE: THE RELEVANCE OF PEAK OIL

Eivind Stø 1, Dayton Gordley 1, Harald Throne-Holst 1

1NATIONAL INSTITUTE FOR CONSUMER RESEARCH, NORWAY, Oslo, Norway

Abstract: The shift from production to consumption has necessitated the development of indicators to measure progress toward sustainable consumption. In this paper we will consider food consumption to illustrate the potential importance of peak oil for modern food production and distribution. This will be done within the framework of the precautionary principle.

In the discussion about sustainable food consumption indicators we will suggest four indicators:

• Two primary indicators: meat consumption and food waste
• Two secondary indicators: food miles and organic production and consumption

The reasons for this hierarchy have been the conclusions from LCA studies that food miles is not so important and that the difference between organic and conventional production is marginal.

However, will peak oil change these conclusions? The concept of “peak oil” was originally introduced by Shell oil geologist Hubbert in the 1950s and estimates the year in which half of the world’s total recoverable endowment of oil has been produced. Peak oil is not supported by a Norwegian petroleum economist at the university of Stavanger. Peak oil is just regarded as a theory, and we have enough time to develop alternative fuels. However, the Association for the Study of Peak Oil & Gas concludes that peak oil is a scientific reality and the main question is how world economy will tackle this challenge. Recently the peak oil theory has been empirically supported by the International Energy Agency (IEA)

Oil has been described as the “life-blood of our modern civilization” where oil production has increased in tandem with world economic development for decades. The prospect of peak oil may have dramatic consequences with regard to world food security. Pimentel and Giampietro (1994) estimated that each American citizen required 400 gallons of oil equivalents annually to be fed. This means that we have to prepare for fundamental changes in conventional food production. Could organic production be a solution to the upcoming challenges? Furthermore, the global food trade and transport is to a large degree dependent upon relatively cheap oil. The peaking of oil may change this fundamentally. This will affect world trade and make transport substantially more expensive. Thus, food miles may be a central indicator for sustainable food consumption in the near future.

STUDENT SOLIDARITY-BASED PRODUCER-CONSUMER PARTNERSHIPS: TOWARDS INNOVATIVE FORMS OF ENVIRONMENT-FRIENDLY NEW SOCIAL MOVEMENT IN AIX-MARSEILLE UNIVERSITY

Jean Lagane

1LAMES, UNIVERSITY OF PROVENCE, Aix en Provence, France

Abstract: Solidarity-based producer-consumer partnerships tend to spread to universities in France and support innovative committed consumers modes. These actions share some proximity with the 1960’s Japanese responsible farmer-member teikei systems and the 1990’s North American patterns of Community Supported Agriculture (CSA). They altogether struggle against intensive agriculture and large scale food chains and advocate the necessity to change eating habits – to switch to fresh season products - and the importance of setting human direct relations between the urban and agrarian worlds.

For these reasons, students commit themselves in fruit and vegetable weekly box scheme’s delivery programmes in three different university venues in Aix-en-Provence and Marseille. Their box schemes are tailored for students needs and they also propose access to collective farming.

This communication questions how such initiatives may be apprehended as pathfinding environment-friendly forms of collective action. Through ethnographical fieldwork, several forms of student cooperation and socialization are analyzed - among which trust-based economy principles - while secondary modes of confrontation also appear and transcend collective action, bringing about environmental action rally and asserting in this way some characteristics of new social movements.

THE CONTESTED MEAT: ARE ENVIRONMENTAL AND ANIMAL WELFARE CONCERNS CHANGING MEAT CONSUMPTION IN FINLAND?

Johanna Mäkelä 1, Mari Niva 1, Terhi Latvala 2, Eija Pouta 2, Jaakko Heikkinen 1, Laura Koistinen 1, Sari Forsman-Hugg 2, Jaana Kotro 1

1National Consumer Research Centre, 2MTT Agrifood Research Finland, Helsinki, Finland

Abstract: In contemporary societies, meat is an apostrophe of the conflicts faced in everyday consumption. Meat as the most valued food of both traditional and modern societies is increasingly burdened with ethical problems relating to health, environment and animal welfare. Even though these issues seem not yet to affect aggregate consumption of meat, they can be observed in individual
consumption patterns and as intentions to make changes in the use of meat.

This paper is based on an Internet survey (N=1623, representative of the Finnish population) on meat consumption conducted in March 2010. The study investigates changes in meat consumption in the past as well as intended changes in the future. It identifies consumer groups with different patterns of change in meat consumption and examines how the groups differ from each other both sociodemographically and in their stated reasons for change.

In the paper, we analyse the current place of meat in Finnish eating habits, examine the roles of environmental and animal welfare concerns in meat consumption, and explore the conditions for more sustainable meat consumption in the future. Our findings show that some consumer groups are already changing their consumption patterns for ethical reasons. In addition, we suggest that ongoing ethical discourses are already part of public understanding of meat as a societally controversial issue. However, at a larger scale, societal concerns expressed at citizen level may be difficult to reconcile with the culturally high valuation of meat manifested in the choices of everyday life.

ENVIRONMENTAL JUSTICE: THE CASE OF FUEL POVERTY

Karl-Michael Brunner 1, Anja Christianell 2, Markus Spitzer 2

1Institute for Sociology and Social Research, VIENNA UNIVERSITY OF ECONOMICS AND BUSINESS, 2Austrian Institute for Sustainable Development, Vienna, Austria

Abstract: People living at risk of poverty or in conditions of manifest poverty very often cannot satisfy basic needs such as being able to heat their homes adequately. These groups of energy consumers are vulnerable to the consequences of insufficient or insecure access to energy. Reports by social welfare organisations state that a large part of low-income households has problems in paying their energy bills, at least for some time, and that disconnections are more widespread than expected. Rising fuel costs, bad housing conditions, the use of energy-inefficient appliances etc. belong to the list of problems these vulnerable consumers face and which call for socio-ecological solutions that contribute to energy efficiency as well as to social empowerment.

The proposed paper presents results and policy recommendations from the project “Sustainable energy consumption and lifestyles in poor households” (German acronym: NELA) which investigates energy consumption in low-income households in the Austrian capital Vienna. The study is based on a broad, multidisciplinary approach regarding underlying social theories and guided by questions about the type of socio-cultural and everyday life images that shape energy consumption in low-income households and the target-group-specific strategies and measures that can be developed in order to combine energy efficiency and energy savings with an improvement of living standards. The methodological approach of the project is premised on the qualitative paradigm, and data was collected in qualitative interviews. In summary 50 interviews were conducted in low income households in Vienna, 10 interviews in more affluent households and subsequently analysed.

The main aim of the project is to identify potentials for energy efficiency and energy savings (and thus also of costs) and to develop and implement policy measures that help combat fuel poverty and social exclusion in close cooperation with key actors within the energy system (e.g. energy companies, policy makers, NGOs, social workers).

ENVIRONMENTAL JUSTICE LOGIC AS FRAME FOR CLIMATE JUSTICE POLICY IN ISRAEL: CO2 AS A MULTIPLIER OF SOCIO-ECONOMIC INEQUALITY

Carmit Lubanov 1

1General Director, THE ASSOCIATION OF ENVIRONMENTAL JUSTICE IN ISRAEL, Ramat Hasharon, Israel

Abstract: Climate policy tools designed to curb emissions, have considerable social, economic and political consequences that emanate from differences in current use of fossil fuels by different sub-groups. The Association of Environmental Justice in Israel (AEJI) initiative new research, conducted by Prof. Dan Rabinowitz (Tel Aviv University) presents first analysis of some of these disparities in the case of Israel, is part of a larger project that covers four areas of consumption: electricity consumption (DEC); transport; food consumption and solid waste. The first phase scrutinized the inequalities in greenhouse gas (GHG) emissions in two sectors that are responsible to more than 70% of Israel’s energy and transport.

The article focuses on CO2 emissions emanating from domestic electricity consumption (DEC) and private vehicle use (PVU). The research has four methodical objectives: A) To develop indicators for comparisons of CO2 emissions levels across different groups of population. B) To apply these indicators for a comparison between emission levels of individuals belonging to the top and bottom income deciles in Israel; C) To create a CO2 emission profile of towns and cities. D) To demonstrate the importance of environmental justice and its logic for the design and implementation of an effective and acceptable corrective climate policy.

Our findings so far suggest that while considering DEC and PVU, individuals belonging to the top income decile emit approximately 25 times more GHG than those belonging to the bottom income decile. This gap, which is approximately 4 times bigger than the monetized consumption gap between the two said groups in Israel, illustrates the extent to which CO2 functions as a multiplier of inequality.

The article will present in detail the data and portrait how relevant it is that the effort undertaken by the government should be informed by differences that exist between sub-groups in their respective patterns of energy and fossil fuel consumption. Given these differences, we argue, policy tools could have divergent economic, cultural, social and political implications for different populations. Therefore these consequences of reducing carbon footprints need to be accounted for in the case of each group separately.

ENVIRONMENT AND INEQUALITY IN GERMANY

Henning Best 1

1GESIS - LEIBNIZ INSTITUTE FOR THE SOCIAL SCIENCES, Mannheim, Germany

Abstract: Whereas the study of Environmental Justice and the relationship between social inequality and environmental burdens has received great attention in the US, there are only few studies on the topic for Europe. In this paper, I will empirically analyze environmental inequality in Germany.
Using data from a nationwide panel study (GSOEP 1986-2004), I first assess the amount of inequality in environment related living conditions. Then I proceed to analyze panel data, in order to test hypotheses on mechanisms producing respectively reproducing environmental inequalities. A special focus of this paper is on the effect of selective migration and unequal opportunities in the housing market. The data show that there indeed is substantial inequality regarding the (subjectively perceived) environmental quality of living conditions (pollution, noise, green spaces). This inequality is linked to the household income and remains stable under control of education. First results of the panel regression models show that the perceived environmental quality improves with moving to a new place to live. Yet, opportunities on the housing marked are influenced by a household’s disposable income. The effects are similar for all three indicators of environmental quality, but differ in magnitude.

INTEGRATING SMALL COMMUNITIES’ WILLINGNESS TO ADAPTATION TO CLIMATE CHANGE INTO THE LOCAL RELEVANCE OF IPCC SCENARIOS

Ágnes Zsóka 1, Zsuzsanna Marjainé Szerényi 1, Katalin Ásványi 1, Zsuzsanna Flachner 2
1Dep. of Environmental Economics and Technology, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: One of the most important consequences of global climate change is expected to be the joint appearance of extreme weather phenomena, namely flood, inland inundation and drought. Human population living along rivers, are most seriously affected by those phenomena. In the frame of the WaterRisk project (financed by the National Research and Technology Office of Hungary), we focused on the small communities living along the river Tisza, exploring the most acceptable possible solutions in their opinion, regarding water-related problems. Their conformity – also called as willingness of adaptation – has been analyzed by two survey methods. Our questionnaire contained several questions on water-related issues, including the willingness to pay of respondents for increasing the proportion of natural and nature-close areas. On the other hand, the value system and priority setting of inhabitants towards water-related problems, local patriotism, community relationships, economic opportunities and the natural environment have been assessed via Q-methodology. This latter method is suitable for identifying respondent groups (called factors here) which show clear consensus in some of their behavioral features and opinions while significantly differing in other features. With the help of Q-methodology, value- and attitude-based behavioral profile of inhabitant groups will be shaped and the willingness as well as capability of adaptation is going to be evaluated. Our first findings show that despite the impacts of extreme weather phenomena respondents tend to insist on their residence and community, they do not want to move from the area even if they are not satisfied with the local opportunities. Their risk aversion is reflected in the high attached value to real estate insurance. The preference order and the behavior profile of respondents include several inconsistent elements which will be described and discussed in the paper. Both sets of information provides input to analyse local communities’ willingness of adaptation and consequently, to describe area-specific application of IPCC scenarios.

IS THERE A DIFFERENT CONSTRUCTION OF ENVIRONMENTAL JUSTICE IN EUROPE AND US?

Alicia Arriaga 1, Mercedes Pardo 1
1Political Science and Sociology, Carlos III University, Getafe, Spain

Abstract: The environmental justice discourse has arrived to European debates in the last few years. The environmental justice movement is distinctively a US phenomenon but recognized for having a lot of potential for being implemented at an international level likewise. Prior to the 2000s, similar research about environmental inequalities in Europe was very rare, rather lacking from the academia and institutions’ realm. Consequently, there has been an urgent need to investigate existing and available figures in order to determine whether poorer and ethnic communities, in certain geographical locations of Europe, are disproportionately being burdened by overexposure to environmental hazards and risks.

More than three decades of research experience in the US is leveling the ground to those who are leading the task to find out how environmental injustices are being constructed in the European context. Nonetheless, there are significant differences, as well as various similarities, between US and Europe on how the environmental justice debates and frames are being assembled. This paper will firstly explore the European institutional context of environmental justice. It will also try to indentify evidence of environmental injustices in Europe, before comparing and contrasting both European and US constructions of environmental justice.

VITORIA-GASTEIZ AS A JUST SUSTAINABLE CITY? A CASE OF PLANNING FOR JUST URBAN GREEN SPACES

Alicia Arriaga 1
1Political Science and Sociology, Carlos III University, Getafe, Spain

Abstract: Vitoria-Gasteiz, in Northern Spain, is considered a model of quality urban development. With approximately 11 million m² of green urban space, is the city with the highest ratio of green urban areas per person (42m²/p), both in Spain and in Europe. As a result, Vitoria-Gasteiz was name the winner of the European Green Capital 2012 award.

This study examines the extent of the level of commitment to environmental justice in sustainability programs by examining whether issues of social justice and equity are being incorporated into public green space initiatives within urban sustainability efforts in Vitoria-Gasteiz. This study will be explored throughout 3 main blocks: the management, both social and political, of green space in the city; the physical structure of the city’s green spaces in terms of distribution and accessibility; and its environmental justice commitment.

CIVIL SOCIETY, INSTITUTIONS, SCIENCE AND NON-HUMAN ACTORS IN CONFLICTS OVER MUNICIPAL WASTE MANAGEMENT INFRASTRUCTURES: A CASE STUDY FROM ITALY.

Natalia Magnani 1
1Department of Sociology and Social Research, UNIVERSITY OF TRENTO, Verona, Italy

Abstract: The main aim of the paper is to highlight the added value of an actor-network theory approach to understand environmental
conflicts over municipal waste management infrastructures and in particular to untangle the complex interdependencies between human actors and the material/natural world which characterize them.

My contribution will be articulated in two parts. In the first part I will highlight how the majority of the literature on conflicts over waste management plants has focused on the ability of community and environmental organizations to influence top-down decisions by adopting either a discourse analytical approach or a political opportunity structure approach. In this way the role of natural/material factors has systematically been ignored.

In the second part I will focus on an empirical case study from northern Italy concerning the conflict emerged around the decision of local institutions to build a municipal waste-to-energy incinerator. I will show how the outcome of the case-study - namely the fact that eventually the incinerator plant has not been built - can be fully understood only by adopting an extended definition of agency and actor which include also the material world and in particular the waste itself.

In the case analyzed waste ‘behaved’ differently from what expected from political institutions and predicted by their scientific experts from the Department of engineering of the local University. In this way it produced a significant shift in dominant political discourses and in the course of action itself.

In particular, waste worked as a catalyst for the action of the civil society, which by itself would have not been able to block the incinerator project. Drawing on a medical counter-expertise stressing the health risks of incinerators, the civil society then re-enrolled waste in alternative networks - first the ‘green incinerator network’ and later the ‘no incinerator network’ - which were able to mobilize and associate a larger part of the local community.

DECISION-MAKING IN THE REALM OF ENVIRONMENTAL SUSTAINABILITY: CAPTURING THE SUSTAINABLE DEVELOPMENT OF NATIONS

Philipp Babicky1

1Department of Sociology and Social Policy, UNIVERSITY OF SYDNEY, Sydney, Australia

Abstract: Decision-making in the realm of environmental sustainability is undoubtedly a complicated and often controversial process. Not only is it still uncertain how society could develop towards a more sustainable long-term path, but also do we still lack agreement which countries are already on the right track. Bearing in mind the impressive growth rates of large economies such as China and the associated increase in natural resource consumption give rise to a fundamental question: How can we measure and quantify the sustainability of countries and how can we ensure that society as a whole is on a sustainable path?

The UN Conference in Rio 1992 gave the first decisive impetus to develop indicators that capture the sustainability of nations and has finally led to the emergence of various types of environmental indicators. It is often argued that sustainability measurement is not simply a one-dimensional but rather a multi-dimensional exercise, which has to encompass broad aspects of society. One significant and comprehensive attempt is the widely used and well-established Environmental Sustainability Index (ESI), which aims to inform about socio-economic, environmental and institutional dimensions of sustainability on a macro-social scale.

Taking a comparative perspective, I discuss the construction of the ESI and examine the coherence of the indicator in a cross-national analysis. A critical assessment coupled with exploratory methods reveal a bias towards economically developed countries and certain inconsistencies, which this research aims to eradicate. I therefore fundamentally challenge the configuration of the underlying socio-economic, environmental and institutional components of the ESI to eventually propose an altered version of the sustainability measure. Depending on the purpose, the modified version allows researchers and policy-makers to look at sustainability from three different perspectives: social robustness, environmental consciousness and natural endowment. A different weighting scheme and an alternative organisation of the core components allow me to construct a modified index which is characterised by an increased criterion and construct validity, by a reduced number of components and therefore by an increased facilitation in environmental policy and decision-making.

OLD ENVIRONMENTAL BURDEN – PRESENT ADVENTURE. IGNORANCE IN DECISION MAKING, THE CASE OF CONTAMINATED AREAS

Alena Bleicher1

1Department of Urban and Environmental Sociology, HELMHOLTZ CENTRE FOR ENVIRONMENTAL RESEARCH, UFZ, Leipzig, Germany

Abstract: The promise of modern society has been resolving problems by scientific explanations and predicting future developments based on well grounded scientific knowledge. Instead contemporary society is confronted with growing uncertainty in scientific knowledge. Especially in environmental management decision making based on well grounded scientific knowledge in reality can hardly be achieved. Against this background in the last decades an intense discussion about the limits of scientific knowledge and the growing importance of ignorance was started within research fields of Sociology of Science and the Sociology of Scientific Ignorance. One of the main arguments is that reliable decisions can be made when ignorance is taken into account in decision making processes.

This presentation departs from the questions how decision making in face of ignorance is possible and which strategies actors need to develop to deal with incomplete knowledge. Taking the example of revitalizing contaminated areas those questions will be discussed.

Contaminated soil and groundwater resulting from former industrial, military and mining activities poses a risk for human health and ecosystem functions. Due to the long history of contaminations knowledge on former dumpsites has often been lost and natural degradation processes transformed original contaminants into new substances. For these reasons decision making in revitalization projects has to permanently deal with (known) unknowns and actors often have to decide in spite of ignorance.

By using a dynamic typology of ignorance I will discuss how actors define the importance of unanswered questions in decision making processes. By so doing they do not deny unknown facts, but take them into account. On this basis actors develop a spatial and temporal limited framework that is characterized by specific forms of interaction and regulation that enables well-considered decisions and innovative approaches in dealing with ignorance.
PROCESSES, STRATEGIES AND LEARNING. TAKING POLICY-SCIENCE-CITIZEN DYNAMICS INTO ACCOUNT IN INTERNATIONAL ENVIRONMENTAL GOVERNANCE

Rolf Lidskog 1, Göran Sundqvist 2
1Centre for Urban and Regional Studies, ÖREBRO UNIVERSITY, Örebro, Sweden, 2Centre for Technology, Innovation and Culture, University of Oslo, Oslo, Norway

Abstract: International environmental governance is a topic that during the last decades has received increased attention by social sciences. There exist different approaches claiming to conceptualise the important factors and causal relations that shape international environmental regulation. In our evaluation of these approaches, we find that important social-scientific findings on the interrelations and dynamics between science, governance and citizens have not yet been included in a sufficient way in these approaches. By discussing perspectives and findings from three different approaches; that of institutionalism (Oran Young), that of epistemic communities (Peter M Haas) and that of science and technology studies (Sheila Jasanoff), we propose a more elaborated understanding of the science-policy-citizens dynamics in international environmental governance. This approach focuses on processes rather than products, strategies rather than interests, learning rather than knowledge, and thereby it better grasps how international environmental governance is shaped.

AGROBIODIVERSITY BETWEEN PROTECTION AND USE – THE EXAMPLE OF RURAL DEVELOPMENT IN GERMANY

Annemarie Burandt 1, Tanja Mölders 1
1Institute for Sustainability Governance, LEUPHANA UNIVERSITY LÜNEBURG, Lüneburg, Germany

Abstract: Agrobiodiversity has diverse ecological, economical and socio-cultural values. It is one of the most fundamental resources for future uses and its loss is irreversible. There is a special relationship between agrobiodiversity protection and its human use. The existing diversity was shaped significantly by human activities (agriculture) and can hardly be maintained without any further use. As the use of agrobiodiversity in agriculture is an essential condition for protection, protection and use have to go hand and hand.

However, the forms of farming have played an important role for agrobiodiversity loss during the last 50 years. Due to an intensification of agriculture through an orientation towards a competitive, industrialized system, aspects of protection and use of agrobiodiversity have been more and more separated. Often strategies only consider one side of the coin: either they foster a specific use or they aim at protection.

The Common Agricultural policy (CAP) of the EU and its member states offers also support for rural development and provides new starting points to shape and develop nature along the principles of sustainable development which includes the integration of protection and use to a form of sustainable use.

In my presentation the results of a qualitative comparative study of the European and German strategies for rural development will be presented focusing on the prescribed integration of protection and use. An analysis of selected documents is currently being carried out regarding the following key questions: Which understandings of biodiversity are represented in the strategies? How do the strategies deal with agrobiodiversity protection and use? Are there any approaches for integration?

The study is conducted in the research project “PoNa – Shaping nature: Policy, Politics and Polity. Rural development and agricultural biotechnology between criticism and vision” which is focusing on the question how nature and the various relationships between nature and society are shaped by politics.

COLLECTIVE ACTION FOR BIOSECURITY: THE ROLE OF TRUST AND POWER

Sonia Graham 1
1School of Humanities and Social Sciences, CHARLES STURT UNIVERSITY, Wagga Wagga, Australia

Abstract: The introduction and spread of invasive plants into new habitats can cause losses to biodiversity and disruptions to ecosystems. In Australia, landholders who have declared weeds on their properties are legally required to manage and in some cases eradicate these plants. Much of the existing social science research that attempts to explain why landholders do, or do not, control weeds focuses on individual behaviour. This is problematic because weeds are a collective problem. If they affect one property they are also likely to affect neighbouring land, which means that the eradication of weeds requires communal effort. The aim of this thesis was to explore the way that social relations shaped landholders’ willingness to control noxious weeds. Particular attention was given to the concepts of trust and power because they permeate all social relationships and have been found to facilitate the achievement of collective goals.

Interviews, participant observation and document analysis were used to explore the nature of interpersonal and institutional relationships surrounding the management of the highly invasive, noxious weed serrated tussock (Nassella trichotoma) in Australia. This was achieved by using two case studies, one in two different States, as there are different institutional approaches to managing noxious weeds in each State.

The results showed that the nature and quality of social relations influenced the extent to which landholders and government agencies were willing to share information, engage in mutual aid and apply pressure on one another to control serrated tussock. Expert power and competence-based trust were particularly important for facilitating flows of information. Reward and referent power as well as goodwill and competence-based trust were important for the provision of encouragement, practical assistance and incentives. Legitimate, coercive and goodwill trust shaped attempts to apply pressure. These results indicate that there is merit in placing social relations at the centre of research into biosecurity-related problems. Furthermore, the results demonstrate that when the concepts of trust and power are studied conjointly it facilitates a deeper understanding of collective action.

RESILIENCE AND RESILIENCE OPPORTUNITIES. LINKING SOCIETY TO NEW MODELS OF URBAN PLANNING

Angela Colucci 1
1Dipartimento di Architettura e Pianificazione, Politecnico di Milano, Milano, Italy
Abstract: The resilience (and related concepts/approaches) is interpreted as an opportunity and a key strategy to give responses at the critical phenomena underlined in the urban planning process. In the last years, a large number of experiences, researches and literature based on the resilience approach were developed. The paper underlines those resilience principles and criteria that represent opportunities to promote sustainable cities future visions:

- holistic approach and complex systems approach
- the population involvement (social aspects in planning, the local knowledge);
- the potential of the resilience concept in order to develop a sustainable community development vision;
- the concepts of diversity, flexibility, process dynamic, local communities (...).

Resilience, society and urban planning. The paper aims at synthesizing the relationships (existing and possible) between main resilience key strategies and the urban planning, focusing on intersection points between the planning model/theory, the resilience approach and the desirable impact/involvement of social actors.

Focus and goals. The paper focuses on the implementation of resilience strategies in the urban planning decision making process. With the aim to open an operative discussion, the key issues underlined in the paper are: (1) the resilience opportunities in the urban planning decision making process (described as complex system of social relationships); (2) resilience principles and future strategies for city/urban areas; (3) guidelines or criteria towards the quality improvement of urban systems, both human and ecological components (to gain resilient and liveable cities).

The paper develops the key issues in relation to two levels of questions: a) the resilience vs planning (opportunity in innovation), b) planning towards resilient systems, c) the positive effects on social relations and the decision making process in critical situations.

Resilience “injections”. The first part discusses the relevance of the resilience injections in the urban planning process (design and implementation). Actually, the cities show different vulnerability phenomena: environmental problems (water quality/management, natural risk, pollution...), social vulnerability (health disparities, quality of life, community and social fragmentation...). Working on the vulnerability reduction it is possible to gain quality of social-environmental urban systems.

THE MATERIALITY OF EVERYDAY LIFE IN URBAN GREENSPACE

Lars Kjerulf Petersen

Abstract: Just as infrastructures for accommodation, traffic, energy, sewage, waste disposal etc. all are important features of urban life – and of the environmental impacts of urban life – so is urban greenspace a vital organ in urban metabolism, an important factor in urban sustainability and a central element in the lives of urban populations. The question in a sustainability perspective is how urban greenspace contributes to improved environmental conditions within the urban sphere, but also how greenspace may contribute to social sustainability in terms of better living conditions for urban populations. The question in a sociological perspective is not just how urban green areas may improve living conditions, but how it is used by the residents in urban areas and how it becomes part of their lives. This paper investigates how urban greenspace is integrated in everyday practices of urban populations. What are the social functions that green areas serve, and how do people interact with the materiality of urban greenspace – its bio-physical structures and its nature and landscape? The paper reports from a recent empirical study in the city of Copenhagen, Denmark, and it seeks to unfold and qualify concepts of lifestyle and everyday life, i.e. concepts by which sociological studies can capture and understand patterns of actions in people’s daily lives and life courses.

A number of studies show that urban green areas are beneficial for human health and wellbeing. These studies do, however, not go into a broader understanding of the social significance of urban greenspace and its significance in people’s lives. The social functions of urban green areas are not limited to whatever good effects they have on public health and wellbeing. The question is also which roles green areas play in people’s lives and in the community. The study presented in this paper shows that urban green areas are included in everyday life as spaces for free time and for household flexibility. They serve a number of different social functions by providing spaces for solitude, for being together with close friends and relatives and for the experience of civic diversity. And the possibility of having sensory experiences of nature and landscape become an integral part of urban life.

DEBATING GLOBAL WARMING, A CHALLENGE FOR CITIZENS AND EXPERTS.

Giuseppe Pellegrini, Silvia Caprioglio

1Department of Sociology, University of Padova, Padova, 2Department of Social Sciences, University of Torino, Torino, Italy

Abstract: Fifteen relevant organisations, scientific centres and science museums were engaged in 2010 by the European project ACCENT (Action on climate change through engagement, networks and tools) in a coordinated action aimed at strengthening their relationship with scientists and citizens on climate change issues. Throughout Europe, 25 LCDs (Local Citizens’ Debates) took place, gathering panels of experts and the public in a three steps discussion. During LCDs, citizens discussed issues among themselves and to exchange views together with a panel of experts including scientists, stakeholders, journalists, local governors. The discussion concluded with a presentation of recommendations for mass media, scientific community, local, national and EU institutions.

In this presentation we propose our analysis of reports and documents collected during the meetings.

LCDs show people’s need for clarification of the effects of climate change. Citizens need to know the extent to which global warming is caused by human activity, and the extent to which it is a natural phenomenon. The problem is that in a “risk society”, as Beck (1992) and Giddens (1990) stated, the number of intervening factors is such that uncertainty dominates and it is difficult to reach indisputable conclusions. The consequence is that people feel disoriented because of the complexity of reflexive modernity (Beck, 1992) and express the need for some “popular education” on climate change, as if they believe that climate-friendly behaviours may be induced. Speaking about the necessity to change their lifestyle in order to consume more responsibly, citizens show a way of thinking that is reminiscent of Homans’s exchange theory (1958), based on the principle that human behaviour is oriented by a cost-benefit
analysis. Changes can be seen in general environmental behaviours during the last decades, but they are slow. Perhaps the effects of climate change have not hit hard enough for us to try seriously to remedy the situation. In the citizens’ opinion, the political class is afraid of losing consensus by trying to spread positive, but unpopular, alternative models. As a result, maintaining the present (unsustainable) standards is always taken for granted. Climate change is apparently standing out as the “big story” of the new century, an interpretative frame that involves different issues for trying to explain the present age.

ENVIRONMENT, DEVELOPMENT AND CHANGE: THE VULNERABILITY CONTEXT IN LIGHT OF THE SUSTAINABLE LIVELIHOOD APPROACH

Mei-Ling Paulina Lin

Abstract: The global warming, depletion of the ozone layer and melting ice caps, depletion of resources, loss of biodiversity or a rise in pollution has become inescapable in development discourse. The challenge will only become more serious as global warming brings more extreme weather patterns. The risk of extreme rainfall due to global warming is substantially greater than estimated in current climate models. A cultural and political ecological approach to environment and development issues has become the focus of attention. The maintenance of social and cultural practices may be as important as income gains and poverty reduction for local communities. This paper focuses on local knowledge and practices, and their roles in the face of global change. It considers the wealth and significance of adaptive strategies directed to diversity maintenance, and the range of ways in which livelihoods may be constructed in a sustainable manner. It seeks to understand how local societies meet difficult challenges to ensure their survival and development in the face of diverse social, economic, environmental and political challenges. Typhoon Morakot dumped nearly 3,000 mm of rain -- half a year’s rainfall in Taiwan -- in Aug. 7-9 2009, triggering landslides that buried entire villages in Taiwan. Such challenges, from climatic change to population growth, have led to evolving regional institutions and environment management practices. The ecological and environmental issues are key to any understanding and analysis of structures of sustainable development. The following areas of concern are outlined: (1) What impact do climate and environmental change have on the livelihoods of vulnerable groups? (2) What are the role and function of social sciences in public debates and for policy-making? (3) How do communities seek to take charge of their lives, champion the virtues of their own local systems of production and consumption, and engage in the complexities of new structures of development that demand response to the vacillations of global politics, economy and society? (4) How do local communities, Taiwan manage its water resources and in the process to better protect vulnerable areas from soil erosion and landslides, and improve the capabilities in the case of environmentally induced migration? The author combines quantitative analysis of a survey data set with qualitative analysis.

INTEGRATING THE SOCIAL SCIENCES. SOCIAL SCIENCE CONTRIBUTIONS TO ENERGY AND BUILDINGS RESEARCH BETWEEN INSTRUMENTAL SUPPORT AND REFLEXIVE UNDERSTANDING

Harald Rohracher, Michael Ornetzeder

1IFZ - Department of Science and Technology Studies, UNIVERSITY OF KLagenfurt, Graz, 2ITA - Institute of Technology Assessment, Austrian Academy of Sciences, Vienna, Austria

Abstract: While there is widespread concern about the need to put more emphasis on the ‘social dimension of technological change’ within mostly technology-oriented energy and environmental research programmes at EU and national levels, social science contributions to such research programmes are still rather limited. The reason for this situation seems to be rooted equally in the ‘supply’ and ‘demand’ side of such research, i.e. at the level of science policy and research programme management which strictly separates social from technical problems and also at the level of social scientists who often do not show much willingness to engage with technology-driven problem perceptions of potential partners for interdisciplinary research networks.

This presentation is based on a review of social science research within Austrian research programmes on sustainable energy and buildings, but also draws on available material from other international programmes. Before this background different types of social science involvement in such programmes are identified and critically discussed. It is argued that social sciences may either directly contribute to technological design (e.g. by investigating user attitudes; organisation of participative processes), i.e. have a rather instrumental or procedural relation to technological projects; social science approaches may also help embedding technological projects into a broader socio-technical systems context (focusing on socio-technical regimes, governance issues, embedding in wider social context), i.e. taking on a contextualising role; or social science research may contribute to a more reflexive approach by the engineers and other actors involved in the programme with respect to technological change and the basis of their actions and strategies, i.e. contribute to the reflexivity of the R&D programme. These roles of social science also pose different epistemological challenges to sociology and relate in different ways to the policy making process on technical change.

SUSTAINABILITY OF ENVIRONMENTAL ACTIVISM IN POST-SOCIALIST SERBIA

Mina Petrovic, Jelisaveta Vukelic

1Sociology, FACULTY OF PHILOSOPHY, BELGRADE, Belgrade, Serbia

Abstract: Sustainability of Environmental Activism in Post-socialist Serbia

Abstract

The paper focuses on the impact that external factors, such as process of EU integration and related political opportunities/ accessible resources have on the environmental activism in the context of a weak civil society in Serbia. Drawing both on quantitative (questionnaire research on citizens’ representative sample N=2000) and qualitative (50 in-depth interviews with representatives of environmental organizations) data, the emergence of a specific form of ‘income oriented’ and competitive environmental activism is investigated. We argue that the ‘imported’ (assisted by international donors) activism has impeded the emergence of a genuine grassroots activism. More precisely, foreign assistance in capacity building of civil society has stimulated the creation of ‘donor-driven’ professionalized environmental non-governmental organizations (ENGOs), which are influential in political terms but not rooted in
ROLE OF LOCAL NGOs IN BOLSTERING THE SOCIAL PILLAR IN GLOBAL MULTI-STAKEHOLDER INITIATIVES: REINTRODUCING CARE, JUSTICE AND ATTACHMENTS

Emmanuelle Cheyns

Abstract: Since the beginning of the new millennium, initiatives have been developed to create “sustainable voluntary standards” for agricultural commodities through a series of international “Roundtables”. Their official objective is to define and promote sustainable agricultural practices while evolving through “open” participation processes referred to as “multi-stakeholder” initiatives.

Our contribution aims to characterise the political instruments suggested as the means of formulating agreement on sustainability and taking different voices into consideration. Referring to the specific cases of two Roundtables (“Roundtable on Sustainable Palm Oil” and “Roundtable on Responsible Soy”), we will undertake an analysis of the construction of the social pillar of sustainability and the role of local NGOs in integrating “local minority voices” in these international forums.

In the first section, we will present the instruments which were to lead to the construction of the 3 pillars – social, economic and environmental – to define sustainability and the manner in which they are interpreted, in particular through management practices and how certain political components have been scaled down.

In the second section, we will show the role played by “social” NGOs in strengthening the social pillar and giving it substance. We will highlight the limitations of the representation of local voices by international NGOs, whose interpretation of the content of the social pillar in terms of “equalities of rights” is different from that of the local communities and small family farmers, focussing for their part on arguments of solidarity and distribution of value.

In the third section, we will demonstrate that these global multi-stakeholder initiatives, based on the central figure of the “stakeholder” and negotiation, experience no small difficulty in taking account of personal attachments opening up to people affected in their real life. By promoting global knowledge as well as technical “forms of language”, these initiatives find it difficult to recognise local knowledge and affected people, who express a desire to talk about justice and with genuineness, as being legitimate. Nevertheless, by experiencing “concern” with what applies to and affects local communities and by taking care of and opening up to attachments, local NGOs allow affected people to introduce the most public stages for debate and to express their concerns.

COMPARING THE RELEVANCE OF SOCIAL SCIENCE ASSUMPTIONS FOR THE EXPLANATION OF WATER RESOURCES DETERIORATION – A METHODOLOGY AND ITS RESULTS

Bettina Bluemling

Abstract: A variety of assumptions are used within social sciences to examine the impact of social processes on the use of natural resources. The relevance of these assumptions for explaining the evolution of an environmental problem is, however, never compared. In this paper, three assumptions from different social science disciplines are compared in their relevance for the mitigation of agricultural groundwater overextraction in the North China Plain. If an assumption proves to be empirically valid and proves to be explanatory for the problem then it is here defined as having “comparative relevance”. A mathematical formula was developed with which the comparative relevance of the three assumptions was assessed. These assumptions are (1) that the problem of groundwater over extraction is a result of farmers’ lacking awareness for groundwater table decline, (2) that groundwater overuse is a result of changes in cropping patterns as a result of transitions in farm households’ income structure and (3) that collective irrigation management does not perform optimally, leading to groundwater overuse. These three assumptions have been tested in an empirical survey. Calculation results show that a “classical” social science assumption to solve problems of water overuse (based on the Common Pool Resources school of E. Ostrom, the third assumption here), is not highly relevant for the mitigation of groundwater overdraft. Rather socio-economic processes and their implications on cropping pattern change are important dynamics which need to be captured by social theory if it wants to contribute to solutions for mitigating groundwater overdraft.

INDIVIDUAL AND FAMILY OWNED BOREWELLS: DOES SHARING INDUCE MORE SUSTAINABLE GROUNDWATER USE?

Manjunatha Arahalli Venkataronappa, Amjath Babu Tharayil Sheerief, Nuppenau Ernst August, Puran Mal

Abstract: Joint ownership of groundwater extraction infrastructure is a common tradition in Indian sub-continent. Nevertheless, the dichotomies in resource extraction induced by this institution, in comparison to individual ownership, have not given adequate attention. Kinship is one of the factors that drive shared ownership of irrigation borewells infrastructure. It is possible that land is fragmented as it is inherited to next generation and water remains shared. This system is characterised by interlinked decisions on water extractions. It is hypothesised that a number of factors such as shared investment costs, transaction costs of water sharing, interlinkages of decisions and reciprocal externalities promote more sustainable groundwater extraction in comparison to individually owned borewells. This theoretical premise has been tested by the empirical data from south Indian villages featuring intensive groundwater based agriculture. The jointness of the irrigation investments by families tends to reducing reciprocal externalities and
decreasing average costs aiming towards promoting more sustainable extraction. As this traditional institution of sharing resources promotes more sustainable groundwater use, the results of the study may provide insights to the policy makers in promoting joint investments in groundwater extraction.

HISTORICAL DEVELOPMENTS OF WATER MANAGEMENT IN THE VUOKSI RIVER VALLEY

Kristiina Korjonen-Kusipuro 1,2*

1South Karelian Institute, LAPPEENRANTA UNIVERSITY OF TECHNOLOGY, Lappeenranta, 2University of Oulu, Oulu, Finland

Abstract: My paper discusses the historical roots of the water management in the Vuoksi River valley. The Vuoksi is 150 kilometres long river that runs from Finland (lake Saimaa) to Russia (lake Lado-
oga). Before the WWII the river valley was part of Finland, but in 1944 the area of Karelian Isthmus was ceded to the Soviet Union and the Vuoksi river valley was part of the ceded area. People from the Vuoksi River valley lost their homes when almost 430 000 Karelians were resettled to various parts of Finland. The management system of the Vuoksi river needed to be negotiated with the former enemy.

The economical importance of the Vuoksi is huge because of the four hydro power plants built during the first half of the 20th century. After the war the Soviet Union got two of the hydro power plants and the amount of water passing the border line became a major question. There were several actors involved in the negotiation process over the water management including state owned and private power companies as well as the states of Finland and the Soviet Union.

Today the Vuoksi can be seen as a place with several parallel narratives. National master narrative is still strong and economical interests play a leading role. Thus, on the surface big water values seem to overcome the local small water values. In the minds of the local people the importance of the river is diverse, and today they also want to get their voices heard. The importance of the Vuoksi River lies in recreation and as a place of everyday practices. The lost part of the Vuoksi remained as a site of memory for Karelians and the have sifted their view to the forthcoming generations too. On local people’s viewpoint the transnational cooperation in water management with Russia is not always seen in positive light.

My presentation brings into light the silenced local viewpoint where the tragedy of the lost home still affects the behaviour of local people and their attitude to the water management issues. My paper is based on ethnographic fieldwork. In my study I have explored local people’s relationship to the Vuoksi River via interviews and written memoirs about as well as archival material on the first steps of water management between Finland and the Soviet Union. Theoretical framework of my study comes from political ecology where concepts of place, vulnerability and power have a key role.

THE WATER FRAME DIRECTIVE TRANSPOSITION AND WATER POLLUTION IN PORTUGAL

José Pedro Silva 1, José Gomes Ferreira 1

1Instituto de Ciências Sociais - Universidade de Lisboa, Lisboa, Portugal

Abstract: On 1st January 1986, Portugal joined the European Union. Important changes were necessary, as the country had to face the new European commitments and was pursuing better quality of life and higher standards of living. The environment had been a largely overlooked issue during the previous decades, but Portugal had to transpose European directives into national legislation and deep reforms were needed. As far as water pollution is concerned, Portugal faces several problems. Water quality remains poor in the main rivers and the waste water drainage and treatment network is still to be completed. Several studies show that the measures undertaken in order to solve these problems and reach the established goals have so far been insufficient. Our presentation will address the present river water quality situation in Portugal, as well as the consequences of the Water Frame Directive transposition into the Portuguese legislation regarding water pollution.

WATERSHED MANAGEMENT & INDIGENOUS LAND RIGHTS - HOW TO SCALE THE UNITS COMPARATIVE ANALYSIS?

Helge Hiram Jensen 1

1Political and Social Sciences, EUROPEAN UNIVERSITY INSTITUTE, Florence, Italy

Abstract: The paper is a methodological one. It deals with how "cases" in political studies are defined, with regard to space and scale. The usual habit, "methodological nationalism", is being challenged by recent sub-fields of political study, like environmental politics and minority politics. Those two inter-related fields are of relevance for public policy and contentious politics aimed at climate justice. The paper uses examples from ongoing research on the contentious politics of river management, selected from areas conventionally called "North Norway" and "South Lebanon", names that are recognized by the UN, but challenged by the social movements involved. On the basis of those examples, the paper discusses alternative geographical framings of cases for political research, like "bioregion", "watershed" and "landscape". Most often, the normative claims made by states, about sovereignty and hierarchy, are used to define the space and scale of "societies" in political research. But such hegemonic framings of political geography may or may not fit with the environmental or cultural geographies at stake in issues of environmental politics and minority politics. Those two inter-related fields are of relevance for the purpose of climate justice. Example are the claims of Via Campesina, the circumpoliar indigenous populations, and the transnational movement against big dams. Studies of environmental politics may serve the agenda of technocratic policies, of eco-centric romanticism, or of social demands for environmental justice. For research with an interest to inform the latter kind of practice, we should take seriously the challenge posed to hegemonic political geography, by environmental and cultural geographies. Experiences from river management conflicts in the areas conventionally called "North Norway" and "South Lebanon" demonstrate some shortcomings of the state as an analytical unit, but they also demonstrate some problems of applying "watershed management" as an alternative geographical framing.

WHAT REFRAMING OF THE GOVERNANCE OF DRINKING WATER QUALITY IN FRANCE? THE GOVERNANCE BY THE RESPONSIBILITY AND THE RESULT EXPECTANCIES IN QUESTION.
Aurélie Roussary
ADER, CEMAGREF, CENTRE DE BORDEAUX, CESTAS cedex, France

Abstract: Taking as a whole, the quality of the drinking water distributed in France was improved thanks to curative and palliative solutions. However, the quality of the water resources used to produce the drinking water keeps on deteriorating. However, this bureaucratic and technicist logic of the management of the sanitary risk now appears to be for a bend.

The increasing vulnerability of drinking water resources in agricultural pollutions, the necessity of securing more durably water supplies, the demand of a bigger transparency, a solidarity and a better equity in the access in public utilities, participate in an intensification of interdependences between health and environment policies. At the European level, this process was translated in the Water Framework Directive. It requires sanitary, environmental, economic and social "performance" of public drinking water supply utilities, at the risk of financial penalties for the French State. This model of integrated water management is supposed to be implemented by the State and the French Water agencies. It requires clarifying mechanisms of multi-partnership cooperations between two categories of public and private actors at multiple levels of governance. These two categories are the actors of drinking water management and those of agricultural pollution management.

In France, in agreement with the principle of good governance, this process joins in a political, economic and social project. It promotes the principle of subsidiarity, the strengthened rationalization, the individual and collective empowerment. It also promotes the empowerment by the "result expectancies" as conditions of integration of territorial logics, of participative democracy, of efficiency of health and environment public policies. All actors see themselves so placed in a situation of interdependence and "co-responsibility" towards the environmental results of their collective action, and this in the name of the interest of users. This governance by the responsibility and the accountability transforms the relations between actors at the multiple levels of public drinking water management and at the level of instruments.

In this context, this communication shows how all these new stakes take sense and contribute or not to reframe the territorial governance of the drinking water quality.

CORPORATE SOCIAL RESPONSIBILITY (CSR) OF THE LARGEST RUSSIAN COMPANIES IN THE INTERNET

Konstantin Alekseevich Petukhov
Department of Sociology and Political Science, PERM STATE UNIVERSITY, Perm, Russian Federation

Abstract: Internet - a convenient, rapid and often the most reliable source of information, as well as a platform to express ideas of specific people and a environment for the formation of public opinion. For business, web is a source of serious risks, and a source of great opportunities associated with entering new markets, consolidation of customer loyalty and increasing profits. Formation the image of socially responsible behavior in the Internet allows corporations to use these opportunities in full.

Practices of social responsibility are an integral part of corporate activity. The most important element of CSR is the interaction with stakeholders, discussing controversial issues with them, and informing them about the company. The Internet provides the necessary infrastructure for these purposes, allows to intensify cooperation, improves its quality.

The object of the study was the 500 largest companies in Russia. The subject of study was sites and blogs about socially responsible behavior and sustainable development of these companies. The aim of this work was to assess the quality and techniques of interaction with stakeholders on the Internet.

Analysis of the literature showed that almost all work related to the study of CSR in the Internet, were published in the West. This study was designed to correct this situation, as well as to put into the Russian scientific use new empirical material.

To achieve the objectives of the study was formed a set of formal and informal indicators and some indices were calculated. This allowed us to rank companies according to several criteria: the level of openness of companies to stakeholders, the development priorities of CSR, target audience of companies, style and demand for company’s information resources from stakeholders.

It was found that Russian companies are using traditional mechanisms of unilateral informing of stakeholders about their activities. Companies avoid the bilateral interaction with stakeholders. Representatives of local communities and NGOs pay often still a small attention to activities of companies in CSR. In spite of globalization, and the appearance of Russian companies on international markets, the interaction of domestic business with stakeholders in the Internet is less developed than it is among the western companies.

RIPARIAN ZONES: A SOCIAL ACCEPTANCE PROBLEM IN AN ITALIAN CENTRAL RURAL AREA

Ilaria Beretta
sociology, CATHOLIC UNIVERSITY OF MILAN, milan, Italy

Abstract: During 2008 and 2009, the project “RIMEDIA” has been conducted in the Central Italian rural area called Basin of “Acque Basse Reggiane”. The main aim of RIMEDIA was, through specific calculus methods, the evaluation of agro-zoootechnical origin pollution patterns and the effectiveness of riparian zones as a mean to reduce the pollution in the local draws. RIMEDIA was also aimed to understand the social feasibility of the riparian zones introduction in the area through interviews to local farmers and their associations. More in depth, interviews were used, both, to know farmers’ attitude towards riparian zones, and to make them aware and involved in order to direct possible political – institutional interventions on them. Basically, research results showed the low social acceptance of riparian zones proposal and the need to act in a systematic way to overcome the lack of confidence and distrust shown by local stakeholders. By consequence, giving information and, at the same time, supporting farmers with right financial and legal instruments is needed. Finally, perhaps the most important result is that farmers need to act in the most reliable and stable political context.

CONFLICTS, LEGITIMACY, AND PARTICIPATION IN BIODIVERSITY GOVERNANCE: THE CASE OF NATURA 2000 IN HUNGARY

György Pataki, Ágnes Kalóczkai, Eszter Kelemen, Eszter Kovács, Cordula Elizabeth Mertens

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: The Natura 2000 nature conservation network is a prominent example for more recent EU-wide conservation policies that aim at extending protected areas and influencing land-use practices. In Central European countries, implementing Natura 2000 resulted in a relatively large extension of the authority of biodiversity governance. This conservation strategy raises important socio-political issues with regard to competing land-use options and distributional conflicts between different stakeholder groups. Particularly in recently re-established CEE democracies, the legitimacy of biodiversity governance is at stake.

Legitimacy is usually conceptualised as pragmatic, moral, and cognitive based on different behavioural patterns. Pragmatic legitimacy builds upon the self-interest of stakeholders: they tend to accept a policy legitimate if they can appropriate benefits. Moral legitimacy can be achieved if stakeholders share a supportive normative judgement with regard to a policy. Cognitive legitimacy emerges from the taken-for-granted nature of a policy move. In our empirical research, the Natura 2000 biodiversity governance “process” will be investigated from a legitimacy perspective taking Hungary as a case study.

The phase of designating Natura 2000 sites was based upon expert knowledge and participation was open only for elite nature conservation NGOs. Consequently, Natura 2000 started in Hungary as a top-down policy process lacking wider stakeholder participation, particularly with regard to the involvement of local natural resource users. The emerging social conflicts influenced the policy process at multiple levels. The phase of designing management plans for Natura 2000 sites opened more democratic communicative spaces. However, policy-makers reaction was not strategic and they were half-heartedly committed to the more inclusive phase.

Gaining and maintaining legitimacy in the long-term requires strategic commitment to the ideal and procedural requirements of a more participatory policy-making in multi-level governance, as well as taking seriously the different faces of legitimacy at multiple levels.

INCLUSION OF VALUES OF ECOSYSTEMS SERVICES OF VARIOUS HABITATS IN INTEGRATED COST-BENEFIT ANALYSIS

Zsuzsanna Marjainé Szerényi1, Zoltán Szabó1, Nikolett Eszlári1
1Environmental Economics and Technology, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary
Abstract: Global climate change may have substantially different local implications. Accordingly, frequency and severity of extreme water related events (flood, inland inundation, and drought) may increase in Hungary. Therefore, for the local population adaptation is of crucial importance. One of the options to lessen the impacts of such extreme water related events is to withhold and reserve excess water in natural areas, i.e. construction of habitats which are less sensitive to changes in quantity, level and dynamics of water. Changes in land use may, of course, imply loss of revenue of local farmers. Integrated cost-benefit analysis may be a useful tool to assess such cost implications as well as possible benefits arising from improved ecosystem services of natural habitats. This assessment may enable us to better communicate to stakeholders what form of adaptation (i.e. land use change) to pursue and how it may bring best results. The so-called WaterRisk project (TECH_08_A4/2-2008—0169) aimed to elicit willingness to pay estimates for increases in the area of natural habitats in three locations chosen to represent different habitat types. Based on literature survey five habitat types, including wetlands were chosen and our aim was to assess the value of their services by benefits transfer. This paper aims to outline how literature data is to be modified in order to be applicable on small scale, local level. Also, the exercise provides us the opportunity to compare international and local level willingness to pay estimates. The primary aim of the research is to estimate the yearly value of ecosystem services per hectare of various habitats and include the resulting values in cost-benefit analysis of changes in the built (i.e. rural villages) and natural environment.

POLITICAL FRAMINGS OF BIOLOGICAL DIVERSITY: ON THE NORWEGIAN NATURE INDEX

Ørulf Seippel1, Åse Strandbu1
1NORWEGIAN SOCIAL RESEARCH, Oslo, Norway
Abstract: In 2005 the Norwegian government decided that to handle the issue of biological diversity (BD) appropriately, there was a need for more and better knowledge on the topic. As a response, a Nature Index (NI) which was produced and presented in September 2010. The research question in this paper is how biological diversity is framed as a political issue on the background of the new information on BD provided by the NI: How do politicians actually understand the Nature Index as communicated through text, tables and figures? Which cognitive elements of the BD issue do they highlight? How do they prioritize between these elements? How do they link their understandings of BD to other (political) issues? Which norms and values do they associate with which aspects of the index? Which sources of knowledge do they (dis)trust/apply? Which policy aims and which policy tools to they consider appropriate? To answer these questions, we conducted focus group interviews with members of the six largest political parties in Norway.

SEARCHING FOR THE REAL NATURE WITH THE RIGHT METHODS: NATURE PROTECTION POLICY MAKING IN SLOVAKIA

Jana Klocokova1
1Institute of Sociology, SLOVAK ACADEMY OF SCIENCES, Bratislava, Slovakia
Abstract: Nature protection policies have recently undergone wider political changes. These are described as shifts in relationships between the state, market and civil society. In nature protection, there has been increasing demand for public and local community involvement, partnership building or collaborative management. Furthermore, the idea and ideal of nature as a sphere separated from any human presence and impact has become a subject of severe criticism not only by social scientists but by ecologists as well. Yet protected natural areas have typically been viewed and constructed as places endorsing such a vision of nature. Tensions emerging from the new challenge of involving even more social and economic interests into their management are therefore particularly manifest here. We can also observe common pattern in public discussions on environmental issues wherein expert statements are taken as part of authoritative and impartial knowledge whereas
WHO PAYS FOR WHICH ECOSYSTEM SERVICE – WHERE, HOW MUCH AND WHY? RESULTS OF A CROSS-CULTURAL STUDY OF PES
Jens Jetzkowitz

Institute for Socio-Economics, LEIBNIZ CENTRE FOR AGRICULTURAL LANDSCAPE RESEARCH, Muenchberg, Germany

Abstract: Market-based instruments have gained popularity in environmental policy in the recent past. Amongst them are financial incentives, also called payments for ecosystem services (PES), which are fervently discussed, since a multiplicity of governments apply them as the preferred instrument for adapting behaviour to environmental goals and standards. In the EU the agri-environmental schemes (AES) can be considered as a relevant and well-studied example. Their failure in effectiveness and efficiency has been traced back to reasons such as inadequate spatial targeting and insufficient flexibility in the contracts. Furthermore, the institutional framework of AES is criticised because it limits possible innovations like, for example, participative decision-making. Consequently, environmental policy activists and environmental economists call for legal innovations to stimulate private and civic engagement for PES.

This paper examines how PES are applied to preserve terrestrial ecosystem services and to maintain cultural landscapes. It originates in the idea that paying for ecosystem services is a social practice which is culturally determined and presents the results of a theoretical sampling process of cases of PES in Germany, in Switzerland, in the UK and in the US. To reduce the multiplicity of possible cases, the study concentrates on three ecosystem service (according to the MA classification): water cycling, genetic resources and pollination. The cases are interpreted on the basis of semi-structured interviews, documents and participant observation. Additionally, statistical data is consulted for supplemental cost-benefit analyses. The objective of the study is to (re-)construct a property space (Lazarsfeld) which comprises all relevant cultural dimensions influencing the success or failure of payment schemes.

In the first part, an overview the discourse on the concept of ecosystem service and on PES is presented. The paper then proceeds with the empirical research and discusses its findings in the last section focusing also functional alternatives to PES.

AGENDA 21, URBANISM, AND LOCAL CULTURE: THE FARMER’S MARKET IN BRNO, CZECH REPUBLIC
Benjamin Vail

Department of Sociology, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: There is a great deal of debate in Europe about how to promote sustainable development and devise practical responses to environmental problems ranging from local water pollution to global climate change. Particularly in turbulent times – as resource scarcity, economic crisis, and ecological problems intensify and ramify, making the future more difficult to predict – there is pressure to craft cost-effective and politically acceptable sustainability policies that are consistent with local cultures and ecologies. This paper investigates the social, economic, and ecological meanings of the historic Zelny trh, or farmers market, in the Czech city of Brno. For the first time in the English language, the history and contemporary social significance of the market is explored and documented. Using qualitative and quantitative data, the paper analyzes the relationship between the practices at the market and official Agenda 21 sustainability goals at the local and national levels. The paper concludes that urban solutions are an important part of any meaningful sustainability policy, and that the most practical responses to current and future environmental problems may lie not so much with new technologies and innovations as with relocalizing agricultural production and economic activity while preserving and revitalizing traditional institutions like farmers markets.

KNOWLEDGE OF NATURE AND SITUATED EVERYDAY AGENCIES
Miia Toivo

School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The increasing awareness of climate change has given many societal actors ground for taking part in public discussion about environmental issues. For example state administrations, municipalities, media, NGOs and enterprises distribute different kinds of sustainability indicators and codes of conduct that aim to encourage individuals to change their lifestyles more sustainable. The rationale behind this is based on the assumption that the distributed knowledge has an impact on people’s everyday practices. However, there is a lot of evidence that people adopt science based and other institutionally produced knowledge into their everyday practices in various different ways. So far, the research on adopting environmental knowledge has not paid special attention to how intersecting social categories, such as gender, class position and age, shape ways of knowing and using knowledge.

In this paper, I discuss how individuals interpret the institutional knowledge of nature in relation to their everyday life. I analyse this on the basis of different types of data. The data consists of autobiographies and diaries written on climate change and environment in one’s everyday practices collected by the Finnish Literature Society and memories written about ecological knowledge conducted in
memory-work group. My methodological orientation is influenced by feminist discussions on agency. My key interest is how people negotiate the meanings of institutional knowledge as part of their understanding of everyday life. In addition I will look at how people make sense of the controversies between the local everyday knowledge and institutional knowledge of nature. I pay particular attention to situated meaning making, spatial circumstances and differentiated access to institutional knowledge of nature.

LIMITS TO CERTIFICATION IN TRANSNATIONAL ENVIRONMENTAL GOVERNANCE

Peter Oosterveer¹

Environmental Policy, WAGENINGEN UNIVERSITY, Wageningen, Netherlands

Abstract: The perceived ‘failure’ of states to negotiate solutions to transnational environmental problems through multilateral institutions – as illustrated, for example, by the climate negotiations in Copenhagen - has once again drawn attention to the potential role of private governance mechanisms such as certification and labeling. The rapid expansion in both number and diversity of environmental certification and labeling schemes, across a wide variety of sectors and resources, has led to a proliferation of claims over what precisely these private governance mechanisms can (or perhaps even should) achieve. Through an analysis of the successes and failures across a variety of sectors, including agriculture, fisheries and forestry, this paper explores the limits of certification and labeling in addressing transnational environmental problems. In doing so it will review key challenges faced by existing schemes when reflecting on: 1. whether and how they regulate environmental/sustainability issues; 2. the extent to which they internalize power balances around shifting resource and market access; 3. the trade-offs between proliferation, harmonization or vertical ‘stapling’ of national and global standards; 4. non-responsive consumer markets and the emergence of Europe and Asia as differentiated global consumer regions; 5. issues of procedural justice related to the access and audit-ability of Northern vs. data-poor developing country producers; 6. whether and how they can be successful without a strong media-informed civil society support to generate consumer trust; and 7. their potential role in the depoliticization of contested environmental conflicts. The paper concludes that certification schemes will significantly contribute to solving transnational environmental problems provided they are embedded within a wider social and political framework.

LONDON 2012 AND CLIMATE CHANGE. EXAMINING THE POTENTIAL IMPACT OF THE CURRENT ECONOMIC CRISIS IN THE ENVIRONMENTAL LEGACY OF THE GAMES

John Karamichas¹

¹School of Sociology, Social Policy and Social Work, QUEENS UNIVERSITY BELFAST, Belfast, United Kingdom

Abstract: The International Olympic Committee (IOC) declares environmental protection to be the third dimension of the Olympic movement. That, in effect, means that nations wishing to host the Games have to present themselves as reliable practitioners of environmental sustainability (ES) in their applications. The greening of sports mega-events, and the hosting of Olympic Games in particu-
FIGURATION OF NATURE IN EDUCATION: TRACING NETWORKS IN MACEDONIAN TEXTBOOKS FOR PRIMARY SCHOOLING

Mila Sopova

Abstract: Inquiries in the social sciences and humanities have attempted to re-imagine the relationship between nature and culture while resisting ecology and environmentalism to be but an output of the same discourse practices that maintain a rupture between nature and culture and caused the rise of many uncertainties. Central to these inquiries were the objectivity of knowledge and representation, which — limited to human acts of cultural making — was characterized as offering a reduced interpretational domain.

Abstract: In an ordinary day, humans produce 15 million carbon tonnes, destroying 115 square miles of rain forest, create 72 square miles of desert, eliminate between 40 and 100 species, cause erosion of 71 million tons of soil and increase the population in 263,000 people. It is easy to understand that the development of modernity, as we know, represents a serious threat to the continuity of life on earth (Orr, 1992). Several authors argue that schools play a central role in the change that is needed, and that they can not be part of the solution with the same kind of education that helped on the creation of the problem. The UK Government ‘would like every school to be a sustainable school by 2020’. In practice this means integrating high standards of achievement and behaviour with the goals of healthy living, environmental awareness, community engagement and citizenship. In the last years we witnessed the development of new and interesting educational approaches related with the growing concern with the issue of sustainability. New buildings, new design, renewable energy, recycling, inclusion and participation are some of the key words that characterise these new pilot educational projects. But how are these ‘sustainable schools’ being developed in practice? Are they promoting more sustainable behaviours in the pupils? Can this idea be transferable for other contexts and countries? This paper will explore the concept of ‘sustainable school’ and its relation with the controversies around the concepts of sustainability and sustainable development. It will present some case studies as pilot experiences, and the national framework that have been developed by the UK Government that comprises three interlocking parts: a commitment to care (care for oneself, for each other, for the environment); an integrated approach (curriculum, campus, community); and the eight doorways (food and drink, energy and water, travel and traffic, purchasing and waste, buildings and grounds, inclusion and participation, local well-being, global dimension).

SUSTAINABILITY IN HIGHER EDUCATION: A COMPARATIVE CASE STUDY ON CURRICULUM CHANGE

Matthias Barth

Abstract: Since sustainable development involves and requires fundamental societal transformations, it can only result from a process of societal learning. Consequently, education is seen as key to achieving sustainable development. In this context, universities as research and teaching institutions are playing an important role since they not only generate and transfer relevant knowledge but also educate future decision makers to enable them to contribute to a (more) sustainable future. Higher education for sustainability thus aims at student competence development for decision making in a future-oriented and global perspective. As such it is “not just another issue to be added to an overcrowded curriculum, but a gateway to a different view of curriculum, of pedagogy, of organizational change, of policy and particularly of ethos” (Sterling, 2004).

Embedding sustainability in higher education and implementing EFs in the curriculum poses a new challenge to the academic system. During the last years, many universities have undertaken activities towards implementation, and numerous case studies as well as studies on the drivers and barriers of such processes have been documented. However, considerable criticism centers on the limited possibilities of generalizing the more or less descriptive findings and verifying findings from the outside. The question remains,

SUSTAINABILITY AND PRIMARY SCHOOLS. GREENER SCHOOLS, GREENER CITIZENS?

Margarida Ramires Paulos

Abstract: Inquiries in the social sciences and humanities have attempted to re-imagine the relationship between nature and culture while resisting ecology and environmentalism to be but an output of the same discourse practices that maintain a rupture between nature and culture and caused the rise of many uncertainties. SUSTAINABILITY IN HIGHER EDUCATION: A COMPARATIVE CASE STUDY ON CURRICULUM CHANGE

Matthias Barth

Abstract: Since sustainable development involves and requires fundamental societal transformations, it can only result from a process of societal learning. Consequently, education is seen as key to achieving sustainable development. In this context, universities as research and teaching institutions are playing an important role since they not only generate and transfer relevant knowledge but also educate future decision makers to enable them to contribute to a (more) sustainable future. Higher education for sustainability thus aims at student competence development for decision making in a future-oriented and global perspective. As such it is “not just another issue to be added to an overcrowded curriculum, but a gateway to a different view of curriculum, of pedagogy, of organizational change, of policy and particularly of ethos” (Sterling, 2004).

Embedding sustainability in higher education and implementing EFs in the curriculum poses a new challenge to the academic system. During the last years, many universities have undertaken activities towards implementation, and numerous case studies as well as studies on the drivers and barriers of such processes have been documented. However, considerable criticism centers on the limited possibilities of generalizing the more or less descriptive findings and verifying findings from the outside. The question remains,
how drivers and barriers are interlinked and influence the outcome of implementation processes.

The present study contributes to this question by analysing implementation processes of twelve universities in four different countries. Research consists of two main steps: first, in a grounded meta-analysis of existing research on curriculum change and sustainable development findings are synthesized and an analytical framework is elaborated. Second, in a comparative case study, implementation processes at the universities are analysed against that framework to uncover patterns of implementation and the meaning of specific drivers and barriers with respect to distinctive implementation strategies.

Findings clearly point out the relevance of a process-oriented view on curriculum change with a varying relevance of drivers and barriers, dependent on the implementation strategies chosen. Such a view not only helps to understand the dynamics in curriculum change processes but as well enables to derive policy advice to support such transitions.

IMPACTS OF ENVIRONMENTAL EDUCATION ON SUSTAINABLE CONSUMPTION AND ENVIRONMENTALLY CONSCIOUS LIFESTYLE - SURVEY FINDINGS IN HUNGARIAN HIGHER EDUCATION AND HIGH SCHOOLS

Agnes Zsoka 1, Zsuzsanna Marjainé Szerényi 1, Anna Széchy 1, Tamás Kocsis 1
1Dep. of Environmental Economics and Technology, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: Environmental education is expected to have significant influence on environmental awareness, everyday lifestyle and consumer behavior of the participants. Our paper aims to explore how content, intensity and ways of environmental education reflect in the knowledge, values, attitudes and actual behavior of university students and high school students in Hungary. Two questionnaire-based surveys were conducted by the Department of Environmental Economics and Technology at Corvinus University of Budapest (CUB), supported by the EEA and the Norwegian Financial Mechanism. The results give space to a wider comparative study both among universities representing different professions and between higher education and secondary education level.

Results show that higher intensity of environmental education gradually increases the environmental knowledge of involved students – at both analyzed education levels but the motives behind information seeking seem totally different. University students are more internally motivated while higher education students rather rely on external influences. Environmental awareness appeared to depend basically on commitment reflected in the choice of an environmental specialization at the university level. This phenomenon is more complicated at secondary school level as there is no similar specialization there.

Consumer behavior is even more complex; the impact of environmental education is only one reason behind. However, the focus of environmental education is very important in the attitudes toward sustainable consumption. Interestingly, university students reported to be significantly more conscious about the negative environmental impacts and the necessity of lifestyle change than respondents from secondary schools.

Based on Multidimensional Scaling methodology, the interdependence of variables is explored and illustrated, as well as respondents are classified into clusters according to their consumer behaviour, environmental awareness and attitudes to consumption. Our paper focuses on describing and analyzing the features of the five clusters: hedonist, techno-optimist, active environmentalist, familiar and careless groups. Consistencies and inconsistencies in behaviour patterns are identified in order to set up a framework of more effective educational instruments for the sake of sustainable consumption and lifestyle.

BIOENERGY R&D: WHAT ENVIRONMENTAL SUSTAINABILITY?

Michael Farrelly 1, Les Levidow 2
1Design, Development, Environment and Materials, 2DPP, OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: Bioenergy R&D has been widely promoted for several aims, especially as a means to develop innovative substitutes for fossil fuels. This R&D effort has been linked with wider policy agendas, e.g. a low-carbon economy, a bio-economy, etc. Tensions may arise between environmental and economic sustainability. In many countries R&D programmes have prioritised biomass-to-liquid technology, on grounds that more efficient conversion techniques will provide environmentally sustainable biofuels, yet such claims have been questioned. A transition to a low-carbon economy depends on socially shared knowledge of innovative solutions, but a policy aim is privatisation of technoscientific knowledge. Expectations for commercial exploitation may generate different trajectories than a pursuit of the most environmentally sustainable bioenergy.

This paper addresses the following questions: Among the many possible technoscientific trajectories for bioenergy, which ones prevail in state priorities for R&D funds? And on what grounds, implicit or explicit? How do proponents and funders raise expectations that bioenergy R&D will generate environmentally sustainable innovation? How are eventual applications meant to reduce carbon emissions?

These questions will be addressed for a specific case study: UK R&D priorities for bioenergy. Drawing on theoretical and analytical frameworks from Cultural Political Economy, Sociology of Technological Expectations, and Critical Discourse Analysis, the paper sets out the concept of social and economic imaginaries and analyses the variation in imaginaries around the UK bioenergy research policy regime and poses the question of how some of these imaginaries get selected as a basis for action rather than others.

CONSEQUENCES OF DIFFUSION OF INNOVATIONS IN DOG POPULATION MANAGEMENT. TRAP-NEUTER-RETURN IN BUCHAREST, ROMANIA

Adriana Diana Mica 1
1Institute of Philosophy, Sociology and Journalism, University of Gdańsk, Gdansk, Poland

Abstract: According to Everett M. Rogers “[d]iffusion is the process by which an innovation is communicated through certain channels over time among the members of a social system. It is a special type of communication, in that messages are concerned with new ide-
as”. The present paper deals with the diffusion of a specific practice in dog population control: the trap-neuter-return approach. Sustainability of this method as official policy for dog population control has been argued for in South-Eastern European countries facing the problem of stray dogs (such as Romania, Bulgaria, Serbia, Ukraine) as well as in India (here also with respect to canine rabies control).

According to Vier Pfoten Romania, there are currently 40,000 stray dogs on the streets of Bucharest. Of which, approximately 20% are sterilized. According to Matei Bals Institute for Infectious Disease, in year 2009, 11,436 persons were bitten by dogs, of which 7,571 were bitten by stray ones. In the first semester of year 2010, 2,813 persons were bitten, of which 2,175 by urban dogs solely.

In Romania, animal welfare organizations are the “change agents” promoting the diffusion of trap-neuter-return as an innovative and effective practice in dog population management. Until the beginning of 2008, the outlined measures stipulated euthanasia and/or sterilization. The animal welfare organizations manifested their disagreement, and – eventually – a law issued in the sub-field of animal welfare put a ban on euthanasia. Nevertheless, the support and institutionalization of sterilization – followed by returning of dogs on the streets – has the unintended consequence of reproducing their aggressiveness. The aggression is to be understood here as a first-level unintended consequences of the abandonment of pets. Furthermore, it is also a second-level (residual) unintended consequence of keeping them in public spaces after implementing sterilization.

HEATING HOMES AND MANAGING ENERGY: ‘SUSTAINABLE’ INNOVATIONS AND EVERYDAY DOMESTIC PRACTICES

Ritsuko Ozaki1, Isabel Shaw1

1 Imperial College Business School, IMPERIAL COLLEGE LONDON, London, United Kingdom

Abstract: In the UK, domestic energy use accounts for 28.4 per cent of total energy consumption. In December 2006, UK Government launched the Code for Sustainable Homes, a new national standard for design and construction of zero-carbon homes, which requires housing developers to incorporate technological innovations framed as ‘sustainable’ into their developments. Yet, the relative success of these innovations is, to some extent, affected by the way residents consume energy. To understand how energy that is generated by sustainable technologies (e.g. CHP) is used, the residents’ interaction with mundane objects (e.g. heaters) as part of their everyday practices needs exploring: ‘energy is of little use in and of itself… it must be converted… before it becomes transformed into something useful’ (Wilhite, 2005: 1). Also, the way sustainable innovations are designed, introduced and managed needs considering, as it potentially affects how users encounter and experience them. The stress upon the user as a ‘barrier’ to meeting energy targets is somewhat misguided, as it represents a partial view of the range of actors involved in the provision and consumption of domestic energy and related assumptions about the ‘correct’ way to use energy (Guy, 2006). In this light, this paper examines how residents manage and experience practices of heating in the home. They are not only users of energy, but managers of their own heating consumption (Chapells and Shove, 2004), as their practices are adapted and shaped in relation to technological systems and socio-cultural relations. Our research project is conducted in collaboration with one of the largest social housing providers in South East England, who develops housing schemes, aiming to provide energy efficiency and/or renewable energy. The study scheme is situated in South East London and has biomass CHP on site, and a heat controller, solar water heating, heat exchange ventilation and radiators in each house. Residents have been interviewed in their own homes, and each interview has been fully transcribed and coded openly, so that emerging themes and issues are captured. On the one hand, our analysis attends to the complex ways in which domestic space, time and relationships mutually affect practices of heating. On the other, we consider how the assumptions embodied in heating systems by the housing developer and manager is encountered in use.

NEOLIBERALISM AND TECHNOSCIENCE

Marja Ylönen1

1 Dept. of Social Sciences, UNIV. OF JYVÄSKYLÄ, JKL, Finland

Abstract: Neoliberalism can be characterized as the promotion of market-based solutions to various issues, such as health care, education and environmental management that traditionally belonged to the public arena (Lave & al. 2010). Neoliberalism is regarded also as the dominant form of environmental governance that produces and maintains environmental and social injustices (Faber & McCa rthy 2003). Even though particular neoliberal policy is often an outcome of different interests rather than an unambiguous philoso phy, it is worth analyzing how neoliberal tendencies come up in evaluations and control of risks related to innovations, and in possible constraints on studying and reporting environmental harms.

Neoliberalism is understood here as a hegemonic form of thought that incorporates different interests into ethical-political discursive projects (Gramsci 1967) without endangering the core of economic activity. Environmental innovations themselves can be seen as examples of ethical-political projects that accommodate contradictory interests, such as business enterprises’, governments’ and environmental NGOs’ concerns about the scarcity of natural resources and willingness to decrease environmental hazards as well as governments’ continuous pursuit of economic growth. Due to their contradictory aims, it may be that some aspects of those innovations are emphasized, while some others are downplayed, such as new harms that are difficult to define, like in the case of converging technologies.

As an example of environmental innovation I will focus on a company that uses converging technology in diagnosing risks related to polluted soil and industrial waste water. Through the analysis of interviews with company’s representatives and experts who have participated in assessing environmental harms of converging technologies as well as reports on health and environmental impacts of those technologies, it is possible to gain an understanding of the relationships between neoliberal policies, environmental innovations and constraints on studying and reporting environmental
harms. What are the relationships between neoliberalism and ideologies of objective science and technological neutrality? How representative is the group of experts that is in charge of evaluating and controlling harms related to environmental innovations, in respect to “production and impact sciences”? How has the dialogue between experts and citizens been arranged?
BABY LUST AND CHILDBEARING DECISIONS
Anna Rotkirch 1, Jokela Markus 2
1Population Research Institute, VAESTOLITTO - FINNISH FAMILY FEDERATION, 2Dept of Psychology, University of Helsinki, Helsinki, Finland

Abstract: Individualisation of childbearing decisions has brought increased emphasis on long living as a reason to have a baby. Women dominate the discourses about “baby fever” “baby lust” or even “baby angst”, while lay and media perceptions are ambivalent as to whether men also experience it. We present the first empirical research on the gender similarities and differences in baby longing. We study the situations and social influences which first triggered baby longing, its intensity and whether it led to having a child or not. With logistic regression analysis we also explore socio-demographic characteristics predicting baby longing among both women and men. Research materials include three representative surveys from Finland (20-59 year-old respondents in 2007, all parities, N=1560, 25-44 year-old respondents with 0 or 1 child in 2008, N=3058, and 20-59 year-old respondents in 2009, all parities, N=2000) and in depth interview excerpts from an on-going study on women and men with three or more children.

Results show that the majority of both men and women have felt strong longing for a child a few times in their lives. A higher proportion of men have never longed while a higher proportion of women feel “chronic longing”. Men’s longing less often led to actually having a child, and was by both sexes reported to have less influence on childbearing decisions, especially regarding a second or third child. Men’s baby longing is influenced especially by his romantic relationship(s) - indeed, men with several unions had experienced baby lust more often than had other men). In comparison, women’s baby longing was more strongly related to childbearing history and intentions. Women with problems in their childhood families also longed more often to have babies of their own.

We conclude that unlike popular perceptions, men also long for babies. However, women’s longing is on average more intense, more physical and more influential with regards to childbearing, while men’s baby longing is probably important for sustaining a couple’s attempts to get pregnant and preparing for fatherhood.

IS POSTPONEMENT A NEW PATHWAY TO CHILDLESSNESS? OUTLINING THE (UN)REPRODUCTIVE TRAJECTORIES OF THREE GENERATIONS OF PORTUGUESE MEN AND WOMEN
Vanessa Cunha 1, Jacques-Antoine Gauthier 2
1ICs-UL, Lisboa, Portugal, 2Université de Lausanne, Lausanne, Switzerland

Abstract: Despite the regional and national idiosyncrasies in the timing and intensity of the fertility decline, all European societies carried out this demographic change during the last half of the century. Postponement and low (or even very low) levels of fertility are key components of this trend, but childlessness is also growing in some countries to unprecedented levels. This is not the case of Portugal, where childlessness always has been quite unusual, and a direct consequence of celibacy or sterility. But, until when? In fact, postponing childbearing is becoming increasingly frequent and, therefore, may well jeopardize the expectations of having a child.

The aims of this paper are mainly two: first, we will take a look at the prevalence and the underlying circumstances of childlessness in three generations of Portuguese men and women, born in the thirties, fifties and seventies; second, as the men and women of the younger generation are still in their reproductive years, we are going to explore the linkages between current postponement, the wide range of motives for delaying the transition to parenthood, and latent childlessness.

Data is from a recent national survey (2009/2010), but also in-depth interviews to individuals from these three generations. Both instruments were conducted within the on-going research project “Family Trajectories and Social Networks”.

Preliminary analyses confirm that being childless until late thirties is much more common for the younger generation (30% of men and 20% of women born between 1970 and 1975), although about a half (more men than women) still plan to have a child. And, in fact, there is a wider range of reasons for postponing or even rejecting childbearing, such as structural events linked to economic insecurity or lack of social support, or biographical ones connected with marital instability or personal/conjugal conflicting expectations concerning the transition to parenthood. On the other hand, as data reveal a growing distance between men and women concerning reproductive expectations and behaviors, we are going to map this gender gap.

MEN, FAMILY PATTERNS AND FERTILITY IN THE CZECH REPUBLIC
Beatrice Elena Chromkova Manea 1, Ladislav Rabusic 2
1Department of Sociology, IVRIS, FACULTY OF SOCIAL STUDIES MU BRNO, Brno, Czech Republic

Abstract: Family patterns and fertility levels, as well as male preferences towards these issues, are not a frequently studied subject in demography or sociology. There are only a few studies focusing on men’s family patterns, men’s reproductive behaviour and their fertility intentions in the developed countries. Recent studies have indicated that the inclusion of men in research might lead to a better understanding of family formation process and reproductive behaviour. As far as the Czech Republic is concerned, there is a lot of information available on women’s fertility preferences and levels and family patterns, but so far no specific study targeting men has been carried out. One of the few studies, where male perspective on family formation and fertility was explored to some extent (men were not the main subject of the research), has been conducted at the end of 2005. This paper explores how family patterns and fertility challenge researchers in their approach to study fertility by taking into account male perspective. Firstly, we will shortly describe the changes the Czech family has passed through during the last two decades, the attitudes of men and women towards family formation, their preferences with respect to family size and possible gender differences. Further on, we will deal with what we know about male fertility levels and reproductive behaviour using data from birth registers. The next part of our paper will focus on family
patterns and fertility intentions and desires based on secondary data analyses (data from various ad-hoc surveys will be used). Particular attention will be given to the role men play in family formation and fertility decision-making process. All analyses will be done for both men and women in a comparative way.

ELECTIVE ENDOGAMY, OR HOW DO IMMIGRANT DESCENT IN FRANCE DO MARITAL CHOICE?

Emmanuelle Santelli

1Sociology, CNRS-INED, Lyon cedex 07, France

Abstract: Who do French people of immigrant descent choose as life partners? The question has raised new scholarly interest in France due to the fact a marriage market exists and that endogamy persists as the norm. Using data from a 2007 survey based on biographical interviews with ca. 100 individuals, this proposal analyzes the tension prevailing between the notions of endogamy and homogamy, leading us (Beate Collet and I) to develop the concept of a “socio-ethnic homogamy” that can account for the cultural, social and gendered dimensions simultaneously at play in the conjugal choice. The pre-conjugal spheres of their socialization and the variations surrounding the norm at the time they started life as a couple were subjected to an in-depth empirical analysis.

The paper I will present emphasizes how conjugal options are not only a private matter: they are also revealing of social relationships. In a context of social exclusion, discrimination, residential segregation and frustration at being relegated to a minoritized group, choosing, preferring or accepting a spouse from the same background may be a reflex (‘choosing someone like us’), a need (‘a lack of other possibilities’) or a reaction (‘you don’t want us, so we’ll stick to our own kind’).

Elective endogamy is thus a sign of a double power relationship, both internal (an issue of identity, continuous reaction to a minority status) and external (more disadvantaged social conditions for these young French people of immigrant parents, especially in terms of employment). Elective endogamy represents more than an adaptation of marriage rules in a migration context. It reflects both the impact of the many years these families have lived in French society and the persistence of factors of social exclusion.

The analysis here has shown that elective endogamy is the result of internal motivations and external pressures, with the majority society partly shaping the minority cultural rationales at work. In a back-and-forth identity positioning, the minority seeks to differentiate itself by maintaining and developing specific cultural practices. It thus manifests its participation in the majority society and asserts a universe of values specific to itself.

INTERGENERATIONAL EDUCATIONAL MOBILITY AND PARTNER CHOICE IN THE NETHERLANDS

Nicole Tieben 1, Maarten Wolbers 2

1MZES, MANNHEIM UNIVERSITY, Mannheim, Germany, 2Social Sciences, Radboud University, Nijmegen, Netherlands

Abstract: The Netherlands saw massive educational expansion in the last decades, which led to a growing proportion of social climbers from low educated families, who obtained tertiary education. We know from previous research that own educational attainment is an attractive resource on the marriage market to find a highly educated partner. Parental education, however, has proven to be beneficial on the marriage market on top of own educational attainment. Considering the fact that own and parental education are resources for both partners and that the proportion of first generation highly educated (that is, high educated individuals with low educated parents) is growing, we seek additional insight in the marriage patterns under conditions of intergenerational educational mobility. First generation highly educated succeed in attaining higher education certificates than their own parents. As a matter of fact they do profit from their own educational resources, but they lack the additional resources of their parents, compared to those who stem from traditionally highly educated families. We therefore assume that especially the traditionally highly educated have a better market position compared to first generation highly educated and are more likely to have a partner who also is traditionally highly educated. Those who are downwardly educational mobile, in contrast, may profit from parental resources (that compensate for the lack of own resources) and are more likely to find a highly educated partner than those who are traditionally low educated.

We use the Family Survey Dutch Population as collected in 1992, 1998, 2000, 2003 and 2009. Preliminary analyses show that traditionally highly educated individuals are more likely to marry a traditionally highly educated partner or to remain unmarried than to marry a low or first generation highly educated person. We find that own and parental material and cultural resources have additional effects but do not explain the findings described above.

MARITAL CHOICE OF IMMIGRANT DESCENT. PARTNERSHIP PATTERNS IN GERMANY AND FRANCE

Beate Collet

1Institut des sciences humaines appliquées, UNIVERSITE PARIS-SORBONNE, Paris, France

Abstract: In 2005 we had to opportunity to carry out a life course study on marital choice among immigrant descent in Germany and France. 40 persons (20 men and 20 women living together as a couple) have been interviewed in each national context. In Germany the study emphasized on Turkish immigrant descent, in France we mainly interviewed North-African immigrant descent. Their marital choice seems interesting because of the necessary articulation of family heritage on the one side and society participation patterns on the other side. Choosing a partner, these immigrant descendents have a larger range of options than native people without immigration background have: they may live with a immigrant descent as they are, they may be married to a migrant coming from their parents’ homeland or they may have formed a couple with a member of the main society (mixed couple).

The paper I will present looks on the different choices interviewees made in France and in Germany. How did they combine endogamy demands from their families and ethno-social homogamy or personal aspirations? How influenced is their marital behaviour by their family and cultural belonging? And which cultural patterns characterize their daily live once they settled together? A special attention will be paid on gender questions. Women and men do not behave similarly concerning marital choice because of different gender identifications since childhood, and concrete gender relations in daily life.

A second issue emphasizes more on the comparative aspects. Mate selection and family dynamics of immigrant descent might be influenced by the national immigration traditions in the two countries.
Whereas in Germany a more separating model develops through the last twenty years (Parallelgesellschaft), France had a model based on individual achievement and low recognition of cultural belonging. The German model seems to lead to stronger cultural belonging than the French one. Migrant descents identify more easily as Turks, whereas Algerians, Moroccans or Tunisians descendents, who mainly are French citizens since birth, might be more ambivalent. The national societal context influences the cultural identification and probably the marital choices.

**GENEROSITY OF PARENTAL LEAVE POLICIES IN EUROPE AND THE SCOPE OF ITS USE IN EUROPE**

Gerardo Meil

1sociology, UNIVERSIDAD AUTONOMA DE MADRID, Madrid, Spain

Abstract: The scope of the use of parental leaves among parents varies greatly from one country to another, both for men as well as for women. This variation is due in part to the relative generosity of the different national systems compensating for the costs derived from a leave, but the evaluation of the advantages and disadvantages of using the leaves depends also, beyond gender, from the structural situation of the individuals in the working market, the time demands steaming from the working market and the family as well as the availability of resources for balancing family and working lives. The analysis to be presented wants to evaluate the relevance of the generosity of the different parental leave regulations controlling for such variables in order to discuss the efficacy of the parental leaves policies. Do compositional factors play a more relevant role in deciding to take advance of parental leave or does the generosity of the system plays a role?

The analysis will be based on the microdata of “Job Mobilities and Family Lives in Europe” http://www.jobmob-and-families.eu/, a survey of people living in six European countries (Germany, France, Spain, Switzerland, Poland, and Belgium) and representative at the national level of people aged 25 to 54. The survey was conducted by phone during the first half of 2007 and the sample size includes 7220 interviews, yet in the analysis will be considered only people living with a partner and having at least one child less than 7 years old, what reduces the sample size to 1656 interviews.

The variables to be included in the analysis are gender and country of residence, as well as 1. for the structural situation of the individuals in the working market: self employed/employee; employee with an open ended/temporal contract. 2. For the time demands steaming from the working market: working hours, mobility requirements –overnighthing or commuting-, for both partners. 3. For time demands steaming from the family: age and number of the children. 4. For the resources for balancing family and working live: flextime; teleworking; to have a cooperative partner, family network involvement in child care and availability of child care facilities at home or educational institutions.

**THE MAKING OF THE NORWEGIAN FERTILITY ‘MACHINE’**

Anne Lise Ellingsaeter

1Dept of Sociology and Human Geography, UNIVERSITY OF OSLO, Oslo, Norway

Abstract: Declines in fertility rates have coincided with advances in economic and social developments, and a widely held supposition is that as social and economic development progresses, fertility will fall further. However, recent studies suggest new prospects for the twenty-first century: when developed countries reach very high levels of human development, fertility declines are reversing. Reversals assumedly are brought about by increases in the well-being of citizens and provision of ‘adequate institutions’. Some scholars argue that a reversal of low fertility is about ‘inventing a new machine’; requiring fundamental changes in the institutional contract. This paper seeks to expand insights into the relations between family change, the evolvement of ‘adequate institutions’ and fertility, by investigates the making of a new institutional ‘machine’ in Norway with regard to the costs of children. My institutional lens is child care policies directed at families with preschool age children. By being a country where reversal of fertility decline has occurred, with current fertility rates close to replacement levels, Norway is an interesting case. At the time of the fertility reversal, Norwegian child care policies were in an embryonic state. My analysis covers policy responses in the succeeding decades, evolving into the present mature institutional arrangement: How have child care policy reforms been justified? What perceptions of family change have been drivers of policy reform? How do policies support working motherhood?

**TURBULENCE IN A TEA CUP: GOVERNING THE FAMILY AT A DISTANCE**

Marie Lavelle

1Faculty of Education, UNIVERSITY OF PLYMOUTH, Plymouth, United Kingdom

Abstract: These are indeed turbulent times. Increasing adversity and deepening social inequalities expose families and children to the hardships of the current economic climate. Demands on the public purse mean that services are being withdrawn and the individual (often the mother) is seen as deficit and hence targeted as in some way needing to change. Established by the last UK Labour government, Sure Start Children’s Centres attempted to meet the needs of vulnerable children and families through the provision of non-stigmatising universal services. Today these services too find themselves under threat as demands on them to evidence their value for money increases.

This presentation draws on the findings of an ethnographic study of two Sure Start Children’s Centres in the UK which originally set out to explore what influenced parental use of these spaces. However, what emerged was a critique of institutional micro-processes that often go unchallenged and unrecognised. This presentation will explore one of these small and seemingly insignificant interactions, the offering of a cup of tea.

For many the offering of a cup of tea is significant relational act, a small act of meaning. This is particularly so for parents of young children. The cup of tea represents a moment of lapsing, forgetting, relaxing and enjoying the company of others. In spaces which parents and mothers in particular have traditionally inhabited, the home, the toddler group or the coffee morning, this is still the norm. However, in the newly constructed spaces of Sure Start Children’s Centres the story is slightly different.

In this presentation the humble cup of tea is presented as a symbol of the power that is at play within these new institutionalised spaces. The drive to make a difference to outcomes for children and to
capture these outcomes has the potential to result in unintended consequences. By emphasising outcomes, processes within which power is embedded often go unnoticed, unexplored and hence unchallenged. As a result powerful discursive practices which sustain inequalities of access to services can continue unwittingly. The findings have important implications for the way that these spaces are constructed. As services become more targeted, and the need to evidence hard outcomes increases, there is a danger that some of the more relational aspects of support will be sidelined.

RESIDENTIAL CARE: AN EFFECTIVE RESPONSE TO OUT-OF-HOME CHILDREN AND YOUTHS?
Elisabetta Carrà

Abstract: In Italy, over the last decade the percentage of out-of-home children and youths is growing, and this makes increasingly urgent to assess the quality of services meeting this important social problem. Foster care is spreading rapidly, but there are still many children housed in residential facilities. Recently, reflection on residential care quality has greatly developed, at national and international level.

This intervention presents the results of a research-assessment on residential care facilities for children and youths in a region of Northern Italy (Lombardy), taking into account four dimensions: efficiency, effectiveness, participation in planning and intervention, empowerment of children and youths and their family relationships. Their emerging effect is defined as "relational quality".

HYPOTHESIS: A broad examination of international literature shows that the response to children’s needs is as much more effective as children themselves and their families take an active role in the intervention, with a network approach that connects all services having competence over the cases. The purpose of this research is to verify the effectiveness of such a network, which in Italy involves residential care facilities and social services, with the latter in charge of referring the minors to residential care facilities and follow their families.

METHODOLOGY: We carried out 187 online self-report interviews to coordinators of residential care facilities; 30 face-to-face semi-structured interviews to social workers; 97 self-report questionnaires to minors above 10 yrs living in children homes.

RESULTS: A) efficiency: residential care facilities are generally good, while social services resources often appear insufficient to ensure an adequate work with birth families; B) effectiveness: children and youths’ wellbeing in residential care facilities is high, but generally they move from one facility to another never returning to their birth family; C) participative approach: rather lacking in terms of the involvement of children and their families at different path stages; D) empowerment: the most critical element is the lack of attention devoted to working with birth families.

The application of the assessment frame of relational quality enabled to highlight strengths and weaknesses of the network responding to the needs of out-of-home children and youths.

YOU CAN KILL YOURSELF TRYING TO DO FRESH PREPARED FOOD BUT YOUR KIDS NEED YOUR

ATTENTION AS WELL': NEGOTIATING FOOD AND EATING IN EMPLOYED FAMILIES WITH YOUNGER CHILDREN IN ENGLAND
Rebecca O’connell 1, Julia Brannen 1, Ann Mooney 1, Abigail Knight 1, Antonia Simon 1, Charlie Owen 1
1Thomas Coram Research Unit, INSTITUTE OF EDUCATION, UNIVERSITY OF LONDON, London, United Kingdom

Abstract: Internationally, popular discourse about a perceived decline in ‘family meals’ often makes reference to a rise in working mothers. But in England, as elsewhere, very little sociological work has focused on food and eating in employed families. How does parental employment influence and shape family food practices, in particular the diets of children aged 1.5 to 10 years? How do parents’ experiences of managing the demands of ‘work’ and ‘home’ affect domestic food provisioning in families? And how do children negotiate food practices? This paper presents some findings from a multi-method study of Food Practices in Employed Families with Younger Children, funded by the UK’s Economic and Social Research Council and Department of Health from October 2009 to September 2011, which addresses these questions. The study adopted a practice approach which took account of context and structure as well individual subjectivities. It takes as a starting point that children and parents eat in a range of settings. This paper focuses on children’s and parents’ food across contexts on working days. It suggests that parents’ and children’s differential access to human and material resources, including money, time, skill and energy, intersect in important ways with preferences and dispositions to reproduce the everyday food and eating practices described.

COMPARING THE NUCLEAR FAMILY AND FORMS OF COHABITATION IN LGB’S AND HETEROSEXUAL INDIVIDUALS
Dagmar Versmissen 1, Alexis Dewaele 2, Petra Meier 1, Mieke Van Houtte 2
1Policy Research Centre on Equal Opportunities, UNIVERSITY OF ANTWERP, Antwerp, 2Ghent University, Ghent, Belgium

Abstract: Belgium is one of the few countries worldwide where same sex couples have the right to get married and adopt children together. The current study aimed to investigate whether having these rights results in a similar pattern of forms of cohabitation on the one hand, and the compilation of the nuclear family on the other hand.

Method: An online survey was used to investigate the quality of life of LGB’s in comparison with heterosexuals. The launch of the online survey was preceded by a social marketing campaign, aiming to maximize the sample size. More than 2000 LGB’s were included. Furthermore, over 1000 control subjects participated.

Results: Sixty-two percent of the LGB sample has one (60%) or more (2%) life partners with which they have a committed relationship. From the heterosexual controlgroup, 70 percent has one (69.5%) or more (0.5%) life partners.

Those who have a life partner do not necessarily live together on a permanent basis. From the LGB sample, 31% does not live together, compared to 29% in the heterosexual sample. Looking more in detail to the LGB’s who cohabit, 48% does actually live together but without any legal commitment, compared to 39% of the heterosex-

Behaviors in Portugal since 1950: A sequence-based approach

Jacques-Antoine Gauthier\textsuperscript{1}, Vanessa Cunha\textsuperscript{2}

\textsuperscript{1}Faculty of social and political sciences, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland, \textsuperscript{2}Institute of Social Science, University of Lisbon, Lisbon, Portugal

\textbf{Abstract:} European societies register five decades of fertility decline. This trend is related to important societal changes at structural, cultural and technological levels. Individualization process within welfare states of the (late) modernity along with new family values orientations and the second contraceptive revolution contribute to progressively modify individual reproductive behavior. Most visible outcomes of this multidimensional change are the low fertility levels, raise of the “two-child norm” and the postponement of the transition to parenthood. But this shift tends at generating ambivalent social conditions. On the one hand, as it turns out to be a factor of individual and conjugal emancipation, whereas on the other hand it may give place to unwanted small offspring or even to childlessness. Using data from the national survey “Family Trajectories and Social Networks” on three generations of individuals (born in the thirties, fifties and seventies) currently living in Portugal, we use sequence analysis techniques applied to individual fertility life courses to give account of fertility patterns. Results show that the specific ways in which transitions to parenthood occur and fertility careers unfold vary not only from one cohort to another, but also according to cultural, contextual and relational factors.

Patterns of family life courses in Europe – between standardization and diversity: A cross-national comparison of family trajectories and life course norms in European countries

Dirk Hofäcker\textsuperscript{1}, Jana Chaloupkova\textsuperscript{2}

\textsuperscript{1}Centre for European Social Research, UNIVERSITY OF MANNHEIM (MZES), Mannheim, Germany, \textsuperscript{2}Academy of Sciences of the Czech Republic, Institute of Sociology, Prague, Czech Republic

\textbf{Abstract:} Throughout recent decades, European countries have undergone substantial changes in the timing and sequencing of family transitions. Family and union formation increasingly have been postponed, the average marriage age has shifted upwards and the previously strong linkage between marital status and family formation has loosened.

Many social scientists have summarized these trends as a de-standardisation of family life, implying that a standard “blueprint” for the timing and order of family transitions is losing significance. On the one hand, however, the processes described above have developed to very variable degrees in different European countries, thus suggesting significant and persistent cross-national differences in life course structures and family sequences. One the other hand, recent findings show that some countries nowadays experience even a partial decrease in variation of early family trajectories between individuals, suggesting a re-standardisation and the emergence of a “new standard family life course”.

In our contribution, we will investigate using sequence analysis to what degree there still exist certain standardized patterns in the timing and sequencing of family transitions across European countries. Secondly, we will explore in how far these practiced family trajectories are in line with socially established norms about the ‘right’ timing and order of family transitions. In other words: we aim to disentangle whether there is a congruent or conflicting relationship between family norms and actually practised family life.

In doing so, we shall draw back to data from the European Social Survey Wave 3, that contains comprehensive data on family transitions and related social norms. Furthermore, its pan-European
UNDEADING FERTILITY TREATMENT IN DENMARK: CONSEQUENCES FOR THE RELATIONSHIP AND THE ESTABLISHING OF AN EVERYDAY LIFE WITH CHILDREN.

Lene Tølbøll Blenstrup^1

^1Department of Sociology and Social Work, AALBORG UNIVERSITY, Aalborg Ost, Denmark

Abstract: We present results from a study on the family histories and establishing of daily life after fertility treatment among couples in a five-year-follow-up study in Denmark.

The findings presented will focus on the family histories; that is whether the couples preserve or dissolve their relationship and whether and how they establish a daily life with children during and subsequent to the treatment, including their own children (distinquishing between spontaneous conceived children, ART-children, adopted children and step-children), and whether they have contact with children they do not live with. Further, the family histories will be seen in relation to selected characteristics of the couples.

Women and men, who begin a fertility treatment are seen as having been through an individual as well as a joint decision making process regarding their lives, their childlessness and their fertility intentions with the current partner (Nauck 2007). Their subsequent family lives are expected to be influenced by their experiences during the treatment process.

The population in the current study consists of 568 couples, selected from the so-called COMPI-cohort (Schmidt et al. 2008) which is comprised of 1,081 men and 1,169 women, who initiated fertility treatment in one of four public and one private fertility clinic in Denmark in the period 1st January 2000 – 31st August 2001. Within this cohort, couples, which did not have joint children at this time and which in addition consists of men and women where both partners have answered a follow-up questionnaire both after one year and after 5 years, have been identified for the current project.

There is a lack of analyses which from a demographic-sociological point of view deals with consequences of the treatment and persistent infertility for individuals and couples. Internationally, follow-up studies have focused on the success and the safety of the procedures and health among children born after fertility treatment (e.g., Jensen et al. 2009). Further, there has been a societal and medical interest in calculating and comparing the ‘rate of success’ of the various forms of treatment, that is, the so-called ‘take-home baby rate’. To our knowledge, no longitudinal approach has been used in analysing the relation between the situations during treatment and the subsequent family life, as applied in the current project.

HOW FAR DO CHILDREN MOVE? SPATIAL DISTANCES AFTER LEAVING THE PARENTAL HOME

Thomas Leopold^1, Ferdinand Geißler^1, Sebastian Pink^1

^1UNIVERSITY OF BAMBERG, Bamberg, Germany

Abstract: Little is known about how far young adults move when they leave their parental home initially. We addressed this question using data from ten waves (2000 – 2009) of the German Socioeconomic Panel Study on spatial distances calculated by the geo-coordinates of residential moves (N = 1,425). Linear regression models predicted young adults’ moving distance by factors at the individual, family, household, and community level. Overall, spatial distances of initial moveouts were strikingly small with a median value of only 9.5 kilometers. Those who were well-educated, female, single, childless, had highly educated fathers and high parental household incomes moved across greater distances. The effect of young adults’ education was moderated by the local community’s degree of urbanization, supporting the brain drain assertion. In line with developmental models of migration, our results further show that young adults stayed closer if the parental household was still located at their place of childhood. We found two interactions with gender: At the family level, daughters stayed closer when leaving a single-parent household. At the community level, women from Eastern Germany moved farther, suggesting that the surplus of men in the Eastern periphery is at least to some extent an outcome of initial migration decisions.

INDIVIDUAL AND FAMILIAL CONTEXTS OF STARTING, RETAINING OR STOPPING JOB-INDUCED MOBILITY IN A LONGITUDINAL PERSPECTIVE

Katharina S. Becker^1, Thomas Skora^1

^1FEDERAL INSTITUTE FOR POPULATION RESEARCH (BiB), Wiesbaden, Germany

Abstract: According to the findings of the Job Mobilities and Family Lives project, about every fifth person working for pay in selected European countries is mobile for job-related reasons. In a first wave in 2007, relevance, diversity and causes and consequences of job-related mobility have been studied for Belgium, Switzerland, Poland, Spain, France and Germany (N=7220).
With a second wave conducted in Germany in 2010 (N=504), focusing on circular forms of mobility like e.g. long distance commuting or business travelling, panel-data can be analysed, allowing deeper insight into longitudinal developments and changes over time.

A certain flow in mobility behaviour between 2007 and 2010 can be stated: While 41% of the formerly circular mobile persons ended their mobility during the 3 years-time span, 7% of the formerly not recurring mobiles became mobile.

Questions arise how the starters, stayers or stoppers can be described in terms of socio-demographic, familial and attitudinal characteristics and how the groups differ from each other, leading to a better idea of what may drive people to become, stay or stop being job-mobile in a time course. The paper aims to contextualise the longitudinal flux in mobility behaviour with regard to these individual dispositions.

The importance of the familial/partnership situation and life course position in interaction with change of mobility status can be found in multivariate regression and correspondence analyses. Still, more genuine structural conditions that should be further analysed, seem to be of certain importance, too: Of the people who intended to reduce their mobility in the 2007 wave, in 2010 nearly two thirds are still mobile.

First hints lead to the assumption that there are certain “precarious” familial constellations, limited in their scope of action, showing a higher probability to stay mobile. This corresponds with another finding, leading to a more general hypothesis: People who are less limited in their socio-economic resources show a greater scope of options in handling mobility, being more likely to adjust their mobility to their family and life course.

JOB-RELATED SPATIAL MOBILITY TRAJECTORIES AND THEIR RELATION TO FAMILY DEVELOPMENT IN A LIFE COURSE PERSPECTIVE

Heiko Rüger ¹, Gil Viry ²

¹Federal Institute for Population Research, Wiesbaden, Germany,
²Département de sociologie, Université de Genève, Genève, Switzerland

Abstract: In the course of globalisation of the economy and society, job-related spatial mobility, like daily and weekly commuting, frequent business travel or long-distance relocation, has become a widespread phenomenon in contemporary European societies. Previous research has often found mobility and family events to be interrelated, in particular when mobile people are women. In light of this evidence, we hypothesise that intensified mobility requirements impact on family development and that events of the family life circle impact on mobility decisions as well. We use a unique data set which provides retrospective biographical information about spatial mobility experiences as well as the family and the employment history of 750 individuals aged 25 to 57. The sample derives from the second wave of the “Job Mobilities and Family Lives in Europe” study and was randomly selected from the German residential population in 2007 and 2010. Based on this retrospective information, life trajectories for occupation, spatial mobility, partnership, and fertility will be built using sequence analysis techniques. In terms of job-related spatial mobility, sequences allow us to deal with four relevant dimensions simultaneously: (1) the duration of mobility events, (2) the frequency of mobility events, (3) the position of mobility events along the family life course and (4) the type of mobility. We use optimal matching analysis (OMA) to measure dissimilarities between sequences and multi-channel sequence analysis (MCAS) to handle multidimensional trajectories. Results show strong associations between mobility and family development trajectories. In the case of women, patterns of frequent and long-term circular mobility which started early in the job career are associated with being a single, a low or absent fertility and postponed childbearing. In case of men, life courses characterized by high mobility experiences come along with a fewer number of children.

THE FAMILIAL INFLUENCE ON THE CHILDREN’S PROSPECTIVE LIFE IN A MIGRATORY CONTEXT - CASE: TURKISH MIGRANT FOOTBALL PLAYERS IN BERLIN AND THEIR EXPERIENCES IN TURKEY

Oktay Aktan ¹

¹Sociology, TECHNICAL UNIVERSITY OF DORTMUND, Dortmund, Germany

Abstract: The proposed paper is one part of a qualitative PhD research project conducted in Berlin, which offers a reconstruction study to the everyday life of amateur football players of Turkish origin. Although much qualitative research has been done concerning the social aspects of migration in Germany, very few of them investigate the traditional family relations and their reflections on the spatial mobility via sport.

Intending to study the third generation of this population, Gruppensdiskussionen (Bohnsack, 2004), a kind of data collection method similar to focus group, were conducted with Turkish players who were born and raised in Berlin and who started a football career there. Having been transferred to Turkey and having stayed there some time, these players eventually came back to Berlin.

The empirical results show that the players, at the age of eighteen, have to shape their football career and decide in which team they will continue to play professionally. The family, especially the fathers, due to their social capital in the “homeland” stimulate and persuade their children that they can be transferred to Turkey. The social networks between Turkey and Germany through the football clubs at an institutional level and the fathers’ intense social capital at a familial level assure the young players to imagine their parents’ “homeland” as a “dreamland” in which they rapidly become a professional star.

My paper aims to show to what extent the imagination of “homeland” is possible to form a “dreamland” for the following generation. The main question which I seek to discuss in this presentation is to what extent the familial consensual solidarity (Bloss, 1997), which generates a bonding social capital (Putnam, 2002) by connecting the fellows from the “homeland - Turkey” with the friends in multicultural milieus in Berlin, satisfies the young players’ expectations for the future.

FATHERING IN TURBULENT TIMES: NEGOTIATING COMPETING VERSIONS OF FATHERHOOD IN THE SHADOW OF THE GREAT RECESSION

Jeanna Parsons Leigh¹, Shelley Pacholok ², Anne H. Gauthier³

¹Sociology, University of Calgary, Calgary, ²Sociology, University of British-Columbia at Okanagan, Kelowna, Canada

Abstract: Much research examines how mothers negotiate the ‘cultural contradictions’ of contemporary motherhood (Arendell 2000; Garey 1999; Hays 1996; Hertz 1997; Hochschild 1997), but far less is known about how fathers navigate the tensions inherent in the current discourse around fatherhood. The notion of the ‘new’ more involved father (Wall & Arnold, 2007), rests uneasily alongside the cultural hegemony of the breadwinner-father (Beaupot 2000; Ran- son, 2010) and the construction of fatherhood as a ‘package deal’ that includes being married, holding a steady job, and owning a home (Townsend, 2002: 2). The former calls for more time with children, while the latter requires a commitment to a model of well-paid and steady employment unencumbered by family responsibilities (Acker 1990). However, the recent economic recession may have undermined the ideal of the breadwinner father, and the extent to which it can be attained, because it has made paid work far less secure than in recent decades.

In this paper we ask, to what extent has the discourse of the ‘new’ father, in tandem with the economic downturn, opened up possibilities for reconfiguring fatherhood? Do fathers frame and practice fathering in novel ways when paid work is far less secure? Do they become the ‘new’ fathers so highly lauded in present ideology? What happens when other elements of the ‘package deal’ are disrupted? What are the implications for their level of involvement with their children?

The interview data for this paper were collected as part of a cross-national comparative study on family life in the United States and Canada. Our sample includes fathers with diverse occupations, marital statuses, and levels of involvement with children. Our findings suggest that fathers challenge hegemonic notions of fatherhood, and broaden their fathering practices, when crisis situations such as divorce, job loss, threats to child visitation and the ‘time-crunch’ of overtaxing work, prompt them to weigh the costs and benefits of the breadwinner model of fatherhood. Our paper also identifies a number of tensions experienced by fathers in their attempts to balance elements of the ‘package deal’ with limited options and/or opportunities, and illuminates instances in which these experiences are catalysts for practicing fatherhood in conventional ways.

NEW FATHERS AND PRICELESS CHILDREN AS THE FOCUS OF DUAL EARNER FAMILIES: FIRST RESULTS FROM A QUALITATIVE COMPARISON ABOUT WORK-LIFE BALANCE

Rossana Trifiletti¹

¹DISPO FACULTY OF POLITICAL SCIENCE AND SOCIOLOGY, UNIVERSITY OF FLORENCE, FIRENZE, Italy

Abstract: The paper is a contribution to the growing work-life debate, based on a comparative study in seven countries in Framework seven EU research (Workcare project). In each of the seven countries (United Kingdom, Poland, Hungary, Portugal, Italy, Denmark, and Austria) in-depth biographical interviews were conducted to both members of a number of couples in different family configurations, plus to a little sample of lone parents. The qualitative analysis of these narratives was realized by N.vivo7. The methodological choices and a number of results are illustrated in two reports (available at www.abdn.ac.uk), but in principle we try to go beyond a standard role analysis and to give voice to our parents describing their daily life.

The paper elaborates on the evidence that putting children at the centre stage of the family life and defending them and themselves from overburdening - much more than really experiencing an obsessive time pressure - are the more deliberate choices of our parents, as well in ‘familist’ as in ‘non-familist’ countries. Thus a really “intensive parenting” task and the emerging new forms of attachment to fatherhood describe well the climate of the ‘normalized’ dual earner families’ care arrangement in our times.

This kind of experience seems to be significantly freer from role obligations than in the past, but nonetheless it involves different kinds of ‘gendered moral rationalities’ (Ribbens et al., 2000; 2002): these probably tend to be less conditioned by social class than before and have much more to do with the important function of children confirming adult identities (Duncan et al., 2003; Castelain-Meunier, 2002). Thus, it is possible to observe a ‘weaving’ of daily appointments, when parents guarantee their presence at the moments of transition between private and public, between family and school or childcare services, where bringing and fetching children assumes a special quality of reassurance for both parents and children. This recursive ritual of crossing the border into and out of the family seems to compensate children for parents’ long hours of absence. Scant difference between social classes remain, in the effective capability of parents to defend their children from the nightmare of becoming “hurried children” (Lynott and Logue, 1993). However, important class differences remain in the kind of education our respondents try to give to their children.

LONE MOTHERS IN LITHUANIA: SOCIAL AND DEMOGRAPHIC ASPECTS

Vida Kanopiene¹

¹Social Policy department, MYKOLAS ROMERIS UNIVERSITY, Vilnius, Lithuania

Abstract: Since the beginning of the 1990s the new trends in the matrimonial behaviour and family formation were revealed in Lithuania: the decrease of the number of marriages and rise of divorce rates, the spread of cohabitation and noticeable increase of the number of the illegitimate births. The spreading of the lone mothers’ families in the country is a direct consequence of these processes: in the mid 1990s about 10 per cent of the women aged 18-49 brought up their children without a spouse/ partner (Fertility and Family Survey data, 1994-1995) while ten years later this proportion has nearly doubled (Generations and Gender survey data, 2006).

The paper intends to present the main findings of qualitative surveys (in-depth interviews with lone mothers – never married, di-
Abstract: Ideas about the role of fathers in post-divorce families have changed over the last decades. The geographical distance between parents is then seen as a risk for the child development, because distance potentially hampers the involvement of the non-resident parent, in general the father, in the relationships with the child and the mother. Our contribution considers, first, to which extent the geographical distance and contact frequency between the non-resident father and the child affect a unit coparenting defined as the way the mother promotes a positive sense of her ex-partner and the post-divorce family unit to the child. Secondly, direct and indirect effects of all these factors on the psychological and social difficulties in the child are assessed on the basis of SEM and multiple regression models. To investigate these issues, we used data for Switzerland from the survey “Social capital and family processes as predictors of stepfamily outcomes” (StepOut), which collected data on 150 mothers of school aged children from a step-family in 2009. Findings showed contrasting patterns of effects according to the dimensions of the child development considered and education of the father. Spatial proximity with the non-resident father was directly related to a higher unit coparenting and a better child adjustment only when fathers had a high level of education.

Children whose well-educated fathers lived nearby showed less conduct and hyperactivity problems and a higher prosocial behaviour. These relations were mainly mediated by coparenting. In the cases of low educated fathers, effects of the father’s spatial proximity on unit coparenting was mediated by the father-child contact frequency and impact of unit coparenting on child adjustment was moderate.

MEN, FATHERS AND WORK: CASE STUDIES IN THE ITALIAN COMPANIES

Maria Letizia Bosoni1

1SOCIOLOGY, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: The constant changes taking place in today’s context on many fronts (economic, social, political) place people in a position of having to constantly negotiate and renegotiate their life choices. In this context, the transformations in masculinity and transition to parenthood become a relevant issue. Reflection about fatherhood is strictly related to gender discourses, gender division of housework and labour market participation. Research studies indifferent European countries report an increased desire of fathers to be more present in the growth of children. However, although the time for fathers spent with children actually increased in different countries, there is still a considerable gap between the maternal role and paternal role. Specific studies on men fathers evidenced that fatherhood is changed, but is necessary to deeply understand the fatherhood the sense and meaning of this process. Transformation in the role of fathers need to be conceptualized in relation to contemporary changes in family life and in the couple. The aim of the presentation is to understand how men manage the “double role” of fathers and worker and how the Italian companies supports the employee needs related to family – work balance. In particular, 3 case studies will be presented, considering the different kind of work context, using a qualitative research techniques. In total, 45 interviews has been done, at managerial level and with employees: semi-structured interviews has been used with manager in order to understand the corporate culture and reconciliation policies, narrative interviews has been done with employees (fathers with young children) focus on the transition to parenthood and the relationship with the work.

SPATIAL PROXIMITY AND CONTACT BETWEEN THE NON-RESIDENT FATHER AND THE CHILD IN STEPFAMILIES: EFFECTS ON COPARENTING AND CHILD’S OUTCOMES

Abstract Book

PARTNERSHIP BREAKUPS: THE EFFECT OF ATTITUDES, SOCIALISATION AND HUMAN CAPITAL

Marta Vohlidalová 1, Hana Maříková 1

1Institute of sociology, ACADEMY OF SCIENCES OF THE CZECH REPUBLIC, Prague, Czech Republic

Abstract: The divorce rate in the Czech Republic is one of the highest in Europe. The total divorce rate is today at 50%. The growing popularity of unmarried partnerships, which have increasingly become the environment in which people have children and which are even less stable than marriages, however, suggests that the total rate of partnership instability is far higher than the divorce rate. The paper thus explores partnership instability (in marriages and unmarried partnerships) in the Czech Republic and factors affecting it. To explain this phenomenon, various theoretical approaches are used, which emphasise various factors of partnership instability: the individualisation theory which concentrates on the role of attitudes and values, economic theories (e.g., social exchange theories or theories of human capital) which stress the influence of socio-economic status of partners and specific partnership capital (such as, for example, children or common property), and last but not least, theories of socialisation which emphasise the influence of intergenerational heredity and experience with previous divorces or breakups of unmarried partnerships. In our paper we concentrate on whether and in what ways these various types of factors affect partnership stability. We pose the question whether the mechanism in which these factors act differ in unmarried partnerships and marriage, in various generations, across educational groups etc. In our analysis we use the ‘life-course analysis’ quantitative method, which makes it possible to observe the development of variable dependencies over time. For our analysis we use a data set from the project “Life Course 2010” which included 4,000 respondents and was collected at the Institute of Sociology of the Academy of Sciences in 2010.

SINGLE MOTHERS AND POVERTY RISK: WHERE ARE THE BREAK LINES?

Heinz Leitgöb1, Martina Beham1, Ulrike Zartler2, Christoph Weber1
1Johannes Kepler University of Linz, Linz, 2University of Vienna, Vienna, Austria

Abstract: Ongoing societal changes, driven by diverse macro-level phenomena, generate increasing economic insecurities that frequently provoke precarious living conditions at the individual level. These developments have severe effects on families and particular influences on single parent families, who often face a disadvantage living situation, especially with regard to economic issues.

Notably, single mothers are confronted with extraordinary challenges in nourishing and managing a family on their own, which predominantly becomes manifest in financial difficulties. As a consequence, single mothers hold a higher risk of poverty than any other social group: In Austria, about 28 percent of all persons living in single mother households live below the poverty line (= 60 percent of the disposable median income in Austria), compared to 12 percent of the whole population. Our argument is that in order to explain this outstanding poverty risk and its causes, it is indispensable to take a closer look at a broad variety of socio-economic variables that characterize single mother households.

A detailed inspection of single mother households reveals that single mothers do not represent a relatively homogeneous group with regard to their financial situation and living conditions, but cover a wide range of diverse income and living situations. Within the framework of an Austrian study, we will present different groups of single mothers and answer the following research questions: In what ways do the characteristics of single mothers who live in poverty differ from those who do not live below the poverty line? How do the formal educational level, former employment experiences, the current employment status and the ethnic background contribute to the poverty risk of single mothers? To answer these questions, we conducted descriptive and multivariate analysis by using the Austrian EU-SILC 2008 data (EU Survey on Income and Living Conditions) with the special module “over-indebtedness and financial exclusion” as well as the Austrian Labour Force Survey data 2009. First results uncover the outstanding relevance of the current employment status and of family-related benefit payments.

STRATEGIC RESOURCE BARGAINING WITHIN YOUNG FAMILIES – HOW DOES THE FAMILY CONTEXT AFFECT MOTHERS’ RE-ENTRY INTO THE GERMAN LABOR MARKET

Markus Kiesel1
1BREMEN INT. GRADUATE SCHOOL OF SOCIAL SCIENCES, Bremen, Germany

Abstract: Over the last decades women’s labor market attachment has dramatically increased in all modern countries. The modernization process from industrial to service and knowledge society is accompanied by women’s increased human capital and an alteration of the conventional role model of life long homemaking. However, it is still difficult for women to reconcile work and child care responsibilities in the intensive family phase when children are very young.

The aim of this paper is to analyze the effect of the household context on the social stratification of mother re-entry and occupational mobility patterns after a work interruption due to child birth. Specifically, the relevance of a divorce threat model is investigated which predicts that spouses bargain over their time allocation on the basis of their outside labor market opportunities. It is expected that both spouses want to be employed at the labor market as this enables them to influence the intra-household utility distribution to their favor. Moreover, market related work is considered as an insurance against the risk of poverty in case of divorce.

The outside labor market opportunities of mothers in parental leave are approximated by the occupational prestige of working mothers who display similar characteristics. To test my hypotheses I use event history models to analyze wave 1984 to 2009 of the German Socio Economic Panel.

With this paper I address a research gap because only few research deals with the social stratification of mothers careers whereas numerous papers deals with the difference between childless women and mothers. With regard to the reconciliation problem it is however central to point out the social circumstances of mothers’ “successful” re-entry into employment, that is an early re-entry, and horizontal or upward prestige mobility. Moreover, the empirical implementation of the divorce threat model on the basis of counterfactuals is innovative.

The empirical analyses show that strategic resource bargaining within marital unions seems to have an impact on the timing of women’s re-entry into the labor market after a phase of child rearing. I find that the higher mothers’ outside labor market opportunities compared to their husbands, the higher is their affinity to make the transition back to employment and to keep their former occupational status in this process.

DO WE STILL NEED MARRIAGE? DOES THIS LIFE COURSE TRANSITION SHAPE CHANGES ON FAMILY’S ATTITUDES, GENDER OPINIONS AND TASKS’ ATTRIBUTION?

Valérie-Anne Ryser1, Jean-Marie Le Goff2
1FORS, C/O UNIVERSITÉ DE LAUSANNE, 2Labo Pavie, Université de Lausanne, Lausanne, Switzerland

Abstract: Until recently, out of wedlock births were rare in Switzerland, even if cohabiting unions are increasing since the seventies. Couples consider a cohabiting union as a prelude to marriage; henceforth marriage is seen most of the time as a necessary step linked to parenthood. However, since 15 years, a new pattern of living arrangements seems to emerge, as it is shown by the increase of out-of-wedlock children rate (from 5% to 17.9% between 1995 and 2009). Previous studies, based on the Swiss Household Panel data, indicated that married and cohabiting women with at least one child under 17 years of age differed on their family’s representations. Results demonstrated that married mothers have a more traditional perspective on family than women in cohabiting couples, and these latter report living in more egalitarian arrangements that the former. Moreover, cohabiting women devote more time to paid work and less to housework than married women, and, concerning values; they perceive mother’s role as predominantly devoted to child rearing to a lesser extent. The increasing of out of wedlock births and of differences in women family’s attitudes depending on marital status might underline a social change, which is
interesting to investigate in the Swiss context. As marriage is valorized by institutions and there is a lack of institutionalization of other living arrangements, it is interesting to question women’s adjustments to different couples’ realities.

Using a subsample of married and cohabiting women of the Swiss household panel data, our aim is to investigate if marriage implies a change in women family’s representations, which could be a form of re-traditionalisation. In line with previous studies, preliminary descriptive analyses demonstrated that marriage is associated with the arrival of a child. In addition, analyses on married women seem to confirm that marriage is also concomitant to changes in family’s organization and representation. Once married, women spend more time to housework than before marriage. In addition, married women tend to report less satisfaction with the way housework is shared than before marriage. Further analyses, using lagged and change score methods, will be held to understand dynamic processes underlying this life course transition.

FAMILY FINANCIAL ARRANGEMENTS AND DEBT DURING THE LIFE-COURSE: THE IMPACT OF DIVORCE, UNEMPLOYMENT AND CHILDBIRTH ON THE TRANSITION INTO OVER-INDEBTEDNESS.

Julia M. Gumy

Abstract: This paper investigates the influence of family financial arrangements on the transition into problematic debt, hereafter over-indebtedness. The global financial crisis has exacerbated individuals’ financial difficulties. Many individuals are unable to meet their financial commitments, which could lead to debt accumulation and eventually poverty. However, individuals’ debt behaviour not only responds to changes at the macroeconomic level, but is also strongly linked to individuals’ family relations and how family finances are organised, which are often a reflection of within-household inequalities. For instance, qualitative research has shown that married couples – traditionally considered as a less financially individualised family form – are more likely to pool their income than cohabiting couples. The degree of individualism of families’ financial arrangements also correlates with individuals’ level of non-mortgage debt. For instance, it has been suggested that marriage might act as a control mechanism for individuals’ spending habits, thus decreasing debt. However, little is known about how these arrangements contribute to individuals’ inability to service debts, particularly when life course events occur, and how these events may impact on men and women differently.

The aim of this study is therefore to investigate how family financial strategies mediate the impact of life course events like divorce, unemployment and childbirth on the transition into over-indebtedness. Using the British Household Panel Survey (BHPS) and quantitative measures for over-indebtedness, I analyse the risk of over-indebtedness on a sample of British individuals between 1995 and 2005 using event history analysis. Preliminary results show that non-mortgage debt is lower amongst married individuals and higher amongst cohabiting and single individuals. When considering gender, it is observed that gender mediates the amount of debt in certain groups: single and cohabiting women experience more debt than men as the level of financial individualism characteristic of these groups combined with low income may stimulate the need of taking on more debt. Cohabiting and single women are also more likely to experience over-indebtedness, that is, the inability to service debts. Further analysis will investigate the impact of life course events (e.g. divorce, childbirth) on individuals’ debt status.

PATHWAYS TO PARENTHOOD

Francesco Giudici

Abstract: Transition to parenthood represents a turning point that creates stratification in occupational careers and division of household labour. Mean changes show that Swiss couples enter in a traditional division of labour, where women, comparatively to man, reduce their occupational involvement and increase their amount of domestic and child-related labour. However, divergences occur not only between men and women but also between same-sex individuals: for example, among new mothers some can continue to work full-time, and among new fathers some are more involved than others in spending time with their children and in domestic labour tasks. In my paper I would like to illustrate how different types of occupational and familiar trajectories that lead to parenthood, and their association with specific resources, influence individual changes during the transition to parenthood. Focusing on the biographical past that lead to the first parenthood allows conceptualize these changes as the results of a coherent biographical process.

Analyses will be based on the “Becoming Parent” study, where 466 men and women (233 couples) waiting for their first child were interviewed longitudinally. Using Optimal Matching Analysis (OMA) I will compute types of longitudinal occupational and familiar trajectories leading to parenthood by aligning individual sequences on the year of transition (and not on age as classical studies using OMA do). Changes in occupational and domestic labour during parenthood will be considered between Wave 1 (5 months before parenthood) and Wave 3 (one year after). Findings show, that women with full-time occupational trajectories have more chances to maintain higher occupational rates once mothers. For men, experiencing a period alone in the familiar trajectory is associated to a less important change trough an unequal division of domestic labour. These and other findings will be interpreted as the result of a process of cumulative inequalities in the life course.

WHEN THE BODY BECOMES FRAIL - FAMILIY DYNAMICS IN DEALING WITH THE NEED FOR CARE

Ulrike Manz

Abstract: Recent surveys have found that families still shoulder the major burden of providing care to people in need, even in periods of social transition. The presentation asks what family dynamics and shifts can be observed when families have to incorporate the physical decline of a family member into everyday life. Starting from the assumption that the bodies of family members play a crucial, yet hitherto little considered role for the internal cohesion and functioning of families, the analysis will focus on how the provision of care changes family relationships.

In a first step, some general considerations concerning the relevance of the body for family cohesion will be presented. Drawing on interviews from an ongoing research project on body concepts...
of the chronically ill, the presentation will go on to discuss specific areas of conflict in families with members requiring care. We will see that increasing physical frailty fundamentally calls into question the structural foundations of everyday family life in terms of time and space. The pace, rhythm, and course of time as well as, for instance, the relation between private and public space are subject to substantial change. This is a source of specific family dynamics in families with members requiring care, which will be put up for discussion based on several theses.

**MARITAL CONFLICT AND THE DIVISION OF CARE RESPONSIBILITIES IN YOUNG COUPLES: THE CASE OF SPAIN**

Marga Mari-Klose 1, Pau MARI-KLOSE 2

1Department of Sociology, UNIVERSITY OF BARCELONA, Barcelona, 2INSTITUTE OF PUBLIC GOODS AND POLICIES, SPANISH NATIONAL RESEARCH COUNCIL, MADRID, Spain

Abstract: Along other latecomers to the postindustrial age, Spain is facing challenges related to the emergence of new needs for care in a context of massive entry of women in the labour force. Coinciding with these ongoing trends, there has been an unprecedented surge in divorce rates and lone-parenthood. In a country that has historically displayed strong family structures, divorce rates among younger cohorts in Spain have reached figures found in the European countries where marital bonds are less stable. Our study aims at tracing casual mechanisms that may potentially help account for such developments at the macro level by focusing on dynamics of marital conflict at the micro level. In this study we test the extent to which tensions and conflicts among partners are related to the distribution of care responsibilities for small children. We rely on data from two nationally representative surveys administered to young Spanish couples in 2008 and 2010 to study the impact of pressures related to child care at home on indicators of disagreement, dissatisfaction and marital conflict. We show how different combinations of paid work participation practices, socio-economic features of the partners and each member’s investments in care influence the quality of marriage. The findings of our research shed light on dimensions of new social risks that usually attract little attention in the specialized literature.

**SOCIAL SUPPORT NETWORK OF FAMILIES LIVING IN A CITY. THE CASE OF POLAND**

Jolanta Grotowska-Leder 1

1Institute of Sociology, University of Lodz, Lodz, Poland

Abstract: People deal with their everyday problems on their own and look for and receive support from other individuals, groups and institutions. Social networks are considered important providers of resources accumulated and services delivered by the local community. They are particularly valuable for individuals and families affected by shocks caused by external or internal factors. The article is focused on social support networks of urban families. We investigated four domains of perceived and received social support (from spouse/life partner, family, neighbours, and friends). Following questions are subjected to analysis: How do families deal with everyday problems? Do they reach for institutional resources as well as for the informal ones? What is the scope and structure of family and non-family support networks and what kind of help they provide? Is social support received by the families frequent enough (sufficient) to satisfy their needs? Conclusions: informal social network of families is important for solving their small everyday problems. They receive support first of all from close relatives, friends and the most rarely-from neighbours. The patterns of support perceived and received within informal networks vary according to socio-economic status and age. The paper is based on the results of the research conducted in 2008 (the quota sample – 500 families living in one of the biggest Polish cities) within the project “Social network and local partnership in counteracting social exclusion and intergenerational transmission of poverty” financed by the Ministry of Science and Higher Education (Nr H02E 021 29) and coordinated by author.

**ARCHITECTURE AND JUSTICE: CONSIDERING FAMILY COURTHOUSES IN PORTUGAL**

Eliana Patricia Branco 1, Paula Casaleiro 1, Valerio Nitrato Izzo 1

1CENTRO DE ESTUDOS SOCIAIS, UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: The space where Law and Justice is administered and rendered is always the result of the dominant conceptions of Law and Justice, of sovereignty and State, thus influencing the architectural programs of courts and prisons (Mulcahy, 2008). As a result, the first move will be the demarcation of a space where rules are defined, goals are set, and actors are established (Garapon, 1997), which means that to be effective, jurisdiction has to be inscribed, apparent, available to spatial dissemination (Goodrich, 2008). Hence, the architecture of these spaces assigns legal discourse to a proper place and supports the theatrical dimension of the hearing, for buildings (furnishings and decoration included) and rituals define a landscape through which people materially (in literally concrete terms) experience judicial authority (Haldar, 1994, McNamara, 2004, Lucien, 2010).

Family and child law, given its special characteristics, offers a very interesting field of study regarding the connections between courthouse architecture and justice. In fact, family and child law is summoned today to answer to new problems, with somewhat fuzzy contours, that exist between a tendency to privatization/negotiation and a tendency to (re)publication, namely in the field of new conjugalities and the promotion of children’s rights (Commaille, 1991; Pocar and Ronfani, 2008). Thus, the need to analyse the spaces of justice arises in rich and complex areas such as those of families and children, in which the interaction with the judicial system is associated with the invasion of private life, fragility and emotion, as a result not only of the type of cause/law suit, but also of the relationship with the space of a court. For many families, interaction with the judicial system is associated with unhappy matters, such as divorce, custody, delinquency, neglect, and related adversarial issues around money, children and crime (AIA, 2008). Can architecture help reduce this burden or, on the contrary, make it heavier?

This paper aims at discussing the interaction between courthouse architecture and family and children law by presenting some of the preliminary results of the ongoing Research Project «Courthouse architecture and access to law and justice: the case of family and child courts in Portugal» (Ref. COMPETE: FCOMP-01-0124-FEDER-009199).
COMMUNICATION AND COOPERATION BETWEEN PARENTS DURING THE DIVORCE PROCESS.
Orna Cohen 1, Ricky Finzi 2
1TEL-AVIV UNIVERSITY, Tel-Aviv, 2Bar-Ilan University, Ramat-Gan, Israel

Abstract: One of the greatest challenges facing divorced – as well as separated and divorcing – parents is the task of co-parenting for the good of the children. We all know, from our practice and the professional literature, how much the strong emotions that arise when a marriage dissolves can interfere with cooperative, considerate, supportive, or even civil co-parenting. We also know how important good co-parenting is to children's post-divorce adjustment and how much psychological, social, and educational damage may be caused by lingering parental hostility and the failure to co-parent in a constructive manner.

Many attempts have been made to determine the predictors of good co-parenting after divorce. Research findings point roughly three types of predictors: pre-, peri-, and post-divorce. Virtually all the studies, however, have been conducted after the divorce. While considerable attention has been paid to post-divorce parental relations, very little attention has been paid to the co-parenting relationship and its predictors during the divorce process itself.

This talk presents the findings of a study that investigated the predictors of co-parenting relationship during the divorce process among 207 parents who had been referred by a Family Court judge to the court's Counseling and Mediation Unit in Israel. The co-parenting relationships were researched through: (a) Communication entails speaking about the children. (b) Cooperation entails sharing responsibility for childrearing tasks and treating the other parent with consideration and respect.

Based on the Family System Theory the findings highlight the contribution of gender, negotiation as a conflict tactic, temperament of the child to communication and co-parenting and the unique contribution of individual features such as optimism, mature and immature defense mechanism to communication and cooperation in co-parenting.

Theoretical and clinical implications will be presented.

FALLING OUT OF LOVE AND DOWN THE HOUSING LADDER? UNION DISSOLUTION AND HOUSE OWNERSHIP
Philipp Lersch 1, Sergi Vidal 1
1BIGSSS, UNIVERSITY OF BREMEN, Bremen, Germany

Abstract: This paper sheds light on the causal association between union dissolution and house ownership outcomes by investigating the research question “How does union dissolution of house owners affect the post-dissolution tenure status of ex-partners?” Effects of union dissolution on ex-partners have been analysed widely. Regarding housing outcomes, there is empirical evidence that union dissolution is a disruptive event in the residential career and might cause moves out of house ownership into rental accommodations. This affects the subsequent life courses of the ex-partners and their children negatively. For example, house ownership is an important asset and functions as a financial safety net for later life stages. As a novelty, in the present paper we propose that partners are aware of the risk of union dissolution and this is reflected in couple-specific investments in house ownership. Therefore, more committed couples will select into house ownership, and those couples that are house owners are less likely to separate. Past empirical research did not consider this endogeneity of house ownership and partnership status. By means of simultaneous equation estimation predicting both, the house ownership status and the risk of union dissolution, we allow partnership decisions to be endogenous in house ownership choices and the other way around. As couple-specific investments are very sensitive to variations at the institutional level, above all regarding family policies, we compare two different settings: Britain and Germany. To this end, longitudinal data from the British Household Panel Study and the German Socio Economic Panel Survey for the years 1991-2008 is used. Preliminary results show how high risks of union dissolution are associated to lower initial investments in home-ownership. After controlling for the selection of couples with higher risks of separation, we observe that union dissolution still has a positive effect on the transition to home-renting, but not as dramatic as previous research predicted.

FATHERING AFTER DIVORCE: THE INFLUENCE OF PARENTING STYLES ON CHILD OUTCOMES
Kim Bastaits 1,2, Koen Ponnet 1, Dimitri Mortelmans 1, Christine Van Peer 2
1Department of sociology - CELLO, UNIVERSITY OF ANTWERP, Antwerpen, 2Research Centre of the Flemish Government, Brussel, Belgium

Abstract: From previous literature on children of divorced parents, it has become clear that divorce has an impact on how children are raised. A reduced contact with children (for the non-residential parent) or an increased responsibility over the children (for the residential parent) can have an impact on the parenting of children.

Divorced parents might parent their children less effective than still married parents (Hetherington & Stanely-Hagen, 1999; Pryor, 2004; Sirvanli-Ozen, 2003). However, most studies on parenting after divorce focus on the mother (mostly the residential parent).

In this paper, we examine the parenting styles of divorced fathers (mostly the non-residential parent). The model of Baumrind (1991) and Maccoby & Martin (1983) on parenting styles will be used as theoretical background. First, to investigate in parenting styles of divorced father, variance analyses will be conducted. Second, the impact of the parenting styles on the outcomes of children will be studied (using a regression model). We will take into account characteristics of father and child, like custody arrangement, gender and age of child, educational level of the father, presence of a new partner,...

The data used in this research are a subsample of the “Divorce in Flanders”-dataset. This dataset distinguishes itself from other datasets by its multi-actor design. The DiF-dataset contains information of divorced and married fathers and mothers as well as information of their children. In this paper, data from 809 fathers and their children will be used. 322 fathers are married whereas 487 fathers are divorced.

In a first step, fathers will be divided into the categories of Baumrind (1991) and Maccoby & Martin (1983). Based on the support and control fathers give their children, four types of fathers can be distinguished: (a) fathers that provide support and control (73,4%), (b) fathers that only provide support (13,9%), (c) fathers than only provide control (5,5%) and (d) fathers that provide neither (7,2%).
When comparing married fathers to divorced fathers, it becomes clear that married fathers lend more often support and control whereas divorced fathers are more often uninvolved (giving no support nor control) \( \chi^2=12.92; p=0.00 \). Further analyses will examine the impact of these types of fathers on the outcomes of the child.

**CHILD CUSTODY AFTER DIVORCE: GENDER PATTERNS IN PARENTS MOBILIZATION AND JUDGES DECISIONS**

Ana Reis Jorge, Manuel Carlos Silva

1Research Centre for the Social Sciences, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: This paper relies on the analysis of judicial processes related with child custody in divorce cases and on interviews conducted with judges in Portugal. In one hand we intend to discuss the motivations and the mobilization of the child parents (men and women) in this context. On the other hand we intend to address the judge’s experiences, representations and perceptions at the level of gender and how that could embody their decisions in these cases.

Current changes in legislation and jurisprudence in the family area were designed to foster a greater equality between men and women, following international guidelines and changing values diagnosed in Portuguese society.Despite this evolution at the level of law, official statistics have been showing that in most cases the custody and the child care after divorce are attributed to the mother.

If court decisions in some cases could illustrate the existence of a gap between an egalitarian law and an unequal treatment in practice, in most situations the judge’s decisions tend merely to reproduce the patriarchal patterns at the child care level during the marriage. This is particularly important if we consider that in the majority of the cases the custody is defined by mutual agreement. Indeed, if the judicial context can be permeated by gender asymmetries, we cannot deny the existence of strategies by social actors as well as the strength of the routines installed within the family and in the society in general.

In this sense, it is important to note that an apparent situation of “legal advantage” for women (including the cases in which men can feel aggrieved in their rights as parents) does not translate into economic advantages and in an effective empowerment in their everyday lives.

**DE-STANDARDIZATION OF THE LIFE COURSE ACROSS TIME AND SPACE: ANALYSIS OF THE SEQUENCES AND VARIABILITY OF THE TRANSITIONS TO ADULTHOOD IN EUROPE**

Magda Lalanda Nico

1CIES-IUL, ISCTE-UNIVERSITY INSTITUTE OF LISBON, Lisbon, Portugal

Abstract: In 1987 Rindfuss, Swicegood and Rosenfeld provocatively asked “Disorder in the Life course: how common and does it matter?”. They would then begin to question the recently popular idea of a mass disorder in the life course and the perception that linear and ordered trajectories were associated with well succeeded or unproblematic life courses and that, on the contrary, disordered and de-standardized trajectories were associated with problematic or deviant life courses. Later, de-standardization of the life course would begin to be analyzed outside this normative dichotomy and close to the individualization thesis. In fact, no trajectory can be nowadays called neither culturally nor statistically normative. There isn’t one norm and many deviances, but simply many trajectories.

The conceptual proximity between individualization and de-standardization is such that it has led to linguistic and sometimes analytical economy between the two. Nevertheless, de-standardization, individualization and also differentiation, pluralisation and de-institutionalisation are different concepts that should be analysed separately and preferably diachronically. In this sense, and contributing to bring “the ‘course’ back into the life course” (Aisenbrey and Fasang, 2010), several new variables were created from the original data of the European Social Survey 2006, such as the combinations of sequences of transitional events, the amplitude between the first and last event occurred, the density of the events (and identification of the most relevant conjoint events), the number of events occurred until 35 years of age and a typology based on the nuances of linear and non-linear trajectories.

The analysis of these dimensions across time and space led to three major conclusions. First, such as Brückner and Mayer stated in 2005, the analysis of the various dimensions did not point to a strong process of de-standardization across time. Secondly, it was found that residential trajectories assume a great importance in the differentiation across time and between countries (through the distinction between what was called “three-in-one” and “conjugal package”). And finally, as Widmer and Ritschard also argued in 2009, gender effects perform an important part in the de-standardization of the life course. Gender convergence across time is found in public spheres of life (school and work) rather than in private ones (conjugal, parental).

**FATHERS ON PARENTAL LEAVE: WHAT HAPPENED SINCE THE RECENT REFORMS IN GERMAN FAMILY POLICY?**

Heike Trappe, Manuela Schicka

1UNIVERSITY OF ROSTOCK, Rostock, Germany, 2UNIVERSITY OF Geneva, Geneva, Switzerland

Abstract: In 2007, a reform of the parental leave act was introduced in Germany. Among other goals the reform aimed at encouraging men to share in child care more intensively than in the past. Politically this goal was pursued by following Sweden’s model and reserving two out of 14 months of relatively generously paid leave for fathers. Official statistics show that within four years, fathers’ take-up rate increased greatly from around three percent to almost 20 percent. Additionally, it can be shown that the great majority of fathers do not take more time off than the two ‘daddy months’. However, much less is known about the characteristics of couples within which fathers take parental leave.

Therefore, our paper aims at answering two questions: What are the main determinants of men’s parental leave decisions? What are the driving forces of men’s decisions to take more time off than the ‘daddy quota’? The two competing ideas behind both questions are value change versus economic constraints. Do these men belong to the group of ‘new fathers’ that could not live up to their preferences under the previous regulation with low levels of means-tested remuneration? Or are economic considerations in relation to
the women’s economic capacities the main factor for men’s decisions regarding whether and how long to take parental leave?

We answer these questions by following a two-step research design. First, we use representative survey data for recent parents (‘Junge Familien 2008’, collected by the RWI Essen) to analyze men’s take-up of parental leave. Our major finding is that economic factors have more explanatory power than value-related aspects. So are fathers more likely to take leave if they were not employed prior to child birth or if the female partner had higher earnings. We then look in a second step at the economic determinants for the duration of fathers’ leave. To do so, we use register data for all birth between 2007 and 2009 where parental leave was requested (provided by regional authorities) in two select Northern federal states of Germany. We can show that employment status of the couple as well as women’s and men’s relative earnings have a slightly different impact on the duration of fathers’ leave in both of the German states. Overall, fathers are most likely to take parental leave and to use it extensively if they have relatively poor economic resources.

**FINDING THE RIGHT BALANCE: SOLO-LIVERS’ CONSIDERATIONS ABOUT THE IDEAL LIVING ARRANGEMENT OF FUTURE COHABITATION**

Toke Haunstrup Christensen

1Danish Building Research Institute, AALBORG UNIVERSITY, Hørsholm, Denmark

Abstract: Like in other countries, the number of people living in one-person households is growing in Denmark. From 1981 to 2006 the share of the Danish population living alone increased from 16% to 23%. Studies on (late) modern family life and intimate relations suggest different explanations for the increase in solo-living including the historical detraditionalization of marriage and intimate relationships, increased diversity in family forms, individualization and the “pure relationship” as an ideal for late modern couples.

This paper is based on semi-structured interviews with 11 solo-livers aged 30-65 years. All informants have been living alone for at least two years, although some have a partner living apart (Living Apart Together or LAT). Drawing on the literature on family life and intimate relations, the paper analyses the informants’ understanding of their current situation as solo-living, their previous experiences with cohabitation and their considerations about the possibility of moving together with a partner (again). The interviews suggest a widespread ambiguity among solo-livers as they emphasize the positive qualities of living alone (being independent) but at the same time express a hope of meeting “the right one” to move together with and share their life with. This ambiguity seems to reflect a more general condition of intimate relationships in late modernity.

The paper focuses particularly on the informants’ considerations in relation to the scenario of moving together with a partner later in life. The informants’ reflections about how the process of moving together and the arrangement of the new home should be in order to ensure the best possible conditions for building a lasting relationship and shared everyday life add further details to the theoretical understanding of modern intimacy and family life. The informants particularly worry about how to maintain a degree of individual independence while at the same sharing the daily life and the home with somebody else. In order to secure the “right balance”, they consider different “strategies” such as having “one’s own room” in the shared dwelling or combining living apart together with a third home (e.g. a summer cottage) that could be the couple’s “shared home” in the weekends.

**DEPRIVATIZATION OF FAMILY AND ITS EFFECTS ON PARENTING IN ROMANIA. THE CASE OF PARENTS EDUCATION PROGRAMS**

Daniela Cojocaru 1, Stefan Cojocaru 2

1SOCIOLOGY AND SOCIAL WORK, UNIVERSITY ALEXANDRU IOAN CUZA IASI, Iasi, Romania

Abstract: The family is subjected to a variety of increasingly higher prescriptions coming from different institutional contexts, a phenomenon known as deprivatization of the domestic environment.

In this context, the paper presents a qualitative research, based on Grounded Theory, that analyses the deprivatization’ effects on parenting, on how it is defined, regulated and modeled in terms of respecting children’s rights ideology, promoted by the Convention on the Rights of the Child. In this approach, our attention is focused on parent education programs in Romania, especially those in rural areas, due to the magnitude of the impact of new ideologies on traditional Romanian family culture.

The study consists of interviews with 25 parents with a poor economic situation in rural areas, about the influence they have had educational programs on their relationships with children and on family relationships in general. We also explore the motivations, and obstacles associated with parents’ participation in these programs.

**LIFESTYLE-SIMILARITY AND MATE CHOICE - AN EMPIRICAL ANALYSIS BASED ON INTERACTIONAL PROCESS DATA OF A DATING PLATFORM**

Stephanie Beyer 1, Andreas Schmitz 2, Hans-Peter Blossfeld 2

1UNIVERSITÄT BAMBERG, Bamberg, Germany, 2Chair of Sociology, UNIVERSITAT BAMBERG, Bamberg, Germany

Abstract: The reproduction of social inequality has often been analyzed as a consequence of selective association processes due to institutionally structured meeting chances. Online dating is sometimes considered to weaken traditional restrictions as time, space and social influence of third parties by offering actors a free choice on the “dating market”. But it has been indicated that actors disproportionately contact others according to traditional traits such as education, age or physical appearance. In an offline context Pierre Bourdieu was able to show the high relevance of lifestyle-similarity as an emanation of habitus for the probability of meeting and mating. We discuss this thesis of homophily-guided mate choice and test whether it can be supported in an “online dating space” where opportunity structures are seemingly not socially predetermined. Based on web-generated process data from a major German online dating site, a social space is constructed by a joint correspondence analysis of life style variables (such as hobbies, clothing, social capital and furnishing). Within this common space similarities between actors are reflected by short distances whereas dissimilarities are indicated by large distances. According to positions in the space, three different clusters are constructed heuristically. Contact behavior is analyzed in order to test the Bourdieuan hypothesis that lifestyle-similarity promotes higher chances...
of interaction between two actors. Results indicate a clear lifestyle preference for actors from the same cluster within the social space.

**MANOEUVRES OF SEDUCTION: THE PRESENTATION OF SELF IN DATING SITES**

Cláudia Casimiro¹

¹CIES / ISCTE-IUL, Lisboa, Portugal

Abstract: This paper addresses the manoeuvres of seduction undertaken by Portuguese men and women in the process of their online self presentation in dating sites. Plus, it seeks to contribute with empirical knowledge, on one hand, about these strategies and, on the other, on the gender dynamics characterizing them.

The paper is part of a research aiming to explore the impact of social change (e.g., societal implications of the Internet and social networking) in romantic life and, specifically, in the formation and development of couples in the digital age. Technological developments and the ubiquitous Internet are the most significant cultural phenomena of our turbulent times and they mark the landscape of post-modernity. In contemporary times, the forms of entry into marital life are diverse, amongst others, in terms of sociability spaces understood as potential venues for romantic partners.

Times have changed since 1984 when François de Singly wrote about “Les manœuvres de séduction: une analyse des annonces matrimoniales”. Today, the matrimonial (or romantic) parallel market is no longer formed by the “matrimonial ads” appearing on newspapers but by profiles presented in different places in the Internet. Nonetheless, the observation and the analyses of these profiles and the way men and women present themselves, for example in dating sites, allows us to understand some continuities and transformations in the process of self-presentation when trying to find a date/partner/husband or wife. It also permits us to comprehend and explain the scenarios and the processes by which individuals try to call attention to their social value by displaying and making recognizable the attributes that are most likely to seduce, to convince, to gain support and mainly to cause affection.

Data gathered through a qualitative methodology suggests that online dating participants try to express and reveal, simultaneously, aspects of their ideal and true selves. Because their goal is to find a potential romantic partner, interact with him face-to-face, they seem to be motivated to engage in authentic self-disclosures, not lying about constitutive identifying features, and therefore not suppressing negative aspects of their self. Also, the results show that gender produces differences in personal and preferred partner attributes outlined in profiles.

**MONEY AND ROMANCE: THE CONSTRUCTION OF ROMANTIC RELATIONS BETWEEN ESCORT- GIRLS AND THEIR CLIENTS.**

Bernardo Soares Coelho¹

¹CIES-IUL Lisbon University Institute, CIES-IUL LISBON UNIVERSITY INSTITUTE, Lisbon, Portugal

Abstract: Based on an ethnographic research with escort-girls and male clients combined with a biographical approach, this paper discusses a connection between love and material interests in contemporary societies thru the analysis of romantic relations between escort-girls and their clients.

An ideological and cultural divide puts apart economy, money, interests on one side, and love on the other. Love is irrational rather than rational, gratuitous rather than profit-oriented, private rather than public. Commercial sex clashes against these common representations by decontextualizing erotic and sexual encounters from the love frame and at the same time contextualizing sexuality in a profit oriented activity.

Con contradicting stereotypes research easily leads us to find that prostitution as it is practiced by escort-girls is not exclusively profit-oriented; it is also pleasure-oriented and intimacy-oriented. Both escort-girls and their male clients wish pleasurable moments and actively invest in the production of intimacy. In this commercial, erotic, sexual and intimate scenario it isn’t uncommon to find romantic relationships between escort-girls and male clients. When producing their romantic relations, escort-girls and their male clients connect by multiple forms love and interest:

**Disadvantaged men:** Escort-girls exploit and manipulate clients when they fall in love with them, their bodies and sexual abilities.

**Confluent interests:** Escort-girls are willing to step out of activity and find a wealthy man to help them and the client is willing to be that man. Or when, escort-girls and clients produce a deep intimacy and begin to project their lives together – money is always present because the most common situation is her withdraw from the activity.

**Disadvantaged women:** When escort-girls fall in love by a certain client and his life-style and men manipulate escort-girls promising a romantic relationship, but the only thing those men desire is free sex.

**THE LONG-DISTANCE ROMANTIC RELATIONSHIPS: DISTANT SPACE, SHARED TIME**

Iveta Jurkane¹,²

¹Sociology, SÖDERTÖRN HÖGSKOLA, Huddinge, ²Sociology, Uppsala University, Uppsala, Sweden

Abstract: THE LONG-DISTANCE ROMANTIC RELATIONSHIPS: DISTANT SPACE, SHARED TIME

Irene Levin (2004) argues that the emergence of long-distance or living-apart-together relationships is strongly linked with acceptance of cohabiting relationships and the changes in social norms: “[t]he question considered here is whether two people may be considered to be a couple without having a common home. In recent times the answer has become ‘yes’ and a new family form has appeared.” If the answer is “yes”, next research question, however, emerges — how can a couple manage to maintain a romantic relationship when the probably most significant component is lacking: a physical proximity?

I suggest that relationship quality is maintained and the tendency to idealize the distant romantic partner is due to a different perception and use of time in long-distance in comparison to geographically-close relationships: the present situation of geographical distance is often treated as a temporal situation, the limited meeting times are qualitatively filled and the conflict situations are avoided, but the relationship in general is future oriented.

Due to the distance, the couples cannot develop shared daily routines, however they routinize their everyday communication. In order to compensate for the absence, the romantic partners con-
STRUCT the presence themselves. Creation of presence in time (now) becomes the main function of the mediated communication. The possibilities of online conversations and phone calls create the presence in time, while the material means of communication (letters, parcels, pictures) or materialization of the written Internet-and mobile technologies communication (for example, rewriting text messages on paper) replace the presence in space (here). Mediated mutual communication and testimonies of thoughtfulness help to create and re-create the presence in space and in time by using all the senses of a person – the sight, the hearing, the touch, the smell of, and even the taste. Togetherness is experienced not only in a shared space, but also through mediated communication and imagination.

The current paper is based on the secondary studies on LDRR as well as the preliminary results of the interviews done so far with the individuals having long-distance romantic relationship experience.

IT’S STILL A STORY WITHOUT AN ENDING: FERTILITY, PUBLIC POLICIES AND WORKING MOTHERS IN EUROPE.

Analia Cardoso Torres1, Bernardo Coelho2, Diana Carvalho2
1Sociology, ISCP- UTL, 2Sociology, CIES/ISCTE-IUL, Lisboa, Portugal

Abstract: Based on several research projects, on different rounds of the European Social Survey, and official statistics, this paper discusses the connection between family and care policies, fertility and employment in working mothers. This discussion pointed out to different sets of findings, that need still to be deepened, and would benefit from a more broad debate.

First, in the majority of the European countries there is a positive correlation between fertility and employment of mothers of children under 10.

Second, disrupting the political and ideological stereotype that part-time would be a solution for care and employment in Europe we found out that in a majority of European countries mothers do not “choose” this type of work arrangement. And when they do it’s still not present itself as a “solution” since the majority of mothers is at the margins of the labour market.

Third, we argue in this paper that when analysing differences and similarities among European countries regarding fertility and women’s work, we must account for differences in care policies and in the labour market, but also in the specific history of economical and political change in the last 30 years in the different European countries.

Thus, we found, that in the Nordic countries four distinctive trends coexists: the highest fertility rates in Europe in the last decades, very consistent and diversified political packages targeted at care arrangements, the highest European rates of working mothers, and finally a strong rejection of part-time job solutions among mothers.

In central Europe we face two different scenarios. On one side, countries following a political and ideological tradition that consider family and care as a private matter have restricted policies, producing withdraw of women from labour market. On the other side, those countries who adopted diversified policies oriented towards fertility seem to have succeeded in its increase. In eastern European countries an abrupt decrease of fertility rates coexists with extreme social, political and economical changes related to state intervention withdrawal. In Southern European countries with disadvantaged political packages or incomplete packages we find the lowest fertility rates in Europe, and very low use of part-time solutions.

MALE PARTNERS’ DOMESTIC BEHAVIOUR AND FEMALE WORK ATTACHMENT AFTER MARRIAGE AND CHILDBEARING

Marta Seiz1
1Centre for Human and Social Sciences (CCHS), SPANISH NATIONAL RESEARCH COUNCIL (CSIC), Madrid, Spain

Abstract: The last decades of the 20th Century and the beginning of the present one have witnessed a generalized and ever-growing incorporation of women to the labor market. The magnitude of the changes has been such that it has even elicited claims of a genuine revolution of women’s roles. Against this backdrop, fundamental questions arise on the position of men’s themselves in such a scenario and their potential contribution to the shape it eventually takes. This paper examines the role of the intra-family division of unpaid labour following marriage and childbearing on women’s employment behaviour in such crucial stages of the family life cycle; the latter being often associated with labour market exit or a reduction of the time spent at paid work. For this purpose, event history analysis is performed on a longitudinal sample of women and their partners drawn from the German Socioeconomic Panel (1984-2009). Preliminary results reveal that higher levels of male involvement in domestic work indeed appear to decrease their female partners’ propensity to abandon full-time work in connection to marriage; as well as to mediate the influence of income on the phenomenon.

RECONCILING FAMILY AND WORK IN TURBULENT TIMES

Sara Mazzucchelli1
1ATHENAEUM CENTRE FOR FAMILY STUDIES AND RESEARCH, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: The work-family reconciliation is a fundamental theme in the political debate; the EU is facing a huge dilemma in terms of social policy: it requires to increase employment rates to ensure both economic growth and sustainability of welfare systems, while also promoting social inclusion in a context characterized by high complexity, especially in intergenerational perspective. In this frame is fundamental the contribution of the companies which, according to a vision of Corporate Citizenship, are strategic actors in the process of lifetimes’ arrangement.

The paper will present the results of a national survey carried out on behalf of the National Observatory on the Family-Department for Family Policies, aimed at identifying some company good practices of work-family reconciliation.

Italian companies involved in the work-family reconciliation have been mapped with a quantitative methodology; then were identified some promising practices and case studies have been made. For each case study were carried out in-depth interviews with the company management (HR, CSR, Diversity managers...), and focus groups with employees of different occupational profile, age and sex who were able to take advantage of the reconciling measures.
In the interviews with employees we have tried to understand whether the reconciliation measures provided by company were actually useful for them to reconcile the different commitments of life. Then attention was also focused on the family situation, trying to clarify the distribution of tasks within the family, the support provided by the partner, the parental and friendship network and the change potentially brought about in their lives since the birth of their children. The survey allowed to highlight the complexity of work-family reconciliation in turbulent times and also the bond with the process of structuring of personal identity: reconcile family and work does not imply for people to hold together and harmonize different times (the time of the family and the time of work) but especially to give a judgment regarding themselves as a person in their lives. The conciliative strategies concretely adopted so derived, from an ideal point of view, by the order attributed to the personal ultimate concerns.

INTERGENERATIONAL TRANSMISSION OF DIFFERENT TYPES OF POLITICAL AND CIVIC PARTICIPATION

Marieke Voorpostel

Abstract: It is commonly found that political and civic participation runs in the family. Yet, little is known about diversity in the extent of intergenerational transmission between different types of participation. Therefore, and using data from the Swiss Household Panel (SHP), the aim of our study is to investigate to what extent the intergenerational transmission of participation differs between different types of participation with each type demanding different resources and skills: voting, activism, voluntary work, passive and active associational membership. Moreover, we will investigate which parents are most successful in transmitting their participation patterns. In particular and taking insights from theories on cultural capital, we will argue that compared with lower socioeconomic parents, higher socioeconomic parents have more cultural, social and cognitive resources and are thus better equipped to educate their children and to offer them the necessary resources for political and civic participation. This may be particularly important for participation types which are more demanding with respect to necessary skills such as voluntary work and active associational membership compared with less demanding types of participation such as passive associational membership.

LONE MOTHERS UNDER PRESSURE: THE CRITICAL IMPORTANCE OF GRANDPARENTS FOR ENABLING EMPLOYMENT.

Shireen Kanji

Abstract: Raising employment rates of lone mothers has been a key policy target of recent years in the UK, as it has been in a number of other countries. Despite a significant increase in lone mothers’ employment overall, a very low proportion of women who start out as lone mothers works after the birth of their first child. The question answered in this research is how do these mothers, operating under intense constraints, manage to support work and care. The data for the analysis come from the Millennium Cohort Study, a nationally representative survey of families with children born in the UK around the time of the millennium.

We focus on the effect of grandparents’ help on a lone mother’s work status. We analyse, first, a particularly challenging time for accomplishing paid work and care: that is when the first child is between nine and eleven months old. This is a time at which mothers may have a distinct preference for grandparent care because they have greater confidence that their children will be safe if they are left with grandparents than committed to formal childcare (Del Boca, 2002). In addition, private care is not only extremely expensive at this point in time, particularly if it is of high quality, but also limited in its availability. The attention to women who start out as lone mother is because these women face in an heightened form one of the key dilemmas of our time, that is how women – given the social construction of caring – can manage to combine paid work and care (Albelda et al., 2004). Closely linked is the question of how low wage rate workers can manage to support children. The relatively lower level of attainment (Kiernan and Smith, 2002) and lesser labour force experience of women who start out as lone mothers places them in a particularly challenging situation in terms of participating in paid work. We also compare lone mothers employment across time periods: when their children are only under one year old and later when they have reached school entry.

In the context of grandparent care provided to enable mothers to work, the paper explores two opposing hypotheses. First, that the modernisation of intimate relationships is leading to a breakdown in ties within families and to more fluidity (Giddens, 1991; Beck and Beck Gernsheim, 2002). Second, that intergenerational relationships remain strong and are also growing in importance (Bengtson et al., 2010).

Olga Ganjou, Eric D. Widmer

Abstract: This research tackles the interrelations existing between family relations and support values in various welfare states. Is there a difference between the ties of individuals with their family members and other network members according to welfare states? Our research considers the hypothesis that state social policies modify family relations, in particular the frequency of contacts with relatives and the density of networks. Following Esping-Andersen’s typology, we hypothesize that in countries with a «conservative welfare state», based on the principle of subsidiarity, family contacts are diversified and frequent. In countries with a socio-democratic welfare state, interactions and support between family members are more limited. In countries with a liberal welfare state, personal networks are diversified and more widespread. State social policies also transform the structures of family relationships and the family’s values. Our analysis is based on a cross-national survey. We used the data from ISSP concerning four clusters of countries: conservative countries (France and Germany), liberal countries (USA, Switzerland and Great Britain), socio-democratic countries (Sweden, Denmark, and Norway) and Russia (the country with strong influence of the state and the resistance of the family). The results show that state social policies modify structures of fami-
ly relations. In the conservative countries family contacts are diversified and frequent, while in the socio-democratic countries family contacts are limited and supported by the conjugal contacts. Vertical (intergenerational) ties are dominant across all counties considered. Horizontal relations (collateral) are more frequent in the conservative countries and Russia. In conservative countries the values of the support are based on not only the family, but also the state (the principle of subsidiary is not real). In the liberal and socio-democratic countries the individuals are looking for the help and the support into the other types of networks, especially with the state services. In Russia the social guarantees are low and the family sources are limited. Individuals try to extend their network of support to friends, colleagues, neighbors, etc. Contrary to a frequent presupposition, the extension of the family help is connected mostly to the state help in all welfare states.

SOCIAL TRANSFORMATIONS AND INTIMATE LIFE IN BULGARIA: CROSS-GENERATIONAL EXPERIENCES
Mariya Stoilova

1Birkbeck Institute for Social Research, Birkbeck, University of London, London, United Kingdom

Abstract: Situated within the feminist critique of post-socialist transformation theory, the paper explores the changing experiences of two generations of Bulgarian women with respect to family and intimate life. Subscribing to the assertion of the close and invisible correlation between the “public” and “private” domains, the author uses generation theory to suggest how gendered subjectivities are historically situated.

Drawing on recent qualitative semi-structured interviews with two generations of Bulgarian women the paper explores the significant changes and continuities in family practices and values. It focuses on the moral negotiation of existing norms and “new” non-conventional practices and demonstrates cross-generational differences and similarities.

The author suggests that there is an increasing importance of choice in shaping intimate life journeys, but points to the embeddedness of decisions in pre-existing gender unequal social contexts. Therefore, it is argued, choices and practices related to family and intimate life have to be seen as results of dynamic negotiation but also as regulated by certain practices with rather stable and normative status that are taken for granted by individuals and “transmitted” between generations.

FAMILY AND STEPFAMILIES: BETWEEN STRUCTURES AND CHOICES STRUCTURING RELATIONSHIPS
Ivan De Carlo 1, Gaëlle Aebly 1

1Département de sociologie, UNIVERSITY OF GENEVA, Genève, Switzerland

Abstract: The following presentation explores issues related to the gap between the demographic composition and the actual family configurations based on elective ties in an era of rapid social changes. New theoretical and analytical tools have to be employed to understand new family processes.

Family demographic composition includes living and available family members. It depends on age, position in the life course and critical events such as divorce, death, birth, etc. For instance simple household composition is often used to study family transformations. To our mind, this kind of approach focusing only on structural constraints misses the understanding of real family life and dynamic in contemporary societies.

Another approach suggests considering actual relationships between people. Individuals are asked to report important family members in their current life (cf. Family Network Method in Widmer, 1999, 2000, 2006). Only the interdependencies among the relevant family members are considered. This configurational perspective of the family enables to understand how structural constraints are managed by individuals. Relational dynamic within family can indeed strongly mediate structural effects and bring about individual agency in family processes.

We analyze a sample of 150 women from first-union families and 150 women from stepfamilies. We show relevant differences between demographic structures (living and available family members) and family configurations stemming from relevant family members.

Two typologies are described and discussed. The first one is based on demographic composition, the second one on nine family configurations describing specific relational patterns among relevant family members. Analyses are performed to compare the two typologies. We point out that demographic composition is far away from being an equivalent for family configurations. Furthermore the distinction between first union and step families does not explain family configurations. Drawing on social constraints individuals make choices to create their own family. These individual choices lead to the reallocation of resources and constraints in new ways.

SHARING SENSITIVE INFORMATION: NEGOTIATING FAMILY RELATIONSHIPS IN THE CONTEXT OF ASSISTED CONCEPTION AND NON-GENETIC KINSHIP
Petra Nordqvist 1, Carol Smart 2

1Sociology, University of Manchester, 2Sociology, The University of Manchester, Manchester, United Kingdom

Abstract: This paper seeks to contribute to a debate about the changing nature of family life in a time of flux and transformation by exploring how new medical developments and conception methods impact on family relationships. It draws on data from an ongoing research project exploring how couples who conceive using donated sperm, egg or embryos negotiate disclosing and sharing information about their conception process. In the last decade assisted conception using donated gametes has become an increasingly widespread method of conception among heterosexual as well as same sex couples, and one that alters cultural idioms of family and biogenetic connectedness. Following recent regulatory changes in the UK, parents of donor conceived children are now strongly encouraged to disclose to their children information about their “true” biogenetic origins. However, recent research suggests that many parents are hesitant about telling the conceived child about his/her origins, and also about sharing information with family members. In an ongoing study conducted at the Morgan Centre for the Study of Relationships and Personal Life, University of Manchester, UK we explore how lesbian and heterosexual couples who conceive using donated gametes negotiate sharing information about their conception with their children, families of origins and also others. Drawing on new data from qualitative interviews with
couples, in this paper we explore the sensitivities that emerge from telling family about donor conception, and they way in which couples negotiate these sensitivities with family members. We shall explore why it is that although many couples decide to share information with their families and relatives, to do so is not necessarily easy or straightforward.

WEB S OF LOYALTY AND FAMILY CONFIGURATIONS IN FLUX
Anna-Maija Castren
1
1Department of Social Research, UNIVERSITY OF HELSINKI, University of Helsinki, Finland
Abstract: The paper focuses on the concept of loyalty and its possibilities in configurational research of family relationships. As a developed analytical construct loyalty figures in the field of family therapy, and it is of central importance in the approach called the contextual-relational model developed in 1970s (see Boszormenyi-Nagy & Spark [1973] 1984). In this model especially the biological existential basis of family loyalty is emphasized while marriage and other forms of partnership receive less attention. Loyalty has also figured in studies on friendship (see Baxter et al. 1997) where it has been approached from a dialectic perspective: loyalty becomes meaningful only when united conceptually with the possibility of its opposite, the betrayal. The aim of the on-going research presented in this paper is to investigate the evolvement and dissolution of loyalty structures in family configurations. The empirical focus is on datasets collected at the time of wedding (social networks of young couples getting married for the first time) and after the family dissolution (social networks of mothers and fathers who have divorced). The first years of marriage cement a couple as a new loyalty unit in the wider configuration of family ties. The birth of children is often followed by the strengthening of the borders around the unit, but also significant new loyalties are formed especially towards in-laws who are now connected by a biological link. At the family break down the loyalty unit dissolves and considerable strain emerges towards the loyalties in in-law relations which may, nevertheless, survive to the post-divorce situation. The research investigates the formation and dissolution of loyalty structures as the objective is to make sense of the dynamics that produces worsening conflicts between divorcing parents. Can loyalty structures of contemporary family and kin configurations help us understand why are there so few signs of cultural adjustment on the socio-emotional level to divorce and diversification of family forms?

IMMIGRANTS IN PORTUGAL: HOW DO THEY MARRY?
Madalena Ramos 1, Ana Cristina Ferreira 2
1CIES-IUL, 2Dinâmia/CET-IUL, ISTC-IUL, Lisbon, Portugal
Abstract: Throughout its history Portugal has gone through different cycles of migration: from an emigration country has changed to an immigration one. As a matter of fact, the foreign population has been growing in Portugal since the sixties, especially after the Revolution of April seventy four and in the nineties. The growing weight of immigrant communities was accompanied by a new phenomenon – intermarriage or mixed marriages. In Portugal, in a context where the numbers of marriage have declined, the relative importance of these marriages has grown. While in 2001 they represented about 20% of all marriages, in 2009 they were already approaching 26%.

Given the importance that mixed marriages may have as an engine to social changes, the analysis of its patterns and trends is particularly important. In this presentation, we will present the evolution of marriages occurring in Portugal, where the husband and/or the wife were born in another country. The data for our study are taken from national official statistics: the marriage micro data from 2001 to 2009.

Our goal is to design the overall profile of the individuals involved in this kind of marriage and respond to questions such as: Do immigrants mostly marry within their group (endogamy)? Do different communities marry in a different way? Are there different levels of exogamy between men and women? Is there a tendency for “marriages between equals”, whether in age or in educational resources?

IS IT ALL ABOUT FREE WILL? FORCED MARRIAGE AT THE INTERSECTION OF DISCOURSES ON GENDER, FAMILY VIOLENCE AND MIGRATION
Melanie Goisaufer 1, Rossalina Latcheva 2
1Department of Sociology, INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria, 2Institute of Sociology, University of Zurich, Zurich, Switzerland
Abstract: Forced marriage is seen as a form of domestic violence which appears in the private sphere of the family. Some scholars discuss forced marriage as a violation of human rights, others as a product of traditional practices and still others as a product of diasporic experiences. All these different perspectives from which forced marriage can be looked at, especially when it concerns modern democratic societies, locate it at the intersection of gender and migration regimes and require an analytical framework which explicitly considers social structure.

Based on in-depth interviews with victims of forced marriage and on expert interviews with representatives of local government agencies and NGOs in Austria, the paper aims at analysing forced marriage as a process consisting of different stages, for which different meanings, practices and consequences becomes inherent. Following a praxeologically informed analysis of this process, we focus at three central issues: (1) Which practices become relevant at the different stages and how do they interrelate with gender, class and ethnicity; (2) What motivates the (re)activation of specific practices in the migration context? (3) How are these practices framed by current scientific debates, public and political discourses on migration and integration and local practices of prevention and intervention?

SOCI OLOGICAL DISCOURSE ON FAMILY REUNIFICATION AND REDEFINITION OF FAMILY RELATIONS POSED BY MIGRATORY EXPERIENCE
Beata Sokolowska 1, 2*
1Sociology, TRINITY COLLEGE DUBLIN, Co Dublin, 2Social Sciences, TCD, Dublin, Ireland
Abstract: Problematising family reunification in the light of the recent transnational migration opens an interesting debate for redefinition of family relations. It is commonly argued, that migration ‘is transformative process with profound implications for the family’ (Suárez-Orozco 2001) in terms of socio-cultural adjustment in
the host country, and family reunification however, migration does not exist in the vacuum. Moreover, the social construct of family relations in the light of family reunification is insufficiently explored. With recent dramatic social and economic changes, there is a need for updateability. In general, we are all aware that migrants’ mobility is driven mainly by economic imperatives; however, qualitative studies on immigrant families provide an important insight into nuances of individual migratory experience, and into our better understanding of transnational migration.

This paper analyses adaptation of Polish immigrant families examining the reunification of Polish immigrants in Ireland, drawing primarily from the qualitative data obtained during the exploratory longitudinal research study. The first findings reveal that family reunification is a multifaceted process. The experience of separation from and re-unification with in conjunction with the lowered status in the host country, often accompanied by restricted social mobility, requires very dynamic and demanding relations. Additionally, the complex processes of family relation and adaptation underg overlay a permanent process of re-definition and re-construction accounting for variation in acculturation trajectories. The study brings to light unique data on decision-making within reunited entity. A dynamic construct that evolves in response to contextual migratory factors constantly re-define dynamic family relations. Strength of the study lies in its longitudinal design that allows for investigation of dynamic family relations accounting for the Celtic Tiger period and current Irish economic downturn. Conflicts in family values imbedded in the acculturation process, ‘negative social mirroring’ and ‘acculturative stress’ often poses substantial challenges for the family as unique entity. Because of the varying pressures and opportunities each re-united family encounter its own momentum and has its own choices to be made.

CONTACTS BETWEEN ADULT GENERATIONS: A EUROPEAN COMPARISON

Betina Isengard 1, Ronny König 1
1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: Next to financial support, care and help or support of grandchildren, contacts between parents and their adult children are another important form of intergenerational (so-called associational) solidarity in contemporary societies. Thereby different kinds of contacts and also their frequency depend strongly on geographic proximity between adult generations, which itself is strongly influenced by socio-economic determinants. Although contacts between parents and their offspring are not only relevant for the individuals themselves but also for society in general (e.g. social isolation in advanced age), little is yet known about the determinants and especially about country-specific divergences or convergences.

For this reason, this contribution analyses contacts between generations in different European countries. What individual characteristics and family structures influence contacts between parents and their adult children? Are there any country differences observable, and if so, how can they be explained? One important consequence of proximity or distance is the kind and the frequency of contacts between generations. While numerous contacts between parents and adult children living (close) together are the norm, what about those parents and adult children who do not live together? In which way and how often do they keep in touch?

To investigate individual, familial and cultural-contextual determinants of contacts the empirical analyses are based on the Survey of Health, Ageing and Retirement in Europe (SHARE) including in 14 European countries, ranging from North Europe and West Europe to South Europe and finally to East Europe. Using logistic multi-level models, we can observe that especially socio-demographic and socio-economic determinants (e.g. gender and age) are important predictors for contact frequency as well as the family situation of both parents and children. Contacts also strongly depend on the geographical proximity between generations and on the individual educational level. Altogether, explaining differences in regard to contacts between generations, individual determinants and also the family structures play an important role in European countries. Nevertheless, there are substantial country-specific differences observable, as, for example, intergenerational contacts are more often observable in the South European countries and Eastern Europe.

HAPPY TOGETHER? - FAMILY STATUS, PARENTHOOD AND WELLBEING AMONG MEN AND WOMEN IN OLD AGE

Karina Nilsson 1
1Department of Sociology, UMEÅ UNIVERSITY, UMEA, Sweden

Abstract: Family is not only an important part of our everyday life, it can also act as disruption, facilitator or as a base of resources in our lives, and the make-up of our families can have lifelong consequences for our welfare. This paper focuses on the importance of family structure on one important welfare dimension, psychological wellbeing. The aim is to explore the relation between family status and self-reported wellbeing among older men and women in Sweden. Family status can mean many things, in this study focus in placed on living arrangements as well as parenthood status. The meaning of living with a partner, different forms of living alone (being divorced, widowed or single) as well as having children or not is analyzed in relation to other background variables. Results indicate that the self-reported health or men and women is differently affected by both current family form and being a parent of not. This is studied through utilizing the Swedish Panel Survey of Ageing and the Elderly (PSAE) it is possible to study welfare outcomes among older population in Sweden. This survey, which was conducted 2002 and 2003, is an extended version of the yearly conducted Swedish Survey of Living Condition panel (ULF). In PSAE those aged 65 and over were over-sampled, and the questions are relevant to this older population.

INTERGENERATIONAL PREFERENTIAL CRITERIA FOR SPOUSE SELECTION

Abida Imran Sabir 1, Imran Sabir 2
1 Laboratoire PRINTEMPS, UFR de Science sociale, UNIVERSITE VERSAILLES, UVSQ, FRANCE, Saint Cyr L’ecole, 2université de Paris-Sorbonne (Paris IV), Paris, France

Abstract: This paper shows how the process of spouse selection modulates the primordial ties of kinship and imperceptible changes within familial relations in the lifespan of two generations: parents and their children in urban and rural areas. These comparisons
were made to identify spouse selection preferences of both generations and to find out the controversial criteria in a transitional society (Pakistan). Data were collected qualitatively through indepth interviews in 2010. In Pakistan, individual’s social life is circled mainly by family and kin. Though the importance of familial support is still there, but it is the individual indeed who is mainly supposed to finalize the decision regarding the extent and nature of his/her relationships, family composition and marital affairs. Thus preferential criteria of spouse selection have a direct connection with the family trends in composition and functions. These trends have changed through the advent of modernity as currently they are not same as were in the past with the elder generations. Simultaneously Pakistan being traditional and transitional society, individuals’ (either parents or their children) relationships are not standing exclusively on the two opposite edges of the monochrome of individualism and collectivism. Hence, they contextualize their criteria and choices of spouse selection in order to make compatibility with each other’s. It was observed that predominantly in both urban and rural areas intergenerational differences of opinions related to kinship ties, family formation and marriage choices came to a greater degree as more controversial. Divergences of criteria for spouse selection actually were the ways of perceiving similar ideals but differently for both generations. Differences of opinion over the issues of: how to choose a spouse; parents’ authority over final decision; and, living arrangements and composition of family were clearly the high concerns of parents and children. After scrutinizing the preferential criteria of both generations across geographic areas, the researcher anticipates that the trends of idealism between parents and their children will be more controversial in near future due to the changing familial conditions, modernization, redefined gender roles and high geographic mobility.

DISCOVERING THE NEW FATHER – INVOLVED FATHERHOOD, GENDER CONFLICTS AND IMAGES OF MASCU LINITY

Michael Meuser

Abstract: During the last decades fatherhood gained increasing prominence in public and political discourses on the family. Fathers are confronted with new expectations how to shape the paternal role. The “new” father who is involved into domestic work and child rearing became a popular, nevertheless disputed figure. Involved fatherhood is described and discussed in relation to the traditional figure of the male breadwinner, still remaining the dominant cultural pattern of defining fatherhood. Because this figure is a cornerstone of hegemonic masculinity redefining fatherhood affects not only the whole gender arrangement of the family, but also patterns of masculinity.

Relying on data from an ongoing qualitative study in which spouses are interviewed together it will be shown,

• that involved fathers have a biographical blueprint that differs from the so called male ‘standard biography’; they are less ambitious concerning occupational career than the majority of men, and interpret their career break for the benefit of family duties in a positive way;

• that involved fathers do not only relieve women from family duties, but also challenge established spheres of influence dominated by women; involved fatherhood requires a re-negotiation of established relations of intra-familial power;

• that under the auspices of involved fatherhood the family tends to become a battlefield of distinction between the sexes; the ‘frontline’ is no more the ‘frontier’ between the private and the public, but is shifting into the family;

• that family work becomes an important arena of constructing masculinity that it is not in the case of traditional division of labor between wife and husband.

According to our data, the ‘project’ of involved fatherhood succeeds if wives do not defend the domestic sphere as a terrain being exclusively under their command. Given this condition, involved fathers can even develop a sense of masculine superiority compared to those men who are focused on their career – being progressive modern men who prove masculine autonomy in both spheres, the public and the private. On the contrary, in those families where the wives claim possessing the competence and power of defining the standards of good domestic work, it is difficult for involved fathers to preserve a sense of masculine autonomy. Doing domestic work under the wife’s guidance is not compatible with socially accepted patterns of masculinity.

EQUALITY-MINDED PARENTING? GENDERED VALUES AND GENDERED BEHAVIOURS IN THE SOCIALIZATION OF CHILDREN IN A NORWEGIAN REGION CHARACTERIZED AS THE LEAST EQUAL

Ann Christin Eklund Nilsen1, Ove Skarpnes2

1AGDER RESEARCH, Kristiansand, Norway, 2Welfare department, AGDER RESEARCH, Kristiansand, Norway

Abstract: In this paper we explore in what ways parents act and express gender equality-promoting values in the socialization of their children. The research project has its origin in statistical findings indicating that there has been a long-lasting regional variation in the attainment of gender equality in Norway, where the southern region has been identified as the least gender equal. This is likely to be caused by an interplay of economical, political and cultural structures. The project seeks to explore the cultural dimension, asking if it is possible to identify some structures in how socialization values favoring gender equality and/or inequality are passed from one generation to the next. Data is generated through individual in-depth interviews with 8 mothers and 6 fathers. The focus in the paper is on how the parents both explicitly and subtly, and in both words and actions, express or oppose to gendered values and gendered behaviors in relation to their children.

STRANGERS BUT ITALIANS. SECOND GENERATION YOUNG AND INTERGENERATIONAL RELATIONSHIPS

Luisa Leonini

1dept. of Social and Political Studies, UNIVERSITY OF MILAN, Milan, Italy

Abstract: The aim of this paper is to present some results of a research conducted in the period 2008-2010 in Milan on secondgeneration young immigrants. The research had the aim to study secondary school students, of foreign origin, aged 14-20 to understand how they defined themselves, if and how they lived their strangeness, and how they perceived themselves when comparing
themselves with their Italian classmates. Did they define themselves as Italian, as foreigners, as a cultural hybrid; did they experience their foreign origin as a resource or a burdensome? How did they experience intergenerational conflicts within the family if compared to Italian adolescent? And what did it mean for them to be at the same time foreign and Italian young person. Their origin did not seem to influence their ability to integrate in the Italian context. Other variables seem to play an important role. A typology has been built in order to explain the different identity strategies of these young people and we argue that family cultural capital, independently from the work the parents have in Italy, all together with the parents ability to build and maintain a network of relationships either with compatriots or Italian, and the amount of time they have been living in Italy can explain some of the differences we have found in second generation young people identity strategies.

**CHANGES IN THE SHARE OF DOMESTIC TASKS DURING THE TRANSITION TO PARENTHOOD**

Jean-Marie Le Goff 1, Nadia Girardin 1

1Laboratory of life course research, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: The concept of gendered master statuses as formulated by Krüger and Levy (2000 & 2001) postulates the predominance of integration in a specific area of social life which differs between men and women. For men, the primary integration is in the professional sphere whereas family integration is subordinated to the primary one. In the case of women, the primary area of integration is the family whereas the occupational career is subordinated to family insertion. This can be seen by the fact that the professional career of women is often regulated by family events contrary to men for whom family events do not mean changes in the professional life. The main hypothesis of the research “Becoming a parent” realised in the French-speaking part of Switzerland is that the gendered master statuses are activated by the transition to parenthood. Until the birth of their first child, couples are living more or less equally in conformity with social norms that promote equality in gender relations, while they are living with more traditional roles after the birth in conformity with other norms that encourage mothers to take care of children.

The design of the research “Becoming a parent” is a panel survey in which couples were interviewed three times: a first time when the woman was pregnant of her first child, the second time when the child was aged four to six months and a third time when he/she was between one and two years. At each wave, couples were interviewed about the share of domestic tasks and, from the second wave about the share of child care. They were also interviewed at each wave on their expectations about these shares in the next few months. In our communication, we will cross expectations for the future and what finally arrived.

Descriptive analyses show that couples often become more traditional after the birth of the child, even those who declared egalitarian intentions before the birth. Same results are observed in the case of child care. These descriptive results are confirmed with regression analyses that show that intentions about share of domestic tasks and child care do not predict facts. Moreover, expectations as expressed at one moment of the time seem to depend from the situation of domestic share and child care of the moment.

The hypothesis of the manifestation of gendered master statuses during the transition to adulthood then appears to be confirmed.

**GENDERED LIVES: CLOSING IN OR MOVING APART?**

Maria das Dores Guerreiro 1, Karin E. Wall 2, Helena Carvalho 1, Vasco Ramos 2

1CIES-IUL, INSTITUTO UNIVERSITARIO DE LISBOA (ISCTE-IUL), 2Instituto de Ciências Sociais, Universidade de Lisboa, LISBOA, Portugal

Abstract: Gendered lives: closing in or moving apart?

Karin Wall, Maria das Dores Guerreiro, Helena Carvalho, Vasco Ramos

This chapter addresses the implications of gender inequalities for the life trajectories of men and women in contemporary Portuguese society. Women’s labour market participation and changing social, political and economic contexts over the last three decades have undermined the system and assumptions of the male breadwinner and female housewife model. Political reworking of the work/family/welfare relationship into dual earning has individualised gender roles and challenged the structures that supported gender inequality in state and family. Nevertheless, as in other European societies, gender equality is far from achieved. On the other hand, European integration and enlargement is bringing new challenges as it draws together gender and family regimes with contrasting histories and pathways, as in the case of Portugal.

The main aim of the chapter is to map the gendering of life paths across the life course and to discuss how the gender divide plays a key role in the changing lifecourse regime. It will analyse gender effects on the life course within the frame of some taken-for-granted hypotheses regarding life transitions, trajectories and investments in western late modernity: the new timing of transitions; the pluralization of the lifecourse; and the idea, less widely discussed, of the gender lag in the life investments of men and women. We begin by mapping a) the gendering of transitions b) the shape and interdependence of trajectories c) the life investments of men and women, in the context of social and historical time.

Drawing on mean ages and intervals between major life events in childhood and early adulthood – leaving school, first experience of work, entry into paid work, leaving home, first experience of geographical mobility, entry into conjugal life and parenthood - we begin by comparing the gendering of the life calendar and the degree of “dis- or re-ordering” in the timing of transitions across three different generations of men and women. Optimal matching is then used in order to identify the gendered patterning of trajectories and multichannel analysis to identify interdependencies between trajectories. In a third step, factor analysis is used to identify male and female investments in different domains of life.

**MIXED COUPLES AND CONFLICT AMONG PARTNERS IN SIX EUROPEAN COUNTRIES**

Pedro Romero-Balsas 1

1Department of Sociology, AUTONOMOUS UNIVERSITY OF MADRID, Madrid, Spain

Abstract: Although endogamy is still predominant in the majority of couples, the rise of mixed couples in several European countries increases the number of partners which must deal with intercultur-
al issues inside the couple. The aim of this paper is to analyze the
relations between mixed couples and conflict. The term mixed cou-
ple is defined as people who declare themselves having a partner
from a different nationality. Our main hypothesis is that, according
to the literature, mixed couples have more probability of conflict
than endogamic couples. Moreover, several studies refer to socio-
economic aspects, personal attitudes and children as factors which
can increase (or reduce) conflict in mixed couples. Thus, we use the
control variables of gender, family, work conditions and education
in order to consider its impact on conflict. In this paper we propose
an empirical model using logistic regression. Conflict is measured
through stress induced conflict with partners. The analysis is based
on the microdata of Job Mobilities and Family Lives in Europe
http://www.jobmob-and-familives.eu/, a survey of people living in
six European countries (Germany, France, Spain, Switzerland, Po-
land, and Belgium) and representative at the national level of peo-
ple aged 25 to 54. The survey was conducted by phone during the
first half of 2007 and the sample size includes 7220 interviews. Still,
the analysis considers only people living with their partner, which
reduces the sample size to 3977 interviews. Our main findings are
that conflict among partners can be explained by work conditions,
family and personal factors. However, being part of a mixed couple
is not reason enough to come into conflict with a partner. In addi-
tion, major levels of inequality in other areas – such as educational
heterogamy – shows a significant effect on mixed couple conflicts.
Finally, we provide several hypotheses which could bring about
these results.

cultural Couples, Bi-national Couples

GENDER ROLES IN BASHKIR AND MIXED FAMILIES
AND THEIR INFLUENCE ON REPRODUCTIVE BEHAVIOR

Vladimir Kozlov, Rosalia Fakhrislamova

Abstract: The article is devoted to the distribution of gender roles in
families of the Bashkortostan Republic. The territory was chosen
because it is one of the most interesting Russian regions, multina-
tional characterised by widespread multiculturalism. The main
purpose of the research is to find on the first stage the main gender
role patterns and their main determinants (economic, cultural,
socio-demographic). On the second stage we plan to find how gen-
eral role distribution within the family influence the demographic
(mainly reproductive) behavior and to construct the model, which
explains the situation.

The research is based on quantitative surveys (one is devoted to
demographic development of Bashkortostan and the other to the
role of Bashkir man in the modern society) conducted by the Centre
of social and political researches (Bashkir branch of the Russian
academy of science) and qualitative surveys, conducted by the au-
thors.

SOCIAL CLASS AND ATTITUDES TOWARDS FAMILY
AND GENDER ROLES: AN INTERGENERATIONAL
PERSPECTIVE

Tiago Carvalho, Vasco Ramos

Abstract: The main aim of this paper is to analyze the interconnect-
eness between social change and social class, specifically in relation
with values towards family life and gender roles among different
generations, using the analysis of a survey data from fieldwork
carried in Portugal.

The specific objectives are: (1) to understand how values towards
family life and gender roles have changed; (2) to map structural
change in terms of social class; (3) to extend the understanding of
the relationship between social class and attitudes. The text aims
to discuss, on a theoretical level, the questions raised by the so
classed “death of class”, taking into account socio-historical change
and socialization contexts, more specifically within the family, and
to demonstrate both the theoretical / logical and empirical weak-
nesses of these proposals.

This is an area of current debates, and we aim to demonstrate that
differences in various dimensions of attitudes towards family life
and gender roles arise not only from generational differences but
also from positional differences. We also review, summarily, the
literature on values and attitudes in several areas, although with a
stronger focus on family issues.

The variables that we analyze are: (1) generations (independent
variable); (2) social class (moderator variable); (3) attitudes towards
family values and gender (dependent variable – different measures).
We will conduct an integrated and systematic analysis of the relation-
ship between social formations and a set of issues related with family
life, the way it is organized and the importance it assumes in individu-
als’ lives, according to more differentiated or egalitarian, and more
traditional or modern conceptions. The atti-
dudes are divided into different issues: marriage and cohabitation;
centering on the family; division of household work; new family
forms; and last reproduction and the role of children.

This analysis will allows us to understand social change, but also the
differences between social classes. Our general hypothesis points
to a general change in attitudes towards more liberal attitudes,
however this relationship is moderated by social classes, ie, dis-
tances and differences between them persist.

THE EFFECTS OF FAMILY STRUCTURE ON THE
TRANSITION TO TERTIARY EDUCATION IN EUROPE: A
LONGITUDINAL AND COMPARATIVE PERSPECTIVE

Martin Kreidl, Martina Stipkova

Abstract: Family structure during childhood and adolescence has
been recognized as an important predictor of educational attain-
ment and is frequently included among the covariates in quantita-
tive investigations. However, the size, statistical and substantive
significance as well as interpretation of the effects of family struc-
ture are inconsistent across various studies. Some papers showed
strong advantages associated with a two-parent family, while other
failed to find significant net effects of family structure. Possible
explanations of this inconsistency include the variability in the
measurement of family structure, population composition effects,
and changing self-selection patterns.

The proposed paper examines the effects of the various types of
non-intact family structure upon the transition into tertiary educa-
tion in Europe in a comparative and longitudinal perspective. We
use binary logistic regression to model university entry among secondary school graduates using data from eight countries (Austria, Bulgaria, France, Germany, Netherlands, Norway, Romania, and Russia) that participated in the first wave of the Generation and Gender Survey, have made their data publically available and have included relevant measures of parental background.

Family structure — a key predictor in our models — is a detailed measure of the family structure differentiating two-parent families, one-parent families created by the break-up of the parental couple, or resulting from the death of one parent, or produced by single motherhood. The measure also incorporates (in case parents broke up) information on the timing of the break-up.

The models also control for cohort, country, parental socioeconomic status(es), family size, and respondent’s gender (and possibly some interactions). We explore whether the effects of family structure vary across the specific type of family configuration as well as across cohorts and institutional contexts — as some literature has suggested — in a predictable manner.

THE SPATIALIZATION OF INTER-PERSONAL RELATIONS IN THE FAMILIAL SPACE IN PAKHTUN CULTURE

Gabriele Griffin 1, Muhammed Saeed2

Centre for Women’s Studies, University of York, University of York, York, United Kingdom

Abstract: This paper explores masculinity, gendered inter-personal relations and domestic violence within the context of Pakhtun culture in the Khyber Pakhtunkhwa Province of Pakistan. As a tribal region of Pakistan, Khyber Pakhtunkhwa has been one of the most turbulent spaces in Pakistan, socially and politically. Strife and both low- and high-level forms of conflict are the norm rather than a state of crisis here. The paper argues that the specific gendered spatialization which governs the familial sphere, and by implication the public sphere, in that culture, and the imbrications of that spatialization in the complex and contradictory construction of masculinity within Pakhtun culture, leads to what we term ‘beleaguered’ masculinity. This, in turn, together with the particular forms of spatialized management of gendered familial relations in Pakhto culture, promotes certain forms of domestic violence, significantly named ‘family conflict’ in Pakhto. Our paper then argues that particular types of spatialized familial structures promote certain forms of violence.

The paper is based on original empirical research in the form of interviews with men in Khyber Pakhtunkhwa conducted in 2009. It presents data on an area and familial structures that are not often discussed in the European context.

MIDDLE CLASS FAMILIES IN RUSSIA: MANAGEMENT OF EMOTIONS AND WORK ON "RELATIONSHIP"

Larisa Leonidovna Shpakovskaya1

Department of Sociology, HIGHER SCHOOL OF ECONOMICS, St Petersburg, Russian Federation

Abstract: The paper presents the everyday meanings of family relations in the middle class families and partnerships in contemporary Russia. The notion of class is drawn from Bourdieu’s thinking and conceptualized as lived experience, lifestyles and capitals possessed and shared by its members. Such spheres of family life as division of house and childcare work in couple, education of children and rapport with older generations (grand parents) were studied using interviews with representatives of middle and lower classes. The family relations are described with the following analytical notions: emotional work, work on "relationship" and management of self. These aspects are highly class dependent in Russian context and can be seen as class boundaries. The results of research are put into current academic discussion about the directions of gender order transformations in Russia and Europe: paternalism vs liberalism, traditionalism vs egalitarianism. These tendencies are different for different classes in Russian context and depend on lifestyles, values and capitals possessed by their representatives.

TRENDS IN UNMARRIED AND UNPARTNERED MOTHERHOOD IN THE CZECH REPUBLIC

Martina Stipkova 1,2

1Department of Sociology, UNIVERSITY OF WEST BOHEMIA, Pilsen, 2Department of Sociology, CHARLES UNIVERSITY, Prague, Czech Republic

Abstract: Czech children are born to markedly different families today than only twenty years ago. Parenthood is less universal, postponed to later ages, and less tied to marriage. Especially the rise of non-marital births is often pointed to: the proportion of children born outside marriage increased from 8 to 39 percent between 1989 and 2009. However, the official registration lacks information about whether the unmarried mothers have partners. So, we do not know, to what extent can the increased share of out-of-wedlock children be explained by rising spread of unmarried cohabitation.

This paper aims to fill this gap in knowledge and focuses on the trends in family forms children born to in more detail. Monitoring these trends is important for the assessment of life prospects of next generations, because the family arrangement at the beginning of life is related to later conditions and outcomes such as experience of poverty, educational performance, or health status. Moreover, having a child without being married or without having a partner is more common among women with lower socioeconomic status who, in general, live in worse material conditions, have less supportive social networks, worse health etc.

The goal is to capture trends in the unmarried and unpartnered motherhood and its social stratification in the Czech Republic. I use data from a longitudinal survey of Czech household, the Labour Force Survey 1993-2009. I restrict the dataset to the households with a child younger than one year (N=8243). I define two binary dependent variables: unmarried motherhood and unpartnered motherhood. I estimate logistic regression models of these outcomes on period (3 categories: 1993-1998, 1999-2004, 2005-2009), maternal education (4 categories: elementary, vocational, secondary, tertiary) and their interaction. I also control for maternal age.

Preliminary results show that the proportion of unpartnered mothers increased during the study period, but larger part of the above mentioned rise in unmarried motherhood is to be attributed to unmarried cohabitation. As expected, the higher is the mother’s educational level the lower is her chance to have a child outside marriage. However, once the mother is not married, her educational attainment does not predict whether she has a partner. The magnitude of educational differences in unmarried motherhood has not changed significantly over the study period.
BECOMING A FAMILY TODAY: ADJUSTMENT AND NEEDS OF FIRST-TIME PARENTS IN THE POSTPARTUM

Isabel Margarida Marques Monteiro Dias Mendes 1, Zaida de Aguiar Sá Azeredo 1, Rogério Manuel Clemente Rodrigues 1
1ESCOLA SUPERIOR DE ENFERMAGEM DE COIMBRA, Coimbra, 1ICBAS-Universidade do Porto, Porto, Portugal

Abstract: Background: Nowadays families become smaller and urbanization can be a constrain to improve the relationships between extended family. Postpartum is a time of adjustment and adjustments to the parental role. This transition calls for changes in role relationships, especially in the first-time parents. The aim of this study is to understand the adjustment of the first-time parents to the parental role in postpartum. Design: qualitative study using descriptive phenomenological method. Participant/Sample: S natuation of data was obtained with a group of 25 first-time parents of a newborn at term; parent’s age between 18 and 35 years of age; with at least first degree of education; in a regimen of cohabitation. Discussion: Two essentials structures emerged, the first described a positive experience and the second a negative experience. From the positive key constituents we highlighted: the pregnancy and the birth as periods of transition to the parental role; the father involvement and a positive co-parenting relationship are positively associated with relationship quality after the birth of a child among cohabiting and married parents; the sense of responsibility to the parental role; the greater cooperation of the couple in the home tasks; the emotional and instrumental support of the maternal grandmothers; strengthening of the familiar relationship. As negative key constituents: insecurity and inexperience in baby care; experiencing of parenthood as an exhausting experience with emotional vulnerability that is labelled as a period of lack of time to take care of oneself; less time for the couple and less social activity. The health professional’s support it did not come up to both parents needs/expectations. Conclusions: The transition to parenthood is arguably one of the most stressful times for a family. There are many changes to parents’ daily routines, increased worry and stress, greater responsibility, lack of sleep, and increased financial expenses. This study provides qualitative data related to essentials structures of the transition to the parental process and the adjustment of first-time parents in becoming a family, where the interaction with the baby, positive co-parenting relationship, the maternal grandmother support and the support of the health professional are key elements to their adjustment during this time of transition.

FAMILY AND MARRIAGE IN THE LIFE PLANS OF RUSSIANS FOR PRESENT TURBULENT TIME

Antonina Noskova 1,2
1Sociology, MOSCOW STATE INSTITUTE OF INTERNATIONAL RELATIONS, 2Sociology, Russian State Social University, Moscow, Russian Federation

Abstract: The study is addressed to a problem of the family-marryage behavior transformations in Russia for the present turbulent time.

The subject of the paper is the conflict between the modern types of demographic behavior and the Russians traditions in the marriage and the family. On the one hand, the family processes in Russia are similar to ones in other European countries. On the other hand, they have some interesting peculiarities. These two points cause some contradictions in the family behavior of Russians. For example, in Russia, the current birth rate is very low now, it is lower than in some European countries, e.g., in France, Sweden. But even today, the family values for Russians are in the first position of the hierarchy for the life values. So, according to the sociological surveys about the most important life priorities, 75-80 percent of Russians put “the family” on the first position. Another contradiction is that there is a high divorce rate in Russia and, simultaneously, there is a high satisfaction of the marriage relations. So, 72 percent of Russians positively estimate their marriage. There are some other contradictions, which are analyzed in the parer. These facts correspond to the available data of the nation-wide sociological surveys, which are being carried out by the Russian State Social University in 2006-2009, and some current statistic documents.

The next point of the paper is the investigation of the factors, which determine these contradictions in Russia. These are the cultural traditions of Russians and the historical peculiarities of the Russian family evolution, the social and economic crisis of 1990s, modern social processes and others.

In the conclusion, there are analyzed some possible future trends in the Russian family transformation.

FAMILY CARE TO ELDERLY PEOPLE IN PORTUGAL: FROM ISOLATION TO THE INCREASING USE OF INSTITUTIONAL SUPPORT

Luisa Gaspar Pimente 1,2
1Polytechnic Institute of Leiria - School of Education and Social Sciences, Leiria, 2ISCET – UNIVERSITY INSTITUTE OF LISBON, CIES-IUL, Lisbon, Portugal

Abstract: Due to the limited coverage of formal social support networks and the importance of family care for the well-being dependent elderly people, informal solidarities have recently re-attained great meaning. It’s surprising to observe persistent mutual aid and care to elderly people within a family, when social conditions make this role more difficult or, in some cases, almost impossible.

It’s within family that most of elderly people find emotional and material support. However, the solutions found by relatives are more and more related to formal social network. Specialized caregivers are often hired when relatives cannot provide specific treatments or when they need to relieve their work. Thanks to this kind of support, family can continue being in charge of the elderly, avoiding the feeling of burden.

Using the results of a qualitative research, based on 34 family caregivers’ testimonies, we will reflect on the strategies that enable families to care of their oldest members and on the institutional resources that have been put at families’ disposal in Portugal.

NEW PATTERNS OF PARENTHOOD IN TURBULENT TIMES.

Magdalena Smak Wójcicka 1
1sociology, UNIVERSITY OF WARSAW, Warsaw, Poland

Abstract: Work schedules, high requirements from employees, the demand of availability and flexibility, all these labour market features affect everyday life of families. The focus on effectiveness
may be spread to family relations as well, that is why different strategies of managing the family life appear.

My research is a case study of families who send their children to catholic schools in Poland. The aim of it is a description of new patterns of parenthood, the reasons why they decide for this type of school (not so common in Poland, there are only 500 of them), and the way it affects the family life. I assume that people who send their children to non public schools somehow problematize the process of bringing up a child. The catholic schools are part of the private sector but collect minor fees than the private non religious schools. For that reason the socioeconomic status of students and their families is more varied than is other schools.

What is common to those parents is the conviction that bringing up a child is too complicated to do it alone, so a catholic school, in many cases, is used as a supportive institution in this process. Nevertheless, there are two different patterns of incorporate school in the agenda of rising children.

The first is, what I call, a vicarious parenthood, which consists in sending children to a boarding schools (there are no public or private non religious boarding schools). The second one is a close connection between school and household. Among those who send their children to boarding schools there are many post divorced families, single parent house holds, patchwork families. While in the other one faces the assumption that parents are the most important people in school, because their involvement in the educational process and the school life is essential. Each family has its own supervisor, who consults a monthly plan for each child. Besides the school there are informal education institutions like an academy for parents where parents are to be thought how to be good parents using the MBA studies method. Those who use the second type of schools are families, with husband and wife and usually minimum three children.

In both context religion is used in an instrumental way, when the norms of Catholicism are appreciated as bonds generating and community making.

RELIGION AND THE IDEAL LIFE COURSE

Lilith Roggemans 1
1Sociology, VRIJE UNIVERSITEIT BRUSSEL, Brussels, Belgium

Abstract: In this article we are interested in the ideal life course of young people in Brussels. Previous research indicated that in Flanders there exists a consensus among young people about what the ideal life course should look like. Young Flemish people agree on the ideal age to take certain important life events and on the ideal sequence of these life events. No major differences were found between the ideal life course of boys and girls, and high and low educated young people. The mono-culturalism of Flanders did not allow for differences in the ideal life course of various religious groups. Brussels, on the contrary, is a very multicultural city. In 2010 we collected data of 1700 Brussels youngsters, age 14 to 18, by means of a written questionnaire. 44% of all respondents declare to be muslim, 26% is Christian and 31% is not religious affiliated. In this study we explored if the ideal life course of young people in Brussels varies among religious belief. We found some differences in the ideal timing and the ideal sequence of important life events between muslim and non-muslim youngsters. Young muslims do not want to have sexual experience before marriage, they also want to postpone living together with a partner and having children until after the wedding.

SOCIAL-PSYCHOLOGICAL ANALYSES INTERETHNIC MARRIAGE IN AZERBAIJAN

Abulfaz Suleymanov 1
1Sociology, INSTITUTE OF PHILOSOPHY, SOCIOLOGY AND LAW, Bakuf, Azerbaijan

Abstract: Azerbaijan society is living serious changes, especially, from social-cultural point of views. In this process, there are some envitable changes on characteristics of azerbaijanian family. In this relation, the one of the total problem became acceleration causes of marriages azerbaijanians with foreign citizens, that expose revision of traditions and socieetal values.

Purposely, to investigate of this phenomenon, it is done questionaires. In the frame of this investigation 76 respondents (38 azerbaijanian, men and 38 women) was quizzed, getting to international marriages and lived in the different regions of republic and in the abroad. The first block contents 11 questions, related to individual dates, social-economical and social-cultural variables (structure of family and social environment of life, educational level, music and other things).The second parts of investigation contain 32 questions, related to marriage (condition of dates between spouses, average period of marriage, relation of parents to marriage, quantity of children in international marriage, selection of names of children, impact of cultural difference in solving of problem in the family, religious confession, social role of spouses and dividing of responsible between spouses- total- 43 questions).

It dominated male spouses by the origins of western nationality among female respondents (German, Englishman, Frenchman, Scottishman and other nationals) (34, 2%).

Turkey Turks is stated in the second places, in the third place, Slavonians (Russian, Belorussia-15, 8%). The quantity of Muslim and Cristian spouses are equal azerbaijanians female who got a marriage (44, 7%). The quantity of Slavonians (Russian, Ukrainian) national spouses is dominated among male respondents (52.5%). The quantity of cristian spouses is dominated among male respondents (55, 2%). But, Muslim are 44, 7%, Hebrews, 7, 8%. By the origins of nationality that got a marriage with non-azerbaijanians are azerbaijanians by the origins of nationality and Muslim by religious.

SOCIO-DEMOGRAPHIC CHARACTERISTICS OF COUPLES WHO DELIBERATELY ENDS FERTILITY TREATMENT IN DENMARK WITHOUT HAVING CONCEIVED

Lisbeth Bondesen Knudsen 1, Lone Schmidt 2
1Sociology and Social Work, AALBORG UNIVERSITY, Aalborg Oest, 2Dept. of Public Health, University of Copenhagen, Copenhagen, Denmark

Abstract: Studies on fertility in blended families and the impact of ‘yours, mine and our’ children on fertility have focused on various hypotheses regarding the wish for and the meaning of having a joint child, pointing at the complexity of fertility decisions and that relations between and roles of the man and the woman in couple may differ.
The research presented here is part of an ongoing project on "Family histories and establishing of daily life after fertility treatment", including couples, who initiated a new period of fertility treatment at a public clinic in Denmark (covering 63 pct. of all registered treatments) during 2000-2001: The COMPl-cohort (http://www.compiro.dk/). The access to fertility treatment has been regulated by law since 1997, specifying that the treatment could be offered to couples, consisting of a man and a woman.

Both partners were individually interviewed at the initiation of treatment and after 1 and 5 years, irrespectively whether they were still undergoing treatment. In total 568 couples, who had no joint child at the initiation of the treatment have completed all three questionnaires.

We study whether couples, who deliberately end further treatment even though they have not had a child after treatment differ from other couples in the COMPl-cohort, as regards socio-demographic characteristics, infertility related stress and previous family histories. At a further step, it will be studied whether there is a medical or treatment-specific condition having a specific impact on the choice to end the treatment, and if so, if the couple subsequently turn to 'low—technological' treatment (insemination) instead and with what result.

The various data on the partner's relation and experience of stress facilitate analyses of the relative weight of the transition into joint parenthood by having a joint child compared to continuing as a couple without children. Moreover, whether having a child from a previous relation makes the couple more opt to choose to end the treatment. Ongoing studies by other members of the COMPl-group study these couples' reasons for ending treatment, but none of these include information on the kind of family, the couples establish subsequently and whether they include children.

**THE IMPACT OF EDUCATION ON MARRIAGE AND COHABITATION IN FRANCE AND WESTERN GERMANY**

Katja Köppen

Institute of Sociology and Demography, UNIVERSITY OF ROSTOCK, Rostock, Germany

Abstract: Over the last four decades, there have been remarkable changes in the pattern of union-formation and in the extent of having children outside marriage in many western European nations. Next to the spread of low fertility, there are hardly any other changes in family life which were as dramatic as the rapid rise in unmarried cohabitation and non-marital births. The following paper will look at these changes in union formation behavior in more detail by focusing on the analysis of first union formation in western Germany and France. I focus on the impact of women's education on union formation behavior since education has been found to be a strong factor in explaining differences in marital behavior between social groups.

First, the process of diffusion of cohabitation will be studied more closely: has cohabitation been an answer to unstable living arrangements of less educated French and western German women as has been shown for the United States, Great Britain or several post-communist countries; or are highly educated individuals the forerunners in values and behavior connected to new living arrangements such as non-marital cohabitation?

Second, I show whether the growing economic independence of women reduces the risk of marriage as has been predicted by the economic theory of the family, or whether marriage becomes delayed through the continuing prolongation of education and greater bargaining opportunities of women.

The data for this project comes from the German Familienreport (2000) and the French Étude de l' histoire familiale (1999). A competing-risk framework is used to study direct marriage vs. non-marital cohabitation. For the descriptive results cumulative incidence curves were estimated. For the multivariate analysis I applied piecewise-constant hazard-models.

My results indicate that education has different effects on union formation behavior in both countries. While French women with tertiary education are clearly early adopters of non-marital cohabitation, in western Germany the effect of education is less clear. It is more closely connected to educational enrollment than to the final level of education. In addition, the economic independence theory does not hold as explanation for decreasing marriage rates: in both countries women with a university degree do not refuse marriage but rather postpone it to later in life.

**THE INFLUENCE OF RECONCILIATION OF WORK AND FAMILY ON THE REPRODUCTIVE CHOICES OF LITHUANIAN POPULATION**

Giedre Purvanekiene

Department of Education, Vilnius University, Vilnius, Lithuania

Abstract: Much cross-national research on gender inequality have suggested that state policy towards women, work and childcare is one of the main explanatory variables of unequal gender relations at work and at home. Economic incentives to increase employment and population growth significantly reinforce the range of reconciliation strategies developed in post-industrial democracies. The ways in which the transitions between the employment and care is handled and socially protected influence not only the employment rates of women but also the number and timing of births.

The paper based on a representative public opinion survey of Lithuanians of the reproductive age (18-45 y. a.) conducted in March, 2011, attempts to evaluate to what extent tensions encountered by women and men in reconciliation of work and family life affect their reproductive choices and matrimonial needs and possibilities. It also examines the extent to which ideological, cultural, economic and legal structures hinder gender equality and the establishment of egalitarian family model. A representative public opinion survey enables to demonstrate the influence of the mentioned structural factors on Lithuanians’ matrimonial and recreational attitudes and preferences.

**THE INFLUENCE OF UNION CONTEXT ON FAMILY STABILITY - TESTING NORMATIVE INFLUENCES**

Christine Schnor

Laboratory of economic and social demography, MAX PLANCK INSTITUTE FOR DEMOGRAPHIC RESEARCH, Rostock, Germany

Abstract: This paper studies the determinants of union stability of couples with children. Commonly it is assumed that marital unions are more stable than non-marital unions because the latter are less consolidated and do not operate as a long-term commitment. However, cohabiting unions might become more stable the more widespread they become. We test this hypothesis using data from
the German panel study *pairfam* and its supplement *DemoDiff*. Germany is an interesting case in this respect, because of the large East-West differences that exist in nonmarital childbearing. Furthermore, our data allows us to differentiate between cohabiting unions, marital unions and non co-residing couples. We are also able to investigate how changes in the union status over time influence dissolution rates. The results from our event history model shows that respondents who were married at time of conception have the lowest dissolution rates in both East and West Germany, followed by non-marital unions. Non co-residing couples experience the highest risks of separation. If we consider the timing of marriage, some interesting aspects are revealed: marriages starting during pregnancy are negatively associated with union stability in western Germany, but not in eastern Germany. A simultaneous modeling of the probability to be in a married union form at the time of first conception with a hazard model on family dissolution risks reveals that these processes are not driven by joint observed heterogeneity.

**THE ROLE OF THE ELDERLY IN THEIR FAMILIES – FUTURE CHALLENGES**

Klaus Haberkern¹, Tina Schmid¹, Franz Neuberger¹

¹Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

**Abstract:** All European societies are “ageing societies”. The increasing share of older and elderly people is often equated with an increase in old age dependency ratio. The focus on the old age dependency ratio, however, is misleading in two ways: First, elderly people are not only receivers of transfers and support. They provide support such as grandchild care and elderly care themselves. Second, the old age dependency ratio – 65+ vs. 15-64 – is not set in stone. Welfare states can adapt to increasing longevity and healthy life years, e.g. increasing labour force participation rates of older workers.

However, there is much uncertainty about the role of the elderly in the future. On the one hand, the family is subject to change and more heterogeneous than in former decades. What the role of the elderly in their families will be depends largely on family structures, e.g. the availability of family members, and how strong solidarity is in the “new families” but also on the questions: What is the family and who defines it? On the other hand, welfare state policies influence the role of the elderly, e.g. public child care and elderly care services can substitute for family care or legal obligations can enforce family support. Policies to increase older workers and female labour force participation rates limit their time available for informal care and volunteering.

At first, the paper discusses the role of the elderly in their families in European countries, e.g. what do we know about the elderly as providers and recipients of support. We focus on family structure, family life and developments in welfare state policies. Second, future challenges for welfare states and families are discussed against the background of two plausible scenarios developed in collaboration with OECD (Golden Age? and Back to Basic): How do family structures change and what can be the impact on the role of the elderly in the next decades? What effects have recent trends in welfare state policies on the role of the elderly in the future? Finally, we suggest different policy measures to cope with future challenges.

The analysis is based on the Survey of Health, Ageing, and Retirement in Europe as well as various international databases such as the Human Fertility Database, Human Mortality Database, OECD Family Database etc.

**FAMILY MAKING PATHS IN ITALY BETWEEN MORPHOGENESIS AND MORPHOSTASIS**

Giovanna Rossi¹, Sara Mazzucchelli¹, Maria Letizia Bosoni¹

¹Department of Sociology, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

**Abstract:** One of the most significant changes in family structures concerns the process of couple formation: until a few decades ago this transition used to take place according to precise social norms, either expressed or implicit (falling in love, engagement, religious marriage, birth of children). Today, however, in Italy, as in the European context, entering into coupled life may occur in different ways.

The paper illustrates this theme, presenting the specific results of the fourth wave of the European Values Study 2008 (www.europeanvaluesstudy.eu), a large-scale (47 countries), cross-national, and longitudinal survey research program on basic human values.

The work will specifically focus on the Italian sample (1,519 persons). Adults aged 35 - 50 years and 51 - 65 years represent respectively 28,4%, and 24,1% of the total, accounting for more than half the sample size. Young adults (aged 25 - 34) represent a small portion (17, 2%), followed by another 10,8% of young people (18-24 years), while elderly aged over 66 years account for 19,2%.

Through these data it is possible to reconstruct and analyze thoroughly, from the reflection on the morphogenetic process of the family, couple’s formation / dissolution patterns, focusing on those who are currently married; married couples who have co-habited before getting married; separated / divorced with prior cohabitation; separated / divorced who currently live together; live-in partners; unmarried (singles), LAT - living apart together.

For each pattern, we took into consideration ideas, beliefs, preferences, attitudes, values and opinions with respect to some significant elements as work, family, children, marriage, cohabitation and the division of tasks between men and women.

The results show a great deal of significance attributed to family and work. They also show how fidelity and negotiation skills are relevant for the success of marriage.

The analysis of individual paths in accordance with the morphogenetic-relational theory shows that, among the above mentioned patterns, only two are morphostatic, hence got more stable: i.e. those who are currently married and those who experienced cohabitation before marriage. However, we can highlight the implementation of a complex morphogenesis in the paths of the separated / divorced and in trajectories of those cohabiting.

**FAMILY MODELS AND SOCIAL RELATIONS OUTSIDE THE FAMILY: LITHUANIAN CASE**

Vida Cesnuiute¹

¹Department of Social Policy, MYKOLAS ROMERIS UNIVERSITY, Vilnius, Lithuania
Abstract: The research goal is to explore the impact of social relations outside family to family formation patterns in Lithuania. The research questions are related to the complexity of social relations and negative demographic trends in the country.

The research idea is based on the life course theory: critical events in individual life change social networking; the changing social environment influence individual decisions. The diversity and complexity of individual life course changes the primary social ties with family members, relatives, friends, neighbours, colleagues, other members of society. It is evident shift from family and community dominance on the individual to the tolerance of individual choices, including choice of family formation pattern.

This research is part of the project “Trajectories of family models and social networks: inter-generational perspective”, supported by the EU Social Fund (Operational programme for human resources development for 2007–13 (Global Grant)) and Science Council of Lithuania. Qualitative research methods were applied.

THE IMPORTANCE OF STRESSFUL EVENTS DURING CHILDHOOD ON ADULT LABOUR MARKET OUTCOME

Frida Olsson Skog1, Mats Borrie2, Karina Nilsson1, Urban Lindgren3

1Department of Sociology, UMEA UNIVERSITY, 2Department of social and economic geography, Umeå universitet, 3Department of social and economic geography, UMEÅ UNIVERSITY, Umeå, Sweden

Abstract: This paper examines if stressful events during childhood impact the labour market position in adulthood within the Swedish 1973 birth cohort. Empirical analyses are based on individual, longitudinal register data from the ASTRID database covering the total Swedish population between 1960-2008. We will analyze the different ways in which three specific events; parental separation, death of parent(s) and/or frequent migration, affect labour market outcome in an OLS-regression, controlling for family background characteristics. These are major life events for both adults and children, where children have little control over the circumstances and yet have to deal with feelings of loss and sometimes also decreased quality of parental care as well as economic deprivation and parental conflict. These events can occur in isolation or they can be interrelated. It is important to examine the effect of one single event as well as the accumulated effect of several events. The 1973 cohort makes an interesting case, having experienced change in the nucleiar family system during childhood, and a period of recession and youth unemployment as well as cutbacks in social policy programmes during their age of labour market entrance. Our study focuses on how stressful events in childhood affect children’s lives in turbulent times.
