Most research in this area originates in the UK and the US, countries that differ from Sweden in several respects. Sweden is characterized by having universal welfare programmes, relatively equal income distribution and high female labour market participation. It is reasonable to expect that the consequences of stressful events during childhood are milder within the Swedish context. In contrast to previous research predominately focusing on legal divorces, we also analyze the importance of dissolution of both marital and non-marital unions. Potential problems related to selection bias into divorce, death and migration are addressed by the use of pertinent statistical models estimated on total population data. We consider a modelling strategy where we gradually introduce different categories of explanatory variables. First we include our control variables, which reflect individual and family background characteristics. Thereafter we add our experiment variables related to the different stressful childhood events.

MANAGING TRANSNATIONAL FAMILY RELATIONS: OPEN INTER-COUNTRY ADOPTIONS

Riitta Hogbacka1,2

1Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland, 2Beatrice Bain Research Group, University of California, Berkeley, Berkeley, United States

Abstract: While Western domestic adoptions are now almost invariably open with some kind of contact or exchange of information between the adopted family and the birth family, transnational adoptions have been closed and all previous ties with the adopted child’s birth kin have been cut. These practices are, however, increasingly criticized. This paper investigates Finnish adoptive parents’ and South African birth mothers’ experiences of openness and contact. It will be shown that while this has clear benefits for birth mothers, adoptive parents worry about maintaining the exclusive boundaries of the nuclear family. Their relations are also influenced and framed by stratified reproduction and unequal power relations. The paper further explicates the difficulties in such relations and how they may be overcome.

MULTICULTURALISM AND INTERETHNIC PARTNERING PRACTICES: THE CASE OF PERSIANS IN THE UK

Ali Amirmoayed1

1POLSSIS/Sociology, UNIVERSITY OF BIRMINGHAM, Birmingham, United Kingdom

Abstract: There have been extensive discussions on multiculturalism and its relationship with the ongoing socioeconomic turbulence in Europe. Echoing the recent comments by the Chancellor of Germany Angela Merkel, the British Prime Minister David Cameron criticized “state multiculturalism” in his recent speech. In this paper, I will theoretically assess whether interethnic partnering practices present challenges in the multicultural British society. More specifically, I will evaluate the interplay between the multicultural state and interethnic partnering practices, that is, I will investigate whether the state can influence such relationships to a certain degree and the manner in which these practices may challenge the state. Evaluating Cameron’s above-mentioned speech, where he argued that the UK needed a stronger national identity, I will explore the significance of the notion of identity in understanding interethnic partnering practices in the multicultural British society. Moreover, by employing the theory of intersectionality, I will argue that new researches on family life need to consider the ways in which one’s multiple identities could shape one’s partnering experiences. There was some consideration of gender and sexuality in theorizing family life; however, it seems to me that there is now a need for further research that considers the aspect of ethnicity in relation to partnering practices. To explain my argument, I will focus on the Persian communities in the UK. Generally speaking, it could be argued that studying partnering practices among the Muslim communities in the UK is important in the sense that the sexual regulations in Islam are different from the legal sexual practices in the country (e.g. polygamy is acceptable in Islam, while it is illegal in the UK). However, Persian communities differ from the other Sunni

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Muslim groups that have previously been studied in the country, because the religion practiced by majority of Persians is Shia Islam. This is important in the sense that Shia theology differs from Sunni theology, especially in relation to partnering practices. For instance, temporary marriage (Mut’ah or Sighheh) is allowed in Shia Islam, but that is not permitted in Sunni communities. This religious difference suggests that my argument will showcase the complexity of inter-ethnic partnering practices that have not been explored in previous studies on transnational families.

**POLISH MIGRANTS IN SCOTLAND: EMOTIONAL GEOGRAPHIES AND FAMILY WELL-BEING IN TRANSNATIONAL SPACES**

Marta Moskal

**Abstract:** Transnational families are common the world over with one or both parents located overseas and the children left in their country of origin to be raised by remaining family members. Separated children and parents are now a frequent aspect of intra-European mobility which is very often circular resulting in return but also open-ended in duration. Little is known about the impact of extended parent-child separation on emotions, intimacy and well-being in such European migrant families. While significant bodies of research have explored migrants’ experiences in their host country this has most often focused on employment or service use and sometimes on social integration with locals. The impact of migration on the emotional quality of the migrant’s parent-child relationships and how geographical distance impacts on their understandings of emotional closeness as an aspect of good parenting and a good childhood has been neglected. Yet knowledge of migrants’ experiences of family life, its emotional quality, both within the host country and across the national border to their place of origin, is directly relevant to the processes of settlement and integration of migrants. It is also relevant to their needs for policy provisions and social interventions in the origin and arrival country. The proposed paper focuses on the role of emotions and intimacy in families split by international mobility, by taking intra-European Polish migrant workers as a case study. It refers to qualitative research with parents and children living apart-together in Scotland and in Poland and their experiences: particularly families where young people were left behind in Poland when one or both parents moved to Scotland; and families where children and young people joined parent(s) in Scotland after a period of extended separation.

**REGIONAL DIFFERENCES IN FAMILY CHANGES**

Detlev Lueck

**Abstract:** Since decades sociology points out changes in European families that may or may not be accelerated or retarded by recent turbulent times: trends of individualisation, of pluralisation, and role changes within the family. The description of these changes partly differentiate between countries (finding earlier change in Northern Europe), which promises to reveal causal mechanisms: Is it social policies that shape family formation? Is it the economy? Is it culture? However, cross-national comparison is limited in this respect because the potential causal influences are highly correlated with each other: Nations in Northern Europe have more supportive policies, stronger economies, and a more liberal culture. It remains an open question what is cause and what is consequence.

This presentation seeks to bring this debate forward by two methodological strategies that help identifying the true net effects of macro level circumstances: Firstly it enhances the comparison of six countries (in the survey “Job Mobilities and Family Lives in Europe”) to regions. Including regional contexts within countries has the advantage that some macro level circumstances (such as law) remain constant while others (such as the relation of agricultural, industrial and post-industrial occupations) vary more than they do in cross-country comparisons. Again others (such as the availability of spots in nurseries) can at least be measured much more precisely on a regional than on a national level. Secondly this presentation does not only take dummy variables marking specific regions (or nations) – with all their characteristics – as explaining variables, but, as far as possible, the regions’ characteristics themselves. It does so by matching statistical data regarding regions into survey data using the regional LAU2 code as break variable.

This way a comprehensive set of macro level circumstances can be considered in causal analyses of family structures. The explained variables, indicating traditional or (post) modern family structures, are: partnership (single, LAT, cohabitation), marriage, division of housework and of paid work within the partnership, parenthood,
number of children, and timing of parenthood (age at first birth). Aside from macro level circumstances, of course, also micro level circumstances are considered in the analyses. The presentation uses survey data collected in 2007 in Germany, Switzerland, Spain, France, Poland, and Belgium.

**VISUALIZING EVERYDAY SPACES OF CARE: OVERCOMING METHODOLOGICAL CHALLENGES**

Liina Sointu¹

¹School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

**Abstract:** As the European societies are rapidly ageing, informal care and family relations of older people are becoming more and more significant issues in regard to the wellbeing of citizens. A great deal of informal care takes place at home between elderly spouses. Yet there is a lack of research based understanding on how home as a site of care is organized and experienced by family members and how giving and receiving care is interwoven into the family relations. Scholars in care and ageing research have argued in favour of taking a spatial and embodied perspective in order to better understand the everyday lives of care. However, they have also pointed out the methodological and research ethical challenges posed by the private setting of home and family. As these challenges have been identified as being severe enough to be one possible explanation for the lack of research, there is a need for further reflection upon how the challenges could be overcome during the course of empirical research.

This paper suggests how the methodological and research ethical challenges posed by the private context of home could be overcome. Drawing on previous research on everyday spatiality and from an ongoing PhD study, the paper argues for the usefulness of visual methods as part of an ethnographical and collaborative research approach. The study informing this paper focuses on the spatial and embodied experiences of older people giving care to their spouses at home. The data, consisting mainly of interviews and field notes, is produced in collaboration with 20 participants, of whom 7 participants are interviewed several times. Photographs, taken by the participants of their homes and everyday environments, are used as part of the data collection to elicit talk in the interviews. Using examples from this data collection process, the paper shows how photographs indeed bring up issues that otherwise might not emerge in the interview.

The paper concludes that visualizing everyday spaces enables the researcher to enter the intimate space of home and family thus ensuring relevant data for research, while at the same time allowing the participants control over their homes and family lives. Even if the context of this paper is that of informal care, the paper aims at making a more general contribution to sociological research concerned with home and family relations in the everyday life.

**FAMILY EVENTS AND THE TIMING OF INTERGENERATIONAL TRANSFERS**

Thomas Leopold¹, Thorsten Schneider¹

¹UNIVERSITY OF BAMBERG, Bamberg, Germany

**Abstract:** This research investigates how family events in adult children’s lives influence the timing of their parents’ financial transfers.

We draw on retrospective data collected by the German Socio-Economic Panel Study (SOEP) and use event history models to study the effects of marriage, divorce, and childbirth on receiving large gifts from parents. We find increased chances of receiving gifts of houses or land at marriage and in the following years, at childbirth, but not at divorce. Large gifts of money are received in the year of marriage and also in the year of divorce. Our findings, on the one hand, indicate that parental gifts are triggered by adult children’s economic need. On the other hand, they point to a plurality of givers’ transfer motives and highlight the meanings of different types of wealth for parents, adult children, and their relationships.

**SUBJECTIVE DIMENSIONS OVER THE LIFE COURSE**

Cátia Nunes¹, Rita do Carmo Gouveia¹

¹INSTITUTO DE CIÊNCIAS SOCIAIS DA UNIV. LISBOA, LISBOA, Portugal

**Abstract:** Life course studies have been focusing more on “objective” dimensions of individuals’ life course, and, therefore, reporting more extensively to differences regarding timings and transitions of different age groups within a longitudinal and generational perspective (Mayer, 2009). However, the organization of the life course is conditioned by macro level factors, which depend on the historic and social contexts of individuals’ background, but also by micro level factors, which attribute to individuals a place for agency. Individuals are perceived as taking an active role in decision-making processes, managing both constraints and opportunities, tensions and attractions, thus, actively defining their life course (e.g. Heinz e Krüger, 2001). Therefore, and admitting a space for agency in the organization of the life course, understanding how individuals subjectively perceive it, by taking into consideration different life spheres, represents a relevant dimension of evaluation by confronting, e.g., areas of investment, satisfaction and stress within an inter and intra-generational perspective. Based on the concept of master status (Parsons, 1951) and, hence, considering the accumulation of roles that individuals take on during the life course, we believe that it is important to understand how individuals invest differently in different areas of life (family, leisure, work), and how this investment is associated with different levels of satisfaction and stress. Furthermore, we will also explore the similar or dissimilar relationship between the areas of investment, and the levels of satisfaction and stress associated to the different life spheres and individuals’ trajectories and the experience of particular life course events. We consider the first as subjective dimensions and the second as more objective dimensions of the life course. Following this analysis, we intend to focus on how these subjective dimensions are also reflected in the individuals’ self-assessment regarding their self-esteem (Rosenberg, 1965). The analysis will simultaneously address gender and generational differences in investments and its’ returns, by trying to disentangle the gendering and the generational continuities and discontinuities in the different domains of investment and gratification. We will draw on a national survey (2010), based on a representative sample (n=1500) of Portuguese belonging to three different cohorts.

**TRANSITION TO (GRAND)PARENTHOOD FROM A MULTIGENERATIONAL PERSPECTIVE**

Katharina Ulbrich¹
1DRESDEN UNIVERSITY OF TECHNOLOGY, DRESDEN LEIBNIZ GRADUATE SCHOOL, Dresden, Germany

Abstract: The transition to parenthood has been broadly studied with regard to the triadic relationship between the young parents and the newborn child. However, the wider family context within which the nuclear family is embedded has been rather neglected. This paper has the aim to broaden the perception of this important familial status passage towards a multigenerational perspective. Thus, the focus is on the double generational transition to parenthood and grandparenthood as it is experienced by members of different family generations. The main question to be answered is how this generational status passage influences the intergenerational relationships between the new nuclear family and the respective families of origin.

The paper draws on the results of a qualitative inquiry of six multi-generational family constellations that had just gone through the transition process and of which two to four members were subject to individual in-depth interviewing.

The findings of this study indicate, that the transition to (grand)parenthood contributes to the (re-)construction of gender and generational asymmetries within the family network. This is due to the traditionalization effect that takes place on the level of the couple and that leads to a gender specific parental role division between the new parents. As a result, mothers are usually the main caregivers and have a crucial mediating position regarding the child’s social contacts. For this reason, the relationships that the new nuclear family establishes with the respective families of origin tend to be asymmetric. While contacts along the maternal line are usually close and of good quality, paternal bonds tend to be more fragile and conflict-laden. As a consequence paternal grandparents often find themselves in a rather marginalized position having difficulties to get access to their grandchild. Maternal grandparents on the other hand are usually much more involved in childcare arrangements and the daily family life of their daughters. In times of growing marital instability and union disruption these asymmetries tend to further weaken the bonds between fathers and children and paternal grandparents and their grandchildren as in the case of divorce or separation of the parents child custody is habitually ascribed to the mothers.

FAMILY CONFIGURATIONS OF INDIVIDUALS UNDERGOING PSYCHOTHERAPY: RELATIONAL DYNAMICS AND PSYCHIATRIC SYMPTOMS

Marlène Sapin1

1UNIVERSITY OF LAUSANNE, LAUSANNE, Switzerland

Abstract: Research highlights the interaction existing between family dynamics and genetic factors on the onset of psychiatric disorders and on probabilities of relapse. Studies have revealed important effects of stressful life events, often directly stemming from the family, in provoking onset of psychiatric disorders. The literature on social support emphasizes that family relationships account for a large part of the support available to individuals suffering from psychiatric disorders. Evidences about the positive or negative effect of family support on individuals with psychiatric disorders are however mixed, with some studies underlining the positive effect of non family relationships on patients’ rehabilitation, and other studies suggesting that family relationships exert an essential and mainly positive effect on patients. Based on a 5-waves follow-up of 60 individuals undergoing psychotherapy in a private practice, this paper examines the structural features of their family configurations, considering jointly the relational structures of emotional support and conflict networks, in interaction with psychiatric symptoms. Five distinct types of relational dynamics are found featuring the patients’ family configurations when emotional support and conflict relationships are considered both together, and three of them are significantly associated with the intensity of psychiatric symptoms. Individuals perceiving themselves as being central in the relational dynamic of conflict, or those perceiving themselves as overload by providing support for a lot of family members, show significantly higher level of distress, while those setting back of all types of family relationship display significant lower level of distress.

PRISONERS OF PEACE? EXPERIENCES OF DOMESTIC VIOLENCE IN POST-CONFLICT SOCIETIES

Megan Todd1, Stephen Vertigans1

1Health and Social Sciences, ROBERT GORDON UNIVERSITY, Aberdeen, United Kingdom

Abstract: Post-conflict societies arguably have a unique relationship with gendered violence. Whilst acknowledging that there are many problems with a term such as ‘post-conflict’, not least the implicit assumption that violence is a thing of the past, research indicates that in the context of Northern Ireland, violent activities increased after the paramilitary ceasefires. New forms of violence and social conflict emerged including sectarian and racist violence and ‘anti-social behaviour’ (Jarman 2004). Indeed, figures suggest that levels of domestic violence have increased in Northern Ireland since the Good Friday Agreement. One suggestion is that this is because men within post-conflict societies seek new pathways into violence. A recent study revealed the fears many women had that the demobilisation of ex-combatants explained the growth in domestic violence figures (INCORE 2006). Religious and ideological belief systems may also have a key role to play in the legitimising and normalising of such violence (McWilliams 1997). Moreover, many of the factors believed to contribute to domestic violence such as insecurities, fear and some weakly embedded restraints can be identified within other forms of violence and often remain embedded within post-conflict societies. Women, arguably, experience heightened levels of violence both during and after periods of intensive conflict. Consequently, this paper will argue that forms of violence do not necessarily end with the post-conflict phase. On the contrary, changing social dynamics are contributing to shifting forms of violence from political activities to domestic relationships.

COUPLE RELATIONSHIP AND THE UNBEARABLE THERAPEUTIC LOGIC

Jaana Maksimainen1

1The Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Marriage as a social institution and romantic love as a cultural script have not lost their significance in contemporary society but during the last few decades the concept of “relationship” has taken prominence in our understanding of the love relationship. This cultural change has often been associated with the rise of therapeutic culture. This paper is based on my doctoral thesis (2010) that discusses the cultural understanding of the couple rela-
tionship in the context of contemporary Finnish society. I used material ranging from in-depth interviews to various mass media texts to study the therapeutic logic that determines the understanding of the couple relationship.

The couple relationship has not only become a much cherished theme in the media and popular culture but it has also become an important subject in the discussions on the well-being of families and children. "Healthy relationships" are seen at the heart of "a healthy society". As a consequence, therapeutic support and knowledge is highly valued and called for. The relationship question is not founded so much on moral concern about the weakening of the marriage and the family as on the therapeutic understanding of how complex relationships are and how important it is to handle this complexity. I call this complex relationship therapeutic. Therapeutic relationship does not refer to any particular type of relationship. In contemporary usage the relationship is, by definition, therapeutic. The therapeutic relationship is seen as an endless source of conflict and a highly complex dynamic unit in constant need of attention and support. Notwithstanding this emphasis on relationship work the therapeutic relationship lacks any morally or socially defined direction. In this respect it differs radically from marriage. Here lies the cultural power and according to critics the dubious aspect of the therapeutic ethos.

The therapeutic ethos has – with its grasp on the complexities of the relationship – a strong attraction in a society where divorce is so common. Instead of taking any moral position or dictating whether to divorce or not it offers warmth and consolation by assuring us that anyone can learn better relationship skills and improve self-knowledge. But maybe it is precisely because of trying to avoid moral questions therapeutic ethos offers little help in expressing our fundamental dependence on other people.

**PRISONERS AND FAMILY ISSUES DURING INCARCERATION**

Rafaela Patricia Gonçalves Granja 1, Helena Cristina Ferreira Machado 2

1Centro de Investigação em Ciências Sociais, 2Department of Sociology, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: Prisons are now seen as integrated social realities in a broader context than their own. Therefore it becomes necessary to study the empirical realities that denote points of contact and interaction between the prison and the outside world. This paper aims to analyze the impact of the incarceration in family, through male prisoners’ perceptions.

Using data collected through interviews with male prisoners in Portugal, our purpose is to examine the conflicting processes that c reshape relationships during periods of incarceration, and, simultaneously, highlight the barriers that offenders and family face to maintain contact.

Current studies about the effect of incarceration on children and families lead to the conclusion that families also suffer, and experience various kinds of problems. Consequently, questions are now being raised about the impact of imprisonment on children and families and the extent to which prisoners’ families might be resources and assets in providing emotional and financial support for the prisoner and in the achievement of major social goals, such as social rehabilitation of criminals.

This paper discusses how the imprisonment of a family member tends to be a challenge both for the family members as well as for the prisoner. On the basis of qualitative interviews we found that the variability of family backgrounds of inmates, their marital status and emotional dimensions are central in mediating the relationship between incarcerated parents and children. Despite the impact felt by the family, incarceration can’t be identified as disruptive of family cohesion. The diverse nature of the bonds and social ties that an individual is capable to sustain with his relatives differentiates the types of costs involved in imprisonment.

**A WITHIN-FAMILY ANALYSIS OF PARENT-CHILD RELATIONS: WHAT ROLE FOR BIOLOGICAL AND SOCIAL KINSHIP?**

Sebastian Schnettler 1, Anja Steinbach 2

1Laboratory for Economic and Social Demography, Max Planck Institute for Demographic Research, Rostock, 2Dept. of Sociology, University of Technology Chemnitz, Chemnitz, Germany

Abstract: A substantial and growing number of children lives in stepfamilies. Given that adverse parent-child relationships can lead to a range of negative child outcomes (see Brown 2010; White/Gilbreth 2001), it remains an important question what role the biological status of the parent-child relationship plays and how families can be assisted to reduce potential differences in treatment. Consistent with inclusive fitness theory, evolutionary biologists predict that individuals care more for their biological than their social children and hence that biological children assess the relationships to their parents better than stepchildren. To test this assumption, we use data from the U.S. National Longitudinal Study of Adolescent Health (Add Health). Unlike many other studies that have been conducted so far, this survey allows us to analyze the consequences of the dynamic between social and biological parent-child relationships within the same families. We use comparisons of sibling pairs and fixed-effects regression to achieve the within-family comparison. Both the descriptive and multivariate regression results confirm that – even after controlling for other relevant influences – biological parenthood matters with regard to children’s relationship assessments (perceived parental care and closeness of the parent-child relationship) and in both the relationships to resident fathers and mothers. In the discussion, we comment on the possible integration of the evolutionary and sociological perspectives and close with some recommendations for future data collection that could allow researchers to analyze the relative influence of biological and social influences on parent-child relationships on a more fine-grained level.

**CHANGING MEANINGS OF FAMILY AND FAMILY BONDS**

Karin Wall 1, Eric Widmer 2, Rita Gouveia 1

1INSTITUTO DE CIÊNCIAS SOCIAIS UNIVERSITY OF LISBON, Lisbon, Portugal, 2UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: Personal relationships are today less dependent on kinship ties, and family commitments extend across households linked by friendship, vicinity, dissolved marriages, blended families and transnational care chains. Although there may be a blurring of kin, ex-kin, and non-kin in close relationships, this does not signify a loss of commitment itself. Research on family meanings and practices in
late modernity reveals the continued importance of the bonds of affection and support, even if these are carried out within changing sets of relatives and close persons.

The aim of this paper is to examine family meanings by looking at the changing boundaries between family bonds and a wider configuration of close relationships. It argues that a diversity of meanings of significant family ties are increasingly the norm, requiring new accommodations between co-residence (household), blood or marriage ties and a wider circle of affinities such as friends, non-resident partners or ex-kin. Using data from a national survey (Portugal, 2010) and drawing on a configurational approach, the paper focuses on the overlaps and discrepancies between three sets of close relationships: co-resident members of the household, members of the respondent’s network of close relationships (persons resident partners or ex-married ties and a wider circle of affinities such as friends, non-kin) as well as kin. Using data from a national survey, we will analyze connections between the concept of “family” and the attributes of members (type and duration of bond, past or present co-residence). Given the emphasis in Western societies on bilateral filiation and biological ties, we expect this model of kinship to strongly influence the meaning of “family”. Nevertheless, in the context of growing pluralisation and individualization, we expect meanings to go beyond the nuclear family and to reveal plural subjectivities. The effects of structural variables such as gender, age and education on family meanings are also analysed.

Preliminary findings show a high level of overlap between the network of close relationships and the “family”, with 76% of the respondents considering all close persons as family. However, in most of these overlapping networks non-kin ties are not included (85.4%). Cohorts and social variables have an impact (e.g., inclusion of non-kin is higher in younger cohorts).

SOCIAL CAPITAL ON CHILD OUTCOMES IN FAMILY CONFIGURATIONS

Gaëlle Aebý, Minh-Thuy Doan

Département de Sociologie, UNIVERSITÉ DE GENÈVE, Genève, Switzerland

Abstract: In an era of turbulence family relations are likely to drastically evolve over time, particularly in case of a divorce followed by a recomposition. Sociological research emphasizes the importance of family relationships as social capital. Connections with other family members provide instrumental and emotional support helping individuals in their life trajectories. Children directly benefit from the social capital available in their family. Research on this topic underlines a deficit of social capital in stepfamilies, which is held responsible for the negative consequences of stepfamilies for child development. The work supporting the deficit hypothesis in stepfamilies, compared to first families, is based on the bonding social capital, which is defined by long-lasting, intimate, multitask connections with a high frequency of contacts among persons involved. Another body of research has however emphasized the import of bridging social capital. The bridging type is based on weaker connections between subgroups of a network that create “holes” in the structure; consequently some persons have the function of brokerage. It seems to be the case of stepfamily. However a comparison in terms of family structures is not sufficient to study family diversity and complexity in modern societies. A new approach based on family configurations is necessary to go beyond nuclear family.

Using a sample of 150 mothers from a first family and 150 mothers from a stepfamily (each with at least one school-aged biological child), we intend to reveal the relationships existing between social capital and central dimensions of child development in stepfamilies in comparison with first time families. First, we show that stepfamily structures lead to bridging social capital, while first family structures lead to bonding social capital. Second, we hypothesize that social capital varies depending on family configurations, and not only on family structures. We find nine types of family configurations: « small », « beanpole », « alliance », « friends », « brothers », « sisters », « kinship », « single-parent » and « post-divorce » providing specific social capital. Finally, we shed light the association between binding and bridging social capitals and some distinct child outcomes (for instance hyperactivity, sociability, behavior and emotional troubles).
RN 14 Gender Relations in The Labour Market and the Welfare State

GENDER ASPECTS OF RUSSIAN UNEMPLOYMENT DURING THE CRISIS

Rimma Anasovna Ahmetyanova 1, Rozalia Ravisvona Yapparova 1

1 Public and Municipal Administration, BASHKIR ACADEMY OF PUBLIC ADMINISTRATION, Ufa, Russian Federation

Abstract: Gender aspects of Russian unemployment during the crisis (based on the on the example of Bashkortostan Republic)

The most important gender aspects of employment and unemployment in the conditions of modern crisis in Bashkortostan Republic are considered in this paper. Female unemployment in Bashkortostan Republic has certain specific features depending on the developed economic sectors. One of the most characteristic features of unemployment in the republic is its rather low degree of feminization. Women are engaged in low-paid branches of budget spheres that is in education, health service, service sectors and culture. As a result of crisis in Bashkortostan Republic the branches of industry, in which the level of male employment was the highest (manufacturing industry, building sectors, mining industry) suffered the greatest negative effect. However, women were the first to be dismissed from the service sector of these branches. Now female unemployment is of stagnation kind. In the present day situation many women, especially younger ones, prefer a «wait–and-see» or «developing» patterns of behavior. Some have maternity leaves and some have improved and mastered their education and qualification or have changed of their job completely.

However, our research shows that during the crisis it is more difficult for women to find a new job, that is, their period of being unemployed is longer than that of men. Their requirements to future work are not high and most of them agree to be low-paid.

In spite of rather low level of feminization of unemployment in the republic, higher educational level and adaptation potential of women, the problems of unemployment are more urgent for women than for men. The tendency is characteristic for the Russian Federation on the whole.

UNEMPLOYMENT, GENDER AND MENTAL HEALTH – THE MEDIATING ROLE OF THE GENDER REGIME

Mattias Strandh 1

1 Department of Sociology, UMEÅ UNIVERSITY, Umeå, Sweden

Abstract: The relationship between unemployment and mental health is an issue that has been of great interest. The conclusions from this research have shown that although there clearly exists selection effects, where mental health affects job chances a great body of high quality longitudinal research have shown unemployment to have a negative impact on mental well being. This adverse effect of unemployment on mental well-being does however seem to differ depending on social characteristics. Gender has here been a factor of particular interest. Although it has been discussed as a mediator for the negative effects of unemployment in classical literature and has received considerable interest in modern research, results have tended to be inconclusive. In this article we suggest that the moderating effect of gender on the relationship between unemployment and mental health must be understood from the gender relations of the context. Gender should here mediate the negative effects of unemployment on mental health differently depending on the level of equality on the labour market and in the family. This is investigated using representative longitudinal data on unemployed from Sweden and Ireland, two countries that represent different gender relations and gender regimes. Results show that gender does not mediate the impact of unemployment on mental health in the more gender egalitarian context of Sweden, but that it does so in the less gender egalitarian context of Ireland. This effect of gender in Ireland however disappears when controlled for the economic situation and household position.

WORKFARE - SOCIAL SECURITY OR RISK?

Saila Maria Piippola 1

1 Human work sciences, LULEÅ UNIVERSITY OF TECHNOLOGY, Luleå, Sweden

Abstract: The aim of this paper is to explore how social security and risk can be understood among unemployed men and women in a region – Norrbotten County in North Sweden. Three concepts are important in understanding women’s and men’s opportunities to work and to be self-supportive; these are workfare, social security and risk. Qualitative data were collected during 2002-2009 from two different projects in three geographically spread municipalities: Luleå, Haparanda and Kiruna. In total the data consist of twenty-four interviews with unemployed women and men, employment officers and local politicians. Workfare is a central concept in Swedish labour market policy, a political tool to increase employment. The political demand is that everyone should be self-supportive disregards the fact that human beings live in a social context. High unemployment rates and high competition means that unemployment has become a individual problem instead of a political problem. Women and men make active choices and consider social security and risks in a regional context. Social security as a concept is often used in social policy to mean a temporary reasonable living standard depending on one’s life situation. Social security as a theoretical concept thus ought to relate to feelings, a sense of security but also a sense of freedom from feeling insecure. Unemployed women and men were aware of their insecure employment situation on the labour market but to manage temporary jobs they where dependent of a social network. Risk as a concept refers to an economic risk for the individual that might create an increased polarization between rich and poor, among those who have jobs and those who are unemployed. Unemployed are often directed to education to facilitate return to work. Education where not seen as an option among unemployed women and men because education where not seen as a guarantee for a job. The result shows that unemployed women and men do not have the social or economic prerequisites to follow the workfare policy and its economic principals. This means that workfare helps to create and strengthen differences between high-skilled and low-skilled, and those who have jobs and those who do not. In conclusion, workfare is an abstraction and a
simple idea about how to solve unemployment but in human beings everyday life and praxis it’s limitations becomes visible.

RECONCILIATION OF WORK AND FAMILY LIFE IN GERMANY. IMPLICATIONS OF MOTHERS’ ABILITY TO TAKE UP WORK AT THE DAWN OF LABOUR SUPPLY SHORTAGE.

Torsten Lietzmann

1INSTITUTE FOR EMPLOYMENT RESEARCH, Nürnberg, Germany

Abstract: Compared to other European countries, Germany was quite successful in coping with the recent economic crisis. Rather, the German labour market might face a shortage of qualified labour supply, due to demographic changes.

Increasing labour market participation of mothers is one strategy to tackle this problem. The German situation in this respect is characterized by lower maternal employment rates and child care coverage than in several other European countries. On the basis of the special German institutional context and labour supply and human capital theory, this article analyses the chances of unemployed mothers to take up employment.

Applying a duration model, I estimate the probability of mothers’ transition from unemployment to employment and its determinants in the period of 2005 to 2009. I will evaluate which impact family responsibilities (age and number of children) have, compared to the mother’s labour market resources (i.e. human capital).

It can be shown, that child care responsibilities restrict the ability to move into employment, especially for single mothers. On the other hand, human capital characteristics promote transitions to work in the expected way. Taking into account that a big share of unemployed mothers is well qualified, there are considerable opportunities to foster a better integration of mothers into the labour market, once possibilities for external child care are improved.

WORK LIFE BALANCE IN A GENDER PERSPECTIVE: HOW COULD WELFARE STATE INCREASE CAPABILITIES OF MEN AND WOMEN IN THE FLEXIBLE LABOR MARKET?

Valeria Pandolfini

1Department of Anthropological Science (D.i.S.A.), UNIVERSITY OF GENOA, Genova, Italy

Abstract: The paper is focused on work-life balance (WLB) dimension in the actual post Fordist labor market, characterized by increased deregulation and flexibility which have made workers’ life trajectories more insecure and unpredictable. The review of the literature on WLB (Crompton, 2006; Scott et al., 2008) leads to consider the topic from a gender perspective within the transformation of traditional gender role models in society and in families, rejecting the idea, given by the historical strong gendered division between paid work and unpaid care work, that WLB is a “women’s issue” (Ransome, 2007). The theme is analyzed in a capability perspective (Sen, 1984; 1985; Nussbaum, 2000) where WLB becomes a quality of life issue for considering “substantive freedoms to choose the life one has reason to value” (Sen 1999:74). In such a perspective, the reconciliation policies (EC, 2005) should aim at promoting an equality of capabilities, i.e. a combination of functioning that reflects the freedom of a person to lead one type of life instead of another. The Senian approach is applied to evaluate the effects of the Italian WLB policies on individual working lives trajectories, presenting the results of a qualitative research involving a sample of young adult Italian “flexible” couples, i.e. where one of the partner or both, aged between 25 and 45, has/have a short time contract job, married or cohabitant, with or without children. The research considers several central dimensions to a capabilities framework for WLB, including working times, flexibility, employment situation, job security and perceived economic well being, taking into account differences among people in education, age and partner’s work hours (Hobson & Fahlen, 2009). The results show different strategies adopted by male and female to combine working and family duties and how their capabilities to WLB are limited or enhanced by systemic aspects like public services, companies’ policies and the particular Italian “familistic” Welfare State (Esping-Andersen, 2002), as well by meso factors like the presence and quality of supporting family networks (Gallino, 2001). Finally, the paper indicates some types of WLB policies that should be implemented in order to tackle the emerging difficulties in balancing work and family life as well to avoid the strengthening of gender inequalities in social and labor spheres rather than diminishing them (Hardy & Adnett, 2002).

WORK-LIFE STRATEGIES AND IDENTITIES: A MATTER OF WOMEN’S CHOICE?

Inés Campillo, Lorena Armijo

1SOCIOLOGY I, 2SOCIOLOGY III, UNIVERSIDAD COMPLUTENSE, Madrid, Spain

Abstract: The increasing participation of women in the labor market is by itself one of the most important social and demographic factors of change in post-industrial societies. It has forced significant transformations in the family environment, as well as in the labor markets and the Welfare States. These transformations have been interpreted in terms of gender equality rights and increasing autonomy for women. However, in many cases, the labor activity of women is far from assure them that autonomy, and that’s mostly due to the particular female patterns of employment: against the traditional male homogeneity (full-time, continuity, labor career), women’s employment patterns and behaviors are heterogeneous and they vary from full-time and continuous labor career to a combination of part-time or temporal work contracts with periods of employment inactivity.

There is a rich theoretical debate surrounding the possible causes about the female labor heterogeneity. Probably the most well-known as well as most polemical theoretical proposal is the “preference theory” by Catherine Hakim, which is based on a fundamental assumption: in theses current times of equal opportunities, female heterogeneity does not respond anymore to certain social conditions, but it is rather the consequence of women’s individual preferences and priorities in respect to the conflict between family and work. Nevertheless, the data we present in this paper, which is the result of a qualitative research made through 30 interviews to women from different social and labor backgrounds, seem to contradict Hakim’s thesis.

Thus, our paper will illustrate three fundamental questions: 1) women’s preferences in regard to employment and family are conditioned by their social background, academic education and occupation; 2) women’s preferences in regard to employment and fami-
ly are very rarely stable, they vary according to the context and the life cycle; 3) at a discourse level, that is, the level of values and preferences in abstract terms, class differences tend to disappear. In short, this paper will show how women’s discourses and behaviors in regard to family life and employment are articulated on the basis of two fundamental (and often, contradictory) axis: class and gender identity.

FEMALE LABOUR FORCE PARTICIPATION AND WELL-BEING: AN ANALYSIS OF GERMAN EAST-WEST MIGRANTS

Anke Plagnol

Abstract: The study analyses the impact of institutional change on women’s employment decisions in East and West Germany and its impact on subjective well-being, using data from the German Socio Economic Panel (GSOEP). Germany provides a natural experiment of sudden institutional change as the former German Democratic Republic (East Germany) was quickly incorporated into the existing institutional structures of West Germany. Prior to German reunification, full-time employment was the expectation for all women in East Germany and was promoted by adequate child care provision and preferential social policies for families. In contrast, social policies in West Germany promoted the single breadwinner family model. After reunification female labour force participation declined rapidly in East Germany while it increased in West Germany, but women in East Germany are still more likely to be in full-time employment. Institutional support for women’s employment and female preferences for work thus differed substantially between East and West Germany, but social policy was the same in both regions after 1990. In this talk I look specifically at the labour market behaviour and well-being outcomes of women who migrated from East to West Germany after 1990. These female migrants experienced a rapid change in institutional settings, labour market conditions and societal expectations. Their labour market outcomes are compared to that of West German women and East German women who remained in their region.

GENDER AND ECONOMIC CRISIS: EXPLORING ECONOMIC WELL-BEING IN THE UK.

Tracey Warren

Abstract: The global economic crisis of the past three years has raised fundamental and long-standing questions about the gendered impact of recessions. The particularities of this current recession, and policy responses to it, have already generated a substantial interest in its gendering. Questions are being asked over whether and how this recession differs from earlier economic crises in its short and longer term outcomes for women and men. Most of the research published so far that has a gender dimension, from across a range of disciplines, has focused upon comparing changes in the employment and unemployment rates of women and men as the crisis deepened and eased. Gendered impacts on rates of under-employment and flexible working have also been explored. As valuable as this focus on the extent and pattern of labour market participation is, it does not tap into a number of other core and potentially gendered outcomes of recession. Drawing on a British Academy funded sociological research project into the economic consequences of recession in the UK, this paper will outline the concept of economic wellbeing, considering in particular its combination of subjective and objective indicators of economic inequalities. It will then reflect upon the potential of economic wellbeing for identifying the wider economic impact of recession on the lives of women and men, and in the short and longer terms.

SOCIAL WELL-BEING AND JOB SATISFACTION OF WOMEN WITH SMALL CHILDREN IN RUSSIA.

Pankratova Margarita

Abstract: This paper deals with the problem of social well-being and job satisfaction of women with small children in Russia. A recess in work among women with small children could negatively affect the women’s careers. There is a conflict between female employment and motherhood in Russia. On the one hand, women should devote sufficient time to job to build a successful career. On the other hand, women with small children have to reconcile their jobs and family, so that it is necessary for them to have a flexible work schedule. It is quite difficult for women with young children to find an interesting high-paying job.

The paper discloses factors of job satisfaction of Russian women having small children and identifies the determinants of job satisfaction and social well-being in general. The author analyzes social well-being in dynamics.

All the estimations are made for 4 groups of women depending on the fact of having children and the age of the children. The main assumption is that Russian women with small children are not satisfied with their jobs.

The paper is based on Russian Longitudinal Monitoring Survey (RLMS) for 2000-2009.

FAMILY SYSTEM AND WELFARE STATE IN ITALY. EMPIRICAL EVIDENCE AND POLITICAL IMPLICATIONS ON WORK DECISIONS IN FAMILISTIC SETTING.

Margherita Sabrina Perra

Abstract: International studies of family, gender relations and welfare states have obtained useful results concerning the reproduction of gender hierarchy in various welfare regimes, and have improved our understanding of state-market-family links and their roles in the complex “gender system”. In this context, many countries, such as Italy, is defined by researchers as “familial societies”. It has strongly patriarchal traits, such as the combination of weak welfare states and strong family networks. In addition, some scholars demonstrated that both countries are familial societies based on patriarchal gender system and their welfare state regime could be included in the “conservative model” (Esping-Andersen 1999; Uzuzhashi 2003). This is possible because that strong family ties contribute to maintain patriarchal gender systems in the households that influence the present Italian demographic trends.
In addition to this, strong family ties could be supported by patriarchal gender system at the macro-level. The relationship between these systems could influence the institutional assets, the welfare state and policies concerning family and labour market. In this context, even if, from the 1970s, the feminist movement favoured cultural transformation of gender relationships, women obtained significant recognition in their new role in the public sphere, the female participation in the labour market has always experienced problems. On the supply side, combining childrearing with paid work has been a challenging task for Italian mothers in a modern economy. This situation increases the opportunity costs of marriage for women. The degree of “maternal incompatibility” with paid work affects not only each woman, but is also a problem which concerns the institutional assets and the relationships between state, market and family in the Italian welfare mix. As many studies demonstrate, maternal incompatibility seems to be greater in those “family-oriented” and less feminist countries such as Italy, than in relatively more individualistic and gender-egalitarian countries. In this paper, I intend to test the effect of work in the process of labour market decision-making in the low fertility system and to study the role of the ‘strong family’ in the work-family conciliation. I’ll present some empirical evidences derived from the event history analysis on data made by the Italian Longitudinal Household Survey (ILFI).

**PAID AND UNPAID WORK: HOW SOCIAL STATUS MATTERS?**

Pierre Bataille1

1UNIVERSITÉ DE LAUSANNE, Lausanne, Switzerland

Abstract: Most of national and international surveys have shown that even for women who gain access to professional groups, family events and housework still have an impact on their professional careers (Hirata, Lombardi et Maruani, 2008). In fact, these women often hire housekeepers - generally less qualified women, who often come from the global South - to relieve themselves of this kind of work. To date, little research has been carried out to analyze how their representations and conception of house-work vary according to their social origin. It is generally assumed that, in order to access higher socioeconomic position within a capitalist system, highly qualified women often exploit the labour force of other less skilled women. This modern paradox has recently been studied by several feminist researchers: usually based on the premise that the emancipation of some qualified women is possible because of the exploitation of the labour power of other groups of women (Dorlin, 2009, NQF, 2008).

In this paper, we argue that this question cannot be analysed solely in Marxist or class terms. In others words, to employ somebody to do the domestic work is not only a question of class position, it is also depends on the social and symbolic “status group” (Stand) the individuals belong to (Weber, 2003). Even if they can afford to employ a domestic worker, women from elite professional groups also have to be able to think of themselves as a potential employer, as a person who belongs to a dominant “status group”. Our main hypothesis is that the subjective development of this sense of belonging to an elite “status group” varies according to the social background of highly qualified middle-class women.

Our presentation aims to investigate these the role of these two dimensions (class and status) in the specific relationship that professional women, some of whom have experienced upward social mobility, develop towards the externalization of house-work. This paper will focus the case of female graduates from one of the French “Grandes Ecoles”.

**TITRES-SERVICES AND RUT- STATES SUBSIDIZING PAID DOMESTIC WORK IN BELGIUM AND SWEDEN**

Elin Kvist1

1UMEA CENTRE FOR GENDER STUDIES, UMEA UNIVERSITY, Umea, Sweden

Abstract: In many European countries, different types of political reforms intending to encourage a growth in the domestic service sector have been introduced. The methods and reforms differ; cash for care, service vouchers tax credits and tax incentives but mainly the reforms intend to stimulate a growth of a “new” legal labor market sector within private households. The service sector is often emphasized as the most likely growth sector, currently contributing to more than 70% of GDP and representing 70% of the jobs in EU according to Eurostat (2007). This potential growth sector in combination with insufficient or declining welfare states, inclining female labor market participation and ageing populations could be viewed as explanatory factors to the increased demand for paid domestic work. The growing sector of informal employment within domestic services have drawn European government attention, a transformation of this informal domestic work into formal work could create job growth especially among those with low educations and weak connections to the labour market. In this paper the domestic service policy processes in Belgium and Sweden will be analysed. Belgium has some of the most far-reaching policies within EU on encouraging growth within the domestic service sector, the Titres-services that was introduced in 2001. The Swedish domestic service reforms RUT-avdraget was introduced in 2007 is less extensive but caused a tremendous debate that has been going on for almost 20 years. In this paper the aim is to analyse the differences and similarities between the political reforms encouraging growth in the domestic service sector with a special focus on how gender equality is articulated and discussed in the policy debate. The theoretical ambition is to analyse the challenges that domestic service work poses for gender studies in relation to feminist theories on welfare state and understandings of work and family from an intersectional perspective.

**A COMPARATIVE ANALYSIS OF THE IMPACT OF THE RECESSION ON PENSION PROVISION FOR OLDER WOMEN WORKERS IN THE REPUBLIC OF IRELAND AND NORTHERN IRELAND**

Aine Ni Leime1

1Irish Centre for Social Gerontology, NATIONAL UNIVERSITY OF IRELAND, GALWAY, Galway, Ireland
Abstract: The relative vulnerability of older women workers in relation to pension provision is being increasingly recognised in both policy circles and in the media throughout the European Union. More so as the recent policy thrust in many EU countries away from state provision and towards personal responsibility and private provision tends to increase the vulnerability of women workers. This is particularly so where the pension system is based on strong links between pension provision and labour market participation. It has been recognised by feminist political economy of ageing scholars that the following features prevalent in the social and economic arrangements of many EU countries, both in the recent past and the present, shape the environment in which women make employment and pension provision decisions. These include pension systems, employment, social welfare and social legislation biased towards promoting a male breadwinner model of family life; gendered social norms that assign to women the primary societal responsibility for caring, and the consequent interrupted labour market participation of women; their predominance in part-time work and low-paid work; and their vertical and horizontal segregation into particular typically low paid occupations. Many of these features are or were present in the Republic of Ireland (ROI) and Northern Ireland (NI) where the comparative study on which this paper is based took place.

Despite the recognition of these broad patterns contributing to women’s relative vulnerability, there has been a scarcity of qualitative research into the issue. This paper is based on a mixed methods comparative study which analyses policy and statistical data and conducts interviews with 30 women and 8 focus groups with older women (aged 50 or over) in the ROI and NI. It adopts a feminist political economy of ageing approach to analysis of the broader structural patterns and a life-course approach to analysing women’s subjective negotiation of their work-life biographies. This paper outlines some of the main findings from the qualitative data and explores specifically the impact of the global economic crisis and the recession on the pension provision of older women workers in the Republic of Ireland and Northern Ireland. The policy implications of these findings are drawn out.

HOW DOES THE FINANCIAL CRISIS AFFECT GENDER INEQUALITY WITHIN SWISS WORKING ARRANGEMENTS? A CROSS-CANTONAL APPROACH

Sarah Kersten 1, Michael Nollert 1, Ruedi Eppl 2, Sebastian Schief 1, Martin Gasser 1

1UNIVERSITY OF FRIBOURG, Fribourg, Switzerland

Abstract: Regarding gender relations, paid work is the primary domain where gender equality shows its main improvements and failures, as work is one of the most important factors that characterise the agency of a social citizen. Nonetheless, we understand work in a comprehensive way, as the exclusive focus on the labour market would be too narrow. Thus, we not only include employment but also unpaid work, that is work within the household and family as well as volunteer work.

By using the Swiss Labour Force Survey, we analyse inter-cantonal variations within and between the work spheres - employment, family, household and care work and volunteer work - based on indicators regarding gender inequality. Our aim is to obtain a cantonal typology by running cluster and factor analysis. The typology should be comparable to existing cantonal typologies, e.g. the Swiss worlds of welfare by Armingeon and Bonoli (2004). As Switzerland is strongly marked by its federalism, we hypothesise that the financial crisis affects cantonal economies and policies and therefore cantonal gender inequality to varying degrees. On the basis of the typology we thus can identify the effects of the financial crisis on gender inequalities regarding the work spheres.

We expect cantons with a strong financial services sector (e.g. Zug, Zurich) to be much more affected than, for example, rather rural ones. In those cantons we expect a decrease of social spending, which has severe outcomes on cantonal gender inequality. Moreover, in liberal cantons, the impact of the financial crisis on gender inequality may be worse than in conservative or social-democratic cantons due to a smaller degree of defamilisation. All in all, we expect major changes within the cantons in terms of shifts between the three spheres of work (labour, family and household, volunteer work). The degree of transformation and the differences between men and women depends on the political, economical and cultural framework of the respective cantons.

THE IMPACT OF THE CRISIS: A GENDERED STORY? THE CASE OF IRELAND

Emma Calvert 2, Bertrand Maître 2

1UCD, 2Economic and Social Research Inst., Dublin, Ireland

Abstract: In recent decades, Ireland has undergone a significant transformation with respect to its labour market composition, with increasing numbers of females especially entering employment. However, research has highlighted the often part-time and precarious nature of this growth, with not only implications for gender but also social inequality. The economic crisis has brought further dramatic change to Ireland’s labour market, and drawing on recent SILC data from the mid 2000s and 2009, the present paper explores the intersections between gender and social inequality in terms of both the level and nature of labour market participation in Ireland.

THE IMPACT OF THE RECESSION ON REDUCED HOURS AND OTHER FLEXIBLE WORKING INITIATIVES: EVIDENCE FROM THE UK

Clare Lyonnée 1, Beate Baldauf 1

1Institute for Employment Research, UNIVERSITY OF WARWICK, Coventry, United Kingdom

Abstract: Throughout the global economic crisis, many employers have been vigorously pursuing strategies to retain staff for as long as possible, rather than making redundancies. This allows them to minimise recruitment costs at a later date and to best position themselves for the economic up-turn. Different forms of flexible working, including the increased provision of part-time work, have been enthusiastically adopted by many UK employer organisations, both large and small, and recent figures from the Labour Force Survey (October – December 2010) show that the number of people in part-time employment is now 6.9 million. However, there are still huge gender differences in the take-up of part-time work, with women making up 78 per cent of the part-time workforce. Against this background, the Government Equalities Office funded a research project which aimed, in part, to explore the provision of “quality” part-time work and other reduced-hours or flexible working measures throughout the recession. This qualitative study explored two key issues:
(a) How are organisations responding to the recession and has there been any increase in the provision of part-time work or other reduced hours measures, as well as various forms of flexible working?

(b) Will these measures have a lasting impact on working patterns on men and women within the organisation, or are these flexible working patterns still highly differentiated by gender?

The study drew on 39 telephone interviews with human resources and diversity managers, part-time workers and line managers in 23 organisations from across the UK economy. The research indicates that many employers have taken steps to increase flexible working options, which include reducing hours and allowing or encouraging employees to work from home. Where reduced hours measures have been introduced, they varied in duration, implementation and take-up. Those organisations with a recognised need for part-time employees were much more likely to embrace the increased provision of flexible working options and these were likely to continue beyond the recession, although these also tended to be in traditional “female” occupations. Even short-term experiences of introducing reduced-hours measures and other forms of flexible working may provide more scope for employees and HR teams to better argue the business case for flexible working in the future.

AFFIRMATIVE ACTION PLANS THAT HELP WOMEN IN ALBANIA

Klea Faniko 1, Fabio Lorenzi-Cioldi 1

1Social psychology department, GENEVA UNIVERSITY, Geneve, Switzerland

Abstract: This talk examines the role of people’s level of education on opinions toward affirmative action policies that assist women’s career in politics.

Our studies are conducted in Albania (Eastern Europe). The situation of women in this country has considerably changed since the fall of communism in the 1990s. As from July 2008, Albania adopted a Gender Equality Law, prescribing a quota of 30% of women in the legislative, the executive and the judiciary systems. Since December 2008, quota was also introduced in the new Electoral Code. Thus, the present studies are both timely and of practical interest for implementing affirmative action programs in Albania.

Affirmative action programs differ from one another on a number of criteria. One important difference is the extent to which policies focus on the personal versus collective characteristics of their beneficiaries. Harrison et al. (2006) regroup affirmative action policies that are effective during the selection process into three broad clusters, ranging along an individual versus group continuum. Toward the individual pole, weak preferential treatments favor minority applicants insofar as they possess the same qualifications as majority applicants. Toward the group pole, strong preferential treatments are based primarily on the recipients’ demographic status (ex. quota).

The influence of education on attitudes toward affirmative action is contingent upon specific policies used. On the one hand, education is most often conducive to favorable attitudes toward soft forms of affirmative action. Kravitz and Klineberg (2000) found that educated persons show more positive attitudes toward affirmative action applied under conditions of equal qualification. On the other hand, there is evidence that education predisposes people against quotas targeted to women’s admission to university (Astin, 1977) or toward strong preferential treatment which help women career in companies (Faniko, Lorenzi-Cioldi, Buschin, & Chatard, 2008).

Our recent work suggests that the relationship between education and attitudes towards affirmative action policies directed at women’s career in politics is likely to be explained by the individuals’ endorsement of meritocracy and the feeling of threat that the implementation of affirmative action programs can generate among the highly educated persons. Theoretical and practical implications of these findings will be discussed.

ENTREPRENEURIAL POTENTIAL OF FEMALE GRADUATES. THE LABOUR MARKET TRANSITION IN A GENDER PERSPECTIVE

Ana Paula Pereira Marques 1, Rita Gonçalo Marinho Moreira 2

1DEPARTMENT OF SOCIOLOGY, 2Research Centre for the Social Sciences (CICS/UM), UNIVERSITY OF MINHO, Braga, Portugal

Abstract: Lately in Portugal, entrepreneurship has been assumed in the context of public policies (NSRF 2007-2013) as a national strategic priority to facilitate access to the labour market and may even constitute an alternative way of professional transition particularly important for graduates of higher education. It means that entrepreneurship brings new and important challenges to the University that are related to their ability, together with other actors (economic, social, political) developing entrepreneurial mindset and an entrepreneurial culture and innovation. In turn, the profile of the graduate mainly female in many areas of knowledge, methods of access to employment, career development and cultural patterns associated with the organization deeply dominated by male rationality, and patriarchal, challenge us about the relationship between entrepreneurial characteristics, social resources, academic and professional and economic context, social and cultural environment. Considering the centrality of this theme, in this paper are presented the results gathered in preliminary diagnosis on the entrepreneurial potential of graduates from the University of Minho. Based on responses from an online survey administered to 283 graduates of different scientific areas who finished the course between 2002 and 2008, we intend to examine the gender variable and its explanatory potential of different behaviors in relation to employment and entrepreneurship (propensity for entrepreneurship, enterprise, professional sectors selected by graduates, among others). From a gender perspective, we intend to evaluate the entrepreneurial potential of young graduates, seeking to identify and contrast their academic and professional paths and structures of representation, while contribute to the discussion and reflection on importance of higher education to develop the entrepreneurial potential, and also understand how some activities (curricular and extracurricular) in academic context, may be useful to fostering the entrepreneurial potential and in the develop of cross-cutting skills for enhancing employability of graduates.

Key-words: Higher education, gender, labour market transition, entrepreneur potential

HARD CHOICES: WOMEN IN MANAGERIAL POSITIONS

Beáta Nagy 1

1Sociology and Social Policy, Corvinus University of Budapest, Budapest, Hungary
Abstract: No fundamental and positive changes occurred in the role of women in management in the years following the political changes in Hungary. This is particularly fascinating, because in the period leading up to the new millennium there were voices and opinions that sought to link this new era to women taking on more active roles, even in business life. The situation may be described as generally ambivalent: on the one hand, women's investment in human capital is on the increase and, as a result, their representation in managerial positions is becoming stable; on the other hand, women's overall participation in management is still low, signalling a weak return on their investment in human capital. Alongside international experience, statistics and literature, in my analysis I will use sociological studies from recent years on attitudes concerning gender role, and the perception on women's managerial performance.

WOMEN’S TIME, EXTENSIVE TIME? THE COOPTATION OF GENDER EQUALITY INTO THE PROMOTION OF WOMEN’S MICRO-BUSINESS DEVELOPMENT THROUGH MICRO-FINANCE SCHEMES IN NORTHERN WESTERN EUROPE.
Emmanuelle Desmedt

1THE YORK MANAGEMENT SCHOOL, THE UNIVERSITY OF YORK, York, United Kingdom

Abstract: Recently micro-finance and micro-crediting to individuals with the aim of helping them to start up micro-businesses and become self-employed is currently encouraged by the European Commission as a way to tackle financial exclusion, poverty, and unemployment in Europe. In particular, ethnic minority groups and women are targeted, and in this paper I will focus on how this promotion is operated on women, and in particular how it is operated on women through time capital. It is not the first time in History that micro-lending is presented as a valuable method to create employment and jobs in a time of economic recession. Micro-finance was used at the end of the nineteenth Century and beginning of the twentieth century in Germany, Italy and Ireland, also in times of economic recession (Woolcock, 1999).

In the context of the current recession, micro-finance is perceived as a valuable tool to create jobs, in particular among women in precarious situations. This is not only done through micro-lending, but also through training and coaching support programmes (Nilsson, 1997; Wilson et al., 2004).

In this paper, I argue that women are used as a target group that is encouraged in self-employment, a precarious and insecure form of employment (Parker, 2004). I will look at this by examining political discourse and policy literature that aims at promoting self-employment via micro-crediting, and by using data on in depth qualitative interviews with women who became self-employed after receiving micro-credits (in Belgium and in the UK). Then I will observe the working conditions of these forms of employment by looking at time, and how time is gendered. In particular, I will look at how self-employment is sold among women as a way to easily combine paid and care work, and how results from existing literature on gender, time and self-employment are ignored to establish such claims. I therefore argue in this paper that gender equality is used as a utilitarian argument (Nussbaum, 2003; Okin 1991) to promote micro-entrepreneurial development in the EU, and creates what Stratigaki (2004) calls a ‘cooptation of gender equality’ in the field of micro-finance policy making.

COMBINING WORK AND CARE: EVIDENCE FROM A NEW INVESTIGATION OF WOMEN’S WORK IN LEEDS
Sue Yeandle

1CIRCLE, Sociology & Social Policy, LEEDS, LEEDS, United Kingdom

Abstract: This paper draws on new research being undertaken by Sue Yeandle and Viktoria Joynes at CIRCLE (Centre for International Research on Care, Labour and Equalities, University of Leeds) into the situation of women living in the city of Leeds (UK). The research is being undertaken as part of the EU FLOWS (Female Labour Force Participation, the Welfare State and Social Inclusion) project, a major cross-national study investigating women’s labour force participation, the welfare state and social inclusion in cities in 11 EU member states over the period 2011-2015, co-ordinated by Prof Per Jensen, University of Aalborg.

The paper will cover data relating to Leeds (UK), and will present an overview of the project’s initial statistical analysis of continuity and change, in terms of both progress and disadvantage, in women’s labour force participation in Leeds. Drawing also on prior research undertaken by Sue Yeandle and her team at CIRCLE which has investigated how women and men with care responsibilities for a sick or disabled family member are supported under UK law and in the specific local context of the city of Leeds (and the services and support it offers to carers), the paper will consider the implications for women and men who are carers of changes under way in the Leeds economy. The changes highlighted include the reductions in both public spending and public sector jobs in Leeds, and changes in services offered through or funded by the local state (Leeds City Council). These changes are occurring as the UK enters a period of significant change, following the financial crisis of 2008 and the new approach being undertaken by the Coalition Government, which ended 13 years of Labour administrations in May 2010.

COUPLES’ STRATEGIES AROUND EMPLOYMENT AND UNPAID WORK TRANSITIONS: A COMPARISON BETWEEN ITALY AND THE UK
Tiziana Nazio

1Social Sciences Department, 2Collegio Carlo Alberto, UNIVERSITY OF TURIN, Torino, Italy

Abstract: This paper focuses on the simultaneous study of labour attachment parallel careers at the couple level, stressing the relevance of the couple as the unit of analyses for the understanding of employment dynamics. It aims at investigating the “family strategy” chosen with respect to the combination of resources within a couple and its relation to the partners’ joint fertility choice(s). Using national panel data, we explore the mutual relationship between changing employment careers and childbirth contrasting Italy and the UK, countries with different welfare regimes, labour markets, and long standing cultural family arrangements and traditions. Research questions are:

a) Are employment participation and the decision to give birth interrelated processes? And if so, are these inter-links the same for men and women and across countries?
b) Is it there a link between men and women’s decision to participate to employment and their joint fertility choices?

Results reveal interdependence between women’s individual careers, and between partners’ careers, showing how women’s employment is constrained by couple’s fertility in a way that men’s is not. Unmeasured characteristics seems to influence both fertility and employment attachment for women in both countries, while no such interdependence between the two careers is shown for men in either country. Human capital seems strategic for women’s capacity to adhere or re-enter the labour market, especially in Italy. Being employed in the public sector (as opposite to private) is associated with higher propensity to conceive for women and it strengthens employment attachment for both sexes. We also found a polarisation between households’ behaviour in face of men’s employment exits: in households where men are more likely to exit employment, women tend to either enter it more (compensating for income loss) or to exit it more themselves (due to spouses homogamy or to maximising on welfare benefits), increasing exposure to the risk of falling into a poverty trap.

These results offer a better understanding on the risks of deepening social inequalities within and between households, in face of economic downturns. They reveal how individuals’ employment participation (and interruption) choices are to some extent jointly shaped and how couples, in turn, are thus central actors in mediating the effects of economic recessions.

WORK AND CARE IN 21ST CENTURY EUROPE: THE PARENTAL CONTRACT

Pamela Ann Abbott, Claire Wallace

Abstract: This paper will consider how parents manage work and care in 21st Century in Europe. The paper will draw on research on work and care that the authors have been carrying out. Our research has shown that across Europe both mothers and fathers are increasingly seeing it as the norm for both parents to work even when they have very young children. However, cultural and institutional contexts vary and family policy also differs. We will consider how these contexts influence the ways in which parents are able to manage work and care and how parents organise responsibilities for paid employment, child care and domestic labour. We will argue that cultural, institutional and policy contexts do impact on parents but that the strategies that parents use to manage work and care are much the same across Europe. We will also consider the implications of our findings for gender equity in paid employment as well as in the domestic sphere.

ACCESS TO LABOUR MARKET OF THE YOUNG POLES AND GENDER IN PERSPECTIVE OF QUANTITATIVE AND QUALITATIVE ANALYSES

Jolanta Grotowska-Leder

Abstract: The paper is focused on analysis of the Polish labour market in relation to age, gender and in the context of counteracting intergenerational inheritance of inequalities. Lack of job is one of the most important “producers” of intergenerational inheritance of inequalities, because of strong correlation between employment and life success, i.e. unemployment and poverty. If the lack of job affects young people and their families it determines, to a large extent, educational opportunities of children, limiting their attendance in facultative courses and thus, their human capital. The paper consists of two parts. The first one presents statistical data from Polish labour market according to age, gender and level of education in comparison with EU and shows that work is not equally distributed among different social categories of young people, particularly young women. This age category is especially endangered by the unemployment which in Poland, is one of the highest in the EU. The second part of the paper deals with Polish labour market policy measures aimed at dealing with the above-mentioned phenomenon. Systematic diagnosis of the activities undertaken within the framework of social policy in this area is extremely important for improving them. Empirical considerations constitute the foundation of the Central Statistical Office and Eurostat (years 2000-2010) and the results of qualitative research on young unemployed Poles: women and men.

EXCELLENT SCIENTIST, WOMEN’S SELF-POSITIONING IN ACADEMIC DISCOURSE.

Kairi Talves

Abstract: Excellence in science is often considered as neutral from gender point of view. Still, the statistics shows that there is considerable gender gap in European research area and especially on high positions. Male-dominated culture and evaluation criterias keep women away from high positions in science and not only in SET and ICT areas, but also in humanitaria, which traditionally should be female dominated.

In current study, I will shed a light to the women’s voice in science. Interviews were made in 2006 with female scientists in Estonia, Latvia, Lithuania, Romania and Poland in FP6 project BASNET (http://www.basnet-fp6.eu/). I analysed the discourse of excellent scientist and how this will influence the Estonian women’s self-positioning in science. Previous studies have shown that in masculine culture women often choose the strategy of withdrawal. As a result, their marginality appers to be chosen by them, although it is caused by the masculinity structures that prevail (Husu 2004). As these structural factors are difficult to recognise, women seem to settle voluntarily in the (lower?) position that is created for them (for example teaching) in the masculine organisation and accept it as their own (Naskali 2004).

In current study I created the model of four types of excellent scientist that shows the women’s positioning in science and discourses around the excellency and how these affect the women self-perception and advancement. These four types named as a salesman, a creature from outerspace, a workaholic and a queen bee characterise the different types of excellency in science and are divided on the scale of masculinity-femininity. Therefore, some of them are masculine and considered as a norm or as a real excellency, but hardly achievable for women. Some of them are feminine, considered as suitable for women, but not so highly valued or desirable even by women themselves. As a result, this kind of understanding of positions of men and women in science creates the notion of gender segregated and masculine oragnisation, where gender assumptions form the strong (hidden?) structure.
GENDER AND SUCCESS IN THE VISUAL ARTS: MEN AND WOMEN’S ACCESS TO SOCIAL RECOGNITION AND FAME IN THE INTERNATIONAL CONTEMPORARY ART WORLD

Alain Philippe Quemin¹, Clara Léa Lévy²

¹UNIVERSITÉ PARIS-EST, Paris, ²Université Nancy-II, Nancy, France

Abstract: Since 1970, German magazines Capital and Manager Magazine have published nearly every year a ranking, the Kunst Kompass, that aims at making public the names of the 100 most visible artists on the international art scene. The ranking is built individually for each artist who receives a certain number of points for his or her exhibitions, either personal or collective in major art institutions such as museums or biennales or for the press cuttings that they get in major international contemporary art magazines. Although the ranking is based on the individual, it is possible to consider groups of artists that share common social characteristics. In this presentation, we will compare male and female artists.

After a critical presentation of the instrument that the Kunst Kompass offers presenting both its limits but also what it can bring, the first phenomenon of the increasing share of women among the most visible international artists and their confrontation to a ceiling that prevents them from perfect integration to the art world will be analyzed.

Besides, not only does the Kunst Kompass make it possible to compare the share of men and women among the most recognized international artists, but it also enables us to compare various social characteristics of male and female artists. Such is the case of careers that can be more or less rapid. At what age do men and women appear in the Kunst Kompass? What is the average age of men and that of women for a given year?

Other criteria will be analyzed. In what countries were male and female artists born and where do they live? In what countries is their main gallery (mentioned in the Kunst Kompass) located? What are the main media used by the most famous male and female artists (painting, sculpture, photography, video, performance, installation, environment…) and what movements of contemporary creation do they belong to? This will enable us to study the link between gender and the characteristics of the works. A similar concern for other traits of the works will justify the study of the average prices of the works created by female artists to that of male artists for equivalent positions in the ranking.

In this presentation, we will try and study social characteristics, should they be biographical and related to the private sphere or to the professional space, of female and male artists and try and show the impact of gender on artistic recognition.

WOMEN ENGINEERS WHO DROPPED OUT. THE “RESERVE ARMY” OF LABOUR FOR SOUTHERN GERMANY’S INDUSTRY?

Yves Jeanrenaud¹, Susanne Ihsen¹

¹Gender Studies in Science and Engineering, Technische Universität München, Munich, Germany

Abstract: As the Learning Society in Europe gains more importance, the need for graduates increases, even more now after recession and especially in manufacturing. The percentage of female graduates overall ranges about 40%, in manufacturing there are only a few. This can be seen very clearly in German-speaking countries, where the pseudo-choice between family and career is as conspicuous and unequal biased. This gets even intensified when it comes to engineering enterprises and careers.

Hence our study, funded by the Economics Ministry of Baden-Württemberg, analysed the reasons and causes for women engineers to drop out of employment corresponding to their technical education. The study carried out by Gender Studies in Engineering at the Technische Universität München mid 2008 until mid 2009 longed to answer the questions as to why these women dropped out and how to win them back into technological fields. Therefore the study primarily consisted of 40 biographical telephone interviews among women who possess engineering or comparable degrees but are no longer or have never been employed in the professions their education led towards. Additionally, we identified the need for women engineers by surveying potential employers and run an expert workshop where recommendations for politics and economy are developed on how to encounter these drop outs and regain the out-dropped women engineers.

Even though the study was done just at the edge of the recession, this interfered with the research when the expert workshop was conducted and an insight into gender relations within the technical labour market was enabled. Nonetheless, after recession seems to have been mostly overcome in Germany, there is a strong demand for skilled highly qualified and specialised personnel, particularly engineers in mechanical and process engineering. But there is still only a small, nonetheless slowly increasing, amount of women engineers in Germany. Only about 22% of graduates in engineering sciences are female. But also figures show that chances to be unemployed are still more than 2 1/2 times amongst women engineers than their male counterparts.

Hence we would like to show empirically how women engineers dropped out of employment and how this may be prevented. Also, we would like to discuss if they are now considered more often for jobs that were not available to them before the crisis hit the industry.

EMPLOYMENT INTERRUPTIONS AND CAREER PENALTIES IN CROSS-NATIONAL PERSPECTIVE. ARE WORK INTERRUPTIONS RELATED TO WOMEN’S CAREER PROSPECTS IN GERMANY, SWEDEN AND THE UNITED STATES?

Marie Evertsson¹, Daniela Grunow², Silke Aisenbrey³

¹Stockholm University, SWEDISH INSTITUTE FOR SOCIAL RESEARCH, Stockholm, Sweden, ²University of Amsterdam, Department of Sociology and Anthropology, Amsterdam, Netherlands, ³Yeshiva College, Yeshiva University, Department of Sociology, New York, United States

Abstract: In this paper we study if, and how women’s career interruptions influence their labor market prospects in three welfare state regimes; Germany, Sweden, and the United States. Women with continuous careers are compared to those with discontinuous careers. We look at career interruptions due to child birth, unemployment and for other reasons. Our comparison is twofold; Across these regimes, we expect women to be subject to varying career punishments for time out depending on the institutional context. Within each regime, we explore the degree of support for the skill
depreciation hypothesis versus signaling theory. According to the first, the assumption is that skills deteriorate at the same rate for all types of time out. Hence, the reason for a time out should not influence career prospects when the total time out is held constant. According to the second, different types of time out may signal different degrees of work commitment to employers, resulting in differing career prospects upon return to the labor market. The signal may be perceived differently depending on whether the leave is voluntary or involuntary. We use data from the National Longitudinal Survey of Youth (NLSY), the German Life History Study (GLHS), and the Swedish Level of Living Survey (LNU) in the period up until the year 2000/05.

Preliminary results from event history models indicate that parental leave length in Sweden is associated with a slower transition rate to an upward occupational move whereas in Germany, no significant relationship between time out experience and upward moves is found. The difference in the outcome may partly be due to women’s varying degree of labor force participation in the two countries and the overall gender context. In Sweden, were almost all women work, extended periods of time out on family leave have a more negative impact on women’s career prospects than in Germany where women to a higher degree self-select into paid work (and full-time home making still is common). Analyses for the United States will shed additional light on this and show how women’s career breaks influence career prospects in a market oriented regime.

PARENTAL LEAVE POLICIES AND MATERNAL LABOUR FORCE PARTICIPATION AFTER THE FIRST CHILDBIRTH IN SPAIN
Irene Lapuerta

Abstract: In this paper I focus on analysing the factors that explain the different choices concerning employment of the Spanish mothers after their first child, paying special attention to the role of two new options introduced by the extension of the parental leave policies. Namely, full-time parental leave and reduced working hours (or also called ‘part-time parental leave’). Until now, most studies do not take into consideration both possibilities and, if they do, do not distinguish between part-time parental leave and part-time work. The result is a lack of knowledge about the causal mechanisms behind mothers’ labour decisions and, even worse, the misinterpretation of the choices with very different constraints, especially in Southern Europe where part-time jobs are very poor in terms of job protection, social benefits and earnings. The empirical research adopts an Event History Analysis approach with a competing risk design, through which I analyse the probability of making the transition from full-time employment at the moment of first childbirth to any of the following destination states: 1) full-time parental leave, 2) part-time parental leave, 3) part-time work or 4) inactivity or unemployment. The data is based on a subsample of 16,902 women stems from the Spanish Workers’ Social Security Files (‘Muestra Continua de Vidas Laborales’, waves 2005-2008). The results support the opportunity cost hypothesis but, contrary to initial expectations, they do not show significant differences between full and part-time parental leave. Only those mothers with middles wages and a very high labour stability have full and part-time parental leave as real labour alternatives after childbirth while those in a weak position have to work on part-time basis or, more frequently, to leave the labour market.

WORK CONDITIONS AS DECISION MAKING FACTORS IN PATERNITY AND PARENTAL LEAVES IN SPAIN.
Pedro Romero-Balsas, Dafne Muntanyola-Saura, Jesús Rogerio-García

Abstract: Parental and paternity leaves seem to give men the possibility of balancing their time among personal, familiar and work activities. This paper comes from a larger researcher framework, which compares the use of the recently introduced paternity leave in Spain with parental leave. The aim is to understand the conditions, usages and consequences of using both types of leaves. We apply a qualitative methodology, Critical Discourse Analysis, based on sixty in-depth interviews to fathers who have taken paternity and/or parental leaves. We consider structural characteristics of work in the productive and reproductive sphere, family resources, couple decision making, motivations, attitudes and personal values as part of our analytical framework. Also, we look at their effective consequences on their identity as fathers, their career and the relationship with others: family, colleagues and friends. Specifically, this paper focuses on work related factors, such as sector, flexibility, work culture, vertical and horizontal relationships at work and position in the organization hierarchy. Our hypothesis is that certain professional profiles encourage (or inhibit) the fathers’ choice of different types of paternity and parental leaves. Our preliminary findings indicate that, on the one hand, parental leaves’ scarce knowledge, as part of work culture, restricts the Spanish fathers’ use of parental leaves to the public sector and large private companies. On the other hand, use of maternity leaves is considered in these sectors as legitimate workers’ right. In addition, vertical and horizontal relationships are a key factor in decision making, especially in self-employed and small, family businesses.

INFORMAL NETWORKS AND WOMEN’S VERTICAL SEGREGATION IN THE LABOR MARKET.
Irene Cruz Gómez

Abstract: The Glass Ceiling concept describes the systematic obstacles women find against their vertical promotion, compared to their male peers with similar credentials. According to the literature, this process is the result of a combination of three possible factors (that are not necessarily independent). First, an unequal sexual division of labor that enhances men’s greater commitment with their careers and firms, often at the expense of a wife taking on double or triple shifts. Second, discriminatory attitudes from employers and top managers, drawn upon plain sexist prejudice. And finally, the isolation of women from the informal networks where important pieces of information are put into circulation, mentorships are cultivated and relevant decisions are taken.

1 Departamento de Trabajo Social, UNIVERSIDAD PÚBLICA DE NAVARRA, Pamplona, Spain
2 Departamento de Trabajo Social, UNIVERSIDAD PÚBLICA DE NAVARRA, Pamplona, Spain
3 Centre d’Estudis Sociològics sobre la Vida Quotidiana i el Treball - QUIRT, Departament de Sociologia, Universitat Autònoma de Barcelona, Bellaterra, Spain
The previous two factors have been analyzed in some depth for the Spanish context, but the former remains unexplored. In this communication the relational mechanisms behind the exclusion of women from informal job-related networks will be analyzed, using a social network analysis perspective. These can be summarized in two main ideas. Firstly, for women, unlike men, two of the most basic patterns of sociability are incongruent, namely, homophily and the preference for high status contacts. These two patterns present no contradiction for male employees since contacts with higher statuses tend to be men themselves. On the contrary, extensive sexual stratification (particularly in the workplace) makes rather unlikely the interaction of women with high status females or of cross-gender relationships of the same power.

Secondly, differences in network composition and in network structure provide diverse outcomes in terms of professional instrumentality. Personal networks rich in weak ties have accredited value for male managers, as described in Granovetter’s *Strength of Weak Ties* hypothesis. Nevertheless, for women in the managerial world, networks rich in strong ties compensate for their less favorable position, offering trust and closeness as an extra credential.

Illustration of these mechanisms is offered drawing upon data from a recent personal network survey carried out in three Catalan cities. Results confirm the hypothesis of incongruence between homophily and high status preferences for women. Other noteworthy results show differences in the esteem expressed by women employees about male and female superiors.

**MOTHERS’ EMPLOYMENT IN GERMANY – WHAT ROLE DOES THE MIGRATION CONTEXT PLAY?**

Nadja Milewski, Esther Geisler

Institute for Sociology and Demography, UNIVERSITY OF ROSTOCK, Rostock, Germany

Abstract: The goal of our study is to examine employment patterns of mothers in Germany comparing immigrant women and Germans. We pay special attention to a within-group comparison of the migrant women by distinguishing between the first and second generations as well as different countries of origin.

Germany ranked first as destination country in Western Europe until recently. Today, almost 20 percent of the population are immigrants or were born to immigrant parents with Turks being the biggest and most visible immigrant group. While employment in general and fertility behavior have become widely studied topics, little is known about the employment situation of immigrant mothers. This topic is, however, important in order to understand processes of immigrant incorporation. From the perspective of structural integration, immigrant women of the second generation seem to be better off than their male counterparts; previous studies show advantages in educational attainment and lower unemployment rates. At the same time, there is evidence for maintenance of the culture of the respective countries of origin. Gender roles are found to be rather diverging from German mainstream in particular for Turks, the male breadwinner model here being dominant. German family and labour market policies have shifted away from the male breadwinner model in the last years. We want to investigate if this shift can be observed among immigrant and German mothers’ employment patterns to a similar extent.

Our research questions are: How do the patterns of mothers’ employment differ between immigrant and German mothers? And what are their determinants? We pay attention to the national origin, migrant generation, living arrangement, education as well as the age and number of children and characteristics of the partner. We apply logistic regression models to data of the 2008 German microcensus. Descriptive results show that, in comparison to German mothers, immigrant women with children are to a higher extent unemployed or not active in the labor market while their full-time employment rates are comparable to their non-migrant counterparts. However, within the second generation the proportion of non-active mothers is considerably smaller than in the first generation.

**WOMEN MIGRANTS IN THE LABOR MARKET - SUCCESSFUL ADAPTATION STRATEGIES**

German Mendzheritskij, Ekaterina Bagreeva

1Faculty of Applied Social Sciences, UNIVERSITY OF APPLIED SCIENCES AND ARTS, Dortmund, Germany, 2Department of State-Legal and Criminological Disciplines, Russian Economic University of G. V. Plekhanov, Moscow, Russian Federation

Abstract: The comparative pilot study of adaptation of Russian-speaking migrants in Germany (190 respondents among them 117 women) and Norway (62 respondents among them 45 women), conducted in 2008-2009 is trying among the other to answer the question: “what adaptation strategies in the labor market lead to the greatest satisfaction with the quality of life among Russian-speaking migrants?”

An active migration within the former Soviet Union and to the Western Europe was forced or voluntary response to the crisis, conflict, economic instability caused by the collapse of the Soviet Union.

The main reason for migrating to Germany was the ethnic migration, whereas family reunion was the primary motivation for migration to Norway.

The study showed that both migrants in Norway and Germany responded favourably to the questions related to realization of one’s goals (50.6% in Germany and 61.4% in Norway). However, the number of respondents selecting the highest level of satisfaction differed significantly (6.5% in Germany and 27.3% in Norway).

The research shows that a larger share of the female migrants in Norway considers their job- and financial expectations to have been met, compared to Germany. Even though the approach to the labour market in the two countries was the same, the migrants to Norway were more successful in acquiring a job matching their qualifications.

Majority of respondents in Germany and Norway underline the successful migration and its positive impact on quality of life. The correlation was found between the level of expectations of external help, personal efforts and level of satisfaction with the achieved results. The less passive position have had the women, the more they were involved in an active process of interaction with the host culture, including the situation of job interaction the more they are satisfied with the new quality of life.

**BETWEEN THE LABOUR MARKET AND THE FAMILY: SOCIAL AND LEGAL CONDITIONS OF FEMALE ACTIVITY.**
izabela Łucjan

1Institute of sociology, UNIVERSITY OF MARIA CURIE-SKŁODOWSKA, Lublin, Poland

Abstract: A rapid development in economy, industrial technology, and communications and information technologies exert a material influence over the changes in the overall economic system. Occupation and employment are the areas particularly affected by the profound transformation of the past decades. The development of knowledge-based economy requires employees to adopt a new approach to employment and own career. There is a mounting pressure on fostering creativity, development, self-improvement and mobility. These transformations in the labour market necessitate changes in the organization of professional life and in the employees' private and family life.

Market pressure forces incessant development, high productivity and optimum use of the capital. One of the phenomena that perfectly accommodate the needs of today's labour market is the promotion of flexible forms of employment. In experts' opinion, their broader application may curtail unemployment and off-the-books activity, as well as contributing to increased mobility and activity in the labour market, increasing business competitiveness and triggering cuts in public spending on unemployment benefits. Above all, however, flexible forms of employment are likely to boost productivity while significantly reducing the number of hours spent at work. Moreover, an employee may arrange his or her day as they wish and diversify working time, which helps fit the working hours to the actual needs in order to, for example, be able to reconcile work and private life, thus applying the idea of work-life balance in practice.

Women are considered the target beneficiaries of these new solutions. More than men, women face the challenge of finding a balance between professional and private life (family). The reasons for this are chiefly socio-cultural factors. Admittedly, the female role was framed by the historical and cultural influences. Thus, the stereotypical division of roles between man as the "only breadwinner" and woman entirely devoted to home and children is so deep-seated in the social awareness that in certain communities it can hardly be challenged. This division is also to blame for the current position of women in the labour market.

BETWEEN WORK AND FAMILY: FINNISH PARENTS IN THE CONTEXT OF AMBIGUOUS FAMILY POLICY

Minna Salmi 1, Johanna Lammi-Taskula 1

1NATIONAL INSTITUTE FOR HEALTH AND WELFARE THL, Helsinki, Finland

Abstract: The paper studies tensions between work and family in the context of Finnish family policy comparing experiences of mothers and fathers with children in and under school age.

In international comparison, Finnish family policy is well-developed with leave schemes and day care services available. On the other hand, family-friendliness in work organisations is less developed. However, the role of working arrangements is central as Finnish parents take actively part in the labour market, and Finnish mothers work full-time. Experiences of work–family tensions are common among parents, and 40% of parents worry about their coping as parents.

In the present economic crisis, there are strong demands to cut the state budget and economize in the municipalities. A higher employment rate is the main goal of governmental policy, and demands of effectiveness are strong at workplaces.

We examine the connection of parents' worry to their experiences of work–family tensions and analyse the development of Finnish family policy. We ask whether the family policy schemes answer to the needs of families and discuss the future of work–family dynamics and family policy.

The analysis of work–family tensions is based on a survey from 2006. The sample was selected from a total population of Finnish families with a child less than 18 years of age. 1762 mothers and 1102 fathers answered the survey, the response rate being 52%. The policy analysis is based on an evaluation of Finnish work–family policies from 1995 to 2008.

Part-time work and flexible working arrangements have been presented as solutions to work–family problems. Many parents wish to work part-time but do not find it possible for family economy or for fear of higher intensity of work with less pay. Neither are the employers interested to rearrange work to be done on a part-time basis. Flexible working arrangements do not necessarily lessen the tensions experienced in balancing work and family.

One explanation to the parents' problems lies in Finnish family policy. In the past 15 years, it has focused on parental leave schemes. Income transfers to families lag behind income development, child poverty has three-doubled and local authority services to families have been object of cuts and rationalization. Creating supportive policies for combining employment and family life has not been very active since the latter part of the 1990s.

RE-ENTERING THE LABOUR MARKET AFTER PARENTAL LEAVE - BARRIERS AND SUPPORT”

Michaela Gstrein

1Economics and Finance, INSTITUTE FOR ADVANCED STUDIES, VIENNA, Vienna, Austria

Abstract: With women's increasing participation on European labour markets, facilitating the reconciliation of work and family life has become an important issue on the agenda of policy makers. Yet, many women in Europe work part time only to combine work and family responsibilities, and often in less secure and long term jobs than men. With the economic crisis, support for young families has been partly reduced and jobs – especially those of women – have become less secure. How will this affect family formation, job perspectives and security as well as reconciliation?

One of the most important transitions in early family life occurs when mothers of young children re-enter the labour market and family life has to be re-organized around the new time-restriction. Various welfare regimes (with their different opinions on private and public family support) have resulted in different adaptation processes, both visible within family life and in the public sphere (on the labour market, in fertility rates, etc.). This paper dwells on the back-to-work transition process from an economic point of view and shows data for international comparisons of this transition and especially detailed data for the Austrian case. It will use existing literature on EU findings (and disseminated in the WORKCARESYNERGIES dissemination project) as well as new Austrian data on the re-entering of the labour market (AMDB, the Austrian Labour Market Service Database) and will offer (1) new in-
sights into how families in general and especially in Austria make this important transition and (2) what effects it has for them as a family, labour market perspectives and social security.

**THE EFFECTS OF TEMPORARY AGENCY WORK ON TRADE UNION ORGANIZING IN AUSTRIA**

Saskja Schindler 1, 2

1Sociology, UNIVERSITY OF VIENNA, 2Sociology, Institute of Advanced Studies, Vienna, Austria

**Abstract:** The number of temporary agency workers in Austria has increased considerably over the last fifteen years. Within the different forms of atypical employment in Austria, temporary agency work is the only male-dominated one and has the lowest percentage of low-paid-workers. Nevertheless, it has a highly precarious potential (e.g. worse provisions for dismissal protection than the permanent staff, worse conditions for professional development, hardly any promotion prospects etc.). The major part of temporary agency workers is employed in the industrial sector. This sector has traditionally been characterised by powerful trade unions, stable labour relations and hardly any precarious employment. Thus the increasing use of temporary agency work causes important changes within this sector.

The paper focuses on problems and challenges in respect of organizing and collective bargaining that Austrian trade unions are faced with and on the strategies they adopt dealing with this situation. Regarding these questions the main interest is the practical knowledge and working experience of the actors involved. Therefore, the paper is methodologically based on guided interviews with union delegates, shop stewards from temporary employment agencies and companies that employ temporary agency workers as well as permanent workers.

**WOMEN TEXTILE WORKERS DEMAND DIGNITY OF WORK: CONTENT ANALYSIS OF A STRIKE**

Ines Jemric Ostojić

**Abstract:** In September 2010 women workers of Kamensko, a textile plant, started general disobedience and a hunger strike, demanding payment of five unpaid monthly salaries. A similar scenario unfolded earlier in the case of Dalmatinka nova, a yarn factory, and at the beginning of the year in Uzor, a fashion house. All three cases come from the textile industry which traditionally employs mostly women on lower paid jobs.

The already unfavorable position of women on the labour market becomes additionally difficult in industries affected by the crisis. The stated examples from the textile industry are a good illustration of the trend that exists in feminized professions, where women are underpaid, exposed to legal and social insecurity, have low social status and are frequently on the verge of poverty.

This paper tries to show the effects of the economic crisis and recession on the position of women in the labour sphere and their further implications on the private sphere, using the example of the media coverage of Kamensko women textile workers strike. The method to be used is content analysis of printed and electronic media, with the aim of pointing to various factors characteristic of the profession feminization process in the Croatian society.

**WORK INTENSIFICATION IN THE EU: GENDER-SPECIFIC EFFECTS OF FLEXIBLE WORK SCHEDULES AND AUTONOMY AT WORK**

Agnieszka A. Piasna

1Department of Sociology, UNIVERSITY OF CAMBRIDGE, Cambridge, United Kingdom

**Abstract:** This paper examines work intensification in the EU, a risk factor linked with adverse effects for workers’ well-being and organizational performance. In particular, I study gender-specific effects of flexible work schedules, hereafter flexitime, and autonomy in determining working time on work intensity. Flexitime includes several types of variable work schedules beyond the traditional 9-to-5 work day, such as flexible start and finishing times, different number of hours worked per day or days per week. Flexitime allows employers to reduce staff costs and to adjust to current market demands. For employees, it offers better work-life balance without a direct reduction in income. The working conditions of flexitime workers deserve more attention in an economic downturn. This typically more precarious group is particularly exposed to market pressures with flexitime likely to become a response to employers’ rather than employees’ needs. It is assumed that the impact of flexitime on work intensity varies by gender as men and women may have different motivation for using it.

Using the European Working Conditions Survey I derive an index of work intensity from two self-reported measures: working at very high speed and working to tight deadlines. The analysis is based on a sample of 58,368 workers from the EU-27 interviewed between 2000-2005. My results suggest that flexitime is associated with increased work intensity and this effect is stronger for women. This finding may be related to women’s disproportionate burden of additional unpaid work. However, the effect of flexitime on work intensity is mediated by the level of autonomy in determining one’s work schedule. Increasing flexitime decreases work intensity at high levels of autonomy and this effect is also gender-specific, with women benefiting more from higher autonomy than men. However, only 13% of women compared to 20% of men were able to entirely determine their work schedule. One in five respondents with flexitime reported having no control whatsoever over their work schedule. The findings provide supporting evidence for the role of welfare states in improving quality of work and narrowing the gender gap in working conditions by supporting organizational structures associated with greater autonomy of workers. An example is set by the Scandinavian countries and the Netherlands, where discretionary forms of work organisation are more developed.

**LOCKED OUT, EMBRACED OR TRAPPED INSIDE? EMPLOYER-EMPLOYEE DEPENDENCE IN A COMPARATIVE GENDER PERSPECTIVE**

Anne Grönlund

1Sociology, UMEÅ UNIVERSITY, Umeå, Sweden

**Abstract:** The aim of this paper is to explore empirical patterns of employer-employee dependence, study gender differences in dependence and the impact tenure rates and on-the-job training and finally, to examine how family policy may impinge on these rela-
Employer-employee dependence is defined as combinations of employability and replaceability and, using latent class analysis, five clusters are retrieved, representing symmetric and asymmetric dependence relations. Multi-level regressions are used to examine how the probability of belonging to each of the clusters is influenced by gender, tenure and training. The results show that tenure and on-the-job training both increase symmetric employer-employee dependency; however, a long tenure increases employer power (low employability, high replaceability), while training strengthens employee power. Women are less often found in situations of symmetric dependence or employee power and more often in an employer power-relation. Some of these differences are explained by the gender gap in on-the-job training.

In all family policy models, women tend to be found in more unfavourable positions than men. However, dependence patterns vary between policy models in a way that reflect the importance of institutions promoting continuous female employment. The results point to the need of further examining determinants of employer-employee dependence, especially regarding the impact of labour market and welfare state institutions.

PATTERNS AND CONTEXTS OF ENTREPRENEURSHIP IN PORTUGAL

Maria das Dores Guerreiro 1, Alice Rosa Alexandre 1, Ana Isabel Couto 1, Margarida Barroso 1
1CIES-JUL, ISCTE – INSTITUTO UNIVERSITÁRIO DE LISBOA, Lisboa, Portugal

Abstract: Entrepreneurship has been gaining particular importance in recent years and is considered a way of reducing unemployment and ensuring economic independence and better occupational inclusion conditions for broad sectors of the population, especially women.

This paper presents the main results of the study “Gender, Entrepreneurship and Qualifications”, funded by the Portuguese Commission for Gender Equality – Presidency of the Council of Ministers. A number of research questions was identified as guiding points: How can we characterize and explain gendered patterns of entrepreneurship? Which factors promote or constrain the entrepreneurial initiative? How is gender articulated with other factors such as age, social class and qualifications in determining entrepreneurship behaviors?

In this presentation we will focus the main results of the national web survey of entrepreneurs conducted with the aim of gathering concrete entrepreneurship practices (past, present and planned) of women and men. The main goal of the national web survey was to analyze entrepreneurship patterns and dynamics in Portugal, how they affect the daily functioning of SMEs, and how they influence the life course of individual entrepreneurs.

We will give special attention to the perceptions and representations of men and women entrepreneurs regarding the effect of gender in business practices as well as the opportunities and constraints identified in business creation.

PORTRETS OF ENTREPRENEURSHIP IN PORTUGAL: CHOICES, OPPORTUNITIES AND CONSTRAINTS FOR WOMEN AND MEN

Maria das Dores Guerreiro 1, Alice Alexandre 1, Ana Caetano 1, Eduard Rodrigues 1
1CIES-JUL, ISCTE – INSTITUTO UNIVERSITÁRIO DE LISBOA, Lisboa, Portugal

Abstract: Sociological approaches on entrepreneurship have increasingly been paying attention to gender as a crucial dimension of analysis. Even if in recent years the creation of businesses by women has become more common, entrepreneurship as a set of practices and representations continues to emerge as an institution characterized by profound gender differences. Why do women create businesses less often than men, and when they do so, why does it occur in quite different activities?

These gendered social dynamics are analyzed in the research project “Gender, Entrepreneurship and Qualifications in Portugal”, funded by the Portuguese Commission for Gender Equality – Presidency of the Council of Ministers. The main goal of the study is to examine entrepreneurship patterns in Portugal, how they affect the daily functioning of Portuguese SMEs, and how they influence the life course of individual entrepreneurs.

This paper will present the qualitative dimension of this research which was based on comparative case studies of SMEs managed by both women and men. Through the elaboration of individual sociological portraits of entrepreneurship we highlight the factors that promote or restrict their behaviours and attitudes regarding entrepreneurship. We give special attention to the ways in which gender is articulated with other factors such as age, social class and qualifications in determining entrepreneurship behaviours.

PREFERENCES, SOCIALIZATION, AND PARTNERSHIP – DETERMINANTS OF THE OCCUPATIONAL GENDER SEGREGATION IN GERMANY

Anne Busch 1, 2
1Berlin Graduate School of Social Sciences (BGSS), 2German Socio Economic Panel Study (SOEP), German Institute for Economic Research (DIW Berlin), Berlin, Germany

Abstract: In Germany, like in other European Countries, we observe an astonishing persistence of gender specific labour market segregation. Empirical research generally deals with consequences of working in gender typical occupations in terms of labour market outcomes. Only few analyze systematically the causes of the gender specific occupational channelling. This paper fills this gap. It is tested to what extent supply-side and institutional approaches explain segregation. Supply-side explanations are driven by economic and gender socialization theory, focussing on gendered attitudes formed in youth, to explain gender specific job paths. Institutional approaches assume that the gender segregation is an institution working in favour of the traditional family model. The latter approach is operationalised using partnership information. To the author’s knowledge this is the first time that information about the partnership is used for explaining gender typical job paths. Research hypotheses are tested using the SOEP 2009, merging the occupational gender composition from the BIBB/BAuA Survey of Employed People to the SOEP. Results confirm that family/work preferences affect working in gender typical jobs: For both women
and men, a strong family orientation is associated with working in gender typical occupations, a strong occupational orientation with working in a male occupation. These effects diminish after including human capital measurements. Consistent with the gender socialization perspective, having a mother (father) who worked in a female occupation when the observed person was 15 years old increases the probability of working in a more female occupation for women (men). For women, partnership information affects the gender typicality of the job: Women who carry a higher amount of housework than their partners work at the same time in more female occupations. If the partner works in a traditional men’s occupation, most women themselves are employed in a traditional women’s occupation. Finally, a decomposition of the “occupational gap” (meaning the employment of men/women in different occupations) show that only 15% of the gap is explained with gender differences in endowments in the included variables. This shows that there are also other mechanisms, e.g. family unfriendly working conditions or stereotyping at the workplace, that (re)produce segregation.

WORKING CONDITION IN CARE SECTOR. MARKET, POLICIES AND GENDER.

Carolina Recio1

1Sociology Department, UNIVERSITAT AUTÒNOMA DE BARCELONA, Cerdanyola del Valles, Spain

Abstract: The present paper deals with the labour conditions of the Spanish care sector, which is placed within the theoretical framework of national employment models. We consider the relations between the social institutions—the family, the State and the market—that are behind the Spanish social care model, based on family dependency, low public resources and precarious labour conditions. We analyze the divergences between the public discourse, which reinforces the universal right to receive care, and the real practices of the social actors. Although the Spanish care sector is gaining importance in the public policies, the family continues to be the main provider of wellbeing. All of these factors hinder improvements in labour conditions and service delivery.

GENDER INEQUALITIES IN THE PORTUGUESE LABOUR MARKET: JOB SATISFACTION AS AN INDICATOR

Ana Lúcia Teixeira Dias1

1CesNova, Faculdade de Ciências Sociais e Humanas - UNL, Lisbon, Portugal

Abstract: The labor market is a privileged arena for the analysis of gender inequalities. The recent massive entrance of women into it, the conditions in which this access occurred, the social representations and the values associated with the concept of femininity and the issues of work-life balance contributed to frame women’s participation in the labor market. With this presentation we intend to address a less common topic of interest when gender inequalities at work are concerned: could job satisfaction be an echo of persistent gender inequalities entrenched in common routines and, most important, in the perceptions of both men and women regarding their responsibilities as professionals? Job satisfaction, besides an independent field of research, could be a relevant set to understand the mechanisms that underlie the objective differences between men and women at work (e.g. pay gap) and to realize the extent to which gender roles are embedded in the intellectual structures of men and women.

To accomplish this research plan we resorted to a previous work on job satisfaction trajectories of Portuguese workers between 1998 and 2001 and isolated the gender dimension. The data comes from the European Household Community Panel, a longitudinal survey led in 12 EU member states on an annual basis until 2001. This panel is representative of the population both at cross-sectionally and at a longitudinal level and covers many subjects, such as demographic information, employment, health, social relations, and migration, among others.

While some findings seem to indicate that there are no obvious differences between men and women’s satisfaction in their workplace they also seem to demonstrate that men and women apparently perceive the labor market and manage their personal life distinctively. This is, in fact, correlated to distinct evaluations in terms of job satisfaction and to the fact that men and women dissimilarities in this field are closely linked with different types of work relations. So, our starting question for this presentation is not if women are more or less satisfied than men with their job, but how are women interpreting their personal and professional trajectories and how this mirrors expectations that are built upon unequal gender roles.

THE GENDER PAY GAP IN BUSINESS SERVICES – BASED ON HUMAN CAPITAL OR SEGREGATION?

Ulla Hendrix1

1Educational and Social Sciences, UNIVERSITY OF WUPPERTAL, Wuppertal, Germany

Abstract: The pay gap between employed men and women is still a highly visible phenomenon in European countries. Diverse theoretical traditions and empirical studies offer competing explanations and factors contributing to the gender pay gap. Following human capital theories, the gender pay gap is the result of individual choices in education and occupational specialisation, earnings being a function of educational years and employment experience. While educational years have lost their explanatory power in face of women’s success in educational systems, human capital theorists explain the lower earnings of women by their “wrong” specialisation, lower employment engagement and the greater amount of career interruptions because of family responsibilities. On the other hand, feminist theorists have pointed to the occupational structure explaining the gender pay gap: hence, gender segregation into male-dominated and female-dominated occupational fields and the devaluation of women’s work are responsible for a great share of pay inequalities.

While earnings differences on national, occupational and organisational levels have been subject to many studies, there is little research on sectoral implications. The empirical study presented here will enlighten the amount and possible explaining factors of the gender pay gap in business services, that means firms offering services for other organisations. This heterogeneous set of branches offers a broad range of skill levels, additionally it contains diversely sex-type occupational fields. The growth of business services during the past decades is seen as an indicator of a structural change into service economy. How do women, often seen as “winners” of a service economy, profit by this secular change? Using german longitudinal data, several individual and structural variables and their contribution to the gender pay gap will be tested. First results show
that the pay gap is higher on sectoral level than on average national level.

THE MOTHERHOOD WAGE PENALTY IN GERMANY
Paul Schmelzer ¹, Kerstin Schulze ²*, Karin Kurz ²
¹The Research Institute of the Federal Employment Agency, Nürnberg, ²Georg-August-University Göttingen, Göttingen, Germany
Abstract: In Germany, mothers earn lower hourly wages than non-
mothers. Several mechanisms have been proposed to explain the
wage penalty for motherhood: First of all, the depreciation of hu-
man capital during the employment interruption might lead to
wage losses. Alternatively, statistical discrimination of mothers
might be responsible for wage reductions. Another argument
points to the burden of rearing a child that is held to reduce
productivity and in turn the earnings of mothers. A related argu-
ment states that mothers might re-orientate themselves from ca-
reer oriented jobs toward more family-friendly, but lower paid jobs.
Not yet well understood are the relationships with macroeconomic
developments. Especially in times of economic crisis, mothers
might not return to the labour market or they might start in badly
paid jobs after an employment interruption.

In our study we will take a closer look at the mechanisms that cause
the wage penalty for mothers in Germany. In contrast to other studies we distinguish between employment interruptions that
comprise the legally protected maternity leave only and those in-
terruptions that are followed by unemployment or inactivity spells
after the protected maternity leave. The effect of these interrup-
tions will be investigated over several years, because motherhood
might impact the income development over a longer time span. We
thereby examine potentially different effects between educational
groups. Furthermore, we ask how mothers’ employment behaviour
and earnings are affected by macroeconomic trends.

For the analyses we use fixed-effects panel regression models
which control for women’s time-constant unobserved characteris-
tics. The analyses are based on data from the German Socio-

THE MOTHERHOOD WAGE PENALTY: RUSSIAN CASE
Pankratova Varvara ¹
¹THE HIGHER SCHOOL OF ECONOMICS, MOSCOW, Russian Federation
Abstract: This paper deals with the problem of motherhood wage
penalty and discrimination of women with small children in Russia.
Women with small children face with different problems and diffi-
culties in the labour market. Firstly, they have to reconcile their
jobs and family. Secondly, there exist an employment and wage
discrimination in the labour market.

The paper discloses factors of women’s discrimination in Russian
labour market. The author analyzes women’s wages in statics and
dynamics.

All the estimations are made for 4 groups of women depending on
the fact of having children and the age of the children. The main
assumption is that Russian women with small children are discrimi-
nated in labour market.

The paper is based on Russian Longitudinal Monitoring Survey
(RLMS) for 2000-2009.

BABIES, JOBS AND PLACES. REGIONAL EMPLOYMENT
TRANSITIONS BY MOTHERS OF CHILDREN UNDER
SCHOOL AGE IN THE UK
Pierre Walthery ¹
¹Cathie Marsh Centre for Census and Survey Research, UNIVERSITY
OF MANCHESTER, Manchester, United Kingdom
Abstract: This paper, based on my doctoral research, focuses on the
statistical modelling of regional differences in employment transi-
tions by mothers of children under school age in the UK, with a few
references to Germany, and discusses several explanations for their
persistence. Whereas studies at the national level remain the norm
among works dealing with mothers’ economic behaviour, whether
they involve one country or several -- there is ample evidence of
significant sub national differences in the prevalence of economic
inactivity or part-time work. Accordingly, dominant paradigms tend
to explain these in terms of national policy regimes, institutions or
cultures, while overlooking spatially determined economic or social
factors, such as internal migration or asymmetric regional devel-
lopment.

This paper has three purposes. First, it presents the results of a
model summarising regional differences in transitions between full-
time and part-time work, economic activity and inactivity of mother
of children under 6 years old in the UK. It then assesses the extent
to which these differences could be associated with individual fac-
tors traditionally affecting participation in paid work of mothers
such as family formation patterns, or social position. In a third
stage, the relationship between the regional employment context
and these contrasts is assessed, by looking at the quantity and the
nature of jobs available locally to mothers. Finally an alternative
explanation is explored that builds upon long term regional eco-
nomic trends and economic history, and draws on the structuralist
sociological tradition.

The main method used in this research is statistical modelling of
secondary data: a multilevel latent growth model fitted to two
samples of mothers whose youngest child is aged under 6. The data
is drawn from the UK longitudinal Labour Force Survey 2001-2007,
and the Mikrozensus-Panel 2001-2004 for Germany.

DEFINING THE DETERMINANTS OF LABOR MOBILITY
OF WOMEN AFTER CHILDBIRTH IN RUSSIA
Elena Kolotova ¹
¹Sociology, State university - Higher school of economics, Moscow,
Russian Federation
Abstract: The research puzzle
Existing Russian studies of labor mobility are mainly devoted to the
gender dimension, the impact of human capital and specific capital,
education, the mobility of wages, the relationship of labor mobility
and inequality. Yet, no study to date has studied labor mobility of
Russian women with young children.

Nevertheless, the topic of research is extremely important to ad-
dress demographic challenges and to develop social policy. Many
studies illustrate that women with young children is one of the discriminated categories of labor.

Methodology

The object of this study - women with young children in Russia. The subject of study - the magnitude, pattern and factors of labor mobility of women with young children in Russia.

Labor mobility is operationalising as interfirm labor mobility (for organizational criterion) and movement of individuals in the labor market into categories: employed, unemployed, unemployed.

Object of research on empirical data. The empirical object of the investigation are women aged 15 to 44 years (reproductive age women in Russia), gave birth to a child in the year N. Their labor history will be tracked for 6 years. Data used for the analysis - Russian Longitudinal Monitoring Survey, which is a panel study. In the analysis we plan to use data for 2000-2009 years.

Research objectives:

1) To estimate transition in the labor market of women in Russia at the age of 15 to 44 years who gave birth in the year N ( changing labor status between 3 states: employed, unemployed and economically inactive and changing a job)

2) To compare the rates of transition in the labor market of women who gave birth to a child in N year with the rates of women at the age of 15 to 44 years without children during the observation period, as well as with those of women with children under the age of 7and older;

3) Construct a function of the risk of mobility for women with children aged 0 to 6 years old at the beginning of the period under observation;

4) To test the influence of the factors on the probability of a change in employment status or in place of work for women who gave birth in the year (labor activity of women before the birth of a child, other characteristics of the object, characteristics of the family, health indicators in the family, Economic Indicators settlement)

Transit matrix and Cox regression will be used for analysis.

HOMOGAMY IN UNSTABLE LABOUR MARKET POSITIONS AND TRANSITION TO PARENTHOOD IN FINLAND

Hanna Sutela

Abstract: Since the late 1990s, temporary employment has remained widespread among Finnish women of child-bearing age. In Finland, the gender gap in temporary employment is the second largest in the EU27.

According to the previous results, temporary work and transition to parenthood were negatively associated among young Finnish employees in 1984-2008. On the other hand, there exists much evidence for a positive association between partners’ employment situations. In this paper, I ask to what extent instability of employment situations comes with youngish Finnish couples and to what extent this potential homogamy is related to the first child fertility. Moreover, does it matter for the fertility decision of a couple, whether it is the female or the male partner who has a temporary contract, in case the other is permanently employed?

The study is based on the Finnish Quality fo Work Life Surveys 1984-2008, combined with information from population registers on children born to the respondents until 2009. The results give evidence for gender-specific homogamy. Especially men in temporary employment are more likely to have a spouse outside labour force, in particular enrolled in studies, than their peers in permanent employment. Both partners employed, temporary contracts tend to cumulate within same couples – again, more strongly in case of men than women.

As to transition to parenthood, the type of contract of the female partner makes a particular difference. Temporary employment of the woman decreases the likelihood of entry to parenthood regardless of the employment situation or the type of contract of the man. In contrast, couples where the woman has a permanent contract are almost equally likely to have children regardless whether the man is in permanently or temporarily employed.

Following conclusions can be drawn. Firstly, accumulation of unstable employment situations contributes to social inequality among young couples. The negative outcomes do not show only in material well-being, in form of income difficulties and economic uncertainty, but they also mean lowered opportunities to realise aspirations regarding family formation. Secondly, given the major impact of the woman’s type of contract on fertility of young couples, the high prevalence of temporary employment among youngish female employees becomes extremely meaningful in respect of both social equity and demographics in Finland.

INSECURE EMPLOYMENT AND ITS CONSEQUENCES FOR WOMEN WORKERS IN TURKEY

Belkis Kumbetoglu1, Inci User1, Aylin Akpinar1

1Department of Sociology, Faculty of Arts & Sciences, Marmara University, Istanbul, Turkey

Abstract: This presentation is about Turkish women workers who are working without job- and social security in textile-, food and service sectors. This type of employment which has social, economic and psychological effects is an important contemporary concern in Turkey. In almost every age group unregistered work involves far more women than men. Work contracts are either temporary or totally absent and the norms of industrial relations become replaced by informal relations. Under this trend women workers are expected to take their own risks in the labour market and to give up their expectations for life-long employment, and insecurity has already become a norm in working life. Precarious jobs may be temporary or long term, but the circumstance of insecurity is permanent.

The consequences of insecure employment for Turkish women workers’ lives can be summarized as follows:

- Women are faced with decreasing incomes paid irregularly and with the permanent risk of losing their jobs;
- Since they are unregistered, women workers cannot benefit from social security, unemployment insurances and other financial supports.
- Unregistered women workers cannot expect to receive indemnity.
- Women and their families survive at best, but remain vulnerable especially in times of economic, personal or household crises.
- Insecure employment deprives women of the knowledge and experience of labour rights and labour union activities.
The uncertainty of working conditions results in the consequent inability to plan life.

- Most precarious jobs are supplied by employers who are unregistered themselves and this increases the insecurity in working life.
- Uncertainty and harsh working conditions lead to numerous health and psychological problems which cannot be met adequately in the absence of health insurances.
- Precarious jobs do not only worsen women’s material conditions but they also weaken their household- and social statuses.

These circumstances will be discussed with reference to a qualitative field study conducted in 2008-2009, about unregistered women workers in five provinces of Turkey.

THE IMPACT OF WORK PRECARIOUSNESS ON CHILDBEARING INTENTIONS AND THEIR REALIZATION: EVIDENCE FROM SWITZERLAND

Doris Hanappi 1, Valérie-Anne Ryser 2, Jean-Marie LeGoff 3, Laura Bernardi 3

1National Center of Competence in Research LIVES, UNIVERSITY OF LAUSANNE, 2Swiss Centre of Expertise in the Social Sciences FORS, 3Laboratoire d’étude des Parcours de Vie, University of Lausanne, Lausanne, Switzerland

Abstract: Switzerland as most post-industrial societies has been subject to demographic, economic, and ideational change that has substantially affected gender inequalities on the labour market. One major challenge is work precariousness, which makes women vulnerable to job loss, labour market marginalization, or being pushed into the “reserve army of labour”. It threatens couples’ capabilities to construct coherent life plans, such as combining work and family life. This paper responds to the debate of the complex interrelationship of the labour market and familial situation of men and women. It looks at the impact of work precariousness, including various qualitative aspects of work, on couples’ childbearing intentions. It departs from the hypothesis that socio-economic characteristics, gender-equalitarian attitudes, and practices affect the individual change or realization of childbearing intentions under work precariousness. Former studies show that professional and economic determinants matter for family formation intentions and behaviour. Analysing a subsample of women between 18 and 45 years who were part of the waves 2002 and 2009 of the Swiss Household Panel, we examine the extent to which the actual transition to parenthood is affected by situations of work precariousness among couples with different socioeconomic status, gender-equalitarian attitudes, and practices. First, we adopt a descriptive approach to identify the age, gender and class distributions, of major aspects of work precariousness associated with poor quality jobs, high work pressure, and job insecurity. Second, using nominal regression models, we examine whether individual and socioeconomic aspects induce people to change or realize their fertility intentions under work precariousness.
“TO SCREEN OR NOT TO SCREEN?” HOW GENERAL PRACTITIONERS INFORM THEIR PATIENTS ABOUT RISKS AND BENEFITS OF SCREENING FOR PROSTATE CANCER

Gerlinde Malli1

1Research and Development, INSTITUTE FOR HEALTH PROMOTION AND PREVENTION, Graz, Austria

Abstract: Screening for prostate-specific antigen (PSA) is controversial. In the context of the Austrian Periodic Health Examination general practitioners (GPs) are expected to inform their patients of risks and benefits of screening before undergoing PSA testing. Ideally, this information corresponds to the model of informed decision making (IDM). Little is known about how often GPs provide patients with adequate/balanced information and about the quality of these informational conversations. This study gains insight into GPs practice of communication and explores factors which influence GPs counselling.

Methods: The qualitative pilot study involves five focus groups with 30 GPs and four internists and in-depth interviews with eight GPs. Both, the discussions and the interviews were audio-taped, transcribed verbatim, and qualitatively analyzed. MAXqda was used for analysis.

Results: Concerning the practice of risk communication we found two groups of GPs: GPs who inform the patient only if they formally wish it and GPs who advertise PSA testing. GPs report less discussion of risk and treatment dilemmas. More often they discuss the potential benefit of the testing. They regard balanced information as unacceptable for both, the GP and the patient. Influencing factors concerning the patient include excessive emotional demand, the complexity of the topic and GPs’ argument, patients prefer the authoritarian doctor. Moreover GPs’ attitudes such as their own belief in the efficacy of the PSA test and lack of knowledge about the evidence of PSA screening influence their practice of counselling. The most commonly identified structural barriers to discussions were lack of time and lack of remuneration.

Conclusion: GPs’ presentation of information appeared to be affected by their personal views of the PSA test. They seem to overvalue the benefits of the screening and undervalue the associated risks. Consultation often depends on patients’ demand for the test. GPs’ statements show that the model of IDM concerning PSA screening within the Austrian Periodic Health Examination is not realized.

THE DISCOVERY OF HEPATITIS C INFECTION: A NON-EVENT IN DISAFFILIATED EXMATES LIFE STORIES

Meoin Hagege1

1Sociologie, EHESS, Paris, France

Abstract: The slow implementation of European regulation in French penitentiary institutions is gradually but radically changing the status of the inmate in the management of prisons and its processes of governance. This indirectly affects the issue of healthcare resources and practices in prison, which in turn affects recourses and attitudes to healthcare for convicts suffering from hepatitis (HCV) after release.

In studying the health trajectories of HCV-positive ex-prisoners, paying attention to individuals’ relations to time allows us to uncover a new side of the experience of seeking treatment. Using interactionist methodology to prompt narratives of health trajectories, a series of biographies were collected from disaffiliated inmates after their release from a prison around Paris.

In these, the discovery of the HCV infection is narrated as just another obstacle to be faced, among many other preoccupations. This moment is told as a moment of the life story, without inducing a change in rhythm or intelligibility, turning point nor biographical disruption; as such, it cannot be understood as a life event.

This detail becomes relevant to a sociological approach to the issue of post-penal healthcare when it is considered in its larger context, as an element of the public health management of viral infections. For the institution and its agents, seropositivity is largely assumed to be a life event: in the integrated trajectories of the patients it usually treats, the news of infection is an extra-ordinary event in

CONTINUITY OF CARE AND TREATMENT IN NORTH ITALY: BETWEEN HOSPITAL SPECIALISTS AND GENERAL PRACTITIONERS TO OVERCOME SEPARATIONS

Marco Zanchi1,2*

1Human Sciences, 2CE.R.Co Research Center of Anthropology and Epistemology of complexity, UNIVERSITY OF BERGAMO (ITALY), Bergamo, Italy

Abstract: The research project stems from the fact that the Bergamo area – north Italy - despite being one of the spearheads of the national health system, is characterized by a significant number of cancer patients, diagnosed with innuminous, and a significant number of elderly dependents that, after the phase of active therapy, disappears or in the anonymity of private care pathways or in therapeutic procedures provided by the activation of home care and rehabilitation, in rehabilitation centers.

From the local level, we verified the discrepancies in the consistency and continuity of care pathways linked to the terminal incurability, deepening the study of regulations, strategies of interconnection activated in the area, rebuilding the social models of care in the end stages of life and creating a comparative analysis among different districts and regions.

Specifically, in the Bergamoterritory, we observed the maintenance of continuity of care pathways gradually tracked by mapping the joint and the protagonists, verifying the existence of links among services, people, institutions and media.

In particular, we tried to enhance: the relationship between hospital specialists and general practitioners to overcome separations, lack of communication and information; the connections with other actors of healthcare and welfare; the ties with the territory and with the assistance integrated home and the correct use of protected or planned discharge.
that it is both a disruption of intelligibility, a (possible) death sentence and the beginning of the process of patient care. This opposition with ex-prisoners’ conception of infection as non-event has effects on their experience with healthcare.

Studying the HCV status in ex-prisoners also sheds light on the issue of the expectations of healthcare institutions. More specifically, it is because the discovery of HCV-positive status is considered a life event that the institution produces practices and discourse aiming to include the patients in global a process of medical, social and (post-)penal care. This impetus to action aimed at the HCV-positive person becomes problematic when considering that it also permeates healthcare centers that practice Chicago School-inspired patient care (placing focus on the agency of the patient, adapting practice and discourse to the needs of the patients.)

THE SOCIAL CONSTRUCTION OF TIME AND ITS INFLUENCE IN THE CRITICALLY ILL PATIENTS AND INTENSIVE CARE PROFESSIONALS RELATIONSHIP.

Maria Elena Fabregat 1, RAUL RUIZ 1
1SOCIOLOGY I, UNIVERSITY OF ALICANTE, SAN VICENTE DEL RASPEIG, Spain

Abstract: The admission of a person in the ICU makes the contact between the patient and his/her family exceptionally difficult. Patient isolation causes repercussions in family environment and has also influence on the relationship with medical staff. The increase of anxiety level produced within the ICU structure generates a complex situation in which the three main actors of this environment (medical care staff- patient-family) have to manage. Recently, a very significant thought has emerged with regard to hospital management policies of ICU-patient-family that has enabled to introduce important changes in the theoretical approach of hospital needs of intensive care units actor -especially from the psychological perspective-. However, the concern about how these needs are meet and how the implementation of these changes can be carried out still remains and the lack of feasible solutions in order to promote this change is denounced repeatedly. The results obtained in this research help to understand how sociology of time explains the changes occurred in the expectations, satisfactions and disappointments around the current relationship between critically ill patients and ICU professionals and introduces very valuable information for generating new ideas for the management of this sociological context. Starting from a deep qualitative analysis of it, the research tries to figure out new sociological variables (construction of time specially) with influence in the complex process of communication among the parts and, taking them into account as a system, and providing the innovation of an essentially sociological approach, establishes as the overall goal, the design, development and validation of a ICTs based system for the improvement of Communication of ICU-family-patient which has been already developed by a group of IT and telecommunications engineers and will be installed and validated in three different hospitals in brief.

DEALING WITH HEALTH FROM A SOCIAL CLASS POINT OF VIEW. AN ANALYSIS OF SCHOOL NURSES FACED WITH FAMILIES

Philippe Longchamp 1
1HAUTE ECOLE DE SANTÉ GÉNÉVE, Genève, Switzerland

Abstract: In this paper, we contend that social classes have different ways to relate to health. In order to analyse this hypothesis, we ask a double question: 1) Can a connection be established between an individual’s relationship to health and his/her social position? 2) How do the differing and unequal ways individuals relate to health determine the interaction between patients and health professionals?

To answer both questions, we focused on the activity of school nurses in Geneva. 71 direct observations were conducted at the infirmaries of 3 different schools: a predominantly working-class school, a socially mixed school, and a predominantly middle/upper-class school. These observations were completed by 72 interviews (20 with nurses and 52 with families).

This presentation will bring two results.

Firstly, we will demonstrate that it is possible to identify three ideal-typical relationships to health in nurses and families that can be organized into a space that is homologous to Bourdieu’s social space: negative-somatic (working classes), positive-somatic (economic middle/upper classes) and positive-mental (cultural middle/upper classes).

Secondly, we shall analyse the effects of these differing and unequal relationships to health on the interaction between school nurses and families at the infirmary. The nurse-family interaction displays three class specific patterns: elective affinity (cultural middle/upper classes families), structural misunderstanding (economic middle/upper classes families) and normative imposition (lower-class families).

Ultimately, this paper demonstrates that far from being universal, “holistic health” is part of a class culture. This potentially makes it the source of underlying tensions that stem from social gaps between health professionals and families.

EXPLAINING SOCIOECONOMIC DIFFERENCES IN ADOLESCENT SELF-RATED HEALTH: THE CONTRIBUTION OF MATERIAL, PSYCHOSOCIAL AND BEHAVIOURAL FACTORS

Irene Moor 1, Frank J. van Lenthe 2, Matthias Richter 3
1UNIVERSITÄT BIELEFELD, Bielefeld, Germany, 2Erasmus University MC, Rotterdam, Netherlands, 3Martin-Luther-Universität, Halle-Wittenberg, Germany

Abstract: Similar to the description of social inequalities in health, attempts to explain these differences have mainly focused on adults. Few studies have systematically analysed different explanatory pathways in adolescence. The study is among the first to examine the contribution of material, psychosocial and behavioural factors in the explanation of inequalities in adolescent health.

Methods: Data were obtained from the German part of the cross-sectional "Health Behaviour in School-aged Children" survey in 2006 with a total of 6,997 respondents aged 11- to 15-years (response rate 86%). Socioeconomic position was measured using the family affluence scale. Multistage logistic regression models were used to assess the relative importance of explanatory factors.

Results: Compared with high affluent adolescents, the odds ratios (OR) of fair/poor self-rated health increased to 1.53 (95% CI 1.11-2.12) in low affluent boys and to 2.08 (95% CI 1.62-2.67) in girls. In the separate analyses material, psychosocial and behavioural fac-
tors attenuated the OR by 30-50%. Together, the three explanatory factors reduced the OR by about 80% in low affluent boys and girls. The combined analyses illustrated that material factors contributed most to differences in self-rated health because of their direct and indirect effect (through psychosocial and behavioural factors).

Conclusion: The findings show that the main explanatory approach- es for adults also apply to adolescents. The direct and indirect contribution of material factors for inequalities in self-rated health was stronger than behavioural and psychosocial factors. Strategies for reducing health inequalities should primarily focus on improving material circumstances in lower affluent groups.

MACRO-LEVEL DETERMINANTS OF HEALTH AMONG ADOLESCENTS IN WELFARE STATES: A MULTI-LEVEL ANALYSIS

Katharina Rathmann 1, Matthias Richter 2
1BERLIN GRADUATE SCHOOL OF SOCIAL SCIENCES, HUMBOLDT UNIVERSITY ZU BERLIN, Berlin, 2Department of Medical Sociology, Medical Faculty - Martin Luther University Halle-Wittenberg, Halle-Wittenberg, Germany

Abstract: Previous studies have shown that macro-level factors, such as income inequality, wealth of countries or welfare state characteristics are crucial determinants of health and health inequalities among adults. So far, comparative research has rarely focused on children and adolescents. This study is among the first to examine whether different macro-level determinants are associated with differences in subjective health and socio-economic related health inequalities among adolescents in high-developed welfare states.

Method: Data were collected from the school based "Health Behaviour in School-aged Children":study in 2005/2006, which includes 11- to 15-year old students from 27 European and North American countries (N=134.632), classified into five regimes (Scandinavian, Bismarckian, Liberal, Southern, Eastern). Hierarchical linear regression models were conducted for multiple complaints in health, including stepwise individual (family affluence) and extended by macro-level determinants (wealth of countries, income inequality, health expenditure, welfare state regime dummies).

Results: Boys and girls in the Southern, Eastern and Liberal regimes displayed the highest prevalence rates in multiple complaints in contrast to the social-democratic and conservative regimes. The liberal regime and, thus, countries with high income inequality showed significantly more complaints and a stronger impact of socio-economic determinants on complaints.

Conclusions: Reducing health inequalities should continue to be an important public health strategy with emphasis on the young population in all welfare states regimes and particularly in the Liberal welfare states. Thus, welfare state characteristics and the extent of income inequality are considered as relevant factors in tackling socioeconomic inequalities in health of adolescents.

MULTIPLE SOCIOECONOMIC CIRCUMSTANCES AND ANTIDEPRESSANT USE: A REGISTER-BASED STUDY AMONG FINNISH EMPLOYEES

Elina Laaksonen 1, Tea Lallukka 1, Mikko Laaksonen 1, Pekka Martikainen 1, Ossi Rahkonen 1, Eero Lahelma 1
1Department of Public Health, 2Department of Sociology, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Various dimensions of socioeconomic circumstances are associated with self-reported mental health, but we lack evidence from studies that simultaneously consider multiple socioeconomic circumstances and clinically confirmed outcomes. This study examined the associations of multiple dimensions of socioeconomic circumstances with subsequent use of antidepressants among Finnish public sector employees.

Data and methods: This longitudinal study used baseline survey data from the Helsinki Health Study (2000-2002) among 40-60 year old City of Helsinki employees linked with register data from the Social Insurance Institution of Finland on medication purchases (n=6601, 79% women). Associations of parental and own education, childhood and current economic difficulties, occupational class, household income and housing tenure with the subsequent use of antidepressants during a follow-up of five years were examined. Cox regression analysis was the main statistical method used.

Results: Prevalence of antidepressant use was 12% among women and 10% among men. Reporting childhood economic difficulties (HR=1.51 in women, HR=1.62 in men) and living in rented housing (HR=1.46 in women, HR=1.65 in men) among women and men, reporting current economic difficulties among women (HR=1.32 – 2.00), and belonging to the routine non-manual occupational class (HR=2.14) and the third income group (HR=1.70) among men, were all associated with the use of antidepressants. In contrast, among manual workers in women (HR=0.44) antidepressant use was less common.

Conclusions: Past and present economic difficulties and living in rented housing may be more important socioeconomic determinants of mental disorders and consequent medication use among employees than the conventional socioeconomic indicators education, occupational class and income. Further analyses are needed to clarify the mechanisms.

PARADOXES OF A HEALTHY LIFESTYLE IN TRANSFORMING RUSSIA

Natalia Belova 1
1Sociology, RUSSIAN STATE UNIVERSITY FOR THE HUMANITIES, Moscow, Russian Federation

Abstract: In Russia, as in most European countries, all the more acute is the problem of human responsibility for their lives and health. Over the last decade in European countries experienced an increase in social risk factors for health-related, primarily, with a change in the rhythm of life, as well as personal attitudes and behavior of the individual. This leads to the development and adoption of measures at the national level aimed at promoting a healthy lifestyle.

One of the strategic objectives of government social policy in Russia is to create conditions that orient citizens to a healthy lifestyle. Since 2009, the Ministry of Health and Social Development is implementing the program “Healthy Russia”, whose main goal - is to form careful attitude to the health of citizens, based on the principle of a healthy lifestyle. The country has opened health centers, which, according to available documents, any citizen can get free advice about healthy lifestyles. However, to realize in practice this right is almost impossible.
In the formation of a healthy lifestyle involves not only the Institute of Public Health, and Family, Institute of Education and other. However, these social institutions are hardly interact on the formation of healthy lifestyle.

In studying the problems of healthy lifestyle of the population found a number of paradoxes: the paradox in the transfer of information on healthy lifestyles; contradictions in leading healthy lifestyles; paradox associated with the study of healthy lifestyles and other.

MENTAL HEALTH, WORK AND FAMILY SATISFACTIONS AMONG COUPLES: HOW DOES ONE PARTNER INFLUENCE THE OTHER ONE? A 5-YEAR LONGITUDINAL ANALYSIS

Stéphane Cullati 1, 2, Delphine S Courvoisier 2, Claudine Burton-Jeangros 1

1UNIVERSITY OF GENEVA, 2Geneva University Hospitals, Geneva 4, Switzerland

Abstract: Health inequalities research examined the influence of partners on individual mental health status and showed that partners tend to resemble each other. However transformations of mental health over time taking into account co-influences between partners have been less often studied. Using a longitudinal design, we examine how the mental health’s trajectory of one partner impacts on the trajectory of the other one, and reciprocally, among middle-aged couples. We also investigate whether mental health’s trajectories of these couples interact with the work and family spheres.

Method: The sample is composed of 624 respondents living in couples who participated to the Swiss Panel Households survey between 2000 and 2004. Stable and momentary variations of mental health of both partners were modelled with a multi-construct latent-state trait model (structural equation modelling).

Results: Both men and women have a mostly stable mental health: 75% of the variance of the observed variables was accounted by the stable part of mental health. The relationship between partners’ mental health was weak but significant: correlation between partner’s trait factors was 0.26. However, the year-specific fluctuations of one partner did not influence the mental health’s fluctuations of the other partner one year later. Considering each partner separately, cross-sectional influences of satisfaction with work and with family were significant for both men and women (from 0.11 to 0.31). Considering inter-partners influences, an uni-directional cross-sectional effect was observed for satisfaction with family, not for satisfaction with work: fluctuations of wife’s mental health was associated with her husband’s satisfaction with family in three waves out of five (from 0.09 to 0.12).

Discussion: This longitudinal analysis allows to examine change of mental health among couples and the inter-partners influences. Couples are mostly stable in their mental health and the stability of one partner has an impact on the stability of the other partner. Variability of one partners’ mental health is not due to the partner’s mental health. Other situational influences explain this variability, like satisfaction with family and with work. In particular, women’s mental health seems to be sensitive to the satisfaction with family of their husband.

PATHOLOGY OR NORMAL DISTRESS? EXHAUSTED WOMEN NEGOTIATING THE MEANINGS OF DEPRESSION IN THE CONTEXT OF WORKING LIFE

Sanna Maria Rikala 1

1School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: Consistent findings in research on depression show that the prevalence of depression is approximately two times higher among women than men. These findings have been discussed widely in the field of feminist research. A shared agenda within recent feminist research on depression has been to build a theoretical framework that could take into account both the social causation of gender inequalities in health and the social construction of disease categories. Indeed, many scholars have adopted so called material-discursive approach in order to understand the complexity of the social, material and cultural processes intertwined in the gendering of depression.

This paper reports the preliminary findings of an ongoing PhD study on women’s work-related depression. Bringing together the material-discursive approach of feminist depression research and recent discussions about the new pathological developments in working life, my study explores how the discourses of depression materialize in the context of contemporary work. Within work life research, it is suggested that the proliferation of work-related pathologies manifests an ongoing shift from a political conception of problems at work towards a medical-psychological framework. Drawing from this notion, this study explores how women, who have been diagnosed as depressed when reporting symptoms of work-related exhaustion and distress, give meanings to their condition afterwards. The data consists of 16 semi-structured interviews with female burnout sufferers.

The analysis shows that the medical construction of depression organized women’s accounts of exhaustion. The idea of depression was used as a standard according to which burnout sufferers estimated their health condition and hence made sense of their experiences. However, a strong resistance towards individualizing or pathologizing the problems at work was also present in women’s accounts. Work-related depression was not perceived as an illness, but rather a reasonable reaction to a burdensome life situation, for example excessive workloads or mistreatments at work. Further, the interviewees stretched the medical conception of depression and were after a broader definition. Accordingly, the negotiations concerning the meanings of depression aimed at overcoming the strict dichotomy between health and illness.

« STRESS », A RELEVANT TERM TO ESTIMATE AND MANAGE THE HEALTH IN WORK?

Guillaume Lecoeur 1

1CNAM, Paris, France

Abstract: A day without the word “stress” being pronounced has become very rare. Intuitively comprehensible by everybody, the word “stress” has integrated the common language. « I am stressed », « it’s stressful » “it’s the stress”..., expressions that qualify this state are more and more present in our language. Thus, the stress has become ordinary. Beyond this intuitive observation, the word “stress” seems to be an important subject of society due to his capacity to mobilize individual and collective consciousness. In or-
to understand the mutation of the contemporain world, the word “stress”, both subjective and full of sense, is nowadays increasingly catching the attention of multiple sciences. It’s spreading in the public policy is now an important issue for the coming management of health at work.

In order to put this issue into perspective, the first step will be to underline the diversity of the various scientific approaches. Doing this we will demonstrate the today’s perspective of the Sociology by analyzing the different scientific arguing. Afterwards, we will highlight why a socio historical approach allow a new perception of the subject, by explaining why the current meaning of the term “stress” results from a subjectivity. This subjectivity has made herself in conjunction with its spreading in the social reality, especially since the late 60s.

Analysing the archives of the ILO enables to put more precisely into perspective the celerity of this spreading and its progressive establishment in the public labour policy, from an international to a national scale. The last part of the communication will show, from a field of research, the consequences of the use of the term “stress”, intrinsically subjective at the local scale. The research has been carried out in a big french high tech firm, which organized a stress management policy. This research is based on interviews with the board, the Human Resources, unions, CHSCT and an expert office, that carried out a stress research for this firm. The research shows that the use of the term “stress”, even if it can build a compromise between the different « worlds », curbs the change. By using the term “stress”, the evaluation and the management of the mental health depends on the social use the players do. The perception of the dominant players is thus legitimated.

A UNIFIED THEORY OF WORKPLACE HARASSMENT

Luis de Rivera 1, Ramon Menendez Domingo 2
1Psychiatry, Universidad Autonoma, Madrid, Spain, 2Sociology, La Trobe University, Victoria, Australia

Abstract: The study and prevention of workplace harassment (WPH) has been declared a priority in the European Union, where it has been estimated to seriously affect at least 12% of workers. WPH creates significant problems within the individuals that suffer from it –primarily depression and anxiety–, but also in the organizations in which they are employed –lack of productivity and absence of the workers. Despite its importance, there is no unifying theory that defines WPH. Instead, WPH has been associated with other less inclusive concepts, for instance, ‘mobbing’ or ‘bullying’. WPH requires the dehumanization of the victim and a social environment that tolerates or cooperates with this abuse. Therefore, WPH is not only an interactional dynamic between the abuser and the victim but a wider one which includes the organization of which both belong. It is a psychosocial syndrome generated by the interaction between the abuser, the victim and the group or the social environment where this abuse takes place. In this paper, a description of the characteristics of these three factors will be provided in order to identify the causes that develop this dynamic. The study is based on extensive medical practice and treatment of the victims of WPH.

THE HAPPY CELIAC: AN OXYMORON OR A POSSIBILITY?

Maurizio Esposito 1
1department of Health and Sport Sciences, UNIVERSITY OF CASSINO, cassin0, Italy

Abstract: Background: Several international studies, confirmed in Italy too, show a hard presence of socio-relational problems inside the celiac population.

Methods: Qualitative study involving persons with celiac disease and their families. 25 individual semi-structured interviews were conducted in three Italian regions.

Results: Problems of management of social life for celiac persons are experienced, specially in the fields of: school, work, travels and life outside the home.

Conclusion: Chronic illness is a “biographical disruption” (Bury 1982) and the whole society has to be invested to fight the burden of celiac persons in their possibility of access to public life.

Key words: celiac, social, quality of life, qualitative, chronic illness.

MENTAL WELL-BEING AMONG YOUNGER AND OLDER UNEMPLOYED PEOPLE AT A TIME OF ECONOMIC RECESSION: WHAT IS THE ROLE OF SOCIAL PROCESSES IN CURRENT MODELS OF MENTAL WELL-BEING PROMOTION?

Gianfranco Giuntoli 1, Mima Cattan 2, Jane South 3
1Centre for Health Promotion Research, Faculty of Health and Social Sciences, Leeds Metropolitan University, Leeds, 2School of Health, Community and Education Studies, Northumbria University, Newcastle, United Kingdom

Abstract: There is a burgeoning public health and social science literature on ‘mental well-being’, or positive mental health, and the factors that facilitate or hinder its achievement across the lifespan. Although there is common agreement in the literature that mental well-being is a complex subjective state that does not simply consist of the absence of mental illness, definitions of this concept differ on the types of components that are deemed to comprise it: subjective evaluations of satisfaction with one’s life (hedonic well-being), subjective evaluations of the realisation of one’s potential (eudaimonic well-being), and/or subjective evaluations of one’s circumstance and functioning in society (social well-being). Such differences play a major role in the weight and role that social processes are given as factors affecting people’s mental well-being. This paper reports and critically discusses, against different models and definitions of mental well-being, the findings of a qualitative study that explored the impact of involuntary unemployment at a time of economic recession on people’s everyday life and mental well-being. It aims to discuss how different models of mental well-being account for the ways in which the experiences and social processes involved in involuntary unemployment affect mental well-being. The study was undertaken in Bradford, UK, a city characterised by many years of economic downturn before the official start of the economic recession in January 2009. It focused on unemployed people in a ‘transition phase’ in the job market: young people (aged 18-25) who had recently entered the job market, and older workers (aged 50 and over) who were closer to retirement age. The study involved 73 people and consisted of 16 focus group interviews. It identified six main sources of mental and emotional stress for the study participants and two sources of resilience factors. These sources of stress and of resilience are here discussed against the wider literature on the determinants of mental well-being, with a particular focus on
the insights that they give on the relationship between the wider social and physical environment in which people live and their mental well-being.

A NEW SOCIOLOGICAL INTERACTION-MODEL FOR PUBLIC HEALTH IN A MODERN WORLD

Gunnar Scott Reinbacher¹, Betina Verwohlt¹

¹Department of Culture and Global Studies, AALBORG UNIVERSITY, Aalborg East, Denmark

Abstract: During the last 25 years public health in Denmark has been focusing on individual response to normative demands of the government and the state. Individuals have primarily been individually oriented mass-campains encouraging individuals to apply to state demands (social compliance). This trend seems to be even stronger in modern societies because of rapidly increasing cost in the health care sector. It is difficult to explain why the state keeps pushing this individually oriented ontology since it is ineffective and is increasing health inequalities since better-off citizens are more likely to comply with campaigns than their worse-off fellow-citizens.

On the other hand discussions of more structural aspects emerges, for instance discussions on new and healthier organising of municipalities and workplaces are beginning to look for healthier food due to citizens demand for healthy choices. The structural aspects have become more common issues for discussion, but initiatives are week. The structural approach to public health would in all probability cause a reduction in inequality in health because theese attempts affects the entire population. We are, however, just at the beginning of structural oriented initiatives and we cannot expect to see improvements in the health status of the population before 5-10 years or even more.

Between these two counterpoints we need interaction demands from the state, municipalities and workplaces, and we need an interactive response from citizens. The idea of the new sociological interaction-model for public health is proposed because we expect change not from the individual or the structural level, but from interaction from progressive municipalities, progressive elements of the state, NGO’s and groups of citizens. The experience is that the current interactions between individual and structural initiatives are week. The theme for this article is what must be done in order to improve the current initiatives in interaction between individual and structural approaches and how to implement an ontology based on dialogue, empowerment and concordance. This article is focussing on the interaction level in a sociological and policy oriented approach. We are trying to build new ground by introducing a new dynamic sociological model for public health in the field between individual oriented and structural approaches.

THE JUSTIFICATIONS FOR OUTSOURCING IN THE FINNISH PRIMARY HEALTH CARE SERVICES

Tiina Maria Tiilikka¹, Hannele Palukka²

¹School of Social Sciences and Humanities, ²School of Management, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: This paper examines the justifications and meanings of outsourcing that have been adopted by primary health care in the past ten years in Finland. The presentation sets out to explore the ways in which municipal officials categorize the need for private services in primary health care. The second aspect is to analyse how the government recommendations for health care are constructed. The aim is to understand how the municipal officials see the outsourcing when the aim of national health care politics is to get more competitive services. The main drive of these changes has been to reduce state intervention in the economy and the society, to pave the way for market relations and to improve the efficiency of the service provision. The paper presents the ways in which the municipal officials’ explanations and the goals of the national recommendations negotiate and how they present the justifications for outsourcing. The paper will enter the debate on the recent change in the values and organization of health care in Europe.

The material for the presentation consists of six qualitative interviews with leading municipal officials who were responsible for the subscribing of the primary health care services in 2005—2008 in three Finnish municipalities. In addition to the interviews, the material consists of Finnish national recommendations where the goals of competitiveness and efficient health care services are combined. These documents are the Finnish Government Programmes, the report of the Finnish Innovation Fund and the McKinsey report (published in 2003—2009). The main focus of the analysis is on the narration and discourses. The theoretical frame of the paper is connected with the discussions on power and governance but the paper concentrates on the negotiation between government recommendations and local politics.

EDUCATION AND HEALTH INEQUALITY IN OLD AGE: DIVERGENCE, CONVERGENCE OR CONTINUITY? A LONGITUDINAL STUDY WITH SHARE

Liliya Leopold¹, Henriette Engelhardt¹

¹Department of the Population Studies, OTTO-FRIEDRICH-UNIVERSITÄT-BAMBERG, Bamberg, Germany

Abstract: It is well established that health in old age is influenced by education acquired earlier in life. Empirical evidence on the extent of health decline across educational levels, however, is heterogeneous. It remains unclear whether the health gap between individuals with high and low levels of education increases in old age (divergence), decreases (convergence), or whether it remains constant (continuity). In the present study, we investigate the effects of education on health changes with data from two waves (2004, 2007) of the Survey of Health, Ageing and Retirement in Europe (SHARE) for respondents aged 50 to 80. We estimate OLS regression models drawing on 12 indicators of physical, mental and cognitive health. Our analysis covers both objective and subjective health dimensions. We find that divergence is the main pattern of health decline across educational levels: The health gap between individuals with high and low educational levels increases for the indicators of grip strength, limitations of general and of instrumental activities of daily living, mobility limitations, depressive symptoms, numerical ability, and time orientation. For single indicators, however, we also observe continuous (chronic diseases, subjective health assessment, memory) and convergent (fluency of speaking) patterns.

Keywords: education; health decline; health inequality; cumulative advantage; old age

DIFFERENCES BETWEEN LUXEMBOURG AND PORTUGAL IN THE LIFE SATISFACTION OF STROKE

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
SURVIVORS, TWO YEARS POST-EVENT: THE INFLUENCE OF AN UNEQUAL QUALITY OF LIFE.

Michèle Baumann¹, Katia Lurbe-Puerto², Ma-Engracia Leandro³

¹INSIDE, university of Luxembourg, Walferdange, Luxembourg, ²Dept. Sociology, U. Bragança, Bragança, Portugal

Abstract: Two years post-event, we described the survivors’ life satisfaction (LS) and Quality of Life (QoL), the LS and QoL of their caregivers, and their socio-demographic and health characteristics. We analysed survivors’ LS and its associations with these determinants, from a national (mainly urban society) survey in Luxembourg (LU) and a Bragança district (mainly rural) survey in the Northeast Portugal (PT).

Over 18 months stroke survivors (218 years) living at home and having given their informed consent were contacted. The Inspection Générale de la Sécurité Sociale (LU) and the District Health Centre (PT) had previously listed all confirmed diagnosis population. Survivors and their main caregivers were interviewed at home with questionnaires measuring LS (scale 1-10) and validated QoL’ scales: survivors’ Newcastle Quality of Life (Newsqol); Whoqol-Bref for caregivers.

Participation rate was 26.5% LU, 38% PT: 94 LU (65.5 years) and 50 PT (70.1) survivors; 62 LU (59.3) and 46 PT (60.7) caregivers. LU survivors and caregivers had higher QoL scores than PT samples. PT survivors were more affected by stroke impacts, with significant differences in Newsqol mobility, ‘self-care’ (preparing food, shopping, transport, getting washed, dressed and showed), feelings (dependence, about oneself, change acceptance, depressive, of useless, loss of control over life), and emotional status (more emotional, sometimes crying, short-tempered, less tolerant and nervous). Only PT survivors LS was linked to the current neurological impairments. Difference estimates were obtained between survivors’ LS and Newsqol self-care (regression coefficient (rc) -0.28 PT), caregivers’ LS (rc -0.63 PT) and Whoqol-bref psychological (rc -0.67 PT), environmental (rc -0.73 PT), and social relationship (rc -0.91 PT). LU survivors’ LS was associated with all Newsqol dimensions; stronger links in feelings and sleep; none with caregivers’ Whoqol-bref.

Survivors’ multi-dimensional QoL was predictive of their LS. LU-PT differences recalled the idea of the cumulative effect throughout life of social inequalities in health and highlighted the distinct impact of living in an urban society turned towards community supports or a rural society based on domestic care. In home care settings, survivors’ LS and Newsqol are patient-centred markers for individual and community interventions.

LIFE COURSE EPIDEMIOLOGY AND THE SOCIAL SCIENCES: LIVING APART TOGETHER?

Matthias Richter¹

¹Institut of Medical Sociology, MARTIN-LUTHER UNIVERSITY HALLE-WITTEMBERG, Halle (Saale), Germany

Abstract: Background: Since its origin in the late 1990s life course epidemiology has received growing interest and now presents an active and far reaching research area. Life course influences are increasingly seen to hold the key to a better understanding of disease aetiology and the existence of social inequalities in health. However, the potential of a life course perspective in epidemiology is not fully exhausted as ideas from other disciplines as well as major epidemiological paradigms received little attention. The aim is to discuss the potential of a broader life course perspective, which integrates sociological and psychological research and to encourage the dialogue between epidemiology and the social sciences.

Methods: The paper reviews major principles and concepts applied in different disciplines dealing with the life course and propose a theoretically driven research framework which better informs the interdisciplinary exchange and illustrates how a bio-psycho-social life-course perspective can be infused more fully into epidemiology.

Results: We argue that the paradigmatic principles of interdisciplinary life course research (human agency, timing in lives, linked lives and historical context) provide a strong theoretical framework for a more holistic and theory-driven view of the life course and its interdependent pathways. We emphasize that stress theory is an important aetiological pathway between the organising concepts of the life course and health which could act as theoretical linkage between epidemiology and the social sciences. This perspective offers a multi-causal framework to better illuminate the association between social structure and health across the life course.

Conclusion: In order to better understand the development of health and health inequalities in a life course perspective, it is useful to take an interdisciplinary approach and draw upon the more theoretical ideas from life course sociology and life span psychology. Increasing epidemiology’s attention to social science principles might open new dialogue and enhance the strong biomedical focus that is often observed in epidemiology.

CONFIGURING THE USER: PROCESSES OF SUBJECTION AND SUBJECTIVATION IN THE CARE SPACES

Stefano Crabu²

²Department of Sociology, UNIVERSITY OF PADOVA, Padova, Italy

Abstract: In the last decades, the whole formed by the actors and the organizations working inside the socio-sanitary context have been the subject of radical transformations that make the “scene of care” more complex, where it is meant to cover the medical institution, social services, voluntary organizations and private services.

With regard to this matter, I suggest the analysis of the control-definition processes of the identities of the users living in a Social Community Care, located in the North-East of Italy. This Community is part of the territorial network of the socio-sanitary services that deal with the social rehabilitation of those people coming from a trajectory of psychiatrization of their suffering. This study begins from an organizational ethnography that has taken place inside the Community between December 2008 and January 2010, during which - beside the participants observations - in-depth interviews were realized with the entire Community’s staff. The choice to direct the analysis toward this specific context derives from the fact that inside the socio-sanitary services’ network there is an increasing spread of organizations, likewise to the one that constitutes the focus of my reflection, inside which the care practices are de-localized. In this way, the Community under analysis establishes a paradigmatic place inside which the users of socio-sanitary services continue their voluntary medicalization way of suffering, primarily, through a relational approach to the Community’s staff.

The research has been pointed toward the description and interpretation of the subjection processes (through which practices is the user accepted?) and the subjectivation ones (in which way does the user relate him/herself to the normative and cultural code of
Community) taking place inside the relationship between user and staff, in a context in which the staff defines a highly cogent cultural repertoire. The attention paid to the relationship existing between the two processes under analysis makes it possible to understand the modalities through which, and under which conditions, the users’ identities are re-built turning them into “competent membership” of the Community. In this way, the description of the user entails a socio-relational work that, acting on the liminal border between health and illness, contributes to co-define its possible future relationship with the socio-sanitary services’ network.

INTELLECTUALLY DISABLED: ABNORMALITY IN CLUTCHES OF RATIONALITY
Elzbieta Zakrzewska-Manterys

Abstract: It is stated here - with reference to writings of Anthony Giddens and Ulrich Beck - that the values of contemporary Europe, connected with the position of intellectually disabled persons, are to be characterized by specific dilemma. On the one hand people with intellectual disability are subject of social inclusion and normalization, and they receive invitation into mainstream of social life. But of the other hand promotion or even glorification of rationality and reflexivity, causes that intellectual disability is something absolutely non-accepted in the society.

Giddens announces the death of a "stranger". That means, he postulates to treat all people as potential friends whose distinctness we understand, respect and accept. This vision of the world in a merciless way throw out intellectually disabled persons outside the margin of social life. These persons, not having an opportunity to be "strangers", to be someone non-understood, loose their specificity and we cannot understand any more that the lack of understanding can raise the truly accepting distance. An intellectually disabled person, who cannot be a stranger and by lack of social competences cannot also be a friend - can only take a social position oscillating between "colleague" and "someone whom I do not know". The word “tolerance” properly describes this situation. Giddens seems to forget that "an other" can be also an intellectually disabled person.

Beck writes that the social laws are laws attributed to an individual. We can think about individuals only as of reflexive human beings. A good social functioning means that someone is able to cope with complicated, heterogenous, inconsistent network of social expectations and at the same time he possesses an ability of empathetic understanding of choices undertaken by other people. He is able to do so, even if these choices violate the style of life chosen by himself. In these circumstances persons unable to think in a rational way are more than whenever distant from the mainstream of social life.

THE SOCIAL AND CULTURAL PLACE OF SMOKING IN THE MILITARY
Anni Öijärvä

Abstract: In Finland, every man is liable to serve 6 to 12 months in a military. It is usually carried out at the age of 19-20 years. More than 80% of men in each age group complete their military service. Smoking has a specific place in the Finnish compulsory military service that ties it closely with the confined everyday life of this total institutional setting. It is a central part of the so-called unofficial culture and gives young men and women space and freedom that they otherwise would not have. The army’s structures and informal practices, such as commands and arrangements in the physical environment, also contribute to facilitating and supporting young people’s smoking.

Based on ethnographic fieldwork and interviews conducted in the Finnish military, my presentation investigates smoking among young Finnish conscripts. My PhD study is based on youth researcher, sociology and qualitative health research. I use smoking as an example to study how health behaviours are influenced and shaped by the social and cultural settings in the military. The qualitative research approach draws attention to the social and cultural place of smoking and to the situational meanings and practices ascribed to smoking. Earlier qualitative studies have shown that young people regard smoking as a deeply social activity.

The study results indicate that through the medium of smoking, young people can celebrate their increased freedom in the military institution and tie new friendships. It provides rhythm to the day that is otherwise regulated from the outside, and for a brief moment offers an opportunity for mutual social interaction. Within the institution, the smoking room is determined as a space of youth culture. Depending on the individual, the place and situation, a
break for a smoke may take on the meaning not only of a nicotine refill, but also of distanciation, the avoidance of work or a way of killing time. As young people enter a completely new environment, smoking also helps to alleviate the sense of stress and serves as a vehicle of social interaction.

FATS AND BEAUTY IN WOMAN’S MAGAZINES: HEALTH AND CULTURAL RECONFIGURATIONS IN PORTUGUESE SOCIETY

Monica Truniger¹, Ana Horta¹

¹Institute of Social Sciences, University of Lisbon, Lisbon, Portugal

Abstract: Fats (categorized by FAO as ‘oils and fats’) became a public enemy of sorts to be eliminated in contemporary societies. This fatphobia (Monaghan, 2008) is usually intertwined with claims on a ‘war on obesity’, given that global statistics point to the existence of more than one billion people classified as obese or overweight (WHO, 2009). However, scientific expertise ascertains the importance of ingesting fats and oils in moderate doses, since these are essential to a healthy diet and body (e.g. rich in vitamin E). However, women’s magazines constantly promote images of body slimmness (obliterating fat), which are associated with shared beauty patterns. These messages may contribute to being precursors of eating disorders, such as body dissatisfaction, the drive for thinness, and strict dieting (Wilson & Blackhurst, 1999). In these magazines, advice on the types of fats that are ‘good’ to ingest, and the ones that are ‘bad’. Close inspection reveals that these messages may contribute to being precursors of eating disorders, such as body dissatisfaction, the drive for thinness, and strict dieting (Wilson & Blackhurst, 1999). In these magazines, advice on the types of fats that are ‘good’ to ingest, and the ones that are ‘bad’. Close inspection reveals that these messages may contribute to being precursors of eating disorders, such as body dissatisfaction, the drive for thinness, and strict dieting (Wilson & Blackhurst, 1999).

INCREASING BODY WEIGHTS. THE MEDICALIZATION OF A SOCIAL PHENOMENON.

Mirjam Stuij²

²W.J.H. MULLER INSTITUTE, ’s-Hertogenbosch, Netherlands

Abstract: In our current society, with an abundance of food and minimal need for physical effort, it is a challenge to keep our bodies slender. Although severe overweight enlarges the risk of certain diseases, the media tend to exaggerate the effects of (mild) overweight on health. By using terms like ‘epidemic’, ‘health risk’, etc., overweight is being medicalized in the public domain. Although it is frequently postulated as a health problem, overweight seems to be received mainly as a social problem. A prominent discourse in the public media concerning this subject is that it is a violation of the dominating beauty ideal of a slender and fit body. Being overweight bears the stigma of being lazy, incompetent and lacking self-discipline. People are also held responsible for their own body. This is an important theme in the public as well as the (Dutch) political debate. However, this is largely discussed without taking into account the social differentiation of overweight. Overweight is more present among the groups with a lower socio-economic status. In general, these groups are not represented in the debate about overweight.

Overweight and obesity are popular topics in different disciplines of science, still, their origins are rather contested. What lacks is a covering sociological explanation. This is essential because the ‘sudden’ and large scaled rise in average body weight cannot be explained without observance of the developments and changes in society which underlie this phenomenon. Using the civilizing theory of sociologist Norbert Elias, I will explain how the so-called slenderness norm interacts with the current environment resulting in different forms of self-discipline regarding food and exercise behaviour and hence differences in the prevalence of overweight among different social groups. This also explains why self-discipline is not something to be personally blamed for, as this arises out of the specific social context people live in. The purpose of this paper is to develop a theoretical explanation of the historical variability and the social differentiation of body weight and an argument of who copes with body weight and the dominant slenderness norm in which way.

THE RELATIONSHIP BETWEEN NUTRITION HABITS AND OBESITY IN THE CENTRAL-EAST EUROPEAN REGION – LESSONS LEARNT FROM A COMPARATIVE TRANSNATIONAL RESEARCH

Zsuzsanna Benkő³, László L. Lippai¹, Klára Tarkó¹, Katalin Erdei¹

¹Institute of Applied Health Sciences and Health Promotion, UNIVERSITY OF SZEGED, Szeged, Hungary

Abstract: Obesity is becoming a more and more important social/public health problem in Central East Europe, and more closely in the so called “Visegrad Countries” (Hungary, Poland, Czech Republic, Slovania) too. One of the important background factors influencing body weight is nutrition, the behavioural level of which manifesting in nutrition habits are largely influenced by the society. According to our hypothesis, the value axis of tradition and modernity plays an outstanding role in how the nutrition habits of the “Visegrad Countries” are shaped, that is, in what, when, how and why people consume.

Our research methods comprised of theoretical and empirical (structured assisted questionnaire interview) analysis on a community based representative sample, among 500 families/households from the administrative territory of Szeged (Hungary), Rybnik (Poland), Hradec Králové (Czech Republic) and Nitra (Slovakia) each. Data were processed and analysed with the help of SPSS.

Our hypothesis was confirmed, as the nutrition habits of the “Visegrad Countries” were value driven, where tradition was proven to prevail, namely in the following extent: Czech sample 45,1%, Slovakiian sample 35,0%, Hungarian sample 33,9%, and Polish sample 30,8%. When self-categorisation of nutrition habits was asked from respondents, the order of countries somewhat changed: Slovakia came first (75,1%), Poland second (74,7%), Hungary third (62,4%), and the Czech Republic fourth (60,0%).

It becomes more and more evident in the continuously extending European Union that the fulfillment of global guidelines is hindered mostly by neglecting the role of local specificities. Our research results indicate that the nutrition habits of the “Visegrad Countries” could be influenced towards healthy nutrition only if the domi-
nance of traditional values in the region were taken into account, and accordingly, the nutrition habits proved to be healthy were promoted.

**YOUNG CANADIAN WOMEN’S DISCURSIVE CONSTRUCTION OF HEALTH AND THE BODY IN THE CONTEXT OF THE CURRENT DISCOURSE ON OBESITY**

Haifa Tili², Geneviève Rail¹

¹SIMONE DE BEAUVOR INSTITUT, CONCORDIA UNIVERSITY, Montreal, Canada

Abstract: The general goal of this project (funded by the Social Sciences and Humanities Research Council of Canada 2008-2011) is to examine and deepen our understanding of the connections between, on the one hand, dominant obesity discourse and biopedagogies (Wright, Rail, MacDonald, MacNeill & Evans, 2006) and, on the other hand, young women’s discursive constructions of the body and health.

Using a poststructuralist orientation, we are interested in understanding power and the ways in which differences—particularly those embedded in modern binaries such as thin/obese, normal/pathological, masculine/feminine, White/Other—are constructed and maintained within discursive strategies. Our use of the term construction reflects the poststructuralist notion that reality is made and not found. Young women construct “reality” through language and cultural practices (Rail, 2002; Wright, 2001).

In the first facet of the project, we have investigated the deployment of the obesity discourse and biopedagogies across “texts” (e.g., oral texts, writings, and images) found in a sample of (dominant and marginalized) contemporary cultural sites targeting young adult women in central Canada. In the second facet of the project, we have organized participant-centred conversations with young women. The participants were 100 young women between 18 and 25 years of age and from the Ottawa and Montreal regions (50 English-speaking and 50 French-speaking young women and include: (a) young women from varying sexuality, race, ethnicity and dis/ability; (b) young women from rural/urban and work/study environments; and (c) young women from diverse socio-economic milieus).

For instance, if we take the case of North African immigrant women living in Montreal construct their immigration as a breath of fresh air that enables them to live rich bodily experiences (e.g., freedom to go out without the fear of the others’ gaze and to participate in a wide variety of physical activities). Most participants reproduce dominant Canadian discourses on obesity and individual responsibility for health. As hybrid subjects, however, most have strong Maghreb references around the body, food as well as cultural and religious practices. A few women manifest resistances toward both Canadian and Maghrebian discourses and norms around bodily practices.

**BEYOND MEDICALIZATION AND DEMEDICALIZATION: A TYPOLOGY OF PREGNANT WOMEN’S EXPERIENCE**

Claudine Burton-Jeangros ¹, Raphaël Hammer ²

¹Department of sociology, UNIVERSITY OF GENEVA, Geneva, ²Institute of Health Research, School of Health Sciences, Lausanne, Switzerland

Abstract: Lay experience of pregnancy oscillates nowadays between two main social processes: on one hand, its medicalization is reinforced by the risk approach promoted around antenatal care, on the other hand a demedicalization trend is observable through the preference given to non-invasive procedures and an emphasis on the physiology of pregnancy. In the first case, the experience of pregnancy is placed under the authority of medical expertise whereby the focus on risks is central, ways to reduce these are offered by technical means and adoption of professional advice. Within the second process, the medical approach is challenged to the profit of a holistic approach, more often provided by midwives, and confidence in the good health of the fetus. While these perspectives have received a lot of attention in the literature, few studies have attempted to account for their respective relevance in women’s concrete experience of pregnancy. Based on 50 semi-directive interviews with women met during the first half of their pregnancy in Geneva (Switzerland), this paper presents a typology contrasting the different ways these women describe their experience of pregnancy.

This typology combines four dimensions: evaluation and use of medical tools (including statistical information on risk and technical devices), surveillance of risks in daily life (such as related to food, alcohol and tobacco consumption), relationships with health professionals (role of obstetrician-gynaecologists versus midwives), access and importance given to information related to pregnancy. Our findings reveal a quite complex and nuanced picture of how medicalization and demedicalization tendencies are intertwined in pregnant women’s personal accounts. These results also highlight the various tensions that structure their attitudes and expectations, such as a tension between the valorisation of pregnancy as a natural process and concerns related to the child-to-come health, or a tension related to the relevance of specialised information that can generate undue anxiety. Eventually, the study shows that, despite variations and the distance some women claim with the medicalization framework, none of them can totally escape the latter. Therefore the valence between these large social processes – medicalization versus demedicalization – is more a matter of degree, than a matter of nature.

**CONTRACEPTION AND HEALTH: COMPETENCE AND CHOICE AMONG TEEN-AGE GIRLS**

Micol Pizzolati³

³Department of Historic, Human and Social Sciences, University of Molise, Campobasso, Italy

Abstract: This paper focuses on the results of a research that explores competence in contraception among teen-age girls and that attempts to illustrate how a widespread awareness of the differences between traditional and emergency hormonal contraception is lacking.

Four hundred girls, aged between 14 and 16, living in a central-south Italian region, were interviewed through a self-completed questionnaire.

Almost all interviewees consider that the use of a contraceptive method is always necessary, but the choice between barrier, oral and natural methods is diversified. The method that almost all girls would be willing to use is condom, while more than half of the respondents are not willing to take the contraceptive pill. Moreover, emergency contraception is slightly preferred over the traditional one.
At the same time, there is poor competence on hormonal contraception, particularly a widespread lack of knowledge and awareness about the difference between traditional and emergency pill, as well as a lack of information about functioning, effectiveness, and on how to obtain it.

Both in knowledge of hormonal methods and in the choice of a contraceptive method, there are minor differences in relation to age and to social status of families.

The sociological data seem to suggest that for a significant proportion of the girls interviewed, hormonal contraception emerges as a possible device although it is considered harmful. Thus health and risk prevention appear only as part of a complete picture in which multiple factors determine prevention pattern and choices.

NATURAL CHILDBIRTH MOVEMENT IN THE CZECH REPUBLIC: ALTERNATIVES IN POST-SOVIET SOCIALIST CONTEXT

Ema Hresanova¹

¹Sociology, UNIVERSITY OF WEST BOHEMIA, Plzen, Czech Republic

Abstract: The natural childbirth discourses have been explored widely in many western and non-western countries, but the post-socialist contexts are rarely included. This paper focuses on the so-called "natural childbirth" discourse in the Czech Republic. I discuss activities of various natural childbirth proponents and their strategies to challenge the dominant biomedical model of birth care. In this paper I track similarities and especially divergences from comparable western movements, which have become active approximately twenty or thirty years earlier. In particular I focus on different analogies that the Czech proponents use in order to highlight parallels between today's medical paternalism and the paternalism of the former socialist state. At the same time I also explore what ideas about "natural childbirth" and "alternative" birth care become important within the Czech context, where they come from and how they are connected to western movements (who are important mediators of these ideas?).

The natural childbirth movement offers alternative ideas about birth care, which is declared to be cost-effective, more humane, woman-centered and in many aspects more satisfying to a birthing woman (and her child). It also refers strongly to the logic of consumerism which has become firmly incorporated into the Czech health care system together with many market-driven reforms. In this paper I scrutinize closely what particular ideas and conceptions of a patient/client/birthing woman/mother, her rights as well as proper care and its costs and benefits, and health are linked to this movement in the Czech context.

International audience could have recently witnessed several cases of accusations against the natural childbirth activists and home-birthers in several European countries (e.g. Ireland, Hungary; similar cases have occurred in the Czech Republic, too.) This points to an importance of the topic in recent times when many health care systems are subjected to economic crises and other challenges, but possibly cheap alternatives are still turned down by many.

PATIENTS' EXPERIENCES WITH INFERTILITY TREATMENT: DATA FROM THE CZECH REPUBLIC

Lenka Slepickova¹

¹Faculty of Social Studies, Masaryk University, Brno, Czech Republic

Abstract: Infertility medicine differs from other branches of medicine. Its development, mainly in the last few decades, is frequently popularized by the media who frame its success by terms of scientific progress and a miracle virtue of doctors. Such presentations may evoke hope for infertile couples and portray infertility as easily and well resolvable technical obstacle of conception. New therapies and possibilities are still emerging and it is up to decide which treatment they want to try or how much money they want to invest (as the full cost of treatment is not covered by health insurance). The treatment of infertility is more than just applying objective medical knowledge, it is a negotiated and variable process that challenges our positivistic understanding of health and illness. The relationship between a doctor and a patient have been redefined and can no longer comply with Parson's model of explicitly specified roles of both actors.

The following paper presents the data from a long term sociological study of involuntary childlessness. During the research 35 in-depth interviews were conducted including 30 women and 5 men, representing 30 infertile couples; only the participants who underwent (or were undergoing) infertility treatment have been included in the sample. The main goal of the analysis is to answer the following questions: How is the treatment experience assessed by patients and which factors play the main role in this assessment? What do patients expect from the infertility treatment? How do the patients perceive role of a doctor in the process of treatment and coping with infertility?

The research of patients' experience with infertility treatment has revealed its precarious nature – the diagnosis can vary depending on the time and clinic, as well as on the offered services and required payments. Patients, especially women, rather than being passive subjects of medical expertise, take the role of strategists who actively seek information and a choose best solution of their situation. Based on the analysis, successful treatment was not considered to be the only factor that affected patients' assessments, but it was the credibility of the clinic, personality of the doctor as well as respect given to the patients that played a significant role in patients' assessments.

REPRODUCTIVE AND SEXUAL HEALTH: MEDICAL PROMOTION AND WOMEN'S RESISTANCE IN CONTEMPORARY RUSSIA

Anna Adrianovna Temkina¹

¹Department of political sciences and sociology, EUROPEAN UNIVERSITY AT ST.PETERSBURG, st.petersburg, Russian Federation

Abstract: Based on in-depth interviews with women and doctors and participant observations of medical encounters in three Russian cities I raise the question: why many contemporary Russian middle class women refuse to use a modern contraception. Scholars explain this by the specificity of Russian context: the delay in modernization of sexual life, the legacy of soviet models which are characterized by abortion contraceptive culture, the absence of comprehensive sexual education, the influence of religious morality, etc. I will explore the other side of the problem: 1) encounters between doctors and women on the issue of contraception, 2) identity of Russian women as related to contraceptive's refusal. According to our data, under the lack of comprehensive sexual education in Russia, obstetricians are among those few agents who
actively promote modern contraception. They insist that women should use contraception, avoid STD and plan pregnancy. They insist that this should happen under professional medical control. Simultaneously doctors stigmatize those women who do no regular visit doctors, do not follow their prescriptions. Under the absence of trust to medicine in Russia many women try to avoid this control and stigmatization. Another reason for women not to use hormonal pills is risk for their reproductive health evaluated as very high from the lay perspective. If women will be unable to give birth they will be stigmatized as failed to become a mother (promoted by familial gender policy and religious morality). Modern contraception is medicalized in everyday life and avoided as harmful to reproductive health. Women manage by posteriori medicalization of risks to their health, and acceptance of unintended unplanned pregnancy and single mothering. Child birth is more preferable that abortion, specially in the case of first pregnancy both in professional medical and lay perspectives. Otherwise, according to doctors and women, they could face with the health problems and stigmatized infertility

USE OF NASAL DECONGESTANTS FOR SMALL CHILDREN (0-6 YEARS) IN LATVIA

Ieva Salmane-Kulikovska ¹, Signe Mezinska ²

¹Medical sociology, Doctoral studies, RIGA STRADINS UNIVERSITY, Riga, Latvia
²Humanitarian sciences, University of Latvia, Riga, Latvia

Abstract: A concern exists about safety and efficiency of nasal decongestants in respect to small children. A number of countries have suggested not using remedies containing substances, like phenylephrine, pseudoephedrine, xylometazolinum and oxymetazolinum, for children under six years. In Latvia these medicines can mostly be obtained without prescription, and information leaflets permit using them for small children. The study in Latvia “Use of medicines in Latvia in cases of common cold” in 2010 demonstrated extensive use of nasal decongestants for children, marking the necessity of more profound research.

Aim: To investigate use of nasal decongestants in Latvia and to clarify reasons of choosing these medicines.

Method: 27 semi-structured interviews with caregivers having used nasal decongestants for children under six. Analysis entailed manual coding of transcripts. Codes were grouped into categories, reflecting both specific issues derived from the topic guide and emergent themes. Transcripts were checked for the presence or absence of categories.

Results: Of the interviewed caregivers 23 have used the nasal decongestant Vibrocil (contains phenylephrine). The majority of the caregivers are aware of adverse effects of decongestants, though not all respondents can specify them, and none of the respondents has observed any negative impact of the nasal drops to a child. The decision to use decongestants is mostly made upon the suggestion of a doctor. A number of respondents consider doctor’s opinion always necessary and unarguable. Other reasons for nasal decongestants’ use enclose pharmacist’s suggestion, information in media, previous experience, lay advice, including Internet discussion forums. There is a widespread opinion that most information sources about common cold medicines, including nasal decongestants, are commercially-oriented.

Conclusions: The study results show the necessity of improving the knowledge of medicines users and revision of the existing guidelines and other medicines information. As doctors are a highly respected information source, they have to grasp the opportunity of educating patients by offering reasonable alternatives for relieving rhinitis symptoms for small children. It is essential to ensure comprehensible and non-commercial information source for medicines users.

NEW CONNECTIVITIES: CIVIL SOCIETY, THE ‘THIRD SECTOR’ AND DILEMMAS FOR HEALTHCARE DELIVERY

Ellen Annandale ¹, Ming Lim ², Carlo Ruza ³

¹Sociology, ²Management, UNIVERSITY OF LEICESTER, Leicester, United Kingdom

Abstract: Many countries in Europe have been moving to a mixed model of healthcare financing and provision and provider competition as what is termed the ‘third’ or ‘social enterprise’ sector is brought to the heart of the ‘welfare mix’. Currently, there is little understanding of i) the strategies of civil society organisations for combining different, and often competing, social and political blueprints of their service delivery roles and ii) what effect market engagement might have on existing connections with local communities.

There is some evidence that social enterprises enjoy close relationships with socially and economically disadvantaged groups and individuals within their communities; they function with generally positive reputations as either physical places or emotional ‘safe havens’ within otherwise harsh environments of big cities. But questions need to be raised as to whether transformative potential, closeness to the client and so on are sustainable in the increasingly marketised service environments such as the British NHS. Indeed, the whole focus on patient choice and autonomy so heavily emphasised in health policy in many countries of Europe must come under renewed scrutiny if these connectivities loosen.

We address these issues through a contextualised case study of changing NHS healthcare provision in one English city (data collection is currently underway but will be completed by September). Data include expert focus groups and interviews with health service, civil society organisation stakeholders and volunteers. Drawing on these data we explore

i) Whether existing forms of connectivity between civil society organisations and communities are likely to be lost or diminished and, if so, how they might be regained and/or new forms of connectivity fostered.

ii) Whether civil society organisations are likely to change the ways that they interface with patient/clients e.g. will personalised care be jeopardised or enhanced and under what conditions?

iii) Patient/clients’ levels of awareness of change in the health organisations they use. Since some might embrace and value the emerging ‘social enterprise’ model and others not, is there potential of conflict? How far will responses vary by e.g. health conditions, kind of service; geographical location; type of community, family, and individual social characteristics?

THE CHALLENGE OF SELF-HELP/MUTUAL AID: CITIZENS’ ASSOCIATIONS AND THE GOVERNANCE OF SOCIAL AND HEALTH CARE IN ITALY

Guido Giarelli ³
Abstract: The paper will pursue the specific aim of analysing the role of citizens-users/patients/carers organizations in the community health governance arena in Italy at both regional and local levels using a theoretical approach based on the the active citizenship paradigm as an alternative to the prevailing consumerist paradigm rooted in health economics.

METHODS: The paper will describe the Italian citizens-users/patients/carers organizations in the health arena with specific regards to self-help organizations by presenting the results of a series of 90 semi-structured interviews to the leaders and senior members of such organizations and other stakeholders (health and social professionals, health managers, public administrators, etc.) in the context of an integrated qualitative-quantitative national research project funded by the Ministry of Health and jointly carried out by three universities (Catanzaro, Ancona, Padua).

The origin, development, aims, activities, internal structure and culture, outcome evaluation and resources of such organizations will be described; and a special emphasis will be given to the analysis of the role they play in promoting and representing the interests of citizens with chronic and rare diseases within regional and local health policy arenas.

RESULTS: Different models of health citizenships will be described according to the typology of self-help associations, kind of network relationships with other organizations, ways of participating in public health policy arenas, relationships with health and social professionals. Some exemplary cases will be described in more details in order to illustrate the strengths and weaknesses of each model and discuss the heuristic value and the chances of generalization of the typology adopted.

CONCLUSIONS: The models of health citizenship analyzed suggest that citizens-users/patients/carers organizations in general and self-help organizations in particular can play a significant role in the community health governance arena in Italy at both regional and local levels and that the theoretical approach based on the the active citizenship paradigm can describe it more appropriately and with a wider theoretical perspective than the consumerist approach.

THE DIFFERENCES IN MOBILIZATION OF HEALTH STRATEGIES: DO PERSONAL EDUCATION, INSTITUTIONAL TRUST, AND THE WELFARE STATE TYPES CONTRIBUTE?

Rania F. Valeeva 1, Piet Bracke 1

School of Politics and International Studies, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: Empirical research reports the differences in the mobilization of health strategies both at the individual and country level. People’s choices of such strategies differ, even when they have access to the same resources. How people solve their health needs and why some succeed better than others, could be understood by considering personal (structural and cultural) conditions and contextual backgrounds. The main proposition in this study is that the choice of health strategies is influenced by personal education, institutional trust and the type of welfare state in which people are embedded. Our starting point is the motivation of an agent to self-care from which we derive the several hypotheses on individual, country and cross levels. Our approach is based on individuals’ needs in health resources, which eventually are meant to optimize own subjective well-being.

Methodology: We use the data from the Eurobarometer 58.2 (N =14835) collected via face-to-face interviews in 15 West-European countries (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, Sweden, and the United Kingdom). The mean response rate was 60%. Hierarchical multilevel linear models were estimated using MLwiN and HLM statistical packages.

The mobilization of health strategies was measured on the basis of the answers on two questions about the mobilized sources of health information, such as a chemist, doctor, Internet. Personal education was measured by a question about the number of years of completed formal full-time education. Institutional trust or the trust in the organizations which provide health information, was measured on the basis of the answers on two questions. This variable indicates how frequently the respondent placed trust in organizations, such as university, NGO’s, World Health Organization. The types of welfare states, which reflect different welfare services and social security programs and policies, were measured in accordance with the typology of Ferrera (Ferrera, 1996).

Some selected findings: The results indicate that less educated persons are likely to mobilize more often the health strategies. Moreover, we found that persons with less years of education are likely to be less trusting. Finally, the effect of personal education on mobilization of health strategies differs between the types of welfare states.

CHANGING FORM OF INEQUALITY IN ACCESS TO HEALTH CARE IN TURKEY

Volkan Yilmaz 1

1School of Politics and International Studies, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: Healthcare system in Turkey had been generally portrayed as inegalitarian with respect to the prevalence of significant differences among four public insurance schemes in terms of their premium rates, benefit packages, co-payments and the quality of services they provide for their beneficiaries. Since 2003, healthcare system has been witnessing fundamental changes due to the introduction of a comprehensive health care reform titled ‘Transformation in Health’ Programme. The elimination of previous inegalitarian structure of healthcare system which mainly favoured civil servants and excluded significant portion of self-employed has been at the centre of government’s discourse towards health care reform, which seems to be successful in securing public consent as well as its second electoral victory in 2007. With the objective of putting this aim -that is the elimination of inequalities in access to health care- into practice, health care reform led to the unification of all four public insurance schemes under the umbrella of general health insurance, transfer of hospitals owned by Social Insurance Institution to Ministry of Health and the equalisation of benefit packages for all insured people. Majority of scholars welcomed the impact of contemporary health care reform on access to health care as a success story. However, other major changes within health care reform (such as the introduction of user charges for medication and access to health care as well as the integration of private hospitals into healthcare system as service providers in return for higher user charges) on access to health care have not
received due attention from scholars so far. With the aim of addressing this gap in the literature, this paper concentrates on the question of how and to what extent the introduction of user charges and the integration of private hospitals produce new forms of inequality in access to health care that are likely to consolidate in near future. In doing so, the paper suggests that contemporary health care reform in Turkey eliminates the privileged status of civil servants in getting access to health care, while it fails to challenge and indeed consolidates the impact of income inequality on access to health care.

HEALTH INEQUALITIES IN POST-SOVIET COUNTRIES: TWO DECADES AFTER THE COLLAPSE OF THE SOVIET UNION

Regina Jutz

Abstract: While there is a variety of studies of health inequalities in Western European countries, Central and Eastern European countries were neglected. Since health problems and mortality rates of certain groups in this region increased due to the transition process and the economic recession starting in the early 1990s, it is worth looking at how population health has developed. Describing differences in population health between countries is not sufficient to fully grasp the state of health in a society since one compares means. Only when socioeconomic differences in health within countries are also considered, we learn something about the health status of a society and how to improve it for all socioeconomic groups. According to a sociological position, socioeconomic inequalities in health are especially interesting in societies whose socialist regimes claimed class equality. In my presentation I look at factors that lead to health inequalities in post-socialist countries and explain how the extent of health inequalities differs in following countries: Bulgaria, Croatia, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Russia, Slovakia, Slovenia, and the Ukraine.

Using the European Social Survey (ESS, round 4), I look at the impact of income inequalities on health inequalities. As a result of considerably increased income inequalities in most countries of Eastern Europe since the 1990s, I expect a strong influence of income inequality on health inequalities. Additionally, I control for economic development (GDP) and social capital. The latter is controlled for since it might mediate the effect of income inequalities on health. In Western European countries, social capital usually positively affects people’s health status and reduces health inequalities, but this effect is questionable for Eastern European countries where the transition process disrupted the social fabric.

SOCIAL RENOUNCERS AMONG YOUNG ADULTS: NEW PATHOLOGIES OR NEW NORMALITIES?

Maia Fansten

Abstract: As one can notice by simply following the media interests, there is more and more concern about what is apparently a growing phenomenon: “social renouncers”, as we propose to call them, that is to say exclusive people who have withdrawn from social life. Behaviors of this kind are suppositionally emerging among young people; it is the case, in an exemplary way, with the striking phenomenon of Hikikomori in Japan. In such cases, reclusion and withdrawal, often linked to school refusal, is seen as a new and worrying disorder, leading to isolation and desocialization.

This might be understood under the concept of social phobia, usually linked to some misperception of social space, but it is unlikely that all cases of social withdrawal, even in its most extreme form – self-reclusion at home, or pure « virtual life » – boil down to nothing but to a mental disease. On the other hand, even though accessing adulthood is strongly linked to the well discussed lengthening of youth is partly due to job scarce, it is also unlikely that all kinds of withdrawal from public space be accounted for solely on economical grounds. More deeply, it seems like more young adults express a difficulty in accessing to (accepting) what is supposed to mean adulthood. Impressive indeed are the numbers of new terms and neologisms that have been invented and adopted in the last 15 years to qualify ways and troubles that all seem to have something to do with social withdrawal, dropout, or failure in social integration: NEET, Freeter, Twixer or Parasite Single, but also Hikikomori, Loner, No-life, etc. This wide range of phenomena includes both psychopathological categories and sociological decoding keys.

This is why we intend to adopt a sociological perspective, interrogating their meanings but also their normative background. Following this path, and based on the exploratory analysis of clinical cases and testimonies, we’d like to propose the idea that social withdrawal tends to have become, like depression, addiction or trauma, a language, an “idiom of distress”, a normative way to feel and express malaise or social misfits. Indeed taking into account the cultural and material surroundings of the individuals, the collective representations thereof, and the standard emotions expected, precisely at the threshold of inner/outer spaces, mobility/immobility within and without, intimacy/extroversion, real/virtual worlds, private/public spaces, etc.

DEPRESSION - A SOCIAL PATHOLOGY OF OUR TIME?

Anders Petersen

Department of Sociology and Social Work, AALBORG UNIVERSITY, Aalborg East, Denmark

Abstract: Depression today is everywhere. GP’s diagnose it regularly, celebrities go on global tv to reveal they suffer from it and WHO perceives depression to be one of the largest public health problems of our time. Yet 50 years ago, however, depression was nowhere. How are we to regard the burgeoning depression rates of our day? In this presentation I will link it with the normative demand for self-realization with which contemporary western individuals are confronted. I want to argue that the expectation of lasting fulfillment of authentic self-realization may be regarded as a chronic stress factor for the individual and risks creating depres-sion. The late-modern view of depression supports this perspective. Depression is today regarded as the precise opposite of successful self-realization, and consequently, as a repression of life’s possibilities for self-realization. By looking at depression through this analytical grid, it enables me to discuss depression as a social pathology – perhaps the social pathology par excellence of our time. Moreover, it enables me to discuss how treatment with antidepressants fits into this interpretive frame – how antidepressants can be regarded as a kind of action technique which can sup-port the individual in attempts to realize his or her authentic self.
Abstract:
MOST SUICIDES TURN OUT TO BE MENTAL ACCIDENTS – WHAT NOW, EMILE?
Vladeta Ajdacic-Gross

1Department of General and Social Psychiatry, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: A quick study of epidemiologic data indicates that most theorising about suicide tends to focus on suicidal thoughts and suicide attempts, rather than on suicide itself. The latter of course being an exceptional outcome of the former. Thus, the mechanisms related to suicide are seemingly quite different from those leading to suicidal thoughts and attempts. A closer look at epidemiologic data reveals that most suicides turn out to be some kind of mental accidents.

If Emile Durkheim would have had better epidemiologic data, he possibly would not have chosen suicide, but suicide attempts or suicidal thoughts, to exemplify social facts, and to develop sociological methods. Hardly surprisingly, there is no sociology of accidents, and in particular no sociology of mental accidents. Thus, the question emerges, what is now left for the sociology of suicide, and what is its role in the interdisciplinary research "orchestra"?

In all this there is unquestionably an important role for sociology. The focus is not so much on mechanisms leading more or less inevitably to suicides, but rather on mechanisms preventing personal crises from escalating. This is the moment to reintroduce Durkheim, Cloward and Ohlin, and more recently adapted opportunity concepts.

SOCIAL CAPITAL, GENDER AND DEPRESSION IN MOSCOW
Sara Ferlander

1sociology, SÖDERTÖRN UNIVERSITY, Huddinge, Sweden

Abstract: Mental health problems, including depression, are major causes of poor health all over the world. Depression is even anticipated to become the most important cause of morbidity. Despite the significance of depression, its levels and causes in many non-Western countries, especially in the former Soviet Union, are little understood. The aim of this paper is to examine the level and causes of depression in Russia, focusing on social capital. More specifically, the relationship between different forms of social capital, gender and depression in Moscow is to be examined. It is important to distinguish different forms of social capital as they imply different types of resources, support, influence and obligations, leading to different health impacts, both positive and negative. This was confirmed in our previous study on social capital and self-rated health in Moscow, where we found a relationship between social capital outside the family and men’s health. However, no association between family-based social capital and health was found. Consequently, there was also a clear gender difference in the relation between social capital and health. This study draws on data from the Moscow Health Survey 2004, where 1190 Muscovites were interviewed. The initial results show that 42.5 percent of the Muscovites had felt depressed during the last 12 months. There is also a significant difference between men and women, with almost half of the women having felt depressed during the last year. Based on our previous study in Moscow on social capital and self-rated health, this paper will further examine gender differences in this relationship, but this time focusing on mental health. Gender differences in the relation between social capital and health, both mental and physical, is a topic that has been relatively neglected and needs further investigation.

EDUATION AND EDUCATION IN GREAT SHAPE
Janicke Andersson

1Linköping university, Linköping, Sweden

Abstract: Contemporary society may be described as a “learning society” in which citizens are educated, from childhood, to reflect and evaluate their performance and features. In elementary school, this is done through regular performance reviews, in working life through performance appraisals and health checks and in everyday life through TV and tests in magazines or for that matter newspaper knowledge tests. Mass media has become an increasingly common tool to produce and promote knowledge about health and lifestyle. Experts and coaches who will help us to change our lives for the better in so-called “lifestyle program”, or programs that are categorized as “edutainment” are familiar features of everyday life. My contribution will be drawing on the program “Toppform” (great shape) broadcasted on Swedish television. Toppform is one of the health and lifestyle programs that use coordinated communication channels to interact with its viewers. While the program is broadcast on television, it is also represented with material on the Internet. This study concentrates on the material on the website of the program which contains material also used for teaching in school settings. As such the material represents an interesting encounter between entertainment, school education and public health education which makes it interesting to study. Theoretically, I adopt a discourse analytic approach in which management principles are the focus.

IS A SOCIO-ANTHROPOLOGY OF “RECOVERY”, “REMISSION” OR “CURE” POSSIBLE?
Judith Hermann-Mesfen

1SE4S, UMR 912 ORS/IRD/INSERM, Marseille, France

Abstract: Despite its title, social sciences of health have rarely systematically investigated the way patients become “normal” people again and regain their health. I would like in this presentation to show that the process from illness (and/or sickness) to the end of it; otherwise known as: being cured, going into remission, or recovery; deserved to be described precisely and analysed so they finally can become a real object of social science.

Researchers in social sciences observe this process/event for a large range of pathologies, in several contexts on Northern areas. For instance, in Europe, sociologists studying cancer face different conceptions of the end of the disease (remission, rehabilitation, recovery, etc) that mostly depend on culture. Its appears that different approaches are used and lead to various conceptualisations.

Those studies and results will be compared (and confronted) to my anthropological data obtained in a Southern country, Ethiopia. I observed and analyzed how people living with HIV/AIDS (PLWHA) submit themselves to the ritual of holy water in order to cure miraculously from AIDS.

Those diverse examples illustrate how complex, varied and embedded in society and culture are process leading a sick/ill person to become a “normal” one.
This event and its multiple definitions (which depend on the kind of disease/illness) might be considered at three levels: individual, cultural group and medical institutions. Could be interrogate when and how: (1) persons/subjects consider themselves as release and return to “normal” life; (2) cultural and social groups consider those; (3) health care systems establish, conceptualize and eventually name this process.

Research on individuals and societies conceptions and representations of interactions between sickness and health, could lead social sciences to propose a more precise definition of health.

UNDERSTANDINGS OF CULTURE-APPROPRIATE ELDERLY CARE IN THE PUBLIC DEBATE AND THE ASSUMPTIONS ABOUT ETHNIC ‘OTHERNESS’ THAT THESE MAKE

Sandra Torres¹, Jonas Lindblom¹
¹Dept. of Sociology, UPPSALA UNIVERSITY, Uppsala, Sweden

Abstract: Within the health and social care literature there are numerous studies on what culture-appropriateness means and how it is best delivered. Few studies on this issue have, however, focused on the manner in which media representations about what constitutes culture-appropriateness are constructed despite the fact that these representations influence the way in which the public debate on this issue evolves. Nowadays, when the ethnic diversity that exists across European health and social care systems has increased, it has become necessary to compliment studies on culture-appropriateness with a media angle. The public debate on what constitutes culture-appropriateness is namely bound to affect what health and social care recipients come to expect of the services that systems offer. In addition, media representations of culture-appropriateness provide us with interesting insight into the way in which understandings of ethnic ‘Otherness’ are constructed in the public debate. As such, media representations give us insight into how ethnic relations are understood and how they are believed to challenge different welfare sectors. This presentation deports from a project that focuses on the way in which media representations of ethnic ‘Otherness’ are shaped and the manner in which they are used to convey what culture-appropriateness in the health and social care sector entails. The project’s empirical point of departure is Swedish daily newspaper articles on elderly care that have focused on addressing ethnicity, culture, language and religion and have been published ever since the public debate on culture-appropriateness in this sector started. All 101 articles that were published between 1995-2008 have been analyzed using both quantitative content analysis and discourse analysis. The results show that culture-appropriateness is discussed in a migrant-exclusive manner; a manner that impedes the public debate from discussing the implications of recruiting ethnic ‘Others’ to the sector for the ethnic majority population. As such, the results show that the public debate on culture-appropriateness in the elderly care sector assumes culture is something ‘Others’ have and not something ‘We’ need be concerned with. The presentation will problematize these findings and show the numerous implications they have for the design and deliverance of user-friendly care.

IMPACT OF HIV/AIDS AT WORK: THE PORTUGUESE CASE

Luísa Macedo Veloso¹, Isabel Dias²
¹CIES-IUL, Lisbon, ²FLUP-IS, Porto, Portugal

Abstract: The original and urgent research about the relationship between health and work is a sociological and political debate in Europe, as far as the increasing precarious working conditions in the labour market can have heavier consequences in individuals with HIV/AIDS, as they are more vulnerable to attitudes of discrimination and can face more difficulties in maintaining or finding a job. This Communication aims to analyze the impact of HIV / AIDS infection on: (1) the professional status of individuals and the relationship with discrimination processes; (2) and the particular healthcare needs to be assured in the work places.

It is emphasised the feedback from the individuals inquired, in particular concerning the discrimination processes of the individuals with the infection and the prevention and safety measures taken and the ones that ought to be taken by the employers. The empirical evidence of this paper consists of statistic analysis (descriptive and multivariate) of a survey applied to a sample of 1.600 individuals with HIV/AIDS who require health services in the 15 largest Portuguese hospitals located in Lisbon, Porto, Coimbra and Faro. The multivariate analysis allowed identifying profiles of behaviors and attitudes of workers infected with HIV/AIDS. The results show that reactions to infection and its consequences in work are different according to, namely, gender, level of education, age and profession.

Generally all the individuals reported that fear of discrimination and to loose their jobs are the main reasons that led them to hide the infection in workplace. It is also common to most of the sample the notion that the progression of the infection leads to the loss job opportunities. Concerning the heath care needs, the results of the research also allowed to define profiles of attitudes towards the specific measures taken, concerning, namely, hygiene, contact with colleagues and supervisors.

MAKING DRUG USE HEALTHY: HOW RECREATIONAL HEROIN AND COCAINE USERS LEGITIMATE THEIR DRUG CONSUMPTION BEHAVIOUR

Maria Caiata Zufferey¹
¹Département de Sociologie, Université de Genève, Genève, Switzerland

Abstract: The threshold between illness and health has been variable throughout the centuries, but in the actual context this frontier has changed quickly and significantly. Some conditions which were once considered normal have now become pathological, while some situations which were previously considered pathological are no longer considered as such. The case of drug use – and the case of heroin and cocaine use in particular – exemplifies this situation. Until the 1980s, abstinence was the only acceptable form of behaviour, whereas any use of heroin and cocaine was seen as a symptom of a pathological condition. Nowadays, the situation has significantly changed in many European countries. For social, political, cultural and scientific reasons, the concept of drug has become more complex and the norms regarding the consumption of drugs have become ambiguous. As a consequence, drug use is no longer directly regarded as a problematic behaviour: drug use could be either the sign of a pathological condition or an ordinary practice, depending on the meaning given to the drug experience. The process of making sense in order to redefine what is normal and what is not normal in terms of drug use could be called legitimization.
This paper explores the process of legitimization by using the results from a qualitative study on drug addiction recovery recently conducted in Switzerland. Firstly, the paper will examine the social, political, cultural and scientific factors that have made the concept of drug more complex. Secondly, it will show how recreational users of heroin and cocaine make sense of their behaviour in order to persuade themselves and others that they are not drug addicts. A brief conclusion will provide some considerations on the kind of support needed for this process of legitimization. The data are drawn from in-depth interviews realized with 12 former drug addicts who define themselves to be recovered despite their current use of heroin and cocaine.

STRUCTURAL FACTORS, PRACTICES AND CONSUMPTION: PERCEIVED AND EFFECTIVE IMPACTS ON CHILDREN’S HEALTH

Susana Maria Duarte Fonseca 1, Joaquim Gil Nave 1
1Sociology, ISCTE-IUL, Lisboa, Portugal

Abstract: Research done by the World Health Organization demonstrates that environment-related causes and conditions are one of the main factors of mortality and/or morbidity in children under the age of five. Children are of greater concern do to their particular vulnerabilities.

In developed countries air pollution (indoor or outdoor) is one of the main concerns when it comes to impacts on children’s health. Considering that in the Alentejo Litoral region it is located one of the main Portuguese industrial clusters, GISA project (Integrated management of health and environment in the Alentejo Litoral region) is being implemented. His main objective is to provide a management system that will allow local, regional and national authorities and stakeholders to analyze, on a permanent basis, the evolution of air pollution and its potential impacts in the Alentejo Litoral region.

One of the main research lines of GISA is to better understand the impact of air pollution in children’s health (under the age of two). In order to do so, direct interviews have been conducted with mothers with children born between January 2007 and December 2010 combined with the collection of information on a significant number of health indicators.

Analyzes being conducted allow us to control and monitor certain socio-economic (profession; housing conditions; family context) and cultural indicators (life-style; eating and hygiene habits; health related practices; consumption habits) that may have a role on how environmental factors may influence children’s health. This project also aims to explore perceived and/or actual relations between structural conditions, day-to-day practices, consumption habits and the possible impacts on children’s health (particularly the ones more directly related to air pollution – indoor and outdoor).

Building on the traditional debate of sociological theory on structure vs agency the main goal is to explore how mothers perceive their resources to influence or control (to some respect) structural factors that may influence their children’s health, and at the same time to try to understand mother’s perception of how individual practices may also play a role when it comes to health. Preliminary results seem to indicate a low perception of the impact of some day-to-day practices and consumption habits on children’s health.

MEETING THE NEEDS OF CULTURALLY DIVERSE POPULATIONS: A PSYCHO-SOCIO-POLITICAL APPROACH TO CULTURAL COMPETENCE IN HEALTHCARE

Sonia Hernandez Plaza 1, Beatriz Padilla 1
1Centre for Research and Studies in Sociology, ISCTE - UNIVERSITY INSTITUTE OF LISBON, CIES-IUL, Lisbon, Portugal

Abstract: One of the most important sources of disparities in healthcare for immigrant populations is the lack of cultural competence in health professionals and the healthcare system as a whole. As far as individual caregivers are concerned, most conceptualizations differentiate the following components of cultural competence: (1) positive multicultural attitudes of openness and willingness to interact with different “others”, respect towards cultural differences and mutual trust; (2) ability to identify variations in health beliefs and behaviours associated to culture, through a knowledge base to understanding the worldviews of people living in diverse cultural communities; and (3) intercultural skills and ability to deal with cultural and human diversity to effectively meeting the healthcare needs of diverse populations.

Immigrants tend to occupy a less favourable social position and research indicates that this is strongly linked to their health problems. However, the primary focus on culture of most cultural competence models has often diverted attention from the impact of processes of social exclusion as a fundamental cause of health disadvantages due to unequal access to key resources such as housing, employment, income and community services, including healthcare.

In order to fill this gap, the main aim of this paper is to propose an interdisciplinary psycho-sociopolitical approach to cultural competence in healthcare that links the perspectives of sociology and community psychology. Special attention is given to the impact of the complex interplay between the effects of culture and unequal power on health and healthcare. Taking this perspective, a community-based participatory action-research is described, focused on the particular case of healthcare in Portugal. A multi-method approach is used, combining qualitative (interviews with key informants, focus groups, case studies based on in-depth interviews) and quantitative research techniques (secondary sources, survey), with a strong emphasis on community coalition building. The promotion of cultural competence in health professionals and the empowerment of culturally diverse populations through the enhancement of health literacy are regarded as “two sides of the same coin” in the provision of healthcare based on values of social justice, human development and equality.

ROMANIANS LIVING IN SPAIN: THE HEALTHY IMMIGRANT EFFECT

Daniel La Parra 1
1Sociology II, University of Alicante, Alicante, Spain

Abstract: The healthy migrant phenomenon refers to the fact that, on a variety of indicators, immigrants are often healthier than native-born residents of their host country, and also healthier than their fellow citizens in their home country.

A total of 829.715 Romanians are living in Spain according to the Spanish Municipal Register. They have all arrived in the last ten
years (only 6,343 were registered in 2000). As a group of recent migrants, the healthy migrant phenomenon could explain their epidemiological profile.

The data analysed come from five sources: 1) Romania data set at the UDB SILC 2008 (Eurostat), 2) Romania data set at the European Social Survey (round 4, 2008), 3) National Health Survey for Spain 2006-2007 (INE), 4) Spanish Health Interview Survey on Disability 2008 (INE), and 5) Spain data set at the European health survey 2009.

This comparative cross-sectional study compares a) the self-perceived health status of Romanian residents on Spain with the equivalent measure in the resident population of Romania and Spain; b) health status indicators (different variables) of foreigners born in Romania-Bulgaria with Spanish native-born population.

The main variables included in the analysis are self-perceived health status, long-standing illness, limitation in activities because of health problems, chronic diseases, obesity, age. Logistic regression analysis. Crude odds ratios and adjusted odds ratios (OR) by age, sex, education and occupation, 95% confidence intervals (IC).

Main results: Spaniards living in Spain have a better self-perceived health status [OR 0.57 IC 0.40;0.82] than Romanians living in Romania [OR=1]. Romanians living in Spain are between both groups [OR 0.36 IC=0.05;2.69]. A clear health advantage of immigrants is observed in terms of functional health. Romanians and Bulgarians living in Spain are more likely free of activity limitation than Spanish native born population [OR 2.44 IC 1.67;3.57]. On a variety of indicators, Romanians immigrants are as healthier than native-born Spanish.

There is support for the healthy immigrant hypothesis in the case of Romanian immigrants in Spain, especially when functional health (being able to work) is considered. A healthy worker effect may explain these results.

The Place of Health and the Micro-Powers of Health Professionals in Retention Centres for Unauthorised Migrants: Multi-Situated Ethnographic Research (France-Spain)

Katia Lurbe i Puerto 1,2*, Michèle Baumann 2

1ESOMI, Universidade da Corunha, A Corunha, Spain, 2Inside, University of Luxemburg, Walferdange, Luxembourg

Abstract: This research aimed to identify the place of health in immigrants retention centres (IRC) and analyse the role of health professionals regarding border control and immigration policies. The current structures to confine unauthorised migrants seem to address a two-fold issue: the repressive approach to controlling immigration and the increasing set-up of facilities participating in a mode of government centred on national security concern.

Method. Ethnographical study was conducted in the Medical Units of a French (capacity: 35 pers.) and a Spanish (150 pers.) IRC for respectively, 9-months with a regularity of 30 half-days of presence every fortnight and 21 continuous days over a 3-weeks period. Qualitative data from observational notes and conversational interview views were triangulated and analysed under the Critical Categorical Content Discourse method, with Atlas.ti support.

Findings. Illnesses that could halt deportation were infectious diseases involving treatment requiring a specialized infrastructure (tuberculosis); in France, those whose representation is bound to feelings of fear and disgust (mange) and mental illness that poses a threat to the individual and other persons; in Spain, pregnancy is a reason to allow a release from IRC. Squats are raid when expulsion quotas need to be filled; it accounted for the increased number of substance-dependent persons in IRC at that time. Health professionals in IRC confront moral dilemmas. In France, they have a recognised micro-power able to overturn a deportation order: the medical certificate.

Discussion. In ensuring healthcare access, they are drawn into the vigilance and control logics of the IRC security regime, despite themselves. Standardization of the medical practices is their main fall back and provides for risks management, which relies on the architecture and the neatness of the space, individual strategies of exception and social relationship that are shaped by a moral economy. The retreat into medical grounds allows keeping things “professional” and helps balance the tension resulting from providing medical care in a space that automatically appears to translate any act into one carried out in compliance with the repressive policy against undesired migration. Institutionalisation of European IRC medical units network is recommended to confront inequalities in care (access and quality).

Bringing Gender into Health Human Resource Policy and Management: International Directions

Ellen Kuhlmann 1, Ivy Bourgeault 2, Christa Larsen 3, Toni Schofield 4

1Social and Policy Sciences, University of Bath, Bath, United Kingdom, 2University of Ottawa, Ottawa, Canada, 3Goethe University Frankfurt, Frankfurt, Germany, 4University of Sydney, Sydney, Australia

Abstract: Shortages and many cases of inefficient use of qualified staff together with changes in the composition of the professional workforce by age, gender and citizenship have created a more urgent need for policy interventions and substantive organizational reform. In this paper we bring a gender lens to the health human resource policy and management arguing that sustainability, accessibility and quality of healthcare services for all citizens are closely connected to the improvement of gender equality within and between the health professions. These issues will be addressed by using case studies drawn from Australia, Canada and Germany. The cases selected for inclusion in our analysis focus on developed countries, because we are interested in healthcare systems that have established certain models of planning and also have a legal commitment to gender equality. We will illustrate the benefits of a gender lens by focusing on two ‘hot spots’ of health human resource source policy, namely the migration and mobility of healthcare professionals and the new demands for managing the skill-mix and the shifting of tasks within and between health professional groups more effectively. The international perspective brings the intersecting dynamics of a gendered health workforce into view that need to be addressed more systematically in health human resource policy and management.

“What I Like or What My Country Needs?” The Complex Choice of Medical Specialty in a Context of Hyper-Specialization

Nuno Santos Jorge 1

ISCTE-IUL, Lisboa, Portugal

Abstract: Medical profession has been, since the 1950s, often the subject of sociological analysis. Many of these approaches have focused on issues such as power, the relationship with patients or the medical judgement, and rarely on specialization.

In a scientific and social context of hyper-specialization, there is an increasing need to understand which factors influence the specialty choice by the new graduates in Medicine.

Through the analysis of an internet forum (with more than 7000 registered users), a set of in-depth interviews and a questionnaire to 650 medical interns, we try to understand how this choice is made, under which constraints, which are the arguments used to justify it, and which representations on the medical specialties are at its core.

Also, we try to underline the importance given by interns to the place of the Internship, and how this affects the public procedures of placing doctors in Portugal, and consequently, the functioning of the national health system.

“EUROPEAN HEALTH SYSTEMS AND HEALTH INEQUALITIES”

Annalisa Ornaghi 1, Mara Tognetti 2, Simona Olivadoti 3*

1Observatory and Methods for Health (Osservatorio e Metodi per la Salute), 2Department of Sociology and Social Research, UNIVERSITY OF MILANO BICOCCA, Milano, 3University of Milan-Bicocca, Milan, Italy

Abstract: In recent years there has been an improvement in European citizen’s health. This can be attributed both to living conditions and lifestyles and to the transformation of health systems, also political and institutional factors, such as social and health reforms, progress in medical health, hygiene and environmental factors. Therefore to the spatial and geographical conditions of different societies. Despite this general improvement, actually there is increasingly of health inequalities both at the macro level, between countries, and at the meso level, between different socio-economic groups, of the same nation. The welfare’s situation (health and otherwise) of different European countries and the evolution of health inequalities is a central topic of scientific interest, in general for sociology and Policy Studies and, in particular, for sociology of health. Health inequalities, representing one of the most unjust and severe inequitable forms because health is one of the pre-conditions in order to live out fully individual life. Health inequality constitute one of the worst scandals of our time, especially in developed and democratic countries. Health inequalities are an important concern in our society and are a crucial issue with which healthcare policies are confronted with. In addition to traditional inequalities due to educational qualifications, class, income, age and ethnicity are increasingly complemented by new inequalities, produced by the institutional design of the healthcare systems, in terms of the inequality of access in treatment, etc...

For this reason, it becomes increasingly important to understand how this issue of inequality is addressed by different health policies and by health systems, both with regard to their national character with the potential and regional particularities, both at European level. We believe that the comparison, especially transnational, is the most appropriate methodology for the analysis of such phenomena. Because of the actions of health policy tend to align in relation to socio-economic variables but also to environmental and social factors and geographical proximity. On this basis we propose a paper, which will discuss and analyze the evolution of European health systems, the presence of health inequalities. Moreover to identify elements of convergence and divergence and guidelines for the European and national health policy.

A NEW TREND IN RUSSIAN STUDENTS HEALTH

Irina Vladimirovna Zhuravleva 1

1Social Problems of Health, INSTITUTE OF SOCIOLOGY RUSSIAN ACADEMY OF SCIENCES, Moscow, Russian Federation

Abstract: The health of russian adolescents and young people is particularly worrying to day. During the period 1990-2008, the total morbidity rate of the population has grown by 18% and adolescents aged 15-17 - by 216%. This is largely due to the deterioration of behavioral factors.

Methods and materials research. The study “Health Students”, held the IS Russian Academy of Sciences by a single program and method in 8 cities of Russia in 2009 (n = 3303).

Results. The health research of recent decades has consistently revealed a feature common to all responders, regardless of age, gender and education. Out of the six main motives for the health care (an example of the people around them, the impact of health information, education, family demands, a desire to be stronger and healthier, the deterioration of health) on the first place has always been the “deterioration of health”, that means that caring about health among Russians had a very therapeutic, and not preventive character.

The study “Health of Students” revealed for the first time that a significant proportion of respondents - 40% of young men and 28% of young women named “the desire to be stronger and healthier”, which indicated the gradual restructuring of the system of values. We compared two groups of students who have chosen the options “deterioration of health” (traditional group - TG), and “desire to be stronger, healthier” (advanced group - AG). Comparison of these groups showed that self-rating of health as “good” in AG group was 2.3 times higher than in TG. And the “bad” health reported in TG was 5.3 times higher among men and 3 times higher among women. Every day physical activity among men in AG was 2.5, and among women - in 3.7 times higher than in TG. Contraceptives were reported to be used more in AG - young men (71% in AG and 66% in TG) and young women (64% and 56% respectively). Proportion of men who have passed the required medical examinations, in AG was 2.1 times, and women - 1.6 times higher than in TG.

Conclusion. The tendency of strengthening personal responsibility of individuals for their health is revealed. Support for this trend among young people by promoting healthy lifestyle and creating conditions for its is extremely important.

DO SOCIAL RELATIONS EXPLAIN HEALTH INEQUALITIES? EVIDENCE FROM A LONGITUDINAL SURVEY IN A CHANGING EASTERN GERMAN REGION

Jens Klein 1, Nico Vonneilich 2, Olaf von dem Knesebeck 1

1Dep. of Medical Sociology and Health Economics, UNIVERSITY MEDICAL CENTER HAMBURG-EPPENDORF, Hamburg, Germany

Abstract Book 369

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Many studies provide evidence of an association between social inequality and health but explanatory factors are not yet fully understood. This study explores the contribution of social relationship-ships to explain inequalities in self-rated health in a north-east German region. This region is characterised by social change, high deprivation, population decrease due to migration, and high premature mortality.

We use data from the Study of Health in Pomerania (SHIP) consisting of 4,308 randomly selected men and women aged 20 to 79 years at baseline (2001) and of 3,300 respondents at the 5-year follow-up (2006). Indicators of social inequality are education, equivalent household income and occupational status according to the Standard Occupational Prestige Scale (SIOPS). For measuring social relations, items to assess structural (quantitative) and functional (qualitative) aspects were used. Structural aspects are estimated by the Social Network Index (SNI) which covers partnership, frequency of contacts to children and relatives and participation in voluntary associations. Perceived instrumental and emotional support reflect functional aspects of social relations. Self-rated general health was assessed at both waves of data collection. We use step-wise multivariate logistic regression to analyse the associations between social inequality and changes in self-rated health. In a first model analyses are adjusted for age and gender. The second model is additionally adjusted for social relations. Percentage changes in odds ratios are calculated to identify the contribution of social relations in explaining health inequalities.

Depending on the indicators used, social relations explain between 3% and 29% of the inequalities in self-rated health. Changes in odds ratios are clearer when education is used as inequality indicator, compared to income and job status. Moreover, introduction of the SNI leads to a stronger reduction of the odds ratios than introduction of instrumental and emotional support.

Overall findings suggest that social relations are an important explanatory factor for health inequalities in a changing north-eastern German region. However, contribution varies depending on the indicators used.

POVERTY AND HEALTH IN EUROPE: A MULTILEVEL ANALYSIS WITH DATA FROM THE EU-SILC 2006
Timo Pförtner

Abstract: A wide range of international studies could evidence a significant association between poverty and ill health within Europe, with a strong inter-country variation in the extent of poverty related health burdens. Why the relationship between poverty and health differs within Europe is still unexplored. In that context, David Coburn (2000) and John Lynch (2000) offer a comprehensive concept that combines and implements both the poverty-health association and their structural determinants (namely income inequality, social cohesion, and neo-material conditions) in their encompassing political context. The purpose of current analysis is to analyze the poverty-health relation across European countries and to define its macro-specific determinants.

Method: The study is based on data from the European Union Statistics on Income and Living Conditions (EU-SILC) conducted in 2006 and employs logistic multilevel analysis across 26 countries and 343,001 individuals.

Findings: I present three main findings: (1) poverty as well as other individual characteristics such as age, sex, education and occupation are significantly associated to subjective health, (2) the association between poverty and health differs significantly across Europe, (3) according to the debate of Coburn and Lynch, I tested how economic, social and neo-material features, such as income inequality, social trust and participation, and the accessibility to health care system as well the degree of preventive measures against health inequalities were related to the poverty health association. The results indicate that the poverty-health relation on individual level is significantly stronger the higher the income inequality and the lower the voluntary participation and the preventive measures against health inequalities within a country.

Conclusion: Within Europe the association between poverty and health differs significantly and are explained by economic, social as well as factors of health care system.

APPROACHING SOCIAL INEQUALITY OF “EMOTIONAL PROSPERITY”: INDICATORS OF COVARIATION BETWEEN COMFORT FOOD PREFERENCES AND MENTAL STRESS
Georgios Papastefanou

Abstract: In a recent paper Oswald (2010) coins the term of “emotional prosperity” as alternate concept, which seems to be more adequate to grasp quality of life in advanced modern societies than traditional life satisfaction measure. Being a new concept, there is beginning discussion on its operationalization, especially if research is aimed on providing social inequality patterns. Usually measures of mental illness like depression are quite difficult to be collected by standard questionnaires of population surveys, because they relate for example to extreme behaviors like binge eating under stress. While we know for example for students, that they report being under stress leads them to shift from ingestion from normal (fruits, vegetables, fish, and meat) to sweet and savory foods, it is little known if this is a population wide pattern, respectively to what extent it is homologeous with socio-economic status. In our study we want to utilize survey data from the German General Social Survey of 2004 (ALLBUS) to get a composite indicator of emotional prosperity by using the covariation of self-reports on mental load and on preferences for comfort food. This relational indicator of mental health is then examined for differentiation by educational and occupational status groups.

Abstract: This paper considers how understandings of, and responses to, ‘mental illness’ have alternated between the medical and judicial realms in Ireland over the past 200 years. It is proposed that there are identifiable shifts in the social construction and management of emotions, behaviours and actions, which are constructed as being challenging to society. A movement from the clinical, to the criminal, back to the clinical and once again to the criminal is illuminated.

The key sources of data informing this paper include; the Inspector of Lunatic Asylums / Mental Hospitals Reports, Special Parliamentary Papers, the Medical Press and Circular, and The Irish Psychiatric Hospital and Prison Census. The Irish experience of mental hospital and prison usage is somewhat atypical. Ireland had the highest rate of mental hospital utilisation internationally, limited private enterprise in mental hospital or prison provision, and limited religious control over these institutions.

During the pre 1850 era ‘mental illness’ was constructed as personal tragedy, which was managed through ‘moral intervention’. Clinical understandings of ‘mental illnesses’ became dominant during this time in parallel to the medical takeover of asylums.

A shift from the clinical to the criminal realm commences with the introduction of the 1838 and 1867 Dangerous Lunatic Acts, which moved control over asylum admission from a medical to a judicial process. This established a strong association between mental illness, dangerousness and criminality in Ireland, which remained intact up to the mid-nineteenth century.

A reassertion of medical control over the social constitution and management of ‘mental illness’ was driven by the provisions in Mental Treatment Act of 1945, the international standardisation of diagnostic criteria, and the introduction of new psychopharmacological interventions. This stimulated a continuous decline in the number of residents within Irish mental hospitals, from a high point of 21,720 in 1956 to 4,522 at the beginning of the twenty-first century.

The closure of Irish mental hospitals has been mirrored by a programme of prison building, expanding from 401 prisoners in 1956 to 2,948 at the close of the twentieth century. Essentially this heralds a contemporary shift away from the clinical context back to the criminal realm with mental hospitals being replaced by prisons as the principal sites of confinement in Ireland.

SONETNESS AS USEFUL INTEGRATION OF TWADDLE’S MODEL: FROM THE ORIGINALLY TRIAD TO A NEW ESA-MODEL

Cleto Corsopanto

1Organizzazione pubblica, economia e società, UNIVERSITA’ MAGNA GRAECIA - CATANZARO, Catanzaro, Italy

Abstract: Theoretical reflections and empirical investigations in medical sociology and anthropology have had great boost from the famous triad due to Twaddle. The 3-dimensions model Disease, Illness, Sickness is very useful in many situations in which researchers want to analyze the lack of well-being from all the possible points of view. Using Twaddle’s definitions, “Disease is a health problem that consists of malfunction that results in an actual or potential reduction in physical capacities and/or a reduced life expectancy... Illness is a subjectively interpreted undesirable state of health. It consists of subjective feeling states (e.g. pain, weakness), perceptions of the adequacy of their bodily functioning, and/or feeling of competence” (Twaddle 1994:8); and “whenever a person is defined as having a disease or illness by others, we can talk of sickness, the social label, as ‘unwell’. Irrespective of the reality of the basis for the claim, to be defined as sick is to have certain rights and obligations not shared by others” (Twaddle 1978: 18).

Nevertheless the Triad seems to be inadequate analyzing the global harm of some particular categories of diseases as alimentary intolerances. Celiac diseases is today a social illness in Italy. The attribution of “social” incidence depends, of course, from the prevalence it has in the population (it is estimated that 1% of people suffer from celiac disease all over the world) but also because this severe intolerance forcefully enter the social life of people. Analyzing life and illness histories of patients with celiac disease, what emerge in our research is the awareness of a social harm very important (and in many situations much stronger than biological damage), due to the lack of relational and social capital. For this reason we think that, in some research situations, it can be useful the integration of the originally Triad of Twaddle (already reviewed by Maturo (2007) through the P-model that introduces the Sickscape ) with a new dimension that lead to a new Esa-model in which we can introduce the new concept of Sonetness (a kind of loss of social networks).

Esa-model seems to be suitable to copying from a theoretical point of view the whole range of health problems, including alimentary intolerances that are in great growth all over the world.

SSRI WITHDRAWAL REACTION AS A NEW PATHOLOGY

Margrethe Nielsen

1UNIVERSITY COLLEGE METROPOL, Copenhagen, Denmark

Abstract: Background: Over the last four decades we have witnessed important changes in the use of psychotropic drugs. Usage has changed from benzodiazepines (anxiolytics and hypnotics) and to selective serotonin reuptake inhibitors (SSRIs) but also from treatment of anxiety, which is the main indication for benzodiazepines, to depression, which is main indication for SSRIs. The use of benzodiazepines declined because of the recognition that benzodiazepines could cause dependence. When dependence to SSRIs was raised as a problem, it was rejected that it was dependence and the condition was instead labelled withdrawal reaction.

Objective: To explore why benzodiazepine discontinuation reactions were labelled dependence and SSRI discontinuation reactions as withdrawal reaction and to explore what the difference between dependence and withdrawal reaction is.

Methods: It was a literature study. We explored the diagnostic manuals (DSM and ICD) for the definition of dependence and withdrawal reaction. We performed a systematic literature search for studies describing benzodiazepine dependence symptoms and SSRI withdrawal symptoms.

Results: A new pathology was described in the diagnostic manual DSM-IIIIR in 1987 just after the benzodiazepine dependence was recognised and just before the SSRIs were marketed. The dependence definition was changed, so that more criteria should be fulfilled to obtain the diagnose dependence. The symptoms describing benzodiazepine dependence and SSRI withdrawal reaction were the same. Withdrawal syndrome was added as a new autonomous diagnosis in 1987 and formed a new pathology.
Conclusion: It seems more semantic than evidence based that discontinuation symptoms from benzodiazepines and from SSRIs are labelled with different diagnoses, as the discontinuation symptoms are the same. Withdrawal reaction was formed as a new pathology and in contrast to the experience of many patients.

DYING TO DONATE? FAMILY, GENERATION AND ORGAN DONATION IN THE UK
Charlotte Kenten 1, Sarah Deedat 1, Gurch Randhawa 2, Myfanwy Morgan 3
1Dept. of Primary Care and Public Health Sciences, KING’S COLLEGE LONDON, London, 2Institute for Health Research, University of Bedfordshire, Luton, United Kingdom

Abstract: At a time of advancements in transplant surgery in Europe, there remains a severe shortage of donors regardless of ‘opt-in’ or ‘opt-out’ systems. Unlike other issues within healthcare whilst the individual makes the choice to potentially donate their organs, under the current UK ‘opt-in’ system, should the situation arise, the final decision reverts to the family. The family is thus regularly identified as a key facilitator and concomitantly a key barrier to organ donation.

This paper draws on data from 22 focus groups as part of the Donate Programme that explored views towards organ donation conducted with participants from minority of ethnic groups in the UK (Nigerian, Caribbean, Indian, Pakistani and Bangladeshi) stratified by faith, age and for the Asian participants also by gender.

The paper situates organ donation within a familial and generational context, to explore similarities and differences within and between UK minority ethnic groups. Firstly, we consider the ways that generational perspectives towards organ donor registration and the act of organ donation are either presented as an individual choice (as a source of conflict or protection) or dependent upon the family (cultural practices). Secondly, we outline the barriers often presented by the older generations and the perspectives of the younger generations, and thirdly we reflect on the way that the notion of ‘family’ is evoked in discussing recipients of any potentially donated organs.

The paper summarises the complex ways that the family but perhaps more importantly generations act as facilitators and barriers to organ donation and considers the similarities and differences from other health related behaviours. We argue that nuances within and between different ethnic groups and their generations need to be better understood to address the barriers and enhance the facilitating factors to increase organ donor registration and donation among these groups.

EXPLORING THE ROLE OF AND RELATIONSHIP BETWEEN THE GIFT, DECEASED ORGAN DONATION AND RELIGION: A CASE STUDY OF POLISH MIGRANTS
Chloe Elizabeth Sharp 1, Gurch Randhawa 1, Kulwinder Kaur-Bola 1
1Institute for Health Research, UNIVERSITY OF BEDFORDSHIRE, Luton, United Kingdom

Abstract: Since the Post-EU enlargement, there has been a significant increase in the number of Polish migrants coming to the United Kingdom, this group joins two previous waves of Polish migration. This study aims to explore the interaction between the gift, deceased organ donation and religion among the local Polish community.

The language of the gift has been explored in a number of fields such as sociology, anthropology and psychology and issues such as reciprocity and social solidarity have arisen. Gift rhetoric has played a significant role to engage the population in voluntary deceased organ donation in the UK and this study aims to explore this from a Polish migrant perspective. The gift-exchange theory has been used as a framework for analysing organ donation and a number of differences and similarities have been found. For example, the ‘spirit of the gift’ where there is a perception that the personality of the donor is transferred to the recipient.

Religion and religion-related reasons such as body totality have been cited as a reason for not donating. This study will explore the relationship that Polish migrants have with Catholicism and God and how this influences their attitudes and moral stance towards the body, soul, life and death. Major religions have shown their support for organ donation, except for Islam where there are two schools of thought, through relating organ donation to scripture on helping others and saving lives. This study aims to investigate the significance of these teachings and organ donation.

The values and beliefs of the Polish population towards deceased organ donation may be significantly influenced by their culture and religion. Decisions around organ donation may be influenced by social and economic factors such as migration patterns, a sense of belonging in the UK and levels of knowledge of organ donation and brain stem death.

This exploratory study will use a constructivist grounded theory methodology study and the qualitative research tool focus groups to achieve a rich insight into the role and relationship between the gift, organ donation and religion. The pilot study and first focus group will include Polish migrants who attend the local Roman Catholic Church. The grounded theory approach will guide the sample for the next focus groups. The pilot study and four subsequent focus groups results and analysis will be presented in September 2011.

THE SOCIO-CULTURAL SHAPING OF MORAL PERCEPTIONS AND PUBLIC POLICY DECISIONS TOWARD ETHICAL DILEMMAS CONCERNING HEALTH AND THE HUMAN BODY: THE CASE OF BUYING AND SELLING ORGANS IN ISRAEL
Zvika Orr 1
1Federmann School of Public Policy & Government, HEBREW UNIVERSITY OF JERUSALEM, Jerusalem, Israel

Abstract: International organizations frequently respond to moral dilemmas relating to health, healthcare and the human body by formulating clear unequivocal positions. However, these positions are not always in keeping with moral perceptions, values and practices which are prevalent and accepted in local socio-cultural and religious settings. Recent studies show how ideas from transnational sources which are introduced into domestic communities are vernacularized, or adapted to local social institutions and cultural meanings in order to gain legitimacy.

This paper presents a model which analyzes the particular socio-cultural factors which shape the moral perceptions, discourses, practices and public policies toward ethical dilemmas concerning
health and the human body, particularly as they are vernacularized in specific local contexts. This model examines the complex interactions between the following factors: fundamental moral attitudes, particularly deontological versus consequential and utilitarian ethical approaches; the human rights discourse in its transnational as well as localized versions; deeply-rooted religious views on ethics, social relations and the body; dominant socio-economic worldviews, including the centrality of the neoliberal paradigm and conceptions of the individual’s autonomy; and bodily perceptions, including the perceived connection between the body and the self, as well as ownership over the body. According to this model, the balance between these factors varies in different local contexts and explains the ways in which international ethical norms relating to health and the body are implemented, adapted or rejected in local settings.

This paper, which is based on ethnographic fieldwork, demonstrates the proposed model by analyzing how the above-mentioned factors are balanced against each other in discourses and practices today and in the past three decades regarding the buying and selling of organs in Israel. This paper explores the values and moral perceptions which are reflected in these discourses and practices, and investigates the local moral worlds of various stakeholders who are involved in the transplant process. By analyzing how different values and moral perceptions are constructed in local discourses and practices, this study seeks to explain the gap between international ethical norms and the dominant moralities in Israel concerning buying, selling and trafficking in organs.

**BIOBANKING CANCER TISSUE. PATIENTS CONSIDER EXCISED (TUMOUR) TISSUE TO BE ‘CONNECTIVE TISSUE’.

Eric Vermeulen

1Clinical Genetics/Community Genetics, VUMC, Amsterdam, Netherlands

Abstract: Background. Excised tissues are routinely stored in hospitals for future diagnostic use. These tissues are also important for scientific research. In the Netherlands these ‘residual tissues’ are registered, which makes this collection, consisting of millions of samples, a biobank. In the current legal context patients can declare they do not want their residual tissue used according to an opt-out regime but patients may not be aware of tissue storage and research and the possibility to opt-out. This presentation elucidates and analyses the underlying attitude of patients towards the use of the tissue in genetic medical research. Concepts of ownership in the context of increasing (commercial) value of tissues are discussed.

Methods. The study is based on mixed methods design combining quantitative data (questionnaires) with qualitative data (transcripts from interviews) and observations during an intervention study at the Netherlands Cancer Institute. In total 260 patients were interviewed, 61% of 426 patients who completed a written questionnaire.

Results. Most patients were unaware of medical research with residual tissue and preferred to be informed about research with this tissue. Therefore the current procedure to inform patients is insufficient. Patients endorse medical research with this tissue, only a few (2%) object to research with residual tissue. Most patients (62%) do not consider themselves to be owner of residual tissue and 57% do not consider DNA in the residual tissue to be a personal possession. Patients consider the tissue to be of special value however. For patients the stored tissue is a hypercollective good (the value of the good increases with its use) that should remain in the public sphere (i.e. not available for commercial research) in order to facilitate use of the tissue in research. The tissue connects patients to relatives and other patients, the hospital and scientific community. Respondents prefer an ongoing relationship with the tissue holder. Patients expect to be reciprocated by the tissue holder and be informed about findings of the research.

Conclusion. Dutch cancer patients endorse research with residual tissue. Information about medical research with residual tissue should be improved. A more participatory and reciprocal model of research with residual tissue and biobanking is required.

**MEDICAL SELVES, HYPERACTIVE ADULTS AND NEUROCHEMICAL DISCOURSE

Christian Bröer1, Marjolijn Heerings1

1Department of sociology and cultural anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: How do people describe their health condition and how does this relate to public definitions, particularly to idea’s about brain dysfunctions? In this research, we focus on one particular condition: hyperactivity. We look at Dutch adults who adopt the ADHD label and ask: which discourses structure their description of ADHD and how does the adults discourse relate to the dominant public discourse on ADHD? We expect the dominant discourse on ADHD to structure people’s definitions. Following Rose, the focus is on the relevance of ideas about brain dysfunctions for people’s disease definitions.

The research uses a novel approach: Q-methodology, which combines a discursive relational approach with factor analysis. In Q-method, the public discourse is presented to people systematically. This reveals 5 different personal discourses, which differ markedly from the public discourse. We find some support for Conrad’s thesis that the ADHD label is a way to handle ill-performance. Nicolas Rose’ idea of “neurochemical selves” and Conrad’s argument that ADHD towards adults directs “attention away from social forces to biogenetic ones” seem overstated. People borrow neurobiological, psychological, sociological and even holistic arguments from public discourse to come up with a limited set of medical selves. Contrary to our expectation, this supports reflexivity instead of discipline theory.

**UNRAVELLING FEARS OF GENETIC DISCRIMINATION. TOWARDS A TECHNOLOGY-ORIENTED SOCIOLOGY OF DISCRIMINATION

Ine Van Hoyweghen1, Els Geelen1

1Department of Health, Ethics and Society (HES), Maastricht University, Maastricht, Netherlands

Abstract: Since the 1990s, most European countries and the US have enacted genetic non-discrimination legislations to prevent genetic discrimination in insurance and/or employment. These regulations are installed to prevent people from deferring genetic tests for fear that insurers or employers would discriminate them based on that information. During a qualitative study in which we
interviewed Dutch families involved in genetic testing for hypertrophic cardiomyopathy (HCM), we encountered however – albeit the existence of Dutch regulatory protections against genetic discrimination – that fears of discrimination continued to play a role in justifying genetic testing. These findings triggered us to analyse more in-depth the origins and backgrounds of these fears.

Based on the narratives of the families involved, this paper suggests that fears of discrimination in the context of genetic testing have to be situated in the broader social and historical context of family and kin living with disease and its societal consequences. Fears of discrimination in the context of genetics are nested in preceding experiences and ‘narratives’ of discrimination and stigmatization, related to long-lived ‘family histories’ and memories of living with a disease that causes havoc in the family. In the conclusions, some implications for further research are articulated. On the one hand, there is a need to develop a theoretically and empirically informed notion of ‘genetic discrimination’ and to investigate how this relates to notions of stigmatization and discrimination. On the other hand, it is instructive to investigate the role of biomedical technologies in challenging notions of discrimination. This may develop into a technology-oriented sociology of discrimination, combining insights of science and technology studies (STS) with medical sociology.

VISUALISING GENETICS: MODES OF DIAGNOSIS AND INTERPRETATION IN THE TROUBLING BODY WITHIN PAEDIATRIC GENETICS

Janice McLaughlin 1, Emma Clavering 2
1Policy, Ethics and Life Sciences Research Centre, 2Policy, Ethics and Life Sciences Research Centre, Newcastle University, Newcastle upon Tyne, United Kingdom

Abstract: Paediatric genetics involves interpretative visual diagnostic processes, involving multiple forms of expertise, technologies and actors. One aspect involves studying the physical features of a child to establish what ‘clues’ those features provide as to what genetic syndrome a child may embody. This involves the taking of multiple digital photographs of the child which will be used by the geneticist to point towards what area of DNA sequence they will focus their diagnostic investigations on. At this point the gaze turns from the external to the internal with the production of visual representations of tiny fragments of the child’s DNA via techniques such as Fluorescence In Situ Hybridization or Comparative Genome Hybridisation. These representations of the external and internal child’s body, sit alongside photographs the family has of the child. In these familial contexts, the visual representations produced of the child are not clues to aid a medical diagnosis; instead they are clues to the child’s belonging to kin, both present and past. Each of these representations and the technologies which produce them become part of interpretative processes the geneticists and the family participate in as they seek to identify what differences and similarities this child embodies and potentially its genetic source within inheritance. In so doing questions are raised about: who has authority to interpret visual representations of a child’s body; how is authority given, exchanged and challenged; what is the significance of the external body being used to define the internal; what notions of inheritance and belonging are made and unmade via the identification of clues; and what role do different technologies of representation play in the mediation of troubling embodiment. This paper will draw from ethnographic research, funded by the Economic and Social Research Council, of families referred to a paediatric genetic service. Our work proposes that while medical authority is significant to the meanings generated by the formal diagnostic process, the social significance of the existing narratives and values embedded in familial representations of the child are not simply subsumed by this authority.

ACCOUNTABILITY IN TECHNOMEDICINE: THE FATES OF EMBRYOS IN PORTUGAL

Susana Silva 1,2, Helena Cristina Machado 3, Bruno Alves 1
1Department of Clinical Epidemiology, Predictive Medicine and Public Health, University of Porto Medical School, 2Institute of Public Health, University of Porto, Porto, 3Department of Sociology, University of Minho, Braga, Portugal

Abstract: The first baby conceived by medically assisted reproduction in Portugal is today 25 years-old. However, the Portuguese legal framework on assisted reproductive technologies was only established in July 2006. It became legal to donate embryos for other couples or scientific research, or to destroy them. According to the most recent official data, in 2009 twenty-seven IVF clinics located in Portugal had around 11092 cryopreserved embryos, and the majority was cryopreserved before 2006, i.e. when there was no legislation regulating the fates of embryos and informed consent was not compulsory. Over the last two years the National Council on Medically Assisted Reproduction has been asking to the Portuguese Parliament two legal clarifications on the fates of embryos: a) the definition of the maximum period of cryopreservation; b) what to do when embryos are ‘abandoning’ by the couple.

The purpose of this paper is to analyze the discourses and representations produced by the elements of the National Council on Medically Assisted Reproduction around the fates of embryos. It intends to discuss the challenges posed by national legal, cultural and financial frameworks in a broader context related to the global governance of social, economic, ethical and political issues associated with the quality, equity and security of medical practices.

The construction of new forms of social identity and new technical and scientific relationships oriented towards the future benefit of humankind contributed to legal and medical processing of embryos into objects of knowledge and intervention outside the network of kinship and family. The accounts surrounding the fates of human embryos pose new questions about the types of intimate citizenship, scientific citizenship and biological citizenship, which are occurring in the context of IVF. New lines of inequality concerning the property of biological material are emerging from interactions between citizens and reproductive technologies, visible on the exclusion of the views and experiences of the embryo donors’ from public debate, ethical discourse and political decision processes.

SOCIOCIAL DIMENSIONS IN BREAST CANCER MULTIDISCIPLINARY RESEARCH

Maruta Pranka 1, Agnese Dzervite 1, Ritma Rungule 2, Tana Lace 3, Arvids Irmējs 1
1Hereditary Cancer Institute, 2Department of Sociology and Psychology, Riga Stradins University, Riga, Latvia

Abstract: The current awareness of health and illness being defined not only as problems of medical character, but also largely characterized by social, cultural and psychological factors, related to the
patients’ subjective perception and attitudes towards treatment, promotes research integrating sociology and medicine to develop ways of improving human health and quality of life.

This report will inform on multidisciplinary research project realized in which sociological investigation is allocated an important role alongside medical, genetic and biological research. The project is realized in Riga Stradiņš University. The research target groups are: breast cancer patients and patients with p53, BRCA1 and BRCA2 genome mutations. The project’s scientific aim is to discover correlations between social, genetic, clinical factors and treatment therapy used for the target groups. In the paper particular attention is paid to the aspects related with awareness of health as a value and the ability of retaining subjective identity during illness as a period of biographical break.

The paper discusses changes in quality of life, psychological and social problems after diagnosis of breast cancer or hereditary genome mutation, evaluation of social support and other social aspects. As the theoretical base for the sociological research symbolic interactionism is used, defining that the individual perception of illness and health is influenced by social and cultural factors.

The aim of this report is to deliver analysis how different sociodemographic factors (education, age, occupation, marital status) and social experience correlate with subjective evaluation of quality of life, attitude towards health, activities performed in relation to health, access to information on health, access and evaluation of quality of health care. The following sociological research methods are used:

1) Quantitative survey of breast cancer patients after surgery (N=400) and of hereditary breast cancer gene carriers (N=100)
2) Qualitative in-depth interviews with hereditary breast cancer gene carriers (N=12)

The data from the ongoing research (2010 - 2012) will be presented.

Research project financially supported by the European Social Fund

DIVERSITY IN THE USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE: A QUALITATIVE APPROACH BASED ON NARRATIVES OF THERAPEUTIC TRAJECTORIES

Elsa Pegado

1 CENTRO DE INVESTIGAÇÃO E ESTUDOS SOCIOLOGIA (CIES), INSTITUTO UNIVERSITÁRIO DE LISBOA (ISCTE-IUL), Lisboa, Portugal

Abstract: This paper intends to approach the diversity of modes of relation with complementary and alternative medicine (CAM) by the individuals who use it, as well as the position this use occupies in their health and therapeutic trajectories.

This qualitative approach is based on narratives of individuals who, occasionally or regularly, have resorted to CAM. These narratives, not only focused on CAM, but also on the therapeutic trajectories and consumptions of individuals, have the benefit of not taking into consideration the resort to CAM in an isolated and artificial way. On the contrary, it is analysed in a broader consumption framework, allowing us to establish in what way such multiplicity of available therapeutic resources is related, either in individuals’ practices, or in the underlying logics and rationalities. Empirical data consists of 30 in-depth interviews conducted within the scope of a sociological research about therapeutic consumptions, which was carried out in Portugal, within CIES-IUL. Interviews were conducted with individuals of both genders, different age groups and different levels of education, in urban and rural contexts, in 2009.

The results show that individuals relate to alternative and complementary medicine in distinct ways, considering the multiplicity of aspects that are at stake in its use. In order to make this complexity intelligible, the analysis resulted in the construction of a typology that characterizes and systematizes the way individuals relate to CAM, particularly based on three dimensions: 1) aims associated to the use of CAM (aesthetics, illness prevention, illness treatment); 2) the importance of CAM in the scope of global therapeutic consumptions (CAM exclusiveness or prevalence, using CAM together with conventional medicine, occasional resort to CAM); 3) relation to the expertise systems (orthodox and heterodox) in the use of CAM (autonomy versus dependence).

It is also important to mention that, conceptually, these types mainly correspond to modes of relation and not so much to classifications one would be able to apply to CAM users. Indeed, the analysis shows that modes of relation with CAM are not necessarily coherent and constant throughout people’s lives. On the contrary, they are progressively built and rebuilt according to the different stages of lifecycle and illness experiences (direct or indirect) and also according to the therapeutic consumptions people make.

DOES SOCIOECONOMIC STATUS AFFECT THE ASSOCIATION OF SOCIAL RELATIONSHIPS AND HEALTH? A MODERATOR ANALYSIS

Nico Vonnellich 1, Karl-Heinz Jöckel 2, Raimund Erbel 3, Jens Klein 1, Nico Dragoano 2, Simone Weyers 4, Susanne Moebus 2, Johannes Siegrist 1, Olaf von dem Knesebeck 1

1 Dep. of Medical Sociology and Health Economics, UNIVERSITY MEDICAL CENTER HAMBURG-EPPENDORF, Hamburg, 2 Dep. of Medical Informatics, Biometry and Epidemiology, 3 Faculty of Medicine, Cardiology, University Medical Center Essen, Essen, 4 Dep. of Medical Sociology, Heinrich-Heine University Duesseldorf, Duesseldorf, Germany

Abstract: Social relations have repeatedly been found to be an important determinant of health. However, it is unclear whether the association between social relations and health is consistent throughout different status groups. One could imagine that especially in challenging and uncertain times, health effects of reliable social relations vary in different status groups, as stated in the hypothesis of differential vulnerability.

Based on the Heinz Nixdorf Recall study, conducted in a dense populated Western German region (N=4,814, response rate 56%), we explored whether socioeconomic status (SES) moderates the association between social relations and health.

In the baseline examination of the study, SES was measured by income and education. Social relations were assessed by using both structural as well as functional measures. As a structural measure the Social Network Index was used, while functional aspects were assessed by emotional and instrumental support. Health is indicated by self-rated health (1 item) and a short version of the CES-D scale to assess frequency of depressive symptoms. Based on logistic regression models we calculated the relative excess due to interaction (RERI) which indicates existing moderator effects.
Our findings show highest odds ratios (OR) for both poor self-rated health and more frequent depressive symptoms when respondents have a low SES as well as marginal social relations. For example, respondents with a comparatively low income and a low level of social integration have an OR for a high depression score of 2.85 (95% CI 2.32-4.49), compared to an OR of 1.44 (95% CI 1.12-1.86) amongst those with a low income but a high level of social integration and an OR of 1.72 (95% CI 1.45-2.03) amongst respondents with high income but a low level of social integration. Most RERI scores are positive.

The analyses indicate that there are moderating effects of SES on the social relation and health association. However, results are inconsistent as RERI scores are not significant in most cases and moderating effects vary depending on the indicators of SES and social relations used. Thus, the hypothesis of differential vulnerability can neither be fully approved nor fully rejected.

FORMATION OF SELF-PRESERVATION BEHAVIOR IN STUDENTS WITH HEALTH RISK FACTORS

Igor S. Vyalov¹

¹Department of Sociology, RUSSIAN PEOPLES’ FRIENDSHIP UNIVERSITY, Moscow, Russian Federation

Abstract: The subjective perception of body state largely determines the level of health. Also it forms a self-preservation attitudes and behavior associated with caring for health. Most people describe health only through negative concept – the absence or presence of a serious illness. Considering the health as the basis for the well-being, a person pays attention to it only in case of sickness. However, health status and self-preservation behavior are influenced by both objective and subjective factors, for which a person responds, or vice versa does not notice them. Health risk factors can be defined as a state, leading to intense functioning of organism, and in some cases to the disease.

The article presents the results of a study in Russian university in order to identify the motivation for self-preservation behavior in Russian and foreign students with a corrigeible and incorrigible health risk factors. We investigate students’ understanding of their health, self-determined level of health, their medical activity, occurrence and awareness of health risk factors, including genetics, diet, psychological and emotional stress. To identify university opportunities in the formation of self-preservation behavior we also studied expert interviews with lecturers and doctors. Analysis of the data showed that, despite the prevalence of health risk factors, most of them are removable. At the same time, many students have unresolved problems in the formation of self-preservation behavior caused by a way of life, as well as social, cultural and educational level. There are differences with regard to preserve the health among students from different geographical regions.

Most students appreciate and understand the need to correct modifiable risk factors, and show their willingness to resolve these issues during their studies at university. However, sociological study has shown that the unawareness of the health risk factors do not allow students to take full advantage of the opportunities for the formation of self-preservation behavior.

Key words: health, self-preservation behavior, risk factors, medical activity, students, motivation, correction.

MIGRATION OF ROMANIAN HEALTH PROFESSIONALS: EXPECTATIONS FOR A BETTER LIFE

Cristina Teodorescu¹,2*, Daniela Cojocaru¹,3

¹Center for Health Policy and Ethics, UNIVERSITY OF MEDICINE AND PHARMACY “GR. T. POPA”, ²Department of Psychology and Educational Sciences, “Petre Andrei” University, ³Department of Sociology and Social Work, “Alexandru Ioan Cuza” University, Iasi, Romania

Abstract: Labor migration is a phenomenon of great interest in terms of Romanian social reality, especially after Romania’s accession to the European Union. In this context, studies on Romanian migration are at an incipient stage, specialists facing big challenges resulting from the high dynamics of the phenomenon – which makes it difficult to integrate concepts, perspectives and theories into the field – but also from the extreme variety of life situations related to migration. Although increasing in number, migration studies are still not numerous enough to provide a comprehensive picture of this widespread phenomenon in Romanian society at present.

From a sociological perspective, migration can be seen as an outcome of individual strategies in response to the problems of Romanian society, resulting in temporary or permanent emigration. Studies that have investigated this phenomenon in current Central and Eastern European countries are mainly quantitative and survey results are still shallow compared to the complexity and the scale of the phenomenon.

One of the sectors most affected by migration in Romania is the health sector, where there is a significant shortage of labor. Our study proposes a phenomenological analysis of the life stories of 12 Romanian doctors, male and female, having different specialties, who chose to temporarily practice their profession abroad and returned to the home country either temporarially or permanently. The study highlights the motivations and expectations that led to these professionals’ decision to emigrate, the way they experienced temporary migration, and the factors which influenced their decision to return to the home country. In addition, the study explores individual and family mechanisms for the management of work experience abroad, and their significance for the individual’s biography.

BLOOD, MATTER, PRACTICE: MENSTRUATION AND THE EMBODIED DOING OF THE SMART GIRL

Elina Oinas¹

¹Sociology, UNIVERSITY OF HELSINKI, University of Helsinki, Finland

Abstract: The matter of blood can be approached from a variety of theoretical angles in sociology, leading to very different ways of conceptualizing the relationship between embodiment and society. This paper discusses the consequences of using a particular theoretical lens when studying young girls and menstruation, by contrasting three different theoretical approaches: the medicalization thesis typical for feminist sociology of health and illness the last three decades; the discursive/performative approaches developed from Foucauldian thinking especially by feminist research inspired by Judith Butler’s queer theory; and the contemporary “new materialities” debates on vitality and intra-agency of matter itself typical for science and technology studies. I will use different sets of data collected in Finland 1991-2011 and show how all these approaches have their own peculiarities, but also advantages for sociological
INSTITUTIONAL CONTROL OF BLOOD DONATION: THE SOCIAL AND POLITICAL AFTERMATH TO THE TAINTED BLOOD SCANDAL IN CANADA

Ivy Lynn Bourgeault¹, Elena Neiterman², Yvonne James³

¹Interdisciplinary School of Health Sciences, UNIVERSITY OF OTTAWA, Ottawa, ONTARIO, ²Sociology, McMaster University, Hamilton, Ontario, ³Population Health Improvement Research Network, UNIVERSITY OF OTTAWA, Ottawa, ONTARIO, Canada

Abstract: Until recently, sociological research on blood donation defined donation of blood (and other tissue) in terms of gift giving in that it strengthens social solidarity and contributes to the development of the imagined communities (Anderson, 1991). The anonymity of the blood donor reinforced this notion. The institutional control of blood donation had until recently received very little attention. In the past few decades, sociologists suggested that blood donation as altruistic gift giving has been undermined by the suspicion now associated with the safety of the blood products; this suspicion due to several tainted blood scandals experienced in Canada and elsewhere (e.g. France, Germany, Switzerland, Japan, the United States, Ireland, The Netherlands, Italy, and New Zealand). This has caused distrust in the institutional management of blood banks and the storage and contamination of blood products among both donors and recipients of the donated blood. This paper will draw upon the case of the Tainted Blood Scandal in Canada to analyze the institutional management of blood and the regulation of blood as an issue of public concern and governance. Using the documentary analysis of the published and grey literature related to the public regulation of blood and blood products in Canada from 1970 until 2007 this paper reveals the complexity of the intersection between the governance of blood as a public product, the perceptions of risk associated with those who require blood products and donate blood, and the institutional (mis)management of that risk. We demonstrate how the Tainted Blood Scandal in Canada reshaped the management of blood products and what impact it had on policies related to the transfer and regulation of disembodied blood products and body organs. We situate this case study within the current literature not only on blood donation but also on the institutional control related to disembodied/donated human organs.

SOCIAL DIALOG RESPONSES TO THE GLOBAL FINANCIAL CRISIS: A QCA ANALYSIS
Lucio Baccaro¹, Stefan Heeb²
¹Sociology, UNIVERSITY OF GENEVA, ²University of Geneva, Geneva, Switzerland

Abstract: This paper seeks to identify the conditions in which a social dialog response to the crisis emerges. It uses information on 44 countries around the world collected by the ILO through a standardized questionnaire addressed to country or regional experts (ILO, 2010a), as well as various primary and secondary sources collected by the authors. The analysis adopts an innovative Boolean methodology focused on identifying necessary and sufficient conditions. This methodology is attuned to a complex notion of causality in which the same outcome may be produced by different configurations of factors (Ragin, 1987; Mahoney and Goertz, 2006).

The main conclusions of the analysis are, positively, that freedom of association is a necessary condition for social dialog; negatively, that the combination of a crisis that hits hard and unions that are organizationally weak, or a crisis whose impact is not particularly deep-reaching and strong unions, is often sufficient to produce an absence of social dialog in the country. The first seems a case in which the government is hard-pressed by economic emergency to ignore trade union demands and the unions are not strong enough to force consideration of such demands. The second seems a case in which the government is afraid that involving trade unions in a concerted policy response would imply paying too high a price to them and would imperil economic adjustment.

FISCAL SUPERSTRUCTURE AND DEEPENING OF LABOUR EXPLOITATION
Daniel Bin¹
¹UNIVERSITY OF BRASILIA - UNB, Brasilia - DF, Brazil

Abstract: The article approaches the process of exploitation of one’s labour developed externally vis-à-vis the direct relations of capitalist production through the fiscal state apparatus formed by public debt and tax system. It is argued that capitalist exploitation supported by the fiscal system tends to be more intense than the one developed exclusively in direct relations of productive labour. Hence, the comprehension of the process of exploitation does not follow the economic apparatus stricto sensu of the labour theory of value, departing, then, from a sociological concept of exploitation. This means that our approach to class relations considers the material advantage of one class as being dependent on the additional effort of another one. The fact that public debt does not evolve direct exploitation as occurs in economic activities—capitalist infrastructure—makes such a debt a class relation that happens fundamentally through the political sphere—capitalist superstructure. It is included in this approach the public expense insofar as the tendency of higher commitment with the payment of interests compresses expenses in welfare policies, what contributes to the deepening of the aggregated rate of labour exploitation. In socio-economic terms, public debt brings about a special class relation that intensifies the transfer of wealth produced by labour—what turns the working class into the actual public debt debtor—to the financial fraction of the capitalist class. The quantitative—financial amount, interest rates—and the qualitative and institutional characteristics—legislation, sovereign risk, state apparatus—of public debt assure profits, even ephemeral, to the financial capitalists in levels which are not always available in the productive sphere or at least with the regularity with which they occur in the financial sphere. Hence, the study gives greater attention to the issue of interest than to public debt itself because interest is what deepens the rate of exploitation of the productive classes by the appropriating ones. If on one hand public debt, as a fictitious capital stock, is not accumulated labour – “the capital does not exist twice over” (Marx) – on the other hand, its interests demand labour exploitation to be amplified in order to achieve satisfactory return rates on diverse capitals. As also taught by Marx, the “profit of enterprise” is “the surplus of gross profit over average interest”.

HAS THE ECONOMIC CRISIS REVEALED HIDDEN POWER OF CROATIAN TRADE UNIONS? ANALYSIS OF THE GLOBAL ECONOMIC CRISIS EFFECT ON THE DEVELOPMENT OF INDUSTRIAL RELATIONS IN CROATIA
Dragan Bagić¹
¹Department of Sociology, UNIVERSITY OF ZAGREB, Zagreb, Croatia

Abstract: The global economic crisis had particularly noticeable consequences in countries whose economic growth in the period preceding the crisis was founded on personal consumption financed dominantly by foreign loans, as was the case in the Republic of Croatia. In a situation like that, the economic crisis put strong pressure on the existing employee rights, and in turn on the entire industrial relations system. Industrial relations systems with a long tradition, due to their stable institutions, show a higher degree of resistance to effects of economic crises, whereas relatively young and instable systems, such as the ones in transition countries, are significantly more susceptible to changes. The goal of this paper is to examine the extent to which such economic shocks can affect the stability of young industrial relations systems.

This paper begins with an analysis of characteristics of the industrial relations system in the Republic of Croatia established during the transition period from 1990 to the beginning of the recent global crisis. Characteristics of the Croatian industrial relations system will be analysed from a comparative perspective, comparing them with characteristics of four ideal type models: Anglo-Saxon, corporatist, Mediterranean and transitional. The paper then analyses changes noticeable since the beginning of the recent global economic crisis. These changes indicate a greater power of Croatian trade unions than the power evident in the period preceding the crisis. Such a conclusion has been particularly obtruding itself in the case of public sector unions. Stemming from that is the main research question: has the economic crisis fostered changes in the industrial rela-
EUROPEANIZATION AND SECTORALIZATION OF INDUSTRIAL RELATIONS: BACK TO THE FUTURE?

Bernd Brandl¹, Barbara Bechter², Guglielmo Meardi³

¹Industrial Sociology, ²UNIVERSITY OF VIENNA, Vienna, Austria, ³University of Warwick, Coventry, United Kingdom

Abstract: Industrial relations always transformed along changing labour markets contexts. In the European Union market contexts transform towards transnational markets in some sectors. This transformation of markets induces that national industrial relations systems have to adjust according to shifting sector contexts. In this paper it is argued that industrial relations become increasingly homogenous, i.e. European, in transnational sectors but show sticky institutional change in local sectors. The study concludes on basis of an analysis of nine sectors in all member states of the European Union, that industrial relations are still characterized by traditional national factors in domestic sectors but develop distinct European sectoral industrial relations systems in transnational sectors. Most important, these distinct sectoral industrial relation systems show significant heterogeneity across sectors but homogeneity across national borders. In this sense we find evidence that Europeanization of industrial relations evolves on a sectoral level.

PREREQUISITES AND PROSPECTS FOR THE FUNCTIONING OF THE EUROPEAN SECTORAL SOCIAL DIALOGUE

Barbara Bechter¹, Bernd Brandl¹, Guglielmo Meardi²

¹Industrial Sociology, UNIVERSITY OF VIENNA, Vienna, Austria, ²University of Warwick, Coventry, United Kingdom

Abstract: European Sectoral Social Dialogue Committees (ESSDCs) were established by the European Commission to build an institutional framework of organisational articulation of both employers’ associations and trade unions at European sectoral level. Since the establishment of ESSDCs in 1998 a variety of agreements, resolutions and joint declarations were enacted at sectoral, but European, level, including binding agreements between the social partners and the European Commission. But large differences in the functioning of ESSD are apparent across sectors. In this paper we analyse differences in the functioning of ESSD between sectors. It is argued that the functioning of European sectoral level interest coordination is favoured by certain configurations of sectoral and national industrial relations, including organizational densities, the fragmentation of social partners and more. In context of the complex sectoral institutional and economic environment in which the ESSD are embedded a Qualitative Comparative Analysis (QCA) is applied to identify the prerequisites and prospects for the functioning of the ESSD.

FLEXICURITY MEETS THE STATE TRADITIONS: THE DIFFERENTIAL NATIONAL EFFECTS OF EUROPEAN EMPLOYMENT POLICIES

Guglielmo Meardi¹

¹UN WARWICK, Coventry, United Kingdom

Abstract: The paper presents a theoretical and empirical discussion of the effects of the Europeanisation of employment policies, arguing that the interaction with state traditions in industrial relations is a complex one, which may mediate or even distort EU policies.

A first theoretical section will discuss the enduring relevance of state traditions in industrial relations, despite the increasing internationalisation pressures. It will be argued that state tradition do not imply strong path-dependence, nor coherence and immutability of national ‘models’, as theorised by dominant institutionalist approaches. Yet the state traditions of each countries, as theorised by Crouch (1993), deeply affect the way internationalisation pressures are dealt with, for instance in the case of foreign direct investment of labour migration.

The paper will then move to EU policies on employment, and notably the European Employment Strategy. The specific effects of the promotion of ‘flexicurity’ will be discussed. The ‘cluster analysis’ of national employment policies included in the Employment in Europe Report (2006) of the European Commission will be taken as a starting point. It will be shown how that analysis was static and does not allow to understand, let alone predict, the directions of change across the EU countries. A more dynamic, cross-time approach to the same data shows that while a degree of convergence in employment policies has occurred in the EU in the last two decades, it is not entirely in the direction of flexicurity (flexibility has been increased more than security), and it is not directly related to European policies, in the sense that the timing of changes does not coincide with EU recommendations.

The argument will be illustrated through the cases of the countries that have apparently had the best success in creating employment under the EES (until the crisis of 2008 at least), that is the new member states, Italy and Germany.

TRADE UNIONS AND POLITICAL PARTIES IN PARLIAMENT: A FOCUS ON ITALY IN A COMPARATIVE PERSPECTIVE

Alessia Vatta¹

¹Department of Political and Social Sciences, UNIVERSITY OF TRIESTE, Trieste, Italy

Abstract: In the last decades, the relationship between political parties and trade unions has generally changed in several European
countries. Especially for left-oriented parties, the former alliance with trade unions has transformed from a kind of symbiosis into a less demanding cooperation. This process was the result of the prolonged evolution of mass parties into ‘catch-all’ ones during the twentieth century, but it was also produced by globalisation-related factors, like the fall in union membership and the flexibilisation of employment. Political causes were also important, like the end of the Cold War and the de-ideologisation process. Previously, the link between unions and parties often implied that a number of MPs (members of parliament) came from the unions. Thus, the parliament was a channel of representation where union representatives – through the mediation of parties – could express their views and participate directly in the legislative process. After the recent changes, this form of representation has become more uncertain and party-union connections have often turned more pragmatic. In the case of Italy, this uncertainty has further increased after the crisis of the party system in the early 1990s. The paper intends to inquire about the role of MPs with union roots in Italy in the recent legislatures, as part of a more extensive research project on this subject. This study is made by checking the parliamentary activities and the policy areas where these MPs have been involved, and by setting the Italian case in a comparative framework with the support of the related literature. The purpose of the analysis is to shed light on the current relationship between parties and unions, and to consider whether it can still be meaningful in times of weakening identity ties.

*Keywords:* interest representation, trade unions, parliament

**POLISH TRADE UNIONS AND THEIR NEW STRATEGIES**

Juliusz Aleksander Gardawski

1 Economic sociology, WARSAW SCHOOL OF ECONOMICS, Warsaw, Poland

**Abstract:** The paper aims to analyse the evolution of Polish trade unions as well as its current condition. Firstly, the paper presents trade unions position across various industries, size classes, ownership types, degree of plant technological advancement and so on. Secondly, it characterizes the position of trade unions in Polish political economy. The Polish capitalism could be defined as ‘statist-liberal’: while not strong, the government still maintains the dominant position in the tripartite relations with trade unions and employers’ organizations. The government consequently exercises its position for developing liberal market economy and privatising remnants of government property in the industry. The paper focuses on dilemma connected with ‘...the political game’ of main trade union confederation in Poland. Since 1989 Solidarity not only supported right-wing parties but co-created them, particularly in 1997-2001 period. Post-communist OPZZ played main role in creating left-wing SLD-party. Despite of strong political position of trade unions they were unable to prevent the decline of working class position and trade unions movement influence (even of industrial relations field). Nowadays, after 2010 elections three main Polish trade unions organizations (‘Solidarity’, OPZZ, Forum) seemed to decide to become distanced from political parties. It was particularly unexpected in the ‘Solidarity’ case. Following the congress held in October 2010, newly elected Solidarity leadership decided to weakened its ties with its former very close ally – PiS (Low and Justice party) and shift to more or less neutral political position. New Solidarity leader intends to change its strategy to pragmatic as well as militant direction. OPZZ case is to some extend similar, as union leaders do not intend to run in October 2011 parliamentary elections. Meanwhile, all major trade unions try to find new revitalisation strategy.

**EMPLOYEE REPRESENTATION IN TAIWAN: PAST, PRESENT AND FUTURE**

Hsiao-Hui Tai

1 LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE, London, United Kingdom

**Abstract:** The state has dominated Taiwanese industrial relations for a long time and regulated the systems of worker representation including unions and non-union mechanisms. For example, the Labour Union Law was enacted in 1929, and the Convocation Rules of the Labour-Management Conference regulating a meeting for labour and management representatives to discuss issues in a workplace were announced in 1985. The outcome of worker representation is problematic and sceptical. To examine the representative systems and to understand the voice of workers, this paper discusses origins, current circumstances and feasible development of employee representation systems in Taiwan.

Qualitative methods were conducted in one major case C and two supplementary cases S and F in Taiwan. C is a privatised corporation with the largest single-plant union in Taiwan, where data were collected between July 2003 and December 2010 by participant observation, in-depth interviews with union president, union officers and worker representatives, a survey of workers, and documentary analysis of internal documents. S is a state-owned enterprise with a federation of workers unions, and F is private-owned and non-unionised implementing some non-union mechanisms; in-depth interviews with worker representatives were conducted in S and F between April and August 2007.

Mechanisms of non-union representation are regulated by the state, proposed by unions or formalised by companies. State-regulated mechanisms are implemented in all businesses but are better performed in unionised workplaces whilst unions formalise internal committees to support labour representatives. In non-unionised companies, worker representation is practised as a favour to workers, and as an indicator showing businesses fulfill governmental requirements. Companies treat non-union mechanisms, especially management-oriented ones, as the replacement for unions. Absence of trade unions results in a deficient representative system whilst workers’ voice is not efficiently passed to management who do not much respect their voice.

The dynamics of worker representation provide Taiwanese unions a possibility of influence. Instead of taking non-union representation as obstruction, unions embody them in structures and organisations. Decline of trade unions is ongoing, but unions have more ways to redefine their roles and offer better functions in the near future.

**CROSS BORDER WORKERS IN LUXEMBOURG AND IN THE GREATER REGION: CHANGES IN INDUSTRIAL RELATIONS IN THE FUTURE**

Franz Clément

1 REPREM, CEPS/INSTEAD, Differdange, Luxembourg
Abstract: A new law was introduced in 2008, creating “the single status”. One of the pivotal objectives of the “single status” for wage earners in the private sector deals with the abolition of all existing differences, within Luxembourg’s social legislation, between blue collar and white collar workers in the private sector. The introduction of the single status has led to the reorganization of some institutions: this included the merging of the Chamber of Labor, representing blue-collar workers and the Luxembourg Union of private sector employees, representing private sector white-collar workers. The social elections of November 12th 2008 were the first occasion when the new criteria for representativeness were applied to the new Chamber of wage earners.

A totally different aspect of representation of workers is worth considering. In Luxembourg, since 1985, the number of cross-border workers from Belgium, France and Germany has increased. This specific area is named “The Greater Region” with the Grand-Duchy of Luxembourg, the German States of Saarland and Rhineland-Palatinate, the French Region Lorraine and the southern part of Belgium, Wallonia. These phenomena are likely to augment in the future if we were to believe the forecasts of the National statistical institute of Luxembourg, the Statec. Unions of Luxembourg and the neighboring regions have already established transnational structures to reflect the reality of cross-border workers. Well known is the phenomena of dual membership: cross-border workers became both unionized in Luxembourg and, simultaneously, in their home country.

Briefly, it seems to us that in addition to the old divide that results from the coexistence of ideological unions, Luxembourg will increasingly witness the presence of two different worlds: cross-border workers and resident workers. The figures of the most recent social elections, organized in 2003 and 2008, indicate that the number of these cross-border workers taking part in the election process has been very limited. This would constitute in the medium term a serious problem in the representation of salaried workers in Luxembourg.

WORKERS’ REPRESENTATION IN A SWEDISH MULTINATIONAL COMPANY. DIVERGING DISCOURSES AND PRACTICES BETWEEN PORTUGUESE AND SWEDISH WORKERS

Ana Margarida Martins Barroso

1Sociology, CIES, ISCTE-LISBON UNIVERSITY INSTITUTE, Lisboa, Portugal

Abstract: The complexity of the relations between multinational companies, their subsidiaries and supply chains has been extensively considered by a significant body of research from different disciplinary fields. The transferability of human resources’ practices from one company to its subsidiaries entails some degree of adjustment to the functioning of national institutions.

Based on a case study comparing Swedish and Portuguese workers from the same Swedish multinational company, this paper examines the discourses behind the reasons for being or not unionised in the two countries. The research was supported by semi-structured interviews, focused on the evaluations and perceptions of the general working conditions provided by the company, to workers both from the Portuguese subsidiary and from the Swedish company. Although the general working conditions in this company tend to converge in the two countries, results show different perspectives on the role and importance of trade unions between Swedish and Portuguese workers. Even though some of the interviewed workers in Sweden are not unionised, trade unions have a strong presence in the company and are generally valued by the workers. This contrasts with the reality of the Portuguese subsidiary, where formal structures of worker’s representation are inexistent and under-estimated.

Considering the different industrial relations’ models in these two countries, this analysis allows us to discuss the logics of diffusion and/or resistance of employment practices in multinational companies.

LABOR MARKET SEGMENTATION AND TRADE UNION RESPONSES: THE CASE OF LUXEMBOURG

Adrien Thomas1, MAAS Roland1

1CEPS/INSTEAD, Luxembourg, Luxembourg

Abstract: Luxembourg’s labor market is characterized by a series of outstanding features. In 2010, 43.7% of jobs were occupied by cross-border workers, 26.7% of jobs by immigrants and 29.5% of jobs by national residents. The high presence of foreigners in the workforce has gone hand in hand with a segmentation of the labor market. Luxembourg nationals thus have a high preference for the public sector, whereas immigrants and cross-border workers make up a large share of the private sector. Some immigrant groups like the Portuguese are mainly active in the construction and cleaning sectors. In response to these developments, Luxembourg’s main trade unions have developed a diversification of their organizational structures and put into place for example specific organizational structures for cross-border workers and for immigrants. This contribution, which is part of an ongoing research project, is going to focus on the challenges related to interest representation of a multinational and segmented labor force. In the literature on the sociology of trade unionism, internal cohesion and the creation of a willingness to act have indeed been considered as central to the exertion of power by trade unions. In order to be successful, trade unions do not only need to consider particular interests and identities of their member groups, but they also have to construct collective identities and unify interests. By analyzing the way Luxembourg trade unions balance organizationally and politically the interests and identities of their different constituencies, we aim to contribute to the ongoing debate on the renewal of trade unionism.

INTRA-EU MIGRATION, WORKPLACE REGULATION AND THE EUROPEAN SOCIAL MODEL

James Wickham

1Sociology, TRINITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: Mass migration within the EU is normally seen as a challenge to workplace regulation and as undermining national welfare states – two key elements of the European Social Model. This paper uses the short period at the start of this century when Ireland experienced mass immigration to examine the impact of migration on the regulation of the workplace. This raises the general question of how institutional systems such as those identified by the Varieties of Capitalism (VOC) approach change over time. Furthermore, while the VOC approach focuses on national systems, within Europe the workplace is located within the intersection of sectoral, national and EU level institutional systems (Bosch et al, 2009). Using a study
COMPARING AND CONTRASTING TRADE UNION RESPONSES TO MIGRATION: A COMPARISON OF THE NETHERLANDS, SPAIN AND THE UNITED KINGDOM

Heather Connolly¹, Miguel Martinez Lucio ², Stefania Marino²
¹UNIVERSITY OF WARWICK, Coventry, ²University of Manchester, Manchester, United Kingdom

Abstract: The response by trade unions to the question of migration has become a critical issue in the study of industrial relations. This represents an important turnaround in the research agendas in Industrial Relations. This paper develops an analysis of how the trade union movement has understood and responded to the challenge of social inclusion and migration within three European contexts.

The paper builds on the insights of two sets of work in relation to comparative Industrial Relations. The first is the work of Penninx, Roosblad and Wrench, who have developed specific frameworks for understanding union responses to migration in terms of how union responses to migration have varied and why. The second set of work focuses on wider debates on the more complex impact and interplay of regulatory context and internal union structures and processes on the development of union responses (see the union revitalisation and contextualised comparison literature in Industrial Relations). These bodies of work are central contributions that have been largely overlooked in the mainstream IR and migration debate.

This paper will add insights from in-depth empirical research looking at the way different union movements have responded to migration and how the issues are understood. The paper and presentation is based on qualitative research in the form of interviews and observation in three different countries (the Netherlands, Spain and the United Kingdom) including the European Union policy making levels over a three year period. It also involves an element of action research. This has allowed the researchers to access a range of actors and issues within the debate on the union response to migration.

The paper will add that a major factor is not just the structural and regulatory environment but the way class, solidarity and race are understood and referenced within the different cases. The paper will show how issues of union politics must be understood alongside the broader impact of structure. This brings a more sensitive aspect to the debate and raises issues of union identity not solely migrant need and identity.

EUROPEANIZATION OF INDUSTRIAL RELATIONS? THE EMPLOYEE INVOLVEMENT IN THE EUROPEAN COMPANY UNDER REVIEW

Sophie Rosenbohm¹
¹Faculty of Social Science, Chair of Sociology / Organization, Migration, Participation, RUHR-UNIVERSITY BOCHUM, Bochum, Germany

Abstract: Since 2004 it is possible to establish a European Company (Societas Europaea, SE) in the European Economic Area (EEA). The question about the employee involvement plays an important role...
because the EU legislation defines that a SE may not be registered before employee representatives and the company’s management have tried to reach an agreement on employee involvement. For the last years there has been a dynamic development as the number of SEs has steadily increased. By December 2010 around 700 European Companies had been established – although just 171 companies can be classified as so called ‘normal SEs’ which are both economically active and have employees. Among them are some big European companies such as BASF, Allianz and MAN. All in all, negotiated forms of employee involvement are empirically important, as they are already effective for more than a hundred thousand of employees in the EEA.

The paper examines for the normal SEs what types of arrangements the employee representatives and the management made up and thereby analyzes what kind of European forms of industrial relations are evolving. It focuses thereby on the question whether the involvement procedures differ from those, which had existed before the SE was established. Based on considerations of the negotiated order approach and the path dependence theory it is argued that there are four different types of developments that differ regarding their involvement scope and their degree of change: The first type is characterized by path stabilization, which is combined with a higher participation degree because the existing participation forms are mainly preserved. The second type is also characterized by path stabilization but it is combined with a lower participation degree because participation forms hadn’t have existed neither before nor after the SE establishment. The third type is characterized by a path switch, which leads to a higher degree of participation because entirely new participation forms are established. A path switch also characterizes the fourth type but in this case it leads to a lower degree of participation because existing participation forms are taken back. Based on a document analysis and case studies it is explored how these types fit the empirical cases and how they possibly vary with corporate characteristics like size, sector or ownership structure.

EMPLOYER ASSOCIATIONS IN DENMARK - EMPLOYER BEHAVIOR IN DENMARK IN A COMPARATIVE PERSPECTIVE

Carsten Strøby Jensen
1

1Department of Sociology, UNIVERSITY OF COPENHAGEN, Copenhagen, Denmark

Abstract: In this article we will focus on analysing employers, their forms of organization and their influence in relation to developments in national employment relations systems. We will mainly focus on the private parts of the labour market I Denmark. The analysis has an double aim. Firstly we will focus on the forms of organization among business and employers. We will identify and analyse characteristics about employers forms of organizations with respect to their organizational forms (e.g. domaine representation), their participation in collective bargaining etc. Secondly we will try to identify how and why employers and theirs associations have tried to influence the development of national employment relations systems. The article focus especially in Denmark but compare Denmark to other European countries. has a comparative starting point looking on forms of organization in two European countries. In the employment relation literature there is quite a comprehensive debate about the character of the different national employment relation systems and about the possibility to identify more generalized models of employment relations (Ebbinghaus 1999, Commission of the European Community 2004). Establishing an employers association can been seen as a result of companies and employers interests in dealing with types of problems that are common for them. Employers associations are the solution to a problem or a field of problems that can not be solved by a single company or by the single employer, where collective action are more successfull than individual action. Employers organise in an employers associations because they expect to safeguard their interest through membershhip. Employers associations are in the employment relation literature often analysed through an optic focusing on the relation between collective and individual interests and forms of action (Traxler et al. 2001, Traxler 2004, Croucher et al. 2006). This means that theories dealing with free-rider problems (Olson 1965) often plays an important role when the formation and action of employers associations are understood. Employers associations are in this respect seen as organisations that should be able to provide the single company or the single employer with goods and services they se as attractive goods or services.

THE COLLECTIVE BARGAINING IN A WORKPLACE: THE INTERNAL AGREEMENTS AND THE LEGAL FRAMEWORK

Paulo Martins Fernandes 1, António José Almeida 1, João Pedro Cordeiro 1

1Department of Organizational Behavior and Human Re, THE ESCE (COLLEGE OF BUSINESS ADMINISTRATION) IPS, Setúbal, Portugal

Abstract: Labour relations in Portugal have been marked by a set of blocks resulting from the change in the balance of power between capital and labor. These blocks, one of the most significant has been associated with low degree of effectiveness of instruments for regulating collective bargaining has long exceeded the practices of human resource management policies adopted by companies and “tolerated” by society. It has passed a certain inability of the actors of collective bargaining in (re) construct a new compromise between capital and labor, which opened the way for a package of reforms, more or less consensual, the legal framework that regulates the system of labor relations, which aimed at increasing de-centralization of bargaining levels.

In this context, as part of an ongoing research project, called the reinvention of negotiation and collective representation of employees in Portugal, to present some results achieved by the development of the contents of collective bargaining in the automotive sector and the articulation of such content to the negotiation enterprise level translated into what some authors have called the internal business agreements.

Keywords: labor relations, collective bargaining, human resource management, internal agreements.

THE INTERNATIONAL LABOUR ORGANIZATION IN THE PORTUGUESE LABOUR LAW: REPERCUSSIONS AND CONSTRAINTS OF A SOCIO-LEGAL PARADIGM

Marina Pessoa Henriques 1, António Casimiro Ferreira 2, Andreia Santos 2

1University of Coimbra, Coimbra, Portugal, 2Centre for Social Studies, University of Coimbra, Coimbra, Portugal
Abstract: This paper explain the coordination dynamics between the different socio-legal spaces and levels in the production and application of labour law, specifically the result of how the ILO has contributed to the settlement of labour law and labour relations in Portugal. It also seeks to understand the extent to which the ILO normativity is experienced at the national level. At same time seeks the analysis of the Portuguese labour law and the Portuguese labour relations systems process of consolidation and transformation, contextualised by the international trends of human rights promotion and labour governance.

In fact, the dynamics of labour law projected on broad concepts such as social dialogue, concept of worker and employment relationship comprise the normative background of ILO conventions and recommendations as guidelines. The ILO guidelines have been increasingly challenged by labour market forces that appeal to a (re) contractualisation of the labour relations and redefinition of the labour functions and their rights. There have been internal changes occurring in the ILO with impacts on their guidance activity to Member States, constituting the concept of decent work, a normative platform gauged through the mechanisms of conventions adoption, of regular monitoring and special monitoring. In the current context of crisis, the ILO labour paradigm provides a framework for guiding the global world of work, less studied than the European Social Model paradigm.

The capture of its influence requires a broad approach to the interaction between legal spaces locally, nationally and globally. We privilege a pluralistic conception of law which emphasizes the diversity of social actors producing and implementing the labour law. This analytical option is justified by the nature of the regulatory mechanisms of international labour standards effectiveness in Member States. This effectiveness is based on the International Labour Code monitoring and in their interactions with national actors and institutions: labour courts, administration work and social partners.

DIFFERENCES IN THE PATTERN OF IN-WORK POVERTY BETWEEN GERMANY AND GREAT BRITAIN. WHAT ROLE DOES UNION POWER PLAY?
Marco Giesselmann¹

¹ESWF, UNIVERSITY OF COLOGNE, cologne, Germany

Abstract: Since the middle of the 90s, the labour market regime in Germany has undergone incremental changes; these changes have led to a departure from the conservative regime towards a convergence with the liberal model. As a result, the labour market frameworks in Germany and Great Britain by now exhibit strong similarities.

Whilst in Great Britain the implementation of liberal ideals in the early 80s was carried out against a background of weakening trade unions, in Germany the wage bargaining system’s framework remained relatively stable. The degree of trade union bargaining power therefore constitutes the central difference between the two countries, nowadays.

In turn, this differentiation has an influential effect on individual labour market results: analyses on the basis of harmonized versions of the BHPS and the GSOEP (2003 – 2006) reveal that in Germany workers on the periphery of the labour market (both entrants and re-entrants) are particularly affected by poverty, while in Great Britain especially older workers live in precarious economic conditions.

The causes behind the observed country-specific patterns of in-work poverty are accounted for by taking the rationality of trade unions into consideration. This predicts that trade unions provide insiders’ positions on the labour market with boundaries, thereby constituting a powerful closure device and protecting especially persons with high seniority from market forces. As most obvious expression of variations in union bargaining power between GER and GB strong differences in the system of labour protection are outlined.

FLEXIBILITY IN SPAIN: NARRATIVES, MYTHS AND PREJUDICE IN UNDERSTANDING EMPLOYMENT SYSTEMS

Carlos Jesús Fernández Rodríguez ¹, Miguel Martinez Lucio ²*

¹Sociology, UNIVERSIDAD AUTÓNOMA DE MADRID, Madrid, Spain, ²People, Management and Organisations, Manchester Business School, Manchester, United Kingdom

Abstract: This paper is intended to understand the complex issues that underpin this debate on ‘free labour markets’ and job dismissal that has become very important in this context of the current economic crisis. Irrespective of economic debates and their nuances, the paper focuses on the way related debates are shaped and how it structures discussions about industrial relations, the labour market and even the economy. This contribution discusses this in the context of Spain where the debate has become a touchstone of national concern and external images of the country. Regardless of differences that exist on the substantive issues on flexibility and dismissal, the free dismissal discourse is vital for defining the way policy is prescribed, constructed and constrained in the case of Spain. This forces us to understand the underlying politics and issues around which employers and academics shape policy and politics. Issues and themes within labour markets are constructed in specific regulatory contexts and specific ‘issues of identity and the political valence different issues possess in the different national settings’ (Locke and Thelen, 1995). They are also the subject of broader ideological and political influences that lead to a perpetuation of myths about the economy and national systems. This myth making is important in any discussion on politics and society.

UKRAINIAN LABOUR MIGRATION, ITS SOCIAL BASE AND IMPACT ON INEQUALITY: TRENDS AND POSSIBLE FUTURE

Oleksii Shestakovskyi³

³INSTITUTE OF ECONOMICS AND FORECASTING, Kyiv, Ukraine

The data reaffirm stably sizeable scale of labor migration from Ukraine during the last decade.
The connections with population, settlement and (to some extent) employment indicators permit to conclude the following. General structural conditions that favor Ukrainian labor migration include (but not limited to): the lack of possibilities for desirable employment at the area, and lesser attachment to a domicile by various reasons. A level of material welfare seems to be not so definitive.

Having a labor migration experience is associated with higher indices of the objective and subjective welfare as well as with higher estimation of the own social position. However there is an overall trend for the associations to decrease in strength. The connections between an experience of labor migration and employment grow down also. All these circumstances may be an evidence that influence of labor migration on the social inequality in Ukraine reduced during the preceding period of stable development.

Beside it, there are two additional findings that are important for the discussion about the labour migration: its apparent institutionalization and high readiness to protests among past and prospective migrants.

In the end some considerations are suggested concerning further tendencies for Ukrainians’ labor migration and their impact on society in the context of “turbulent times” that both European countries and Ukraine go through.

FINNISH TRADE UNIONS’ STRATEGIES TOWARDS IMMIGRATION AND IMMIGRANTS

Rolle Alho

Department of Social Policy, UNIVERSITY OF TURKU, Helsinki, Finland

Abstract: It is often stated that the position of trade unions vis-à-vis immigration and immigrants is ambivalent. On one hand, unions worldwide have expressed solidarity with migrant workers, defending their labour and social rights, and made efforts towards their societal inclusion. On the other hand, unions have seen immigration as an external threat creating competition for jobs, and have therefore used exclusive strategies towards immigration.

This paper argues that Finnish trade unions have adopted both inclusive and exclusive strategies towards immigration and immigrants. I have analysed the union strategies from Walter Korpi’s (1978) power resources perspective. In the context of immigration, Finnish trade unions try to maintain their power resources by advocating restrictions on labour immigration. However, as regards immigrants, there is an aim to include immigrants in unions in order to increase membership and prevent social dumping by the use of immigrant workers. This paper forms part of my PhD thesis.

TRADE UNIONS AND EUROPE 2020: FROM DREAM TO NIGHTMARE?

Richard Hyman

London, United Kingdom

Abstract: On 24 November 2009 the European Commission published its consultation paper on the EU 2020 strategy, with a deadline for responses of 15 January 2010. This timetable was widely criticised, and differed markedly from the four months allowed for consultation on the Green Paper ‘Modernising Labour Law to Meet the Challenges of the 21st Century’ in 2006-07.

In the event, responses were submitted by 16 national and 11 supranational trade union organisations, with a few others from union-related bodies and from national bipartite or tripartite bodies as well as the EESC. This may be contrasted with the replies from 49 national and 14 supranational trade union bodies to the Green Paper consultation.

Union reactions were without exception critical. Key common themes were the lack of analysis of the reasons that the Lisbon strategy failed to achieve it tasks (the Commission published its own assessment only after the close of the consultation), the predominant emphasis on restraint in public finances, and the more general subordination of social to economic priorities. While most responses were brief, some were detailed and sharper in tone than the 6-page ETUC document (which contrasted with its 31-page response to the Green Paper).

My contribution will compare and contrast national and EU-level trade union arguments, and will also discuss some of the reasons for limited trade union participation in the consultation, which may indicate growing alienation from the whole EU policy-making process.

QUESTIONING EU INTEGRATION? IRISH AND FRENCH WORKERS AND UNIONS IN THE PAST EU REFERENDUM DEBATES

Elodie BETHOUX, Roland ERNE

Abstract: Due to the Maastricht Treaty European employers and workers’ organizations have acquired official status allowing them to play a substantial role in the drafting and implementing of rules in the social policy area. But the list of issues addressed in the European social dialogue remains limited. The European Single Market, the EMU and the EU enlargement also triggered significant transformations of company structures and labour markets. The performance of European IR actors hardly matches the increased salience of these new challenges. This reflects the difficulties to reach a consensus between organized capital and labour across an increasing number of EU member states, as well as difficulties of EU interest organisations to represent and mobilise their rank-and-file in relation to European issues. Hence the development of European institutions and rules, with the increased complexity of European IR since the enlargement, raises new questions about the articulation between European, national and workplace levels.

Our paper aims at developing a comparative analysis of the relationships between national unions and developments at EU level in the Irish and French cases. To which extent are national TU members and activists aware of and interested in European labour issues? Which positions and strategies do they take? What resources do they have regarding European issues? What kind of relationships do national players have with the European social partners?

These questions are of particular interest in relation to Ireland and France: the French Referendum on the EU Constitution and the Irish Referenda on the Lisbon Treaty revealed a cleavage between the recommendations of union leaders and the voting behaviour of...
French and Irish workers, as well as conflicting positions inside national union movements.

The positions of the national unions are captured by a systematic analysis of the union and the general press in France and Ireland. The collection of all articles published during the referendum debates in the 2 countries provide the base for a lexical analysis using the Alceste software. Our analysis proceeds in two steps: 1) determining the salience of worker and TU issues in the general referendum debates in the 2 countries; 2) analysing and comparing the worker and TU related articles in the Irish corpus and in the French corpus in the light of our research questions.

THE USES OF ORGANIZATIONAL LEARNING AND WORKER EDUCATION FOR INDUSTRIAL RELATIONS DEVELOPMENT

Catherine Casey

1School of Management, UNIVERSITY OF LEICESTER, Leicester, United Kingdom

Abstract: In the midst of the recalibration of employment relations in liberalizing European Union countries over recent decades there has been heightened policy interest in increasing learning, education and skill levels among the workforce and in organizations. A policy and academic literature on ‘learning organizations’ and diverse practical interventions in organizations and workplaces pursues accomplishment of knowledge-rich, continuously learning and innovating organizations. The policy and business pursuit of organizational learning has gained mixed reception in critical sociological studies of work, labour markets and industrial relations. Critics note that an earlier, mid-20th century labour movement and trade union interest in worker education and skill development, which sought diverse objectives for worker education including advancement of industrial and organizational democracy and improved quality of work, has been marginalized. The predominant interest in organizational and workplace learning in the early 21st century appears essentialized with techno-economic imperatives for competitiveness and restored managerial elite agendas in organizations. Those managerial interests currently circumscribe and delimit the horizon for organizational, workplace, and workers’ learning. A widely observed deterioration in industrial relations and in the quality of work and workers’ lives now confronts institutions of European industrial relations.

This paper proposes that a renewed, critical exploration of organizational learning and worker education offers potential for social application in organizational practices and industrial relations. It proposes that the 2008 crisis of capitalism opens opportunity for revitalized discussions of learning in organizations, including in trade union organizations. A more comprehensive and critical approach has practical potential for effective intervention in regard to crucial issues of quality, representation and negotiation. A re-mobilization of organizational and worker learning may generate improved work practices and more effective trade unions, and extend in reach to a regeneration of institutions of societal democratic citizenship and civilized economic organization.

STATE, CAPITAL AND TRADE UNIONS IN EUROPE AND CHINA. HOW GOVERNMENTS DEAL WITH SOCIAL CONFLICTS?

Margherita Sabrina Perra, Francesca Congiu

1DEPARTMENT OF ECONOMIC AND SOCIAL RESEARCH,
2DEPARTMENT OF HISTORY, POLITICS AND INTERNATIONAL RELATIONS, Cagliari, Italy

Abstract: The paper will draw on one of the central ideas put forward by current critical studies on capitalism and, in particular, on the methods and strategies adopted by capitalist systems to overcome national and international crisis. Since the beginning of the Eighties the international economic system has brought about important changes in labour relations with enormous consequences for both developed and developing countries. Labour conditions in standard wage employment are progressively worsening, in a “race to the bottom” trend, in terms of income redistribution, workers’ rights and workers’ interests’ representation. Scholars define this process as an increasing “proletarianization”, which is characterized by the tendency towards occupational deskilling. This is true, more specifically, for European economic systems. On the contrary, China is both experiencing a process of rapid industrialization, highly dependent on foreign capital and cheap local labour. However, part of the literature is currently emphasizing how China is succeeding at absorbing more and more active labour force in regular industrial employment, improving standard working conditions and emancipating trade unions and their political representative role. Actually, this still is an open question and lies at the core of the current debate on China’s ascendency as a “new development paradigm”. The paper will address the issue of the role of the State in industrial relations’ drastic transformation in the context of the last thirty years’ neoliberalism from a socio-political perspective. The main question to be addressed will be the role played by political institutions in the new social conflicts due to the reconfiguration of labour relations and whether the form of government (democratic or non-democratic) still makes the difference.

There will be two interconnected levels of analysis: an historical and sociological level and a comparative one. Indeed we aim at underling these trends by drawing a comparison between manufacturing industrial workers in Europe and China. By looking at legislation choices, industrial policies, working conditions’ changes emerging by data provided by the European Office of Statistics (Eurostat) and the National Bureau of Statistics of RPC, the paper aims at looking for convergences and differentiations between the two areas.

WHO JOINS TRADE UNIONS: TESTING NEW SOCIOLOGICAL EXPLANATIONS

Christopher Kollmeyer

1Department of Sociology, University of Aberdeen, Aberdeen, Scotland, United Kingdom

Abstract: Why do some workers join trade unions and others do not? Previous research focuses on institutional, economic, and demographic accounts to explain variations in trade union participation across individuals, countries, and historic periods. These accounts, however, fail to consider how the habits, practices, and values of workers shape their decisions to join trade unions. Drawing on theories of social capital and attitudinal change, it is hypothesized that variations in civic and political engagement, as well political and cultural values, help explain who joins trade unions. This hypothesis is tested with select data from the World Value Survey. Results from binary logistic regression models indicate that individual-level variation in
trade union participation positively correlates with civic and political participation, with left-leaning political views, but not with the post-materialist values. The article concludes by discussing the research’s limitations and its potential for shedding new light on questions surrounding organized labour’s changing fortunes.

WORK AND LIFE CHANCES IN TRANSITION SOCIETY (THE CASE OF RUSSIA)

Vasily Anikin

Abstract: Phenomenon of work despite the apparent patency of the word indeed has somewhat complicated social ground related to the cultural context of the way the term is used. It is common for many researches to set off work and labor (Grin, 2005), work and its absence (Friedmann and Havighurst, 1954.) or consider dialectical accord of work and non-work (Riesman et al., 1950) under which work becomes even a form of leisure time.

I suspect work in a sociological tradition as activities which people do for a wage (Watson 2008).

The paper deals with the analysis of roles work plays in contemporary life of Russians. The case considered to be interesting due to its reference to a theory of work in transition societies that moreover suffer from negative crises effects. On a cross-sectional national data (2009) the variety of subjective aspects of work (such as orientation to work, intrinsic and extrinsic values of work, attitudes in the job, job motivations and job satisfaction) is studied in the context of structural logic – primary from the point of professions, job power and decision-making on job, social services and different types of recourses.

The main findings of the research are the following:

1. Work plays a somewhat important role in shaping the life chances of Russians although this is not fully realized by the majority of the population.

2. There is an offset of these affects – specific social relations between staff and management legitimizing the abundance of intrinsic job satisfaction at a lack of extrinsic one.

3. The prepotency of instrumental orientations to work is rather predicted by relations of exploitation then by simple division of labor on manual and non-manual categories and hence considered to be explained by different job motivations.

Here arises the theoretical point concerned with established use of the notion ‘work’. Such implications took it to evaluate this term for transitional societies. Moreover author supposes the analysis of ‘work’ complimented with respect to the socio-economic restrictions will produce somewhat valuable frame to comprehend other transitions.

NOT FOR BAD WEATHER: MACRO ANALYSIS OF FLEXICURITY WITH REGARD TO THE CRISIS

Andranik Tangian

Abstract: Thepaper presents a macroeconomic analysis of flexicurity with regard to the current economic crisis. Flexicurity is the European labour market policy aimed at compensating the ongoing flexibilization of employment relations (deregulation of labour markets) by means of advantages in social security. The analysis is performed with four composite indicators based on statistical figures for 25 countries. These composite indicators are flexibility, security, gravity of macroeconomic situation by 2010 and aggravation of macroeconomic situation in 2008-2010. The latter indicator is used to separate the pure effect of the crisis from previous developments. The indicator of flexibility covers both institutional and factual aspects, the security indicator includes social expenditure and benefit pay-offs, while the gravity of the macroeconomic situation is expressed in terms of output gap, public debt, size of bailout package and unemployment rate. It is shown with statistical certainty that a high degree of flexibility is not advantageous. Both the gravity of the situation by 2010 and the aggravation of the situation during the crisis in 2008–2010 depend significantly on flexibility. A possible explanation is that flexibility encourages firms to indulge in more risky market behaviour, given that potential losses can be recovered through restructurings with trouble-free labour adjustments. Restructurings require credit, making firms more sensitive to failures in the financial sector. When a crisis occurs, both economic losses for firms and labour adjustments take place on a massive scale, aggravating both the economic and the social situation (increase in the output gap and in unemployment). Flexibility-security combinations are not advantageous either, although the pure effect of the crisis is softened if social security is generous. The conclusion is that a better alternative to flexicurity would be a normalization of employment relations; in other words, low flexibility, which also would result in less social security expenditure.

The closing discussion argues that the flexibilization of employment relations and the crisis both stem from the same root: financial liberalization is the background cause of both phenomena, rendering them dependent on one another.

UNION RESPONSES TO THE AUSTERITY MEASURES: A COMPARATIVE STUDY OF FRANCE AND BRITAIN

Heather Connolly, Ralph Darlington

Abstract: This paper compares union responses to austerity measures in France and Britain. Using a contextualised comparison approach this paper compares the responses of British and French unions to recent austerity measures. We look at the different ‘institutional sticking points’ that have emerged in both countries. In the contextualised comparison approach the issues that generate the most intense conflicts are those which are so bound up with traditional trade union identities that their renegotiation sets in motion a much deeper and fundamental re-evaluation of labour’s project within a given institutional setting. Whilst the paper will look at union responses more generally the analysis will concentrate trade unions adopting a more radical politicised unionism.

In France there has been widespread action against government reforms towards the retirement age. The French industrial relations system – alongside traditions of militancy and mobilisation – facilitates such a response. In contrast the British system of industrial
relations constrains coordinated union responses against austerity measures and this has led to a more fragmented response to the public spending cuts. This also reflects trade union identities in Britain, which have tended towards more 'bread and butter' issues in employment relations. Despite the different nature of union responses more generally some radical unions in both countries display similar features of combining industrial militancy with a highly political/ideological edge.

This paper is exploratory and draws on the authors’ previous empirical work on unions in France and Britain, alongside secondary sources. The paper will also draw on primary research as part of a British Academy funded project to compare trade unions in France and Britain which began in September 2010. The research has mainly been conducted in the railway sector in France and Britain, where trade unions have been at the centre of building militant resistance over a number of years prior to the current challenges.

AUSTERITY REGIMES AND LABOUR MARKET RESPONSE
Kevin Doogan¹

¹School for Policy Studies, UNIVERISTY OF BRISTOL, Bristol, United Kingdom

Abstract: The ‘Great Recession’ is the most significant downturn to assail capitalism in eighty years. It is a global recession, but its impact is also highly differentiated and distinctive in its labour market effects. When comparing the recession in the UK with the recessions of 1991 and 1980 the decline in output has been faster and more precipitous in the current crisis but the rise in unemployment has been slower and the proportion out of work (at around 8%) less than in previous downturns. This is not simply a lagged response to the recession but an outcome of the evolution of the crisis through different phases from a financial crisis to an economic crisis then to a fiscal crisis and sovereign debt crisis. More specifically it reveals how the impact of the bailout of the banks has been transposed to the public sector and has emerged as an austerity regime ushering in an unprecedented and prolonged period of welfare retrenchment. The implications of new patterns of public expenditure demands particular attention because the public sector labour market has its own dynamics, planning cycles and patterns of adjustment. That is why the issues are not confined to public sector job losses, but also focus on the raising of the retirement age, pension reform, pay freezes and job downgrading. How these services are to be funded is critical but also potentially explosive as is the case with the student protest against tuition fees. This paper will explore the impact of austerity on the public sector labour market and explore the new sources of insecurity facing the public service workforce as well as the possibilities for resistance.

UNIONS AGAINST GOVERNMENTS: EXPLAINING GENERAL STRIKES IN WESTERN EUROPE, 1980-2006
John Kelly¹, Kerstin Hamann², Alison Johnston³

¹management, BIRKBECK, UNIVERSITY OF LONDON, London, United Kingdom, ²political science, university of central florida, orlando, United States, ³European Institute, London School of Economics, London, United Kingdom

Abstract: The number of general strikes against governments in Western Europe since 1980 has been increasing. Between 1980 and 1989, trade unions staged 18 general strikes, 26 in the following decade, and 28 between 2000 and 2006. The rise in general strikes is noteworthy because it has coincided with a sharp decline in the level of strike activity against employers. Moreover, whilst many general strikes have been called in strike prone countries such as Greece and Italy, they have also been called in countries with historically low levels of strike action, such as Austria and Luxembourg. Finally the rise in general strikes has also coincided with the re-emergence of social pacts between governments, unions and employers, and these forms of union inclusion might have been expected to reduce the level of anti-government protests.

Our research explores three questions: how do we explain the rising number of general strikes? How do we account for variation between countries? And how successful are unions in obtaining concessions from governments? We use data for 16 Western European countries (EU 15 plus Norway) between 1980 and 2006. As general strikes are directed against governments rather than employers, we argue conventional strike theories are of little value. We focus instead on the political context and hypothesize that general strikes are a response to union exclusion from government policy formation and that rightist governments and strong governments will also generate higher levels of general strikes. We expect government concessions to unions will be influenced by governmental strength, party composition of the government and the degree of trade union unity.

We constructed our own dataset containing data on general strikes, social pacts, legislation, the strength and composition of governments as well as a series of economic and institutional controls. Analysis using a one-way fixed effects logit model provides supportive evidence for our hypotheses. The likelihood that unions will call a general strike is significantly higher when unions are excluded from policymaking by conservative governments with a large vote share and when unions wield authority over their affiliates. We also found that concessions to unions are most likely to come from centrist governments compared to more left or more right wing governments.

PARTICIPATION IN A STRIKE: THE ROLE OF DIFFERENT SOURCES OF INFORMATION IN WORKER MOBILIZATION.
Marieke Born¹, Agnes Akkerman², René Torenvlied³ ⁴

¹Political Science, RADBOUD UNIVERSITY NUMEGEN, ²Radboud University, Nijmegen, ³University of Groningen, Groningen, ⁴Utrecht University, Utrecht, Netherlands

Abstract: This paper aims to explain worker participation in industrial conflict when workers receive conflicting information from different sources in their network. Participation in collective action and the mobilization of participants has been a subject of study for decades. The main explanatory variable in this research up to now is social identification. Individuals tend to rely on what ‘others like me’ do. Remarkably, theory mostly focuses on the influence of social movements or the unions, ignoring other groups that could offer the worker information about the (potential) conflict, such as the employer, colleagues and the media. In this paper, we offer an additional explanation for participation in collective action such as strikes: by including other groups as sources of information, we investigate how (potentially conflicting) information from these different groups is filtered. We argue that social identification is not the only determinant filter of information and introduce trust, ex-
pertise and proximity as explanatory variables. We investigate the relationship between a) social identification and trust, b) expertise and trust, and c) proximity and trust and test the hypothesis that trust and social identification positively affect the influence a source of information has on the decision to participate. We empirically explore the influence of these factors on willingness to participate, using survey data of 725 respondents, collected in 2010.

**A QUANTITATIVE SURVEY ANALYSIS AMONG UNION AND FIRM REPRESENTATIVES OF INFORMATION SPILLOVER IN SEQUENTIAL COLLECTIVE NEGOTIATIONS**

Alex Lehr

1Political Sciences, RADBOUD UNIVERSTY Nijmegen, Nijmegen, Netherlands

Abstract: Recent developments in strike research have shifted the focus of analyses from single firm-union bargaining pairs to influence patterns between separate bargaining pairs that sequentially negotiate over collective agreements, with information spillovers proposed as mechanism of influence. This paper aims to establish when union and firm representatives are influenced by information about collective bargaining in other firms. We argue that information about the demands, offers, outcomes, costs of possible strikes, workers willingness to strike and public opinion related to collective bargaining in other firms influences the bargaining strategies of union and firm representatives if these other firms are perceived as similar and information sources are perceived to be trustworthy. Furthermore, negotiators that face high uncertainty about their bargaining positions and/or who’s perceptions about their bargaining positions strongly diverge from their bargaining partners are expected to be influenced more strongly by information about collective bargaining in other firms than those in low uncertainty/low divergence bargaining situations. Standardized survey data are collected among union and firm representatives involved in a sample of collective agreements active between 2009 and 2011 in the Netherlands. A unique design of both union and firm negotiators nested within the same contract allows for assessments not only of negotiators’ perceptions of trustworthiness of information sources and similarity of other firms to their own firms, but also of the divergence of perceptions of bargaining positions between negotiators within the same bargaining pair.

**FOR BETTER OR WORSE? EXPLAINING TEMPORAL TRENDS IN PERCEIVED JOB QUALITY IN 19 OECD COUNTRIES**

Florian Pichler

1Institute for Industrial Sociology, UNIVERSITY OF VIENNA, Vienna, Austria, 2European University Institute, Florence, Italy

Abstract: How workers assess the quality of their jobs not only reflects individual evaluations but is also linked to institutional settings and international developments. Drawing on scholarship from across the social sciences, we investigate a series of interrelated dimensions of perceived job quality, including intrinsic and extrinsic rewards of work, job security, work intensity, working conditions and the quality of workplace relationships. In addition to individual-level correlates of perceived job quality, the available literature suggests that ‘institutional forces’ (e.g. employment systems and industrial relations) or ‘competitive forces’ (e.g. globalization and technological change) shape subjective work experience. Yet, existing work mainly draws on international survey data for a single year to test these contextual effects. This contribution takes the methodologically more powerful approach of testing the predictive value of institutional change on the evolution of job quality within countries. Using data from the International Social Survey Programme covering 19 OECD countries over the period 1997-2005, we investigate changes in perceived job quality over time and trends of polarization within the gainfully employed population. We examine the extent to which theories of ‘Varieties of Capitalism’, ‘Power Resources’ and ‘Globalization’ help explain the variation and temporal trends in perceived job quality. Results from two-step multilevel models with country fixed effects underline the importance of dynamic models to identify institutional predictors of perceived job quality. They confirm that institutional structures and global competition do not go unnoticed by workers; yet, the relevance of different institutional components varies across the sub-dimensions of perceived job quality.

**WORRIES ABOUT LOSING THE JOB: THE IMPACT OF EMPLOYMENT SYSTEMS IN INTERNATIONAL COMPARISON**

Holger Lengfeld

1School of Business, Economics and Social Sciences, UNIVERSITY OF HAMBURG, Hamburg, 2Institute of Sociology, University of Hagen, Hagen, Germany

Abstract: Since the mid-1990s, employee’s worries about losing the job have been increased in most OECD countries. Nevertheless, remarkable differences between countries with regard to degree and trends of perceived job insecurity are observable. These differences can only partially be explained by varying unemployment rates. Therefore, research has well examined socio-demographic determinants of the workforce, but results related to institutional characteristics of a countries’ employment system, such as employment protection legislation and active labour market policies, have been empirically and theoretically contradictory.

In our paper we suggest a more complex explanation of international differences in perceived job insecurity. Based on social psychological appraisal theory, transaction cost and varieties of capitalism (VoC) approaches, we first argue that a high level of employment protection legislation (EPL) may reduce workers’ cognitive perceptions of the probability to lose the actual job, but increases long-term related affective worries to become re-employed after a possible dismissal. In liberal market economies (LME), characterized by low EPL, job transitions are more frequently to occur, so employees have developed coping strategies to deal with dismissals and to find a new job. Additionally, LME’s vocational training systems provide generalized skills which are easier to transfer across firms compared with coordinated market economies (CMEs). Because the latter are characterized by a higher degree of firm-specific skills, a high level of EPL protects from short-term dismissal but decreases the chance of re-employment on the long run. Secondly, and independently from EPL-effect, active labour market policies (LMP) typical for CME’s positively influence the outcome of the appraisal process of anticipated job loss by ameliorating its perceived material consequences and by strengthening the workers’ self-efficacy.
Empirically, we test these assumptions by analysing ISSP 2005 data including 20 countries. Descriptive analyses and multi-level regressions show that affective worries can be traced back to higher EPL and lower LMP levels. In contrast, higher levels of EPL and LMP do not reduce cognitive perceptions of job insecurity.

TRENDS OF JOB QUALITY IN EUROPE

Timo Anttila 1, Tomi Oinas 1, Armi Hartikainen 1, Jouko Nätti 2

1Department of Social Sciences and Philosophy, University of Jyväskylä, Jyväskylä, 2Department of Social Research, University of Tampere, Tampere, Finland

Abstract: Global competition, technological change and intensification of work are common developments throughout industrial world. Growing comparative research literature tries to discern differences between countries' production regimes or welfare state institutions in mediating the pressures of global competition. The presumption is that there are differences between national political and historical compromises on industrial relations and production systems and between societal institutions such as family systems, educational systems and security systems. Thus, policies vary and particular national institutional conditions mediate globalization's effects.

Job quality is a multi-dimensional phenomenon, which touches on a broad set of individual job and workers' characteristics. Central methodological choice in assessing overall job quality is to decide whether to use multidimensional approach with variety of measures or to ask job holder to provide a general or global assessment on his/her job. This study follows the tradition of multidimensional approach to job quality. We employ both objective and subjective measures of job quality dimensions, which can be found in recent and most central contributions in the literature on job quality.

Empirical analyses are based on the fourth wave of the European Working Conditions Surveys (EWCS) collected in 1995, 2000 and 2005. The country-level data for latest survey (2010) is obtained through EWCS Survey Mapping Tool. All analyses are based on country-level data. In contrast to many earlier studies, in which the typologies of country clusters (regimes) are taken as a starting point of job quality analysis, we use a data-driven approach (hierarchical cluster analysis) that seeks similarities among European countries in regard of job quality dimensions.

The analysis of trends in the development of key job quality indicators shows that current assumptions about the impact of 'globalization' on job quality and the decline in the significance of the nation state may be exaggerated. The preliminary empirical findings show that within Europe there are considerable variations between regimes both with respect to overall levels of job quality and with respect to women's and men's job quality, and thus, the implications of the economic processes are not likely to be similar across capitalist societies.

THE LONG-TERM CONSEQUENCES OF STRIKES

Kirsten Thommes 1, Agnes Akkerman 1, Rene Torenvlied 2

1Nijmegen School of Management, RADBOUD UNIVERSITY Nijmegen, Nijmegen, 2Department of Sociology, Utrecht University, Utrecht, Netherlands

Abstract: The long-term consequences of strikes

Teamwork in organizations is rather the norm than the exception, and the manner of collaboration in teams is highly relevant for individual well-being as well as for organizational productivity. Two main concepts in order to describe the ‘manner of collaboration’ in teams are conflict and cohesion.

One major event and challenge for teams is collective conflict like strikes. Past research confirms the impact of strikes on organizational productivity and psychological health and job satisfaction during the conflict. But up till now, there is no research on the long term consequences of strikes for the social relations at work. Our paper aims at filling this research gap by addressing to questions:

(1) During a conflict, fault-lines may arise between individuals in a team because some members participate to the strike and others refuse. The strike-breakers do not have income-loss during the strike whilst profiting from what the strike yields (e.g. higher wages, more holidays). This misbalance between contribution and conflict in times of strike may enhance conflicts in teams and may lower cohesion. In our paper we develop a theoretical model on the effects of a strike on cohesion and conflict in teams and its consequent effects on individual well-being and organizational productivity.

(2) However, the long-term consequences of strikes for cohesion and conflict in teams will probably differ according to individual’s, team’s and situational characteristics. Therefore the degree of cohesion and conflict in a team will not solely depend on fault-lines in teams because of past strikes, but also, for example on social identity (individual level), shared norms (team level) and the severity of the conflict, such as the duration of the strike (situational characteristic). Thus, the second aim of the paper is the development of a theoretical model that is able to explain the effect of such factors on the differences in the long-term consequences of strikes.

Resulting from the discussion of both research questions we will develop propositions that can be tested empirically and thus improve our understanding of industrial conflicts. Additionally, we will provide first empirical evidence for our propositions.

STEREOTYPES, HARRASSMENT AND FRAMEWORK OF CONFORMITY IN THE WORKPLACE

Fermin Arellano Morlas 1

1Sociology, UNIVERSITY OF ZARAGOZA, Zaragoza, Spain

Abstract: Within the ‘processes of conformity’ in the workplace we encounter the extreme pressure to which victims of workplace harassment are submitted by both the aggressor and the group they belong to. The acceptance of a framework of conformity in an organisation creates the environment necessary for the aggressors actions.

On the basis of several cases of workplace harassment tested through trial and error and specialised literature we can get an overview of the problem which can be divided into five aspects. These aspects are: psychological, economic, social, cultural and moral, and are useful to delve into the complexity of the processes of conformity within workplace harassment.

The center around which these five aspects revolve is the formation and use of stereotypes, attack mechanisms used by the harasser which seek to disable the defenses of the victim, undermining their
position in the company and limiting the avenues available to the victim. These stereotypes are designed to stigmatize the victim, creating a perception that they are, in some way, a threat to the group and the company. This constitutes the justification of the actions and treatment the aggressor and, in certain cases, the group have perpetrated against the victim.

The end result will be setting the company as a whole against the victim, ultimately leading to the expulsion of the victim from the organization. Finally, as a conclusion, acts normally considered socially reprehensible become justified when they occur within the confines of the company, which opens a debate on the company’s social responsibility.

UNREASONABLE MANAGERS AND THE DEMORALIZED WORKPLACE

Ralph Fevre

UNIVERSITY OF CARDIFF, Cardiff, United Kingdom

Abstract: This paper reports on the analysis of two surveys: the (British) Fair Treatment at Work Survey and the British Workplace Behaviour Survey. Of all the different types of negative behaviour employers might encounter, it is being unreasonably treated (mostly by managers or supervisors) that they say has the most affect on them. Employees expect fairness and rationality at work and are offended by their absence. Although unreasonable treatment may sometimes be traced to the failings of a particular manager, the survey data also suggest that the amount of fairness and rationality on offer varies quite considerably between different workplaces. In part, such consequences are a result of structural factors. Unreasonable treatment is more likely if the nature of work has changed, or is changing, or if people have less control over their work or the pace of their work has increased. It is also the case that employees are more likely to say they have been unreasonably treated if the pace of their work is too intense. But there are important cultural factors too, most notably a strong correlation between experiencing unreasonable treatment and feeling the organisation’s goals are not compatible with the employees moral principles. This correlation may also hold in respect of a range of other workplace issues including problems with employment rights. We conclude by proposing that workplaces with such a nexus of different problems might best be theorized as ‘demoralized’.

WORKLOAD AND STRESS AMONG FINNISH IT-EXPERTS

Pasi Juhani Pyöriä

UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The aim of the paper is to assess the contradictory work situation of Finnish knowledge workers from the point of view of their organizational environment as well as individual well-being. The paper draws on the findings of a recent member survey by the Pro union. Pro represents employees who work in specialist, supervisory and managerial positions in the economic and financial as well as technical and information sectors of the economy. The survey material, collected in 2009 amidst the financial crisis, is of particular interest, because it allows for a comparison of IT-experts with other white-collar knowledge workers. Although the survey represents members of a single union, in many respects it provides the most comprehensive account on Finnish knowledge workers available. The survey results highlight the anxieties that IT-experts and other knowledge workers experienced during the financial crisis. In 2009, as a consequence of the economic turmoil, Finland’s GDP dropped by 8.2% and the rate of unemployment rose from 6.4% in 2008 to 8.2% in 2009 (adjusted for seasonal variations). Although unemployment didn’t hit Pro members particularly hard, IT-experts felt that their labour market position is precarious. The survey also highlights many other uncertainties that plague Finnish IT-experts. IT-experts share little trust in their organizations (including management) and they must cope with high productivity pressures. Although this is not seen in the prevalence of diagnosed occupational diseases, anxiety and fatigue are somewhat more common among IT-experts than among the rest of the survey population. The results lead to the following provocative question: should we finally dispel the myth of the empowered middle-class knowledge worker?

INTERACTING ORGANIZATIONAL COMMITMENT AND ECONOMIC SUCCESS IN KNOWLEDGE-INTENSIVE WORK

Tiina Saari, Pasi Pyöriä

UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: In this study, we ask how the pursuit of firm-level productivity and organizational commitment are connected in the context of knowledge work. The topic is of particular relevance during the time of economic recession when work organizations’ success is a balancing act between downsizing and retaining key employees.

The research material consists of 17 thematic interviews representing employees and managers in two Finnish knowledge-intensive firms: an R&D department at a global manufacturing enterprise and a call center in a telecommunications company. The material is analysed by the methods of content analysis.

Preliminary results show that economic uncertainty clearly affects employees’ organizational commitment in both firms. The employees feel uncertain about the future of their labour market position and fear that productivity increases are sought for at the expense of employee well-being.

There are also vast differences between the organizations regarding autonomy and control that may affect individual commitment. In the R&D department, the content of work is rewarding and the workers have a high level of autonomy. Employees also think that they can contribute to the success of their organization. In the call center the situation is quite an opposite and the work process is best described as Tayloristic. What is common for both firms, however, is that fair management and good community spirit seems to improve organizational commitment.

The study is a part of the Academy of Finland project Successful Organizations and Employee Well-being in Knowledge-intensive work.

FINANCIAL INSECURITY, HRM AND THE ANGRY KNOWLEDGE WORKER

Jean Cushen, Paul Thompson

UNIVERSITY OF TAMPERE, Tampere, Finland
The paper intends to analyse the changing strategies of collective bargaining in Italy and Germany. To this end we will concentrate on automotive and briefly summarize the main variables affecting sector labour relations in the last decade.

Following Streeck’s approach of historical institutionalism we intend to explore the role of collective bargaining in national socio-economic regulation.

The paper is organised as follows:

1) The automotive sector in the very recent years: Europe.
2) The relevant facts: reorganisation analysed as a strategic choice.
3) The process of communication and the opening of negotiations with the employees’ representatives.
4) The object and the scope of negotiations: pay and working conditions. The nature of changes: temporary concessions bargaining or unilateral regulation?

The final part of the paper will propose a discussion on the changes and adaptations of labour relations.

**EWCS AND RESTRUCTURING: FROM INFORMATION-CONSULTATION TO NEGOTIATION**

Isabel da Costa 1, Udo Rehfeldt 2

1 CNRS-IDHE, Ecole Normale Supérieure de Cachan, Cachan, 2 IRES (Institut de recherches économiques et sociales), Noisy le Grand, France

Abstract: The 1994 EW Directive sets a clear connection between transnational restructuring and EWCS and requires that companies inform and consult representatives of the employees affected by their decisions. Surprisingly however comparative analysis on restructuring in Europe concludes that EWCS play only a minor role in restructuring situations. Yet, some studies, including ours, show that since 2000 there has been a growing number of transnational agreements on restructuring signed by EWCS. We will present an inventory of those agreements, concentrating on those which we consider as the core agreements on restructuring, i.e. those which set concrete and substantive rules for the management of specific restructuring cases at the European level. These agreements directly address employment issues and have an impact on economic management decisions. They include not only principles or procedures, but substantive and practical rules about issues such as job security, work organization or the choice of products and production sites. Collective and individual guarantees are designed to mitigate the effects of specific restructuring plans. They generally provide: guarantees against plant closures and for the maintenance of employment; guarantees for the employees transferred, including similar employment conditions and rights (wages, seniority, pensions etc.); measures to avoid forced redundancies (early retirement, voluntary severance, etc.); and procedural rules about the consultation of the representatives of employees and the monitoring of the agreement.

We will discuss the factors which might explain why a majority of these agreements have occurred in the automobile sector. Our main focus will be the importance of trade union coordination. Finally we will discuss two major issues which remain open. The first is the legal status of these agreements in the absence of European legislation on the matter. The second is the clarification of the respective roles of the EWCS, the unions and the European federa-
Abstract: This paper presents the results of the study made in 2008 on 80 enterprises in Russia. The main research question of this paper is the work-related values of Russian workers and specialists (1210 workers and 663 specialists were questioned). Two main dimensions of this type of values are studied: qualification and democratic style of management.

The data analysis shows that value of qualification is not widespread among Russian employees, this combines with low degree of involvement in training or educational programs on the enterprises, low influence of criteria of high qualification in recruitment and promotion decisions.

Concerning values of employees to democratic style of management, the results showed that there is high level of consent to manager’s authoritarian actions like ignoring interests of employees in decision-making, using personal loyalty and obedience as criteria of promotion etc. The organizational environment in such cases contains a considerable degree of informal relations and low security for employees.

FROM “UNEQUAL NEGOTIATION” TO “FORCED CONSENT”: WORKERS’ DIFFERENT STRATEGIES IN TWO SETTINGS

Sibel Kalaycıoğlu, Fatma Umut Beşpinar, Çağatay Topal

Abstract: This study examines processes of establishing work mentalities, the conflict between different work mentalities, different negotiation and consent mechanisms developed by workers and employers in two different production units of the same textile factory in two different cities. This study is based on the interviews conducted with employers, managers and workers in Istanbul and Çorum (an economically undeveloped small size city in Central Anatolia) in 2010.

With the influence of economic crisis of 2000s and increasing state promotions to support the economic and industrial development of small cities in Turkey, the production of a textile factory which mainly produces goods for export, has shifted from Istanbul to Çorum. The production unit designs and produces the models of prototype shirts for foreign market designed in Istanbul and serial manufacturing realized in Çorum. Workers in these two production units in two cities have different level and types of knowledge, experience and skill. The expectations of the employers related to production process are determined by the skill and production level of the workers who are employed in the model factory head unit in Istanbul. Findings of the research show that workers coming from different social and cultural backgrounds develop different reactions and strategies toward work mentality constructed by the employer. These reactions and strategies show differences from unequal negotiation to forced consent.

In summary, the differences between the skill levels and work mentalities of workers stemming from the characteristics of labor markets of two cities diversify workers’ negotiation powers and strategies on the one hand, influence employers’ perceptions and expectations with respect to production process on the other, thereby determine the dynamics of the relations between the employer and the workers in the production units of the same company within two different cities.

VALUES OF QUALIFICATION AND LOYALTY IN RUSSIAN COMPANIES

Anna Gogoleva

Abstract: The first attempts to characterize the internationalisation strategy of selected first tier automotive suppliers: Do supplier companies differ in their approach to shift production to low cost countries? If so, is this a question of product groups/submarkets, of the companies’ home country institutions or a result of the company-specific corporate governance?

Second, the article analyses the role of the EWCs in coordinating employee response to cross-border restructurings and production relocations: How effective is the coordination of employee representatives inside EWCs? To what extent do interests of the home country locations dominate these bodies?

Third, the article tries to identify systematic causes for effective or ineffective coordination of EWC activities and the ability to somehow influence the outcome of cross-border restructurings. It is argued that compared to their counterparts of the OEMs, EWCs of large suppliers additionally have to cope with the organisational complexity of their companies, which tends to impede the emergence of effective coordination mechanisms.

REGULATING CROSS-BORDER RESTRUCTURING PROCESSES IN THE AUTOMOTIVE SUPPLY INDUSTRY – ANY ROLE FOR EUROPEAN WORKS COUNCILS (EWCS)?

Axel Hauser-Ditz, Valentina Mählmeyer, Ludger Pries

1LS Soziologie/Organisation, Migration, Mitbestimmung, RUHR-UNIVERSITÄT BOCHUM, Bochum, Germany

Abstract: For more than a decade the European automotive supply industry has been in a process of a deep structural change. Due to (1) growing competitive pressure within the industry, (2) high dependence on the automobile manufacturers (OEMs), (3) substantial reorganisation of supplier-OEM-relationships and (4) rapid innovation cycles the industry has seen a major consolidation. Internal restructurings and cross-border relocations of production characterise this industrial sector. Mass redundancies and plant closures in some of the Western European high wage countries go hand in hand with business expansion in Eastern Europe. The recent economic crisis may accelerate the ongoing restructuring processes. Moreover, the electrification of the powertrain will have profound effects too. It will create demand for certain product groups while reducing demand for others. This, in turn, will lead to a complex internal competition inside the country/division-matrix of large suppliers.

The article examines the response of the employee side to these developments. More specifically, it investigates the role of EWCs in restructurings processes and analyses the conditions under which EWCs can function as effective bodies of cross-border interest and labour regulation.

Drawing on a typology of internationalisation of companies, the article first attempts to characterise the internationalisation strategy of selected first tier automotive suppliers: Do supplier companies differ in their approach to shift production to low cost countries? If so, is this a question of product groups/submarkets, of the companies’ home country institutions or a result of the company-specific corporate governance?

Second, the article analyses the role of the EWCs in coordinating employee response to cross-border restructurings and production relocations: How effective is the coordination of employee representatives inside EWCs? To what extent do interests of the home country locations dominate these bodies?

Third, the article tries to identify systematic causes for effective or ineffective coordination of EWC activities and the ability to somehow influence the outcome of cross-border restructurings. It is argued that compared to their counterparts of the OEMs, EWCs of large suppliers additionally have to cope with the organisational complexity of their companies, which tends to impede the emergence of effective coordination mechanisms.
COMMITMENT TO EMPLOYMENT AND ORGANISATION: FINLAND IN A EUROPEAN COMPARISON

Teemu Turunen

Abstract: Employment and organisational commitment are widely endorsed as goals for labour market policy and organisations. The main question posed in this paper is whether employment and organisational commitment of Finnish employees differ from these commitments in other European countries. The pace of economic modernisation in post-war Finland has been quite unique and rapid in a European context. Thus, whether Finnish employees currently diverge from their European counterparts in countries in which modernisation has often taken place at an earlier point in history could reveal important insights into an area in which there have been few studies. The question will be examined by using data from the International Social Survey Program (ISSP), Work Orientation Module III, collected in 2005-2006, i.e. before the current economic crisis. The paper uses data from 17 European countries and takes account of several individual-level determinants of employment and organisational commitment in the researched countries. Data will mainly be analysed by a general linear model procedure. By using a general linear model procedure, one can conduct both a regression analysis and an analysis of variance.

Martin Seeliger

Abstract: Between 2008 and 2010 the world financial crisis has undoubtedly been the central impact, shaping the social reality of business models and labour regulation in the international automotive industry.

In developing a detailed perspective on the economic and social impact of the crisis, different reaction-patterns can be identified, depending on the particular national context, in which these impacts need to be dealt with. To analyze the frame of opportunities and restrictions shaping the policies of management and workers’ representatives, a system of country-specific institutions becomes apparent as the focal point of a sociological perspective.

As the core-object of the presentation, empirical findings about (attempts of) the introduction of short-time work into the production system of a German car-manufacturer, operating in South Africa, will be discussed against the background of the specific institutional setting of the two countries. As has been pointed out, short-time work turned out to be a well-directed instrument to react to the unstable economic situation of the crisis in Germany. At the same time, the introduction of short-time work generally met with a refusal of the South African workers. Drawing on interview-footage collected in the course of field work in both countries, light will be shed on the question of the introduction of working-time accounts. Here, the specific constellation of negotiation comes into play, which with unions, management and works council/shop stewards includes three groups on each side, whose impact on inner-company coordination may cause organizational blockades.

By highlighting these new challenges to the cross-border coordination of interest representation in multinational companies, the analysis of the complex interplay of institutional contexts and the concrete negotiations within a transnational context will become transparent as a viable tool for international sociology.

COLLABORATION BETWEEN TRADE UNIONS AND COMMUNITY GROUPS – REALITIES AND PROSPECTS IN LATINO, FILIPINO AND POLISH COMMUNITIES

Joanna Karmowska, Phil James

Abstract: Trade union membership and organisation in Britain has fallen substantially over the last three decades (Barrat, 2009; Waddington, 2003). At the same time there has been in recent years a large influx of migrant workers to the UK working in occupations that have been traditionally difficult to organise. Against these backcloths, an important strand of contemporary academic debate about trade union revival has centred on the potential value of unions collaborating with community groups as a route to renewed membership growth.

Systematic British based evidence to support this course of action is very limited. That which does exist suggests that the establishment of collaborations with community groups can be problematic because of tensions arising from clashes of values and objectives, and differing views of how decision-making power within them should be distributed (Wills, 2002; Parker, 2002).

The present paper draws on the findings obtained from a comparative cross cultural study of Filipino, Latino and Polish community groups in London to explore their experiences of, and attitudes towards, engagement and collaboration with unions and the factors that have shaped them.

The paper comprises four main sections. The first focuses on existing debates about the objectives and nature of union involvement with community groups, as well as the factors that act to facilitate and hinder it. The next two then detail the methodology of the study and its findings. Lastly, the key conclusions emerging from these findings will be drawn together and their theoretical and policy implications discussed.

THE FUTURE ROLE OF UNIONS AS INTEREST REPRESENTATIVES - A REPORT FROM BELGIUM

Manu Mus, Steven Lanno, Carl Devos

Abstract: Industrial relations are under pressure, due to external factors (economic and financial crises) but also internal factors (inflation, unemployment). In order to ease these forms of pressure a manifold of consultation mechanism are introduced. The Belgian industrial relations are regulated by a highly institutionalized collective bargaining system. Belgium, home country of the Ghent system, has got a long tradition of social pacting. Every two years, the signing of an overall central agreement in the ‘Group of Ten’-an
informal assembly consisting of representatives of trade unions and employers’ organisations- initiates a hierarchical sequence of negotiations at lower levels, resulting in intersectoral, sectoral and firm-level collective agreements.

The last negotiations for a central agreement (2011-2012) failed however, due to a refusal of the unions’ rank-and-file. Union members felt misunderstood and blew on the whistle on the union leaders by rejecting the draft agreement. The relationship between the central-level actors and the rank-and-file was affected. The so-called vertical coordination had failed and the legitimacy of the union came highly under pressure. Questions arose to which extent the unions’ top were still (interest) representatives of the unions’ bottom. But how does the future of unions as interest representatives look? Is there indeed a difference between the rank-and-file and the unions leaders?

In this empirical paper we present the results of a survey held among Belgian union members and union leaders, based on a sample of approximately 10,000 union members. Among the variety of issues, the relationship between the rank-and-file and union leaders is discussed. We treat the issue of legitimacy and representation (do members still recognize themselves in unions?) and seek for differences in the vision and attitude concerning several aspects of economic democracy, syndical action and social security. The members’ motives for membership were inquired in common with what the unions’ priorities should be.

The wide range of questions enclosed in this survey will allow us to elaborate on the future role of unions as interest representatives after a crisis context.

**BALANCED PARTICIPATION ON SAFETY AND HEALTH AT WORK IN ROMANIA**

Valeriu Frunzaru¹

¹Faculty of Communication and Public Relations, NUPSPA, Bucharest, Romania

Abstract: The balanced participation of the employer and employees in the workplace health and safety committees should raise the awareness and the involvement of both parts in health and safety-related issues. Nevertheless, according to the Eurostat, Romania ranked 4th among the EU27 regarding deadly work accidents in 2005 and severe work accidents in 2007 per 100 000 employees.

In this paper I present the findings of a qualitative research analysing the general performance of health and safety committees work in Romania. The findings are used to suggest recommendations for strengthening the organisational and operational capacity of workplace health and safety committees.

I conducted 18 in-depth interviews with members of the committees and with employees and managers from two Romanian companies from the chemical sector, having a high risk for the employees and the community. The analysis shows that there is a gap between reality and the spirit or the letter of the law. Employees are not informed about this committee, employees’ representatives are not properly elected and they do not act according to their rights and duties. Moreover the employers are not open to a balanced participation.

Following the general findings, recommendations could be made for three main dimensions: 1. informing employees about the existence of the committee; 2. training employees to become potential employees’ representatives in workplace health and safety committees; and 3. improving communication within workplace health and safety committees, as well as between this institution and the employees, the union, the management, the labour inspection authority, and other health and safety-related institutions.

**IMPORTANT CHANGES IN INTERESTS REGULATIONS OF TRADE UNIONS AND REPRESENTATION OF THE WORKERS IN LUXEMBOURG**

Franz Clement²

²REPREM, CEPS:INSTEAD, Differdange, Luxembourg

Abstract: A new law has been introduced in 2008: “the single status”. One of the pivotal objectives of the single status for wage earners in the private sector consists in the abolition of all existing differences, within Luxembourg’s social legislation, between blue collar and white collar workers in the private sector. The introduction of the single status has led to the reorganization of some institutions: this included the merging of the Chamber of labor, representing blue-collar workers, and the Luxembourg Union of private sector employees, representing private sector white-collar workers. The social elections of November 12th 2008 were the first occasion when the new criteria for representativeness were applied to the new Chamber of wage earners.

In the aftermath of the elections, the new union representation has been transformed into a real political divide between majority and opposition. The entente that preceded the elections between the two most representative unions has been blown and led to some extent to the explosion of the union of the great unions.

A totally different aspect of representation of workers is worth considering. In Luxembourg, since 1985, the number of cross-border workers from Belgium, France and Germany has increased. These phenomena are likely to augment in the future if we were to believe the forecasts of the National statistical institute of Luxembourg, the Statec. Briefly, it seems to us that in addition to the old divide that results from the coexistence of ideological unions, Luxembourg will increasingly witness the presence of two different worlds: cross-border workers and resident workers. The figures of the most recent social elections organized in 2003 and 2008 indicate that the number of these cross-border workers taking part in the election process has been very limited. This would be in the medium term a serious problem in the representation of salaried workers working in Luxembourg.

However, the answers that could be given to these problems will have to be preceded by a real and inevitable debate on what is widely called the national sovereignty. Would Luxembourgers indeed be ready to abandon a part of their national sovereignty under the pretext of the internationalization of the employment market in their country?

**INSTITUTIONAL CHANGE AND FINANCIAL PARTICIPATION. DEVELOPMENTS IN AUSTRALIA, FRANCE, GERMANY, THE NETHERLANDS AND THE UK**

Ulke Veersma ¹, Erik Poutsma ², Paul Ligthart ²

¹business school, UNIVERSITY OF GREENWICH, London, United Kingdom, ²Nijmegen School of Management, Radboud University, Nijmegen, Netherlands

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Over the last decades we have witnessed profound changes in institutions, especially in systems of collective bargaining and other elements of employment relations based on the notion of solidarity in the Fordist society. In most of the more stringently regulated national systems of collective bargaining, like Germany and the Scandinavian countries, changes took place towards the decentralization of collective bargaining. Alongside with these changes in processes of collective bargaining, also the contents of pay systems changed towards a more fragmented and individualized system of wages (cfr. Traxler, et al. 2008). There is more widely a common trend towards enterprise bargaining where both the contents and processes change.

Profit sharing, stock bonuses and employee shares, also labeled financial participaton (FP), are being viewed as part of this trend to establish payment at the company level. This leads us to the question, until what extent financial participation is just a management tool, of control and to promote organisational objectives and flexibility of capital – with a new type of investors –, or whether this could be viewed as an expression of a new logic of post-Fordism with a substantial new quality of employment relations.

For the research we applied a triangulation of methods, which also includes the analysis of a longitudinal dataset. We analysed CRANET data, a set of several waves of comparable representative surveys in the selected European countries in order to trace developments across countries (1999, 2003, 2008). This period also includes dramatic economic developments. We try to explain differences between countries by looking at country studies for which interviews were carried out with leading experts from trade unions, employer federations and government bodies. Explanations of differences will also be backed up by specific features of FP and regulations which may be very specific for certain countries.

OCCUPATIONAL AND ORGANIZATIONAL COMMITMENT IN THE HIGHER EDUCATION INSTITUTIONS IN ROMANIA

Raluca Aura Balasoiu

Abstract: Organizational and occupational commitments have been studied on various professional groups and in different organizational settings. Nevertheless there are few studies concerned with both organizational and occupational commitment in the higher education institutions and none concerning Romania. The paper aims to comparatively explore, in the context of the new education law applied this year, the organizational and occupational commitments in the public, private and military higher education institutions in Romania. The empirical analysis is informed by the organizational and occupational commitment studies (scales) developed by Meyer and Allen (1991, 1993). The relation between occupational and organizational commitment, the differences between the types of commitments and the factors influencing each type of commitment (affective, normative and continuance) are examined. Data from a national survey from 2011 on Romanian universities are used in the analysis.

THE ECONOMIC AND POLITICAL EFFECTS OF SOCIAL PACTS AND ITS ALTERNATIVES

Bernd Brandl

Abstract: Recent debates on social pacts have focused on the prerequisites for their emergence, whereas questions of their effectiveness have receded into the background. For this reason systematic analyses of the effectiveness of pacts in terms of their alleged function, i.e. enhancing economic performance, are missing. The aim of this article is to assess the economic impact of pacts. As most pacts refer to incomes policy, the assessment of the economic impact of pacts will concentrate on a comparison of the performance of pacts with alternative governance mechanisms for incomes policies, i.e. alternative pay-setting modes. The findings from time-series cross-sectional analyses on basis of data for 20 countries from 1980 to 2003 show that pacts offer no superior economic performance as compared to other forms of coordination. In contrast to the frequently positive connotations associated with pacts the article concludes that pacts are no superior means of improving economic performance.

TRANSFORMATIONS IN THE WORLD OF WORK AND THE PROCESS OF FLEXIBILIZATION IN BRAZIL: A CASE STUDY

Ricardo Gaspar Muller, Lawrence Silva Pereira

Abstract: The paper discusses aspects of the changes which have been taking place in the world of work in Brazilian society – especially the phenomena known as flexibilization and/or deregulation – and their connection with employment relations and existing legal safeguards. It is based upon a case study carried out between June 2007 and June 2009 in the Distribution Centre of the big corporation Lojas Renner (Renner Stores), in Florianopolis, Brazil, and recently merged with JCPenney. For this purpose ex-employees of the company were interviewed and legal proceedings relating to employment were also analyzed – in particular, a Public Civil Action concerned with the demands submitted by employees and the local community complaining about the working conditions of all subcontracted employees. Our concern for this subject arose from the contradictions between the constant court cases involving employment relations and the recent spawning of several discourses in favour of the flexibilization of Brazilian labour legislation, working conditions and employment relations. These discourses usually express actual tensions in social relations and are associated to modern forms of management which may create new kinds of jobs. The flexibilization theme pictures current labour legislation as an element which sustains a sort of economical ‘backwardness’, one of the alleged causes of the supposed lack of competitiveness of Brazilian production at an international level and, at the same time, as responsible for the increase of so-called informality. In this sense, over the last decade, many legal alterations were made to the social and legal safeguards of work relations in Brazil. Often analyses about deregulation of labour and social rights focus on the capitalist society, the globalized market or the role of State. After all, within the corporate world, a great deal of attention is focused on market share and stimulating a type of management committed to competitiveness and profitability, carried out by the speed of events in a globalized economy. Flexibilization has been the basis of the arguments offered by those representing capital, presented as the (only) set of alternatives for solving structural problems within the world of work. Thus, the need to think about the consequences
of the process of flexibilization of the norms which run employment relations. These issues guided this research.

WORK AND EMPLOYMENT IN TURBULENT SKIES OF CRISIS

Ulke Veersma 1, MARIA PAPANIKOU 1
1business school, UNIVERSITY OF GREENWICH, London, United Kingdom

Abstract: Safety and the incidence of (near-) accidents are most crucial on a day-to-day basis for operating in the airline industry. As long as humans are involved with operations in an organisation, accidents or near accidents will happen. Important factors contributing to safety are the technology in use and organisational aspects. The structuring and functioning of organisations is again dependent on strategies of airlines. The deregulation and privatisation of airlines, and also other socioeconomic factors affect strategies of airlines; while the economic recession, a more intense competition and an increased customer orientation or expansion of the market share create conditions affecting flight safety.

The research presented in this paper, which will be carried out at in a number of case studies, focuses on safety, the potential for intervention with accidents or near accidents and the determinants of safety. Most of the factors looked at are at the organisational level, where the interaction between humans and technology and, above all, the interaction and division of labour between employees may have a critical impact. Airlines spend a lot of effort and money on training, which may be part of the conditions for a high-skilled, highly motivated and committed workforce. Also other aspects of employment relations will be looked at as possibly impacting the optimisation of safety.

Such factors are closely linked with the type of airlines: legacy airlines and low cost carriers (LCC). Cost cutting, initially adopted by LCCs thereby differentiating them from the traditional national flag carriers, seems now to have become a common denominator.

In terms of safety, as Reason (1991) also claims, employee commitment is one of the major forces influencing safety. Gillen & Gado (2008) suggest that pilots are employees with substantial bargaining power compared to other professions and they most of their skills are a scarce resource and only limited transferable. However, the standardisation of fleets as a cost cutting tool creates experts on the aircraft type with possibly a lower level of discretion. Thus, employment relations are affected by business models emerging or, rather, adopted by airlines, where various external factors may impact (recession, competition and heightened danger of terrorism), while the reaction to this, the incumbents’ strategies, directly impact the preconditions for safety.

FLEXIBILITY DURING THE ECONOMIC CRISIS - WORKING TIME ACCOUNTS HAVE PROVEN TO BE OF VALUE

Ines Zapf 1
1INSTITUTE FOR EMPLOYMENT RESEARCH, Nuremberg, Germany

Abstract: The German labour market has been affected by the financial and economic crisis less dramatically than widely suspected. Although the Gross Domestic Product decreased 4.7 per cent in 2009, the total number of employees remained widely stable. This labour market stability can be explained largely by the increased working time flexibility of establishments and by the structural change of the economy.

Establishments which were affected by the crisis could react in different ways and increase their internal and/or external flexibility. In Germany, establishments widely implemented their internal flexibility through a reduction in the weekly working hours, short-time work, a reduction of overtime hours and/or formerly accumulated credit hours on working time accounts. The working time calculations of the Research Group “Working Time and Labour Market” at the Institute for Employment Research (IAB) show that the annual working time of employees decreased altogether 41.3 hours per employee (-3.1%) in 2009. Short-time work contributed to this decrease 13.4 hours, the reduction in the weekly working hours 10.1 hours and the reduction of formerly accumulated credit hours on working time accounts 7.0 hours. These results are also integrated in the national accounts of the German Federal Statistical Office.

Besides those macroeconomic results, the paper analyses the reduction of formerly accumulated credit hours as an instrument to increase internal flexibility of establishments from a macroeconomic point of view. The analysis is based on the work council survey of the Institute of Social and Economic Research in the Hans Böckler Foundation in 2009. The results show that in advance of the crisis employees had accumulated a high amount of credit hours on working time accounts. During the crisis the accumulated credit hours were reduced on average by about 45 hours per employee in establishments that were affected by the crisis. Working time accounts were not restricted to small groups of employees. In most of the establishments more than 60 percent of the employees reduced accumulated credit hours. In some cases employees even accumulated debit hours.

As the industrial sector has been affected much more by the financial and economic crisis than the service sector, the results vary between those sectors.

FLEXIBILITY AND LIFE TRAJECTORIES: A CAPABILITY PERSPECTIVE ON A YOUNG ADULTS CASE STUDY

Stefano Poli 1
1Di.S.A.-Dipartimento di Scienze Antropologiche, UNIVERSITÀ DEGLI STUDI DI GENOVA, Genova, Italy

Abstract: The paper, focusing on post-fordist consequences on young adults’ conditions (Gosetti, 2004; Lo Verde, 2005), describes a case study in Genoa, a northern Italy metropolitan context whose labor market situation reflects quite paradigmatically the setting of contemporary crisis, where job flexibility and salary instability reproduce harder job and living situations especially for younger generations (Massa, 2004; Palumbo, Poli, & Torrigiani, 2007).

Following the Senian capability approach (Sen, 1973; 1999; Nussbaum, 2000), the research examines the individual conditions of young adults in the local job market, by reconstructing their biographical paths and by exploring relations between work experiences and life trajectories, in order to observe the effects on realization and achievement of adequate individual conditions of well being and doing.

Through the combined use of secondary data analysis and the empirical results of a quali-quantitative (Greene, Caracelli, & Graham, 1989; Cresswell, 2003) research strategy, the paper explores multi-
ple dimensions in a capability perspective: from the individual perception of social status in terms of “expected” and “achieved” social conditions (reflecting the explicative dimension of an effective functioning depending on personal status and individual expectations), to the individual definition of effective functioning and related well being, as well as the availability of resources and eventual transition factors that are potentially involved for such achievement. This refers not only to the available resources at individual or household level, but also those set at the institutional level, considering welfare system, occupational policies and trade unions actions for younger people. Such combination of resources and functioning composes a wider horizon reflecting not only individual satisfaction and relevance for aspects like economical and occupational conditions, but extends to consuming possibilities as well to family-life situations (like the chance/choice of setting up a family or having children), consequently involving the overall individual social projection, combining ambitions and desires of younger adults toward their life experiences (Gosetti, 2004; Toscano, 2007).

PRECARIOUS WORKERS AND THE CRISIS: THE CASE OF ITALY

Patrizio Di Nicola1
1DEPARTMENT OF COMMUNICATION AND SOCIAL RESEARCH, SAPIENZA - UNIVERSITY OF ROME, Rome, Italy

Abstract: Starting from the 1980s, and even more from the second half of the next decade, flexibility was considered by many a necessity and at the same time something inevitable because it was part of the development of the new post-fordist economic, productive and organizational system. Like a magic formula, flexibility was the solution to all evils, capable of overcoming the difficulties of global competition, increase employment and answering on time to market instability.

In Italy, the introduction of flexibility in the labour market has caused a deep redenition of the regulations regarding demand and offer of workforce. In this renewed ambit, the objective to make the Italian labour market more fluid and permeable has been followed introducing and regulating new flexible work contracts. Unfortunately, this led many workers to become not only flexible, but even precarious. Precarity is a social-economic condition of extreme weakness, which increases during periods of economic downturn, like the one the world is experimenting right now. People with precarious work contracts, in addition to being the lowest paid and the first candidates to unemployment, are also those with the worst system of social protection.

The essay is divided in three parts: in the first we briefly reconstruct the history of the legislation that led Italy, in the past 20 years, to have a large market of flexible and atypical work; in the second part we quantify the amount of precarious workers and their (poor) condition of social protection; in the last part we try to estimate the impact that the critical years 2009-2010 had on these workers.

WITH WORKERS’ PARTICIPATION THROUGH THE CRISIS AND BEYOND? STRATEGIES OF GERMAN CARMAKERS TO COPE WITH THE IMPACT OF THE FINANCIAL CRISIS

Ludger Pries1, Martin Seeliger1

1Fakultät für Sozialwissenschaft, Ruhr-Universität, Bochum, Germany

Abstract: Strategies of German Carmakers to cope with the impact of the financial crisis

As indicated by the huge public attention in the media and underlined by recent scientific publications, between 2008 and 2010 the world financial crisis has undoubtedly been the central impact, shaping the social reality of business models and labour regulation all across the globe. Since the automotive industry does not stand out as an exception in this matter, different ways of ‘steering through the turbulences’ caused by the economic crisis have been established by the various car-manufacturers.

In our presentation we would like to comparatively highlight the strategies of coping with the economic and social impact of the crisis, pursued by two major German carmakers – Volkswagen and BMW. By differentiating company policies into the four dimensions ‘company structure and profit strategy’ (1), the product structure and (international) market strategy (2), the production system (3), and the labour relations and work policy (4), we would like to give an overview about the initiatives taken by the companies to overcome the economic hardships induced by the crisis. Drawing on the analysis of extensive footage of recent developments in the two companies, a summary of the major trends will serve as the basis for the second goal of the presentation.

We will argue that the basis for this comparatively successful way to overcome the crisis, taken by the German automotive industry, can only be understood by drawing on a complex interplay between institutional factors and a dialogic constellation of labour regulation. Based on an understanding of companies as ‘natural systems’ subjected to permanent negotiation between the status groups involved (in our case these are: unions, management, works councils) this interplay constitutes the praxis of the typical German model of workers’ participation.

‘FREE’ AND ‘OFFICIAL’ LABOR UNIONS IN RUSSIA: DIFFERENT MODES OF LABOR INTEREST REPRESENTATION

Irina Olimpieva1
1Social Studies of the Economy, CENTER FOR INDEPENDENT SOCIAL RESEARCH, St.Petersburg, Russian Federation

Abstract: Formally, Russia compares well with other countries in terms of trade union membership; there is a relatively high union density (58%), and the number of collective agreements concluded at the enterprises is very high. However, unions have almost no influence when it comes to advocating labor rights and changes in the labor policy. Besides, the anti-union Labor Code adopted in 2002 has considerably restricted labor union rights in protecting the interests of employees in the collective bargaining process and made it almost impossible for unions to strike legally.

Trade unions in Russia are divided into two continuously warring camps: the ‘official’ unions, affiliated with the Soviet-legacy Federation of Independent Trade Unions (FNPR) and the so-called ‘free’ or ‘alternative’ labour unions, which are independent from FNPR. Free unions differ from official unions in many respects, including their conflict-based ideology, methods of labor mobilization, economic resources, and forms of membership and leadership, among others. Although the official labor unions dominate the organized labor
NEW MODES OF INTEREST REGULATION? TYPES AND OUTCOMES OF NON-STANATORY EMPLOYEE REPRESENTATION IN GERMAN PRIVATE COMPANIES

Markus Hertwig

1Institut for Work, Skills and Training (IAQ), UNIVERSITAT DUISBURG-ESSEN, Duisburg, Germany

Abstract: For decades, research on firm level interest representation in Germany focussed on Works Councils (WCs), which are based on the German Works Constitution Act (‘Betriebsverfassung’) and were regarded to be the compelling model in German private companies. Only in recent years, a number of surveys pointed out that only about 10% of the companies in fact possess a WC, while in a considerable share of companies collective employee representation is conducted by not legally based bodies. According to some analysis, those non-statutory employee representation bodies (NSRs) exist in 10-15% of German private companies. It was assumed that rationales to install an NSR are avoiding a WC, which is often regarded as cost intensive or retarding company restructuring, or the labour identities and preferences of qualified employees. However, despite a number of quantitative surveys and case study research in single industries (new economy), for a long time it was still vague, how NSRs come into being, what they actually do and if they benefit employee interest representation.

The contribution proposed analyses the NSRs’ functions and outcomes regarding employee interest representation. Based on case study research in eight German small and medium sized enterprises, it is argued that four different types of NSRs can be distinguished. Only a part of those bodies can be regarded ‘alternatives’ compared to the WC-model. Another part comprises management initiated and controlled NSRs. By installing those bodies management, selectively, seeks to reduce complexity, improve decision making processes, or prevent the election of a WC. It is demonstrated that on the one hand, the interaction terms between management and NSRs differ from what is known about the interaction of management and WCs. On the other hand, there is a lot of variation in the ‘participation patterns’ of the different NSR-types and their chances to influence company decisions in favour of employees.

Regarding the areas listed in the call, this paper might concern #4, 7, and 8.

WORKING FOR SMALL AND MEDIUM ENTERPRISES (SMEs) IN POLAND

Jan Czarasty

1Department of Economic Sociology, Warsaw School of Economics (SGH), Warsaw, Poland

Abstract: The paper aims to investigate the patterns of labour and employment relations in the segment of small and medium enterprises (SMEs) in Poland. That field of labour and employment relations has been frequently missing from the picture of industrial relations as described in domestic as well as international literature on the subject, due to the fact that in most cases the organized labour representation has no legal grounds for existence in the smallest entities (in order to start up a trade union at the enterprise level at least 10 workers are required, while establishment of works councils is only obligatory to employers with at least 50 staff). The data from the recent survey research carried in early 2011 on the sample of 600 enterprises allows catching a glimpse at the reality of labour relations within the field where 95% of Polish business activities are placed.

TOWARDS TRAIN-FIRST? EUROPEAN LABOUR MARKET POLICY AND THE JOBS CRISIS

Jason Heyes

1Business School, UNIVERSITY OF BIRMINGHAM, Birmingham, United Kingdom

Abstract: The economic crisis that commenced in 2008 caused European labour markets to experience a substantial shock. A crisis that initially affected the financial services sector rapidly became a wider ‘jobs crisis’ as firms shed workers, reduced their hiring activity or went out of business.

As the crisis gathered momentum, national governments were encouraged by the OECD and European Commission to prioritise ‘training-first’ active labour market policies ‘so as to’ provide workers with the skills that will be needed as the economy recovers’ (OECD 2008). The emphasis placed on a training-first approach in policy rhetoric stands in marked contrast to the tendency towards ‘workfare’ oriented activation measures that has been discernible in the labour market policies of many EU member states over the past two decades. This paper will examine whether the crisis has resulted in a reversal of the latter tendency and whether national governments have heeded EU and OECD advice to re-prioritise train-first labour market measures.

The paper will examine experiences in a variety of EU member states, but will focus in particular on Ireland, the Czech Republic, Germany and the UK. The paper will draw on interviews conducted with civil servants, employer organisations and trade unions in the four countries. The paper will show that the emphasis placed on training increased following the eruption of the crisis, with additional training opportunities being offered to the unemployed and, in some countries, workers whose normal hours of work had been reduced. However, the paper will also show that governments simultaneously sharpened the emphasis placed on workfare measures and that this tendency is once more becoming dominant and fur-
GLOBAL COMPETITION, LOCAL INSTITUTIONS AND SOCIAL SUSTAINABILITY FOR THE CHANGING WORLD OF WORK: EFFECTS OF THE NEW ECONOMY ON JOBS

Mei-Ling paulina Lin

Abstract: Modern societies are characterized by rapidly changing social and economic conditions, increasing openness, complexity and uncertainty. People foresee the end of steady work, the necessity of continuous effort, and widening inequality in wages. There is rising job insecurity, discontinuous employment and the requirement to upgrade one’s skills, a structural shift of the relationship between education, training and employment that has generated the contingent work-life course. This leads to a diversification of types of employment with an increase of service jobs, self-employment and contingent careers. Flexibilization of work and working careers, the dissemination of information and communication technologies and the growing role of knowledge are increasingly calling for flexible and transferable skills. Self-employment, part-time, home-based work, and the precarious and low-productivity employment in the informal sector, have expanded opportunities for people’ participation in the labour force, but are characterized by lack of security, lack of benefits and low income. There are widening income inequalities, worrying levels of unemployment and inactivity and growing poverty. This poses a serious threat to social stability and democracy. The paper analyzes in the attempts to enhance the labor market participation of young people who encountered important problems in finding a sustainable job. The goal is to promote research examining the interplay of work and welfare, employment and unemployment. Paper should address questions such as the following: 1To what extent can changes in the welfare state and the workplace be traced to trends in the political economy, such as neoliberalism and marketization? 2To present a picture in the light of demographic trends, changing work patterns, creating and pursuing regional trends, labour market openings for workforce mobility in Taiwan. 3To examine the importance of human capital as a comparative advantage in global competition. 4To emphasize the importance of the role of TVET in facing the challenges posed by these global trends towards sustainable human resource development. The author combines quantitative analysis of a survey data set with qualitative analysis, and raises a number of issues and recommendations on the dynamic interplay between institutional changes, risk re-allocation, and social stratification in the age of globalization.

WORK AND EMPLOYMENT AT SHOPPING CENTERS

Sofia Alexandra Cruz

Abstract: This paper aim is to figure the changes in work and employment that the organizational context of the shopping centers is making up, in particular concerning sales workers. Portugal’s retail is characterized by several and deep transformations by the effect of the market’s extension, the multiplication of retail’s transactions and the aggressive marketing. In what concerns these transformations, we consider the growth of shopping centers in the Portuguese landscape since 1980, in particular at Lisbon and Oporto’s Metropolitan Area, and the changing retail employment relations. The new organizational retailing includes a lot of changes in retail operations. The search for operating efficiencies and improved methods of meeting customer needs have changed the operations of leading corporate retailers. In fact, the number and the size of the retailing spaces, the technology investment and the work rationalization have produced a considerable source of competitive-ness.

The empirical support of this paper is the statistical data from the Population Census (1991 and 2001), the Portuguese Classification of Occupations (1994), and research findings from direct observation conducted in shopping centers and from 60 interviews with sales workers among the 5 larger shopping centers (in terms of all employees existing on it) located in the second biggest city of Portugal (Porto), between 2007 and 2008.

The results highlight some important trends of retail employment in the last two decades: feminization, juvenilization and part-time hours involving sales workers. The results also allow the construction of a typology of sales workers considering their work status.

„INFLUENCE PRODUCTION PROCESS” AS AN ANALYTICAL FRAMEWORK FOR MODELING SYSTEMS OF INTEREST REPRESENTATION. RESEARCH PROPOSAL FOR POLAND.

Dariusz Szklarczyk

Abstract: The evaluation of the present approaches and findings on interest representation lead to several critical conclusions. While there is common manner, especially in European tradition, to focus on rather descriptive issues, there are definitely too few attempts to create an analytical framework which could systemize quite a rich collection of empirical data. Moreover, lack of adequate analytical tools makes it difficult to compare results of investigations even if they are conducted within one country. The present system of interest representation in Poland indicates essential differences in interpretation of the very same reality. While some scholars say that Polish model of interest representation is pluralistic, others by contrast define it as neocorporatism. One of the weakest points in the current stage of research in the field is lack of combining two complementary perspectives: micro (actor’s perspective) and macro (system’s perspective) in one research process.

The influence production process (IPP) (Lowery, Gray 2004) describes a full cycle of actions taken by interest groups. IPP is composed of four stages. The first one – mobilization – investigates the motives and conditions which mobilize people to organize their collective action. The second deals with the struggle between groups or organization in order to gain a position that allows to affect public policies. The third describes various modes of pressure on the government. The fourth one evaluates results of these actions and its multidirectional consequences. IPP framework allows not only to describe single elements of a system as well as their actions, but also explains the relationship between them.
The presentation will focus on the use of IPP’s theoretical potential in designing a research program for national-level interest representation in Poland. Author will discuss the consecutive steps of research process: conceptualization, creation of research questions and hypotheses, the choice of a proper methodological approach. All will be illustrated by his doctoral research thesis which raises a question, whether and, if so, how is it possible to model interest representation phenomena in Poland.

NON-CAPITALIST ANSWERS TO OLD - NEW CHALLENGES TO INTEREST REPRESENTATION
Vera Vrataša

Abstract: This paper critically analyses the main limits of theoretical framework based on the conceptual pair “industrial relations” and “labor market institutions”, to give adequate answers to challenges to interest representation posed by present acute manifestation of systemic crisis of destructive capitalist production of marketable commodities for private profit. First, implicit assumption of this framework’s partisans that more or less market mediated “industrial relations” are here to stay, confines the study of the cyclical reappearance of “economic crises” to descriptive typologisation across nations of the more or less bureaucratisation of interests of private corporations, organised labor and the state. Second, policy implication of this typologisation oriented research strategy, confines the proposals what should be done, to reforms of existing capitalist mode of production whose contradictions precisely reproduce cyclical systemic crises and socially produced war and ecological desasters.

This paper proposes alternative conceptual framework and research strategy that would focus critical analysis of systemic institutional changes necessary for the adequate representation and realization of universalisable interest of the majority of modern wage slaves and the reserve army of unemployed: overcoming of class division of labor and free development of human capacities of all.

The main finding of this paper is that alternative theoretical framework based on the conceptual pair “...socialist relations” and “...producers’ and consumers’ planning institutions” enables construction and implementation of non-capitalist answers to interest representation: active participation of producers at the work place and of consumers in the community in strategic decision making, both directly or through revocable representatives at all levels of sociability.

Key words: industrial relations, labor market institutions, systemic crisis of capital accumulation, socialist relations, producers’ and consumers’ planning institutions

IS THE ECONOMIC CONTEXT ENOUGH TO TRIGGER CHANGES IN INDUSTRIAL RELATIONS? THE KEY ROLE OF ACTORS IN THE COLLECTIVE REGULATION OF BOARD-LEVEL EMPLOYEE REPRESENTATION IN EUROPE.
Aline Conchon

Abstract: Assuming that the current economic crisis will lead to changes in industrial relations [IR] systems the same way the 1970s shocks altered post-war labour relations relies on a dionopian conception where the context determines and constrains actors’ interactions. However, it has widely been demonstrated (e.g. by Kochan, Katz and Mc Kerzie) the existing interdependence and retroactive effects between the context and IR players’ actions. Hence, a collective regulation cannot emerge as a reflex reaction to the advent of a new environmental data but also requires actors to invest this contextual change. In other words, despite a significant change in the economic environment, one could observe an absence of collective regulation in a specific IR arena as long as actors do not consider it as an opportunity to elaborate strategies aiming at producing or adapting rules. The most patent illustration of such inertia is provided by the debates (not) taking place around the issue of board-level employee representation [BLER], i.e. employee representation on the board of directors or supervisory board of companies with a voting right.

Indeed, the following crisis-related developments could have been expected to trigger the revival of this issue: shift of corporate governance [CG] model to a more stakeholders- rather than share-holders-oriented conception (at international, European and national levels); the rise of arguments supporting BLER as a competitive advantage in the race to growth (statements by German politicians, by external observers – e.g. Hill- and evidence-based scientific findings – e.g. Vito’s-). And yet, not only BLER raised no debate in most European countries, but there were even attempts to weaken existing rights (e.g. in Polish privatized companies).

In this paper, we will argue that reasons rests on the weak (lack of) investment of the three main IR actors (opposition from employers, no trade unions claim and when few, no take over from public authorities). Several explanatory hypothesis will then be put forward: the employers’ focus on HRM, information and consultation practices rather than participation ones to implement a stakeholder approach; the reluctance of EU institutions to embark upon hard legislation in the CG field by rather favouring “enlightened” self-regulation; the more defensive than offensive position of trade unions (e.g. by safeguarding or enforcing the implementation of existing rights).

SOCIAl PACTS AND ACTORS. A COMPARATIVE ANALYSIS OF INSTITUTIONAL DIFFERENCES IN EUROPE
Rosa Nonell 1, Joaquim Molins 2, Ivan Mediana 3

1Universiy of Barcelona, Barcelona, 2Policy Sciences, 3Policy Science, UAB, Bellaterra, Spain

Abstract: European countries are facing economic crisis on very different ways and obtain a varied types of performance results. In this sense the achievement of social pacts can be a positive response to the challenges.

The designed strategies differ in the countries according to the organization of their internal markets (liberal, intermediate or coordinated) and their institutional settings. The agreements allow obtain consensus of the adjustment, identify the costs supported by the actors and is a good instrument to establish the appropriate compensation.

The literature has focused its analysis on the study of the preconditions to encourage the agreements, or the institutional organization of the actors or the characteristics that institutionalize these
agreements. This paper tries to analyze, in first place, why governments in some countries are willing to share the design and development of their economic policy and how the actors respond according to their specific characteristics and their capacity to govern their organization. The second question is study the institutional conditions of the market in which such agreements have been developed and how could interpreted the performance.

The comparative analysis of the social partners in Spain, UK, Italy, France, Holland, Austria, Norway and Germany will assess the institutional differences between liberal or coordinated economies in the last thirty years.

The case studies are selected to compared countries with different degrees of coordination or not. The impact of these agreements on economic and social development could not be measured only with a uniform methodology and therefore results may differ from each other. The research methodology has always reduced the variables of the model to a set of standardized indicators that simplify the comparison but not just defining the complexity of the actors and their relationships in some specific institutional context. Our propose is to build quantitative and qualitative variables that reflect more fully the differences between countries and the singularities of the actors according to the economic and social rules and norms of the country.

DIGITAL NETWORKS, COMMUNITIES – DIGITAL CLIENTELISM?

Roy Panagiotopoulou 1

1Communication and Media Studies, UNIVERSITY OF ATHENS, Athens, Greece

Abstract: The rapid increase of social media use has caused new modes in the area of political communication. Although new media operate at a universal level, they focus on individuals, offering personalized services. Relational techniques are now shared by an increasing number of people and therefore political parties must produce and deliver specific information and content and at the same time aggregate their voters within communities. Apart from the political parties the same applies to all political agents that now dispose a variety of new media platforms to address their supporters. Their main aim is to create a voter community and maintain personalised political communication beyond the period of electoral campaigning.

Up to now the political culture on the Web uses new mediation techniques unevenly. The same applies to the social uses of technologies which vary considerably among different social groups and have not been standardized yet. However, social media have become a new way to give visibility to communities and groups, to political parties and candidates and highlight their actions through a global network society. At the same time, they allow politicians and parties to create lists of supporters and maintain a more “personalised” contact. Political culture is gradually shifting from a general, transparent, accountable political discourse to a more individually centred debate that addresses individual ideological and material needs.

This paper aims to discuss the emerging power of social media as a new way of political communication during the recent electoral campaigning in the USA (2008) and in some European countries that had general elections in the fall of 2009 (Germany, Greece, Portugal). We intend to analyse how the political parties try to create content that can be shared by all devices and set up communities or networks of supporters to encourage online interaction and participation and to examine the content produced and distributed via internet and mobile telephony by the two main political parties of each country focusing on the demand for transparency and accountability of the political parties. Citizens’ interactive participation (blogs, social media platforms, etc.) will provide the empirical evidence. Further, we will analyse the strategies of the political parties to organize the circuit of users on the different devices by securing the loyalty of their supporters.

TEN YEARS AFTER THE ICT REVOLUTION: A COMPARATIVE STUDY OF MEDIA AND COMMUNICATION PREFERENCES IN FINLAND.

Matti Näsi 1, Pekka Räsänen 1

1Economic Sociology/Department of Social Research, UNIVERSITY OF TURKU, Turku, Finland

Abstract: As the Internet provides extensive sources of information and communication platforms, traditional media outlets have come under scrutiny since the early days of ICT, thus casting doubts over the future of the more traditional media. For decades most Western citizens were relatively dependent on television, newspapers and radio to provide information and entertainment in a timely manner. Internet and other new ICTs on the other hand provide a constant access to these services, altering the current media landscape significantly. In this paper we examine how media preferences in Finland have changed over the past ten years by focusing on the perceived importance of television, newspapers and Internet during this time. We are using three sets of nationally representative survey data from 1999, 2004 and 2009 respectively, in order to establish comparative view of the preferences during this time. Our findings indicate that even though during the past ten years the perceived importance of Internet has increased, media preferences in general have not changed radically.

THE EMERGING CENTRALITY OF THE MARKET: MEDIA IN CENTRAL AND EASTERN EUROPE AFTER THE FALL OF COMMUNISM

Raluca Petre 1, Romina Surugiu 2

1Journalism, OVIDIUS UNIVERSITY OF CONSTANTA, Constanta, 2Journalism, University of Bucharest, Bucharest, Romania

Abstract: The passage from state ruled media to market driven media has turned to be a turbulent process in the states of Central and Eastern Europe, the newest to join the European Union. The focus of this paper is on the institutionalization of the market as organizing principle of the media field in the region after the fall of communism. The theoretical framework is set by the economic theories of the market as the place where offer and demand meet; that has as prerequisite the freedom to choose and as result the ‘correct price’. At the same, the limitations of the market principles for the media field are highlighted, like the dominance of the audience driven production and the limitation of the public interest driven media processes. In the specific context of the communist legacy, the state-public - commercial media models are discussed.

The choice is driven by the common challenges that these countries have been facing, first in the context of sudden deregulation, and lately in their alignment with European Union policy tendencies. The first years after the fall of communism have been dominated by the Unites States drive to sign Free Trade Agreements with the countries in the region, thus the institutionalization of the market principle. The convergence towards the European Union has brought new and sometimes conflicting dimensions of media policy options, considering the powerful tradition of PBS in Europe. Moreover, lately, the market as legitimate organising principle has started to be contested itself, in the context of the recent economic crisis. In this paper we problematize the tensions between market
and deregulation, on the one hand, and the public tradition of the European media landscape, on the other hand.

More specifically, from the empirical point of view, we explore the role and consequences of the Free Trade Agreements signed by the countries in the region in the first years after the fall of communism for the media sectors in these countries. The aim is to grasp the general vision, consistencies and inconsistencies, as well as the real options and limitations that the countries in the region face in the field of media policies in this specific context.

UNDERSTANDING THE ONLINE NEWS CONSUMER. A COMPARATIVE STUDY BETWEEN ITALY AND UNITED STATES

Lella Mazzoli 1, Fabio Giglietto 1, Alessandro Bellafiore 1, Mario Orfice 1

1Department of Communication Studies, Università di Urbino Carlo Bo, Urbino, Italy

Abstract: In the digital era, news has become omnipresent. The internet is at the center of the story of how people’s relationship to news is changing. Italy is, under this perspective, an interesting laboratory. Ownership of traditional media is concentrated in the hands of a relative small elite and public broadcasters are often strongly influenced by politicians. At the same time, according to a recent report issued by the national Institute of Statistics, Internet is finally becoming widely adopted by young people.

The paper will present the results of a CATI survey conducted during December 2010 by the "Advanced Communication Research Lab" (LaRiCA) of the University of Urbino on a sample of 1209 respondents representative of the Italian population (200 of whom have been interviewed on mobile phones). In order to foster a comparative analysis, the survey questions set was translated and adapted for the different national context from a previous survey conducted during January 2010 by Pew Internet in United States.

Aim of the research was investigating how Italians inform themselves, which combination of media platforms they do use, what profiles of use and trust emerge in relation to the different parts of the media system, how mobile, personal and participatory news consumption is affecting information.

The results show how Italians, on one hand, remain strongly tied to traditional mass media, with little differences to the past, and, on the other hand, they behave on the Web in a surprisingly similar way to the American Internet users. A further generational analysis clearly pinpoint a common path that describe how the process of news consumption is shifting from the traditional rite of appointment based information toward a new way mainly influenced by foraging and opportunism. In this new multi-platform media environment people seem to access news when the spirit moves them or they have a chance to check up on headlines.

These and other key findings to come out of this study will be addressed in a comparative perspective during the presentation.

NEW MEDIA AND COMMUNICATIVE PRACTICES CHALLENGES IN CONTEMPORARY UKRAINE: SOCIAL REASONS AND SOCIAL EFFECTS

Oksana Lychkowska 1

1Sociology Department, ODESSA MECHNIKOV NATIONAL UNIVERSITY, Odessa, Ukraine

Abstract: The aim of the paper is to propose new theoretical understandings of communicative practices, to reveal new trends which appear in mediated communications due to new media, namely, Internet, blogging, social networking and mobile telephony, to analyze their adaptive opportunities in the situation of social turbulence. Communicative practices of individuals in contemporary society have been considered in 3 interconnected theoretical aspects: 1) as a version of “background social practices”, representing hidden from the observer, unconscious, but quite obvious for participants, rules of communication 2) as mechanisms of use of and interaction with various communication sources, first of all with mass media and multimedia 3) as features of communication process at a social macro level, the practice of interaction in the public space is meant. When analyzing communicative activity in Ukrainian cities, the following trends have been found out: 1) return to non-formal communications in different spheres, including official and public situations, transition to network and partnership relations, 2) inclination to non-reflexive, ritualized rules of communication-communicative practices as any background social ones enable individuals to structure their everyday existence, to normalize it, to preserve ontological safety, to overcome crisis situations. Hence individuals use TV, networking communications, mobile telephony and another social media as an every day ritual of “plunging” into “communication” in order to “escape out” from social reality, 3) the specificity of everyday interaction with media have permitted to reveal 4 pragmatic regimes of media use: regime of mass use, of typicalness, of social distance and of social compensation, 4) communicative practices structuralized the public sphere and produce different new types of public identities such as publics, interests groups, virtual communities. Mass media and multimedia produce division of the audience according to its tastes and ways of life, generate “mobile identities”, i.e. give opportunity for the audience to change its identities or create virtual identities. The changes in social communications can be considered as a search of possible ways out from social crisis at a level of everyday interactions in a situation when institutional ways of a crisis overcoming are impossible or are not accessible to the average man.

PR OF POLITICAL SUBJECTS IN THE ERA OF THE PARTICIPATION CULTURE

Maria Stojkow 1

1Faculty of Humanities, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: The Internet of the Web.2.0 era is not only another image-building tool for politicians. It is more of a unique space where promotional actions for political subjects take place. It is a medium which enables to make your presence known in a virtual form of a public sphere, which is open to anyone having access to the Net. Commenting on other people’s opinions and presenting your own arguments is accessible to Internet users. Currently, politicians activity in the Net is not limited only to creating website of politicians and parties; even the most up-to-date and professionally prepared ones serve only as a place, where the citizens find information. Their layout and contents contribute very little to building and maintaining any bond among the citizens; they are rather used to present politicians themselves, their views and ideas in the form of a programme; and also their careers. They are all presented in a directional communication fashion, like in traditional media, alt-
though they tend to be presented in a more attractive and informative way. They are a version of e-business card, despite the attempts by some politicians at introducing some elements of interactivity on their websites. Promotion of your ideas and yourself these days requires to be present in the community portals like Facebook or twitter, or to write a blog. These new forms of communication with voters are today an important element of politicians’ media presence, and serve as a sphere for modern PR activities, employed in the communication with the voters not only during election campaigns, but throughout the whole period of being on the political stage, also when the media interest in politicians significantly decreases, focusing mainly on sensational and controversial issues. The aim of my presentation is to present the new forms of communication and image promotion on the part of politicians, with particular focus on their presence in Twitter, Second Life and Facebook, and the level of their activity in the blog-sphere and the difference in the way they are used by Polish and European politicians. My prime aim will be showing if the Internet is a kind of a noticeboard and a business card for politicians, or if it serves as an actual sphere of communication between politicians and voters, and among voters themselves, which promotes building the public sphere and is a field for effective public relation activities.

SOCIAL COMMUNICATIONS SPACES: TRANSNATIONAL, LOCAL, PUBLIC, INTERPERSONAL

Nataliya Ikonnikova

1Higher School of Economics, Moscow, Russian Federation

Abstract: The paper presents the results of the first stage of the research project in progress. The essential issues of the project consist in debates, negotiations, information campaign and critique around the constructing arenas and infrastructure, resettlement of locals and rebuilding of their habitual environment, and far-reaching effect of this transformation for the city Sochi, its inhabitants and visitors, Russians at all, natural environment. The process of preproduction and preparation is much longer and more important by its social and cultural results than itself Olympics, and the consequent utilization and habitualisation of Olympic objects either would be important, too. New media resources and communication patterns are developed premeditated, as parts of the strategy, and occasionally, as forms of resistance or by-product. It reveals social meanings of corporeal environment by Olympic construction projects and ways of its representation in visual and virtual reality.

The communication is regarded as a process of construction and/or imitation of identity by symbolic means (media). The influence of social inequality, especially in a changing society, is considered as an important feature of social communication. The paper analyzes concepts of imitation in communication action instead of construction and describes quasi-types of personal and mass communication in post-Soviet symbolic space.

The lack of local public media (especially on city, regional level) such as community TV and radio programs displace the social debates to Internet, LivelJournals. At the same time, the authors of blogs use to point out the possibility of moving data (news, photos, audios) to professional journalists, newspapers, TV. Mobile phones (with photo and video cameras) are used both for coordination of actions, news creating and authorities control.

The protest communications in the context of Sochi Olympics deal with different particular and general topics. General topics (the case of the Circassian Muslim diaspora’ protests) are subject of over-local and even over-national communication and appeal to global audience using global nets and forms of presentation. This campaign is compared with some protest communication campaigns connected with Beijing Olympics preparations (“Free-Tibet”, human rights etc.).

THE INFLUENCE OF THE ONLINE SOCIAL NETWORKS ON THE MODERN RUSSIAN SOCIETY

Evgeny Bik

1sociology, RUSSIAN STATE SOCIAL UNIVERSITY, Moscow, Russian Federation

Abstract: Background & aim: The great influence of the Internet on modern Russian society goes without question. According to TNS Media Research recent data, more than 35 million Russians have access to WWW (January 2011). It represents 59% of all Russians over 12 years old. At the same time more than 65% Russian Internet users are active participants of different on-line social networks. Despite the fact that the average Russian Internet user is about 30 years old, there are a lot of all-ages social networks followers. This study aims to explore the influence of social networks on modern Russian society.

Methods: The main of the research are focus-interviews with all-ages followers of social networks and case-study. The research is being carried out at the moment; the final results will be presented at ESA 10th Conference.

Results: The first results show that young people (under 24 years of age) are influenced by social networks in a much greater way than people of other ages. They spend a lot of time communicating via social networks on-line and in many cases neglect personal intercourse with people in real life. Nevertheless, we shouldn’t be of a low opinion of socialnetworks. Nowadays, on-line social networks become the real agents of socialization of young people in contemporary Russian society.

BUILDING THE MEMORY OF WEB: STAKES AND OPPORTUNITIES FOR EUROPEAN RESEARCH COMMUNITIES

Françoise PAPA 1, Jean-Marc FRANCONY 1, Laurent COLLET 1

1PACTE, UNIVERSITÉ DE GRENOBLE, GRENOBLE, France

Abstract: The web, in a context of fragmentation of media audience and of diversification of information sources, contributed to change conditions of production, broadcasting and consumption of information: professional practices of journalists evolved, non-professional contributors to the information process, emerged; individualisation of access to contents and proliferation of information sources widely available in various forms, had developed.

In 2007, for the first time in France, a presidential campaign was held over Internet. As a consequence, the analysis of communication processes, of contents and relationships between social actors, posed new questions to researchers, including formation, archiving and exploitation of Web corpus. How indeed capture the relevant elements in this flow of information, when Internet devices are transient and changing? How to analyze contents that are hybrids, large and heterogeneous? How to reconstruct a dynamic representation of interactions and networking activities?
As part of a project on the formation of political judgment, the need to establish a memory of the campaign through web archiving at a large scale, in order to analyse it, has led researchers to collaborate with various institutions, including the BNF in charge of legal web deposit. The stakes were threefold: articulate the logics of building Web corpus, organize and deliver the archives so that re-search communities can use them, develop resources and tools for their exploitation. More generally, setting up and making available perennial and reliable data, and developing appropriate methodologies for web analysis, appeared as priorities in order to conduct longitudinal studies and comparisons between countries. In return, that opens up new prospects for research. Created shortly before, social networks like Facebook and Twitter didn’t play any role during the 2007 campaign. Since, these media pervaded and now are involved in public debates. As shown in recent studies, tweets’ stream is closer to social events and produces a helpful timeline guide for web media studies. Thus, the 2012 presidential election will provide opportunities to experiment new approaches and methods for the analysis of web campaign, and to enhance our knowledge of on line communicational process.

These are some points on which we focus in this presentation of a on going research project.

CELEBRITIES AS SOCIAL-DEBATED MODELS IN TURBULENT TIMES
Annik Dubied Losa 1, Valérie GORIN1
1Department of Sociology, UNIVERSITY OF GENEVA, Geneva 4, Switzerland

Abstract: Celebrity microcosm, as it is described in the press, is an interesting object of investigation to understand social relations and their changes in turbulent times. The celebrities are indeed representing values and behaviours that are tirelessly discussed and assessed in public space (see for instance the recent "Polanski affair"). They operate as models embodying the irritable and the inimitable (social promotion, condemned behaviours, etc.), especially because they are part of and benefit from a large media attention, making it easier for them to reach audiences.

Based on a large thematic content analysis of a sample of the European French-speaking press (all types of press included), this paper wishes to investigate celebrities as an elite, and will examine the way media discourses are speaking about this elite’s behaviours (conventional or subversive), values, power (within the artistic field but also reaching social and political spheres), privileges (not limited to wealth), attributes.... We will pay special attention to the closure/openness of this elite, often presented as a place requiring strategies to gain access to it, and maintain itself in it –but not totally closed to incomers. It will therefore explore the meaning of modern celebrity and the way it symbolizes social promotion.

ON THE RELEVANCE OF ENTERTAINMENT FOR ANALYSING THE PUBLIC SPHERE.
Cornelia Wallner1
1Dept. for Communication Science and Media Research, UNIVERSITY OF MUNICH, Munich, Germany

Abstract: In modern media societies it is no longer sufficient to analyse the formation and functioning of the political public sphere for understanding the political discourse and opinion shaping. In this paper it is argued that entertainment in the mass media is just as relevant as political content.

EVERYDAY CONVERSATIONS ABOUT TELEVISION IN POLISH FAMILIES
Bogumila Anna Mateja1
1Faculty of Social Sciences, Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY, Poznań, Poland

Abstract: Everyday conversations about television were mentioned by many different paradigms. The relations between mass and personal communication were considered to be important i.e. by Lazarsfeld and Katz (1955), Morley (1986), Fiske (1987), Luš (1990) or more recently – Jenkins (2006). However, rarely were everyday conversations about television treated as the main topic of the study. Nevertheless, recent concepts of media-saturated world (e.g. Ang 1996) demand a broader approach to media practices, including media-oriented practices (Couldry 2004) and their embeddedness in everyday life. In the research I am currently carrying out in Poland, interpersonal communication about television is treated as such media-oriented practice. The most important questions I am trying to answer are those concerning how talking about television programmes affect the reception process and how it may matter for the society. Drawing conclusions from ethnographic studies conducted in ten Polish families I would like to wonder about the role that such conversations may play in turbulent times for television – in the era of media convergence and progressive fragmentarization. The problems of confirming common vision of the complex and more and more fragmented world and discussing moral values using television programmes (‘identity talk’) would also be addressed.
Based on social and technological changes, the media public spheres in European societies currently undergo a fundamental change, which also induces a change of the political discourse: this does no longer take place just in purely political forums. The communicative spaces for political discourse become dispersed, and they are in smooth transitions to non-political forums. These non-political forums are mostly categorized as "entertainment" and are normally excluded from the analysis of public discourse. Entertainment is neither seen as a constituting factor of the public sphere, nor as a relevant part for the understanding of the public discourse, nor for the process of social "self-understanding", nor for decision-making within the community.

This paper argues, that entertainment and information are no longer dichotomous or contradictory elements, but that both constitute media content and convey information about society for the interpretation of reality. The paper 1) examines the various explanations for the relevance of entertainment (e.g. Appel 2008; Bondesbjerg 1994; Green et al 2006; Gripsrud 2007; Mikos 2010). Built on that it will be discussed, 2) how entertainment could be placed within the traditional models of the public sphere (liberal and discursive model) and 3) how such an "enlarged" public sphere could be empirically investigated.

**THE CHALLENGES OF MANAGING A MEDIA ORGANIZATION IN THE DIGITAL AGE: THE CASE OF THE BBC**

Nicholas Nicoli1

1Communications, UNIVERSITY OF NICOSIA, Nicosia, Cyprus

**Abstract:** This paper is an attempt to shed empirical light on the trends and challenges faced by media managers in the digital age. These challenges include user-generated content, time-shifting devices such as personal video reorders and convergence occurring across the value chain. Media organisations it seems are currently under attack on several fronts. Traditional media organisations now compete not only with each other but with internet service providers, telecommunications companies, search companies, software companies and hardware companies. Furthermore, as one ‘seismic’ technological change emerges after another, many media organisations are often desperate not to be left behind. Using the BBC as a case study, the paper argues that media companies need to turn to creative management tools in order to come to terms with these challenges. Creative management is best suited for sectors such as the media due to their unpredictable and elusive characteristics. The BBC is used because it is seen not only as a bastion of public service broadcasting but also as a pioneer in media management discourse. Furthermore, since media organisations are intrinsically involved with managing creativity and creative personnel, they are better equipped and more experienced in becoming the flagship sector in creative management.

The paper is divided in three sections. In the first it attempts to define the challenges and trends faced by media organisations in the digital age. Using data from the United Kingdom, this part addresses media consumption trends, new digital technologies and falling revenues of media companies. The second section attempts to map the creative management paradigm, historically and empirically. The final section on the BBC draws on a wide range of primary and secondary sources. It combines case study exploratory analysis with long-term historical perspectives on organisational changes that have occurred at the BBC.

**TOWARDS A COMPARATIVE LONGITUDINAL APPROACH OF COMMUNICATION: DIFFERENT DISRUPTIONS AND CONTINUITIES AS INDICATORS IN EUROPEAN NEWSPAPERS**

Maarja Lõhmus1

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

**Abstract:** The truth is: the globalization of communications and the enlargement of the European Union have forced media researchers to continuously broaden their horizons and reassess their approaches.

We present the longitudinal analysis as one of the research methods to study the transformation of communication. In our research - Longitudinal textual analysis, we analysed the content of the daily newspapers of the three countries and compared different cultures in terms of communicative practices. By analyzing the public articulations in the texts, newspapers, we can give an overview and comparisons of shared meanings and definitions in different countries and eras.

The perspectives of the content and spatial–temporal dimensions of daily newspapers raised a number of fundamental questions, including some regarding the functions of journalism. Our long-term comparative analysis of newspaper texts in the different countries introduced us to strategic instruments for moulding the public sphere in different periods.

Empirical material: we did the comparison of transformation of media constructions of Russian, Estonian and Finnish dailies in XX century.

**EUROPEAN DIGITAL PUBLIC COMMUNICATION FOR EUROPE**

Gea Ducci1

1Department of Communication Science, UNIVERSITY OF URBION CARLO BO - ITALY, URBINO (PU), Italy

**Abstract:** In the last years, Europe aimed at the creation of a new European public sphere that comes along, and doesn’t replace the national ones; a core on which building and making grow an idea of
Europe as a sharing value, as a reality of Nations, but also as a reality of Regions and Cities.

This aim, included in the Green Book of 2006, is a result of a long comparison that leads to consider the public communication as a fundamental instrument supporting the dialogue between institutions and citizens. Nowadays communication is considered a structural element of Union’s programs (Rovinetti 2010, Zémor 2008).

The transformation of the media system, the possibilities of communication offered by social media, the growth of participatory cultures (Jenkins 2006), the mass self-communication process (Castsell 2009), have opened new ways to the development of European public communication.

Exploring how European institutions use the Internet, analysing the institutional websites and participatory places, but also the use of web 2.0 and social network sites to dialogue and engage citizens, will consent us to reflect upon the actual change of the communication “of” and “for” Europe.

SCOPIC MEDIA AND THE SENSE OF PRESENCE IN THE SYNTHETIC SITUATION

Vanessa Dirksen

1Sociology, UNIVERSITY OF CONSTANCE, Constance, Germany

Abstract: The empirical work presented in this paper is part of a larger cross-comparative study of the production and functioning of so-called scopic media. Scopic media is a term used to denote a variety of real-time screen technologies that render distant and invisible phenomena situationally present and visible. These on-screen projections are of considerable informational depth and open up new spaces of observation. As opposed to the traditional face-to-face social situation, these new spaces of observation are face-to-screen situations. As this ‘synthetic’ situation is not necessarily one of physical co-locatess and may be defined entirely by electronically transmitted on-screen projections, Goffman’s notion of the social situation, based on the premise that two or more people are in each other’s physical response presence, does not suffice any longer. The main objective of the comparative study of scopic media is, therefore, to analyze the local accomplishment of social order in these new social situations. Ultimately, such an investigation is to contribute to our understanding of the synthetic situation as a fundamental unit of the new global social forms. To this purpose, the paper investigates the production and use of telepresence systems for distributed collective practices in global firms. Telepresence is a form of face-to-face situation simulated by videoconferencing technologies. It is a form of presence enabled by the projection of geographically dispersed participants and additional screen interfaces. This kind of social situation is to be regarded as an imitation of the face-to-face situation but at the same time may well entail a transformation of the face-to-face situation. Some of the leading questions posed in the study are: How is the required immersion in a collective experience technologically created or simulated? Does the technologically constructed meeting convey the emotional feeling that one is participating in a natural meeting? Are response requirements identical to the face-to-face situation, or do people learn to develop adapted response processes to these telepresence systems? By answering these questions, the empirical investigation of telepresence interaction should bring us one step closer to understanding how the microsociological notion of the social situation should be adjusted to include these new forms of mediated interaction.

SOCIAL INTERMEDIARIES AND OBJECT-CENTRED SOCIABILITY

Martin Berg 1, 2*

1GOOD OLD, Malmö, 2School of Social and Health Sciences, Halmstad University, Halmstad, Sweden

Abstract: During the last few years, numerous journal articles aiming at discerning the impact and possible meanings of social network sites (SNS) have been published. It is often argued that SNS significantly diverge from earlier forms of web communities since they are centered around the individual actor rather than themes of interest. According to boyd and Ellison (2007), an important aspect of these changes is that SNS allow for the construction of a public or semi-public profile through which it is possible to put on display a list of shared social connections which, in turn, makes it viable to browse the social connections of other users. By so doing, an establishment of latent social ties is facilitated and thus, as Haythornthwaite (2005) has demonstrated in depth, a form of connectivity emerges that makes otherwise unconnected others connect. Following these lines of thoughts, this paper aims at establishing an understanding of SNS which takes into account two interrelated yet hitherto undertheorised themes. First, SNS (ie. Facebook and Twitter), have largely come to function as mediators of social and symbolic content which in turn provide the basis for social interaction. Following the arguments of Knorr-Cetina (1997), among others, this paper explores the fact that communication on SNS occurs through a shared social object which is not only mediated but also structured thus allowing for a certain kind of object-centred sociability. Secondly, taking into account the emergence of such a sociability, this paper suggests that SNS are not so much mechanisms for self-presentation and social interaction as they can be regarded as social intermediaries which subject social and symbolic content to the specific structure of the digital interface. Taken as a whole, this paper provides an exploratory understanding of emerging social structures in digital culture thus illuminating important facets of social interaction and communication in contemporary society.

THE CONSTRUCTION OF CROSS-COUNTRY COGNITIVE MAPS IN ON-LINE MEDIA

Darya Prosynyuk

1Sociology, NRU HSE, Moscow, Russian Federation

Abstract: Nowadays each political and economic decision is reflected in the information Internet - space. In this area each country has the opportunity for self-positioning and communicating with other countries. The information Internet - space is the connecting link: firstly, it reveals the structure of relations among countries, secondly - it legitimates the economic-political decisions to the grassroots.

The present paper analyzes the media coverage of the problem of entry of Russian Federation to the World Trade Organization. The
paper is interdisciplinary: it combines methodological development of sociology, political science and linguistics. The research methodology includes modern approaches to the analysis of texts: network analysis, content analysis, discourse analysis, cognitive analysis, in part - map analysis.

The empirical base of research is restricted by the time period January 2008 - January 2010. The sample's size is: 50 foreign sources: 61 articles: 15 countries. 85 Russian sources: 163 articles. The empirical base consists of three groups of sources:

1) Official sources:
   • Leading countries' government websites (USA, UK, France, etc.);
   • Official sources (eg, RIA-Novosti, Business New Europe, Berliner Zeitung, etc.).

2) Expert sources (eg Wall Street Journal, Reuters, Le Figaro, etc.).

3) Informal sources (blogs and forums - eg. Englishrussia.com, thedailyreviewer.com, etc.).

The study developed the methodology for analyzing cross-national information exchange at the macro (the algorithm of structuring texts by the "grain of concepts") and macro (construction and analysis of cross-country cognitive map) levels. Also, it revealed the points of view and clusters of countries on three main issues: assessment of chances of entry of Russia into the WTO, assessing the prospects of cooperation with Kazakhstan and Belarus (customs agreement), and assessment of the Russian Federation's opinion about the appropriateness of the entry into the WTO, and examined the corresponding arguments.

This work has a great potential scope. Through this technique it's possible to capture the views of leading countries and experts on world affairs, to indicate the presence of main intellectual centers.

«I'M ALWAYS ONLINE»: INTERNET AS A SPACE FOR CITIZENSHIP, IN A PROFESSIONAL CONTEXT

Nuno Santos Jorge

1Instituto Politecnico de Santarem, Santarem, Portugal

Abstract: The use of information and communication technologies, specifically the Internet, has been subject of numerous studies in recent years. We all know the importance of Internet these days and this is notable in multiple professional activities (especially the more skilled ones).

In the last decade and a half, authors such as Jones (1997), Smith and Kollock (1999), Rheingold (2000), and Wellman (2002) have developed theoretical frameworks that reflect on the virtual communities in cyberspace, its relationship with the real communities and with the public sphere.

Based on a questionnaire answered online by nearly 650 respondents, we assess the degree and type of Internet use by physicians, specifically those who are attending the Internship. Particular attention was given to the use those professionals do of a portuguese online forum, active since 2003, and with more than 7000 users and 14,000 messages posted. This forum is a popular space for discussion, sharing, participation and citizenship (typical characteristics of «Web 2.0»), among junior doctors.

This presentation also tries to identify the structure and main themes discussed in this online forum and to demonstrate in what extent this new form of social interaction, results in new knowledge about the medical profession, which is reproduced and transmitted to younger doctors.

COMMUNICATION PRACTICE AND IDENTITY CONSTRUCTION IN VIRTUAL SOCIAL NETWORKS

Egle Butkeviciene 1, Jurgita Jurkeviciene 1

1Department of Sociology, KAUNAS UNIVERSITY OF TECHNOLOGY, Kaunas, Lithuania

Abstract: The paper aims to discuss existing communication practices and identity construction process in virtual social networks.

In recent years social networking websites such as Facebook or MySpace are increasingly attracting the attention of internet users. As a result these websites have evolved into a kind of virtual meeting spaces where people can interact and represent themselves. These popular spaces allow millions of individuals to create online profiles and share important personal information with vast networks of friends and likely unknown numbers of strangers. Social networking websites suggest opportunities for people not only to discover new contacts, but also to keep in touch with existing specific social and professional groups that they belong to offline. For this reasons social networking websites are playing a prevalent role in everyday social interactions.

Heidi Campbell (2005) presents four models that seek to highlight particular uses of the online context. She argues that the internet is identified as information space, a common mental geography, an identity workshop and a social space. These models could also serve as tools for analysis how people use virtual social networks.

The paper is based upon results of a representative survey conducted in December 2010 for the project "Monitoring of social problems: implementation of International Social Survey Program (ISSP)", funded by a grant (No.SIN-10206) from the Research Council of Lithuanian.

Lithuanians trust virtual social networks; nevertheless at the same time do not reveal much personal information online.

EXTENDED AUDIENCES FROM INTERPRETATION TO REFRAMING OF THE LUDUS

Enrico Gandolfi 1,2

1social sciences, LA SAPIENZA, Rome, 2Centre of Media and Communication Studies Massimo Baldini, LUISS, Rome, Italy

Abstract: The digital age is characterized by some specific traits, including the de-spatialisation and de-corporeality of communities (Van Dijk): digital media support a new state of mind, used to create and to reformulate cultural contexts; a “database” approach able to cross a linear narration. The rituals of everyday life became more malleable to user’s inimitation, summoning a partecipative and generating consumption, maybe improving the network society; this tipe of social practise, evoking the studies of Giddens, works with a strong ludic verve: old and less old media are recruited inside a remediation never seen before (not only videogames, but also ARG and local based software). This nature, basilar in interactive media, central in our fluid culture, experiments the porosity, the immediacy and the mobility of new technologies. I want to explore the manner in which the reborning ludic paradigm is changing peo-
ple with an audience analysis referring to the global game culture (with qualitative methods). With the aim to rescue human inspirations, they are going to give new formality and sacred connotations to game and performance. After all, the best playground is society and the best way to play remains our life.

**SOCIAL WORLD PERSPECTIVE AND SOCIAL ORGANIZATION OF VIRTUAL COMMUNITIES**

Jari Aro¹

¹UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The social world perspective was formulated by David R. Unruh and Anselm Strauss 30 years ago. Social worlds are relatively flexible and diffuse units of social organization. The main idea is that people are members in several communities or social worlds which do not overlap and which are not constructed within each other. Participation in social worlds may take the form of four social types – strangers, tourists, regulars and insiders. The social world perspective has been used e.g. in analyzing post-traditional forms of social communities. This paper will examine how the social world perspective can be used in describing and analyzing social interaction in virtual communities in the Internet. Discussion forums which are organized and are active only in the Internet and which address some limited issue or area of life fulfill characteristics of social worlds quite well. Typically in discussion forums there is a relatively small number of insiders who define and keep up the standards of social behavior in that particular community. Insiders and regulars produce the bulk of comments to the forum. Tourists and strangers take part in discussions only occasionally. People give prestige to each other according to the level of commitment they show in the interaction and according to the level of expertise they show in their comments. Typically people bring forward to the discussion only those aspects of their personality and social status which are relevant for the topic of the discussion. People usually are members in several virtual communities and they can have different social roles and level of participation in different social worlds.

**CHICAGO SCHOOL OF SOCIAL THOUGHT: A LINEAGE OF THINKING ABOUT COMMUNICATION**

Filipa Brito Subtil ¹, José Luís Garcia ²

¹ESCS, Instituto Politécnico Lisboa, ²ICS, Universidade Lisboa, Lisboa, Portugal

Abstract: From its foundation at the end of the nineteenth century to its major figures in the early years of the twentieth, the Chicago School of Social Thought has remained an essential point of reference, by reason of its work on human ecology, the city, immigration, ethnic relations, delinquency, social control and the human self – work which is today regarded as part of the sociological canon. In this paper we argue that these thinkers were pioneers, undertaking research of major significance on the topics of communication and the media in society, helping to make them a focus of attention for social theory and sociology. It is true that the thought of one of the leading thinkers of the Chicago School, the social psychologist Mead, on the communicative nature of the human self and on social interaction led to sociological approaches, such as symbolic interactionism, which grant crucial importance to communicative processes. It was also incorporated into major contemporary theoretical formations, the leading example of which is the work of Habermas. But recognition of Mead’s theories is not enough for a proper understanding of the enormous and in many respects distinctive contribution made by thinkers such as Small, Dewey, Mead, Thomas and Znaniecki, Park and Burgess to social scientific research on communication. It was above all figures in the field of communication research who investigated this legacy. They identified gaps in this area which social theory and sociology, however, still need to address.

This paper has two main objectives. First, to examine the work done in the Chicago School of Social Thought on two fundamental aspects of the study of communication and modern information media. Focusing specifically on the work of Small, Dewey, Mead, Thomas and Znaniecki, and Park and Burgess, we aim to explore their profound insights, on the one hand, into the connections between communication and social interaction, and on the other, and the relations between communication, culture and democracy. Secondly, to show how, following a hiatus, from the interwar period until the end of the 1960s, in which its theoretical contribution to the study of communication, democracy and the media suffered some neglect, this legacy was a source of inspiration for a hermeneutic approach to communication, as an alternative to positivist, utilitarian and functional approaches.

**MEDIAT(AZ)ING IN TIME OF CRISIS: THE COMEBACK OF THE POLITICAL LOGIC?**

George Pleios¹

¹Faculty of Communication and Media Studies, UNIVERSITY OF ATHENS, ATHENS, Greece

Abstract: According to the mediatization thesis the everyday experience of the individuals as well as the social systems depend on mass media —which rely more on their own logic than on the logic of the (other) social systems. Typical cases in this perspective are the role of media in the war on Iraq or in electoral campaigns. The mediatization thesis has tested during periods of economic growth but consumerist orientation of the public, political stability but citizens’ political apathy, extensive cultural consumption but entertainment. In nowadays there is evidence that in turbulent time crisis things may go differently. It is important for example not only that a number of media become ‘red’ or ‘blue’ but above all that they adopt political logic in the coverage of social realities beyond the media.

Bearing that in mind, in this paper which is based upon a series of empirical researches that use content and discourse analysis of a large sample from newspapers in six EU countries and for a four year period, we seek answers to two main questions.

First, does the ‘media logic’ (or mediatization) thesis is (still) valid or there is a comeback of the political logic in media’s coverage and views (mediation)? We test this hypothesis in the relationship between the economic crisis and its political management on one hand and their media representation on the other.

Second, we examine if media, following/are not following the political logic, define crisis as external or as internal one regarding EU. In other words we try to find out if media understand economic crisis as external to EU and its member states or as internal to EU and external to (some of) its member states. Consequently we explore if in media’s views, EU can remain united or not.

The first answer can helps to understand what the second one is and which its source is - the media or the politics.
TV WORLD VIEWS - CULTURE-SPECIFIC AND TRANSCULTURAL NARRATIVES

Peter Ludes¹

¹Mass Communication, JACOBS UNIVERSITY BREMEN, Bremen, Germany

Abstract: Detailed analyses of Key Visuals, Key Invisibles, and Music in TV annual reviews from Germany and the United States vs. Brazil and China, from 1999 to 2010, clarify these "Western" and "Non-Western" TV world views and lead to a sociological model of culture-specific vs. transcultural TV narratives as modes of contemporary societal self-observations. Germany’s state heads, e.g., are often shown with other German and international politicians, but equally often with ordinary citizens and journalists. The United States is characterized by developments from the terrorist attacks of 9/11 through the military reactions in Afghanistan and Iraq to a historic financial and economic crisis in 2008-2009, and re-regulation of financial markets by the first African-American president. Brazil is presented as a rapidly modernizing society in consumption and industrialization. In the Chinese TV annual reviews, the United States are by far more covered than any other foreign power, Europe hardly ever appears – nor opposition movements. Music de-dramatizes most political events, esp. in Brazil. There emerges a clear culture-specific hegemony in visualizing “major events”, which need to be taken into account in a “visual turn” of sociological theory-formation.

INTERNET, DISSENT AND STATE POWER IN EGYPT AND IRAN

Babak Rahimi¹

¹Religious Studies, SCHOOL OF ORIENTAL AND AFRICAN STUDIES, Tehran, Iran, Islamic Republic Of

Abstract: This study aims to rethink the phenomenon of information technology not merely in terms of disseminating information, but as a communication network that produces new identities and (de) construct social relations through virtual spaces of interaction. The case of post-revolutionary Iran, especially post-2009 elections, and popular uprising in Egypt serves as a case study, especially in the complex new ways the information technologies such as Internet continue to form new conceptions of activism in face of changing state and society relations. It is argued that cyberspace is not merely a tool but an interactive space through which new politics is reformulated through immediacy of circulation of ideas, imagery, discourses and symbols of solidarity. In a comparative study of Egypt and Iran, the study shows how such interactive immediacies mark a virtualization of dissent in challenging authoritarianism and state repression. The process is described in two fold. First, it also shows how Internet produces virtual relations in the form of a social space that in turn can build new bonds of sociability that push toward social openings. Second, such new social relations can transform communicative practices in ways that politics can be practiced transparently and globally more accessible through small media and social networking sites like Facebook, Flicker and Twitter. In the final part, the analysis puts forward the notion in how a communication network like Internet can equally serve as a site of power wherein the state can consolidate through surveillance and information gathering in lieu of online resistance. All in all, the Internet is identified as a space of contention for both domination and opposition.

MEDIA SYSTEMS AND JOURNALISTIC CULTURES IN COMPARISON

Mine Gencel Bek¹

¹ANKARA UNIVERSITY, Ankara, Turkey

Abstract: My paper will be mainly based on the comparison of media systems and journalists’ professional values and practices. By relying mainly on the findings of the in-depth interviews conducted with the Turkish and foreign journalists from different countries working in Turkey, I will analyse journalists’ approach their profession and ask what type of professional approach is dominant in theory and in practice among the journalists and what the potentials and obstacles for more democratic forms of journalism are. The preliminary findings show that Western values are the key points for comparison not for the journalists from Anglo-Saxon countries but Turkish journalists as well (the discourse of ‘we are more democratic than Middel Eastern countries, but less democratic compared to Europe’). Turkish journalists and the others differed mostly in relation the the rights and opportunities they have and the differing political culture. They have more commonalities in terms of professional codes.

I will discuss broadly the meaning of these for the changing dynamics (which are increasing internationalisation, commercialisation, tabloidisation, de-unionisation, limited editorial autonomy...etc.) versus the historical political economic dynamics (close relationship between state and the market; cliental links between politicians and media owners; state pressure).

SOCIETAL EXPECTATIONS OF THE MEDIA

Laura Ollkonen¹,²

¹Department of Communication, University of Jyväskylä, Jyväskylä, ²South Karelian Institute, Lappeenranta University of Technology, Lappeenranta, Finland

Abstract: Through times media has shaped the way societies form; the way information is distributed, ‘consumed’, and shared (see for example Innis, 1951.). As Shirky (2008, 17) has stated, “when we change the way we communicate, we change the society”. In current times this change is particularly visible in social media that is changing the relationship of media and society (Horst & Wallis, 2011; Miel & Faris, 2008; Wright & Hinson, 2008). When such changes happen, also expectations change (Chung, 2009).

Expectations can be defined as reference points against which current performance is assessed (Creyer & Ross, 1997). By forming mental standards (Ollkonen & Luoma-aho, 2011) expectations guide perceptions and assessments. In case of the media, the society poses expectations on it regarding both the content media produce (journalism) and the way it runs business as media companies. For the latter, expectations become an important factor for company-stakeholder relations, and more widely business-society relations.

This paper describes the current change in the relationship between society and media, and takes special interest in societal expectations as change agents. The approach of the paper is mainly analytical, but towards the ending section the paper connects to empirical research by presenting a Finnish work-in-progress project of societal media expectations.

Veronique Valedon

Centre d’Analyse et d’Intervention Sociologiques, ECOLE DES HAUTES ETUDES EN SCIENCES SOCIALES, Paris, France

Abstract: This research analyses the influence which can exert the mass-media in the construction of the social representations that the Jews have of the Muslims in France, and vice versa, and the manner as those perceive the Israeli-Palestinian conflict. To accomplish this purpose, I used the analysis of content to identify the concepts contained in the speeches presented in the interviews of the group of study selected, and in the documents with the information transmitted by the media, about the Israeli-Palestinian conflict and its consequences at a local and an international level.

Through this research I could observe that the social representations that the Jews and Muslims interviewed have of their communities in France and the Israeli-Palestinian conflict, were determined by the way that the media present the information about this conflict. This is because the media constitute the means of communication making possible to maintain a permanent relationship with different facts: social, cultural, political and economical, at a national level as well as international. They also influence the manners of thinking and acting of the individuals, and modify the way of knowing and understanding the reality which surrounds them.

THE IMPACT OF MASS MEDIA ON EUROPEANIZATION IN THE SOCIETY OF TENDENTIAL MODERNITY

Constantin Schifirnet

1Department of Communication and Public Relations, National School of Political and Administrative Studies, Bucuresti, Romania

Abstract: The goal of the paper is to broaden the knowledge of the process of Europeanization through mass media. My purpose was to identify the types of requirements regarding the Europeanization that the Romanian citizens have and the ways these requirements are transmitted and known.

Based on data of a research on national sample, this paper examines opinions about Romanian television influence on the process of Europeanization of the Romanian society. Media reflect the changes from Romanian society either in ways taken over from the Western media or by a strictly local approach. In both cases the real issues of the Europeanization of the Romanian society are avoided. In my vision the Europeanization of the Romanian society takes place in the transition process from the tendential modernity which characterizes the Romanian society, to the structural modernity from the European community.

Key words: Europeanization, Romanian society, mass media, television, tendential modernity.
RN 19 Sociology of Profession

PROFESSIONAL COMPETITION IN TURBULENT TIMES: LINKED ECOCOIES IN FAST AND SLOW BURNING INTERNATIONAL CRISIS

Leonard Seabrooke 1, Eleni TSINGOU 1

1Department of Business and Politics, COPENHAGEN BUSINESS SCHOOL, Frederiksberg, Denmark

Abstract: Crises prompt fights over resources, ideas, and prestige as actors scramble to protect what is theirs. The range of actors cuts across political, social, and economic life, including states, firms, institutions, international organizations, non-governmental organizations, and social movements. This paper discusses how professional actors behave during periods of ‘fast’ and ‘slow’ burning crises. While some themes are immediately familiar - such as fights over budgets, status and prestige, and how to frame and place certain ideas in the spotlight - a focus on professions provides insight on the work content involved in policy change rather than the context in which policy work takes place. This paper demonstrates why Andrew Abbott’s work on ‘linked ecologies’ among professional actors is useful for understanding how professionals behave in dealing with different kinds of international crises. Abbott’s focus on how different professional ecologies form coalitions and create alliance strategies to propagate their ideas and skills permits a focus on professional competition at the international policy level. This stands in contrast to scholars who focus on international organizations or the power of norm entrepreneurs in transnational advocacy groups, as well as those who stress how domestic interest groups lobby for international changes. We highlight the role that professions play in linking actors across issues and institutions and how they strive to act as coherent agents for policy change. We explore this through one ‘fast’ burning crisis and one ‘slow’ burning crisis. The former is the recent financial crisis, the latter is the maintenance of expected welfare provision in low fertility societies.

PROFESSIONALISM IN TURBULENT TIMES: THEORETICAL CHALLENGES IN THE SOCIOLOGY OF PROFESSIONS

Julia Evetts 1

1School of Sociology and Social Policy, UNIVERSITY OF NOTTINGHAM, Nottingham, United Kingdom

Abstract: Some theories and concepts in the sociology of professions have been prominent and have then declined, usually because contexts, circumstances and conditions have changed and new questions become of more interest and relevance. Times change and some critical research questions which were important in previous decades might seem less relevant in different time periods, policy contexts, areas and geographical regions. Also new knowledge-based occupations develop which pose new questions and challenges to existing concepts and theories.

The paper considers the main theoretical challenges to and for research and analysis within the sociology of professions. Although interrelated and interlinked, these challenges are subdivided for purposes of explanation. The theoretical challenges include: (i) the changing role of states; (ii) the increasing dominance of organizations; (iii) public policy changes at local, state and international levels; (iv) the development of new occupations and yet the continuing dominance in theorizing of medicine, health and law as prototype professions.

THE PROFESSIONAL LANDSCAPE - THE CASE OF SWEDEN

Lennart G Svensson 1

1Department of sociology, UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: Trust is and will be of major importance to professional work and professional organizations and associations. Their legitimacy is partly defined by aspects of trust from actors as politicians, clients and professionals themselves. Trust can be assumed to vary according to organizational changes as contemporary privatization and marketization as well as changes at work in terms of basis knowledge, for evidences and for audit.

Such alterations have taken part in Sweden as well as in most Western countries in recent decades. They will be compared to the attribution of trust to professional work by professionals themselves as well as common citizens. The paper is based on two Swedish surveys directed to members in fifteen professional groups in year 1996 and 2010, as well as annual surveys to samples of the general public. The analyses will depict the professional landscape of trust — eroded, transformed and recreated by rigid institutions and turbulent times. The study is part of a research project called the Professional landscape, funded by the Swedish council for working life and social research.

NON-LINEARITY AND SYNERGISM IN SOCIOLOGY OF PROFESSION

Mikhail Basimov 1

1Department of education and science, KURGAN STATE UNIVERSITY, Kurgan, Russian Federation

Abstract: "Non-linearity" - fundamental conceptual unit of a new paradigm, including, and sociological research. We offer the new approach to concept of statistical relation (non-linear and linear) in sociological research by means of usage the generalized version of a method of multiple comparison for quantile splittings of the data (objects) on each measured parameter.

In the research “Young specialist at the labor market” (I.B. Britvina et al), which data sets are used for demonstration of non-linear nature of sociological information, it was necessary to investigate three sides of the job placement, coming into action at the moment of appearance of a young specialist at the labor market. They are a young specialist him/herself, educational or professional institution where a specialist was given professional skills and a particular employer as the materialized representative of a labor market.

In our example from the questionnaire of the young specialist were chosen 75 estimations with interval scale, characterizing on answers: the role of the educational institution in training the specialist, features gained by the graduate at the period of the education,
characteristics of the educational institution and professions, characteristics of the enterprise (the job place) and their role in labor activity, characteristics of the job position and their role in labor activity. There were estimated expectations before entering the University and before getting a job, real results and personal importance of the feature.

If we choose dependences with the coefficient of correlation more than 0.5 (our factor of the connection strength also more than 0.5) such dependences are observed 123. While non-linear dependences with factor of the connection strength more than 0.5 and small coefficient of correlation (at least on the module twice less than our factor of the connection strength we have 385. Thus, the elementary (dependences with a maximum and a minimum, monotonous, but not linear) non-linear dependences appeared more than three times more, than linear.

So it is possible to speak about an opportunity of synergetic paradigm in sociological science directed on the investigation of non-linear effects.

**DREAMS OF TURBULENT TIMES: LINKED ECOLOGIES OF WELFARE REFORM**

Lasse Folke Henriksen

1Department of Business and Politics, COPENHAGEN BUSINESS SCHOOL, Copenhagen N, Denmark

**Abstract:** Western welfare states face the prospects of a prolonged global recession, centering issues of sovereign debt and increasing unemployment. This is mostly dealt with through fiscal austerity. The impact on core welfare services such as education, healthcare, pensions and social benefits is clear, but management and control structures in government administrations are also facing important changes. These developments are highly consequential for professions and their jurisdictions. One evident trend is that the number of service professionals relative to the amount of management professionals in the public sector is decreasing steadily: managers and auditors are hired to fire teachers, nurses and social workers.

This paper traces some important roots of this development in Denmark. Drawing on Andrew Abbott’s linked ecologies framework (1988, 2005), it argues that to understand internal changes in the system of welfare professions we need to look beyond the current fiscal crisis which is external to the system. Rather relational transitions in the system are the result of a protracted ‘welfare state crisis’ dating back to the late 1990s. This crisis was constructed internally in the system of professions by an alliance of economists across universities and core welfare planning ministries pointing to a number of long-term challenges to the Danish welfare system (e.g. ageing of the populations) eventually framing the crisis. While economic policies were consistently Keynesian during the late 1990s, this alliance transported the increasing dominance of neo-classical ideas at Danish economics departments to strategic areas of the state administration by creating an expert institution, DREAM. DREAM (Danish Rational Economic Agents Model) is a neo-classical equilibrium model that (with its own staff) provides economic and demographic scenarios. These scenarios – and their dissemination by the DREAM group - effectively helped create the public image of a protracted welfare crisis.

Drawing on network data, semi-structured interviews and policy documents, the paper demonstrates on the one hand how this institution effectively shaped core elements of a welfare state reform agenda that is still predominant, and how it as an institutional alliance across ecologies of universities and politics may end up having profound effects on the division of labor in the system of professions as a whole.

**POLITICAL-PROFESSIONAL-ADMINISTRATIVE INTERACTION AS NEGOTIATED ORDER**

Juha Klemelä

1Sociology, UNIVERSITY OF TURKU, Turku, Finland

**Abstract:** The elected representatives and the office-holders are two central groups co-operating in local government. These groups’ members are differentiated both in relation to structural and actor-properties. This differentiation is a source of some inter-category conflict. The study at hand aims at describing processually how the conflictual features arise.

Actors are depicted with the help of role-identity concepts. Incumbents in both role-positions may be said to have both the sub-roles of a politician, a professional, and an administrator. These roles are prominent to different degrees for the position-holders. Each sub-role opens up a unique perspective, a framework, to action.

Interaction between actors in the two categories is studied as negotiated order. What is negotiated, among other things, are the (sub-)roles that the actors may claim in general, and situationally. This process causes conflicts, when the (sub-)roles and frameworks clash.

The study uses cases of committee decision-making as empirical data. Collection of the data is underway, and besides theoretical ideas, the presentation will give out some preliminary results.

**PROFESSIONALISM AND NEW MANAGERIAL REGIMES IN HEALTHCARE: TRANSFORMATIVE POWERS OF KNOWLEDGE AND THE IMPORTANCE OF LOCATION**

Ellen Kuhlmann, Viola Burau

1Social and Policy Sciences, UNIVERSITY OF BATH, Bath, United Kingdom, 2Department of Political Science, University of Aarhus, Aarhus, Denmark

**Abstract:** This paper seeks to explore how new forms of managerial governance in healthcare mobilise knowledge as a facilitator of control of professions and how this in turn impacts in the relationship between professionalism and managerialism. Specifically, we are interested in the transformative potential of knowledge in relation to both established professions and new ‘knowers’. We introduce the notion of ‘location’ of knowledge to position the impact of the new forms of managing knowledge in institutional settings and take account of the different perspectives of professionals and service users. We draw on a review of the literature and empirical material on the German healthcare system taken from a number of studies carried out by the authors. Our analysis highlights an expansion of the enabling dimensions of knowledge towards new professional groups and service users. However, this type of transformative potential remains limited. Instead, the medical profession is much better able to strategically use the new management of knowledge, which also shields the medical profession much better from the control dimension of knowledge. The study highlights the diverse effects of managerialism and thereby contributes to better understanding the impact of new forms of performance manage-
ment. Suggesting ways of ‘locating’ knowledge in the wider institutional and social contexts of changing governance, the study identifies uneven transformations of professionalism: there are examples of both remaking elitist knowledge and loosening knowledge-power nexuses in healthcare.

Keywords: healthcare; professionalism; managerialism; performance management; knowledge-power nexus

SOCIAL WORK IN THE UK: A CHANGING PROFESSION UNDER CHALLENGE IN TURBULENT TIMES

Mike Saks

Abstract: Social work is a long-established public sector occupation that has only recently become professionalised in the UK. The paper starts by exploring its path to professionalisation in a changing world – initially through rising levels of vocational education and training to degree level and beyond, and then through the formation in 2001 of the General Social Care Council which for the first time effectuated state-underwritten exclusionary social closure protecting the title of social work. Although the arrival of such legally-defined closure has lagged behind other professional groups in the UK – not least in health care – the form that it has taken has been less restrictive than in many professions in terms of the engagement of employers and users in its governance. However, the profession has come under increasingly serious challenge following recent child protection issues that have caused the state to question both the quality of social work practice and the adequacy of its educational base. This paper documents the recent move to transfer the regulation of social workers to the Health Professions Council – and considers the future prospects for the professionalisation and governance of social work in this light in turbulent times in the UK, in which the new profession has found itself under the microscope by the public, media and the state.

DISCRETIONARY POWER; THE KEY ELEMENT IN PROFESSIONAL PRACTICE OF SOCIAL SERVICE WORKERS?

Jorunn Theresia Jessen

Abstract: Discretionary power; the key element in professional practice of social service workers?

Social professionals are characterized by a moral commitment to help others, support their clients and serve the society as a whole. Working within the social services, the professionals’ are intended to use social treatment methods in order to help people becoming more self-reliant. On the other hand, social professionals are subject to managerial control and stronger bureaucratic regulations that may threaten the nature of social work by reducing the scope of professional judgement. This paper investigates the social workers’ abilities of problem-solving in the helping process, by analyzing some of the conditions (predictors) for professional practice in social service delivery. The main purpose is to explore the influence of professional and organisational resources, managerial control and discretionary power in the workers’ provision of social welfare. The empirical data come from a quanti-tative survey among social workers in the Norwegian local welfare agencies. Despite the lack of resources and experience of managerial control, social workers mainly depend on discretionary judgements and sufficient technical qualifications to provide help and social welfare. In addition, difficult co-operative relations with other professionals groups seem to affect the helping process in a significantly negative way. In accordance with the thesis of Lipsky, findings indicate that discretionary power is still a present key factor in social service provision, calling for means testing and individual tailoring.

THE PUBLIC PROFESSIONALS BETWEEN PUBLIC MANAGEMENT AND CRISIS OF PROFESSIONALISM.

Gilles Verpriet

Abstract: The injunction to more professionalism seem to accompany the reforms for public management, inside the great public organisations (Koiman, M Power). A deconstructive analysis of professional practices and professional motivations set up the level distribution of responsibilities between the institutional requirements (as legitimacy), the organisational injunctions (as efficiency and profitability), and the professional logic (as training, skills, involvement)(Freidson, 2001, Dubar, 1991).

This methodology of analysis will be explored in France and Italy on two public professionals groups inside two professional sectors (Secondary teacher, university teacher, Municipal agent, project manager)

This methodology can be also explored between historical periods, between the european reforms for knowledge economy (2000 / 2008) and the financial crises and the consequent public austerity (2008 / 2010). We will examine how the grammar of responsibilities is reframed within a differentiation of behavioural attitudes (exit, voice, loyalty)

• The professional disengagement in face of flexible employment of the public work
• The conformism and meritocracy inside the high staff levels
• The new modalities of professional alienation between crisis of public sectors and financial crisis, inside the weakening of public capacities

So can be evaluated analytically the sociological dimensions of the professional contribution inside a period of economic crisis, and public sector restructuring.

ESTABLISHING RESEARCH ETHICS IN LITHUANIAN SCIENTIFIC COMMUNITY: SOME IMPLICATIONS ON INSTITUTIONALIZATION, PROFESSIONALIZATION, AND SOCIALIZATION IN A POST-SOVIET SCIENTIFIC ENVIRONMENT.

Aurelijja Novelskaite, Raminta Pucetaite, Anna Lipnevic

Abstract: Scientific communities of post-soviet societies such as Lithuania have been experiencing a number of drastic internal and external changes during the last few decades. Formal institutionali-
zation of research ethics, as a part of newly defined academic (i.e. professional) ethics, is just a minor but important development in the recent series of changes. On the one hand, observable outcomes of ethics institutionalization demonstrate that a stringent research ethics supervision system is already developed in the field of biomedical sciences but other fields of science presumably lack research ethics instruments and practices. On the other hand, although some cases of research ethics violations come to public from time to time, there is no empirical data on the overall situation of research ethics in different fields of science in Lithuania, nor on scientific community opinion towards research ethics in Lithuania. Thus, the paper tackles two questions. First, what research ethics instruments and practices are already established in Lithuanian research institutions? Second, are these instruments and/or practices implemented, used and perceived as useful?

The paper is based on the results of content analysis of ethics-related documents of Lithuanian science institutions and an internet questionnaire survey in Lithuanian scientific community which is to be accomplished in March-April 2011. Thus, at the moment answers to the above given research questions are not definite. Based on prior research on ethics institutionalization in Lithuanian public and private organizations it is expected that the study results will reveal that just very few ethics instruments and practices are implemented in Lithuanian research institutions. Moreover, due to the inert attitudes to normative regulations as relative conventions which are inherited from the soviet period, the research findings may indicate that research ethics instruments and practices are perceived more as formal requirements, their usefulness is viewed with skepticism if ever reflected, and some practices may be viewed as an unacceptable practice in the community.

REVOLVING DOORS AND BUILDING PROFESSIONAL ALLIANCES FOR NORMATIVE CHANGE IN PEACEKEEPING OPERATIONS: THE DEVELOPMENT OF THE INTEGRATED MISSIONS CONCEPT

John Karlsrud 1,2

1Department of Security and Conflict Management, Norwegian Institute of International Affairs, Oslo, Norway, 2Politics and International Studies, University of Warwick, Warwick, United Kingdom

Abstract: This paper will explore how the sociology of professions can avail a theoretical framework for analysing and understanding the development of alliances for normative change processes in the area of UN peacekeeping. UN peacekeeping is characterized by a high degree of volatility and change, but is also reliant on firm norms guiding the peacekeeping operations. Existing theory emphasises the role of states in normative change processes, or anomalous and pathological behaviour indicating some degree of autonomy of the organisation. However, such a rigid analysis of behaviour of the UN in the area of peace operations does not capture how normative change processes actually come about, and who the main actors are, aside from Member States. This paper will give an outline of a generic theoretical framework based on the sociology of professions, and show how this can give a more nuanced understanding of the complex interplay between Member States, think-tanks, and the UN and its sub-components in the normative formation for peace operations. As a case study, the paper will look at the development of the Integrated Missions concept, driven forward by individuals from the UN, a few member states and think tanks. Several of these individuals have the common trait that they have been working within all these institutions, creating a revolving doors effect. The paper will analyse how this affects the normative change process and what role it has for the development of peacekeeping as a profession.

TRUST AND CREDIT. HOW THE FINANCIAL CRISIS AFFECTED (AND NOT AFFECTED) THE FIELD OF BANKING.

Christiane Schnell 1

1Goethe-University Frankfurt/Main, INSTITUTE OF SOCIAL RESEARCH, Frankfurt am Main, Germany

Abstract: The paper addresses changes in the field of banking after the so called financial crisis. Arguing that the banker occupation experienced a dramatic loss of reputation but not in power, its organization in between the representation of a quite important component of the public infrastructure and private profit will be discussed. Significant from a sociology of professions point of view is the paradox of trust, which characterizes the field of financial services since ever. We learned from Simmel that money is a highly complex mechanism. Within the development of the global financial system during the last decades the evolution of new expertise and specialization was rising while at the same time theories of the psychological aspects and the role of trust in market dynamics and the calculability of performances developed. The central role of trust and the fundamental suspicion, bankers experienced within the crisis due to the insights in business practices within the financial sector, will be discussed in the paper related to the occupational field of retail banking. After outlining the historical development of retail banking in terms of institutional and occupational frameworks and inherent concepts of professional integrity, findings of my recent empirical study on retail banking in Germany are displayed.

TEACHING PROFESSIONAL ETHICS IN SPAIN AND MEXICO. THE UNIVERSITIES OF GRANADA AND NAVARRA IN SPAIN AND THE NATIONAL AUTONOMOUS UNIVERSITY OF MEXICO

ANITA HIRSCH ADLER 1, JUDITH PEREZ-CASTRO 2

1INSTITUTE FOR THE STUDIES IN UNIVERSITY AND EDUCATION, NATIONAL AND AUTONOMOUS UNIVERSITY OF MEXICO, MEXICO, CITY, 2Department of Education and Arts, JUAREZ AND AUTONOMOUS UNIVERSITY OF TABASCO, Villahermosa, Tabasco, Mexico

Abstract: The three universities agree that in the actual world situation and due to the frequent ethical dilemmas and conflicts during professional practice, it is vital to include contents about professional ethics in teaching university students. It is considered that it is not enough to prepare them in cognitive and technical competencies. It is necessary to include also ethical competencies. This idea is used in all the university subjects in the University in Granada. In the University of Navarra, for more than a decade, two subjects about professional competencies had been offered. The focus of teaching relates to six competencies: communication abilities, motivation and leadership, team work, professional integrity, abilities to negotiate and decision making and problems resolution. In Mexico, in the National Autonomous University of Mexico (UNAM), as part of the Research Project about Professional Ethics, we inter-

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
view the forty graduate coordinators. In relation to the way which they promote professional ethics, we obtained multiple and diversified answers. It is done principally through professors and tutors in the everyday interaction with students. It is also developed in research projects, in the high standards of intellectual capacity; with norms, guidance and reflection about ethical conduct and dilemmas; empathizing social responsibility, with collective participation and trans-disciplinary strategies, favoring collaborative and teamwork, with integral preparation, presenting the important university objectives and functions and by recognizing effort. The proposals of the three universities from Spain and Mexico are of great interest and importance to generate strategies to teach professional ethics.

THE COMPETENCY OF ECOLOGISTS – POSSIBILITIES OF NEW PROFESSIONAL GROUP IN RUSSIA DURING THE MODERNIZATION

Olga Nikolaevna Mamonova 1, Irina Alexandrovna Sosunova 2

1Dept.of Sociology, MOSCOW INSTITUTE OF SOCIO-CULTURAL PROGRAMS, 2Vice-rector, International Independent University of Environmental and Political Sciences, Moscow, Russian Federation

Abstract: The present study examined the possibilities of new social-professional group in modern Russia. The main hypothesis of research is that in contemporary Russia the new social-professional group is institutionalised, which features are: adequate axiological and emotional relation to society and nature, the availability of specific knowledge, capacities to creative action and thinking, which help them to analyze the real socio-ecological problems and to make the balanced optimal decisions in the sphere of nature protection.

The authors have aimed to gain a fresh perspective and to explore the issues of ecologists’ role and competency. In 2010 the in-depth formal interviews were used, more than 240 experts participated. The findings show that competency of ecologists is higher comparing with others professional groups of this field and they have a sufficient influence to other professionals. The group of ecologists differs a lot from the traditional specialists of ecology as a part of biology and “improvising” specialists of other specialties, who is occupied by socio-ecological problems of necessity because of the absence of true professionals. The new profession “ecologist” is characterised by unique specific – its sphere of activity for mass consciousness is quite uncertain and vague, even inside of scientific community there is the free interpretation of this definition. The modern practice gives the evidence that the disadvantage of professional ecologists leads to social, economic, political and other expenses which are predominant to the costs for their training and education. The institutionalization of the ecologists is influenced by its special characteristics: firstly, the special role of ecological ethics and morality in activity of the professional and secondly, the importance of professional activity of ecologists in conditions of local ecological crisis which leads to development of professional self-identity and appearing of professional pathos.

THE SIGNIFICANCE OF THE WORKING ALLIANCE IN THE PROFESSIONAL RELATIONSHIP BETWEEN ARCHITECT AND CLIENT—INTERPRETATION OF A LETTER BY FRANK LLOYD WRIGHT

Oliver Schmidtke 1

GOETHE UNIVERSITÄT FRANKFURT AM MAIN, Frankfurt am Main, Germany

Abstract: In my presentation I would like to focus on the professional relationship between architect and client. According to Ulrich Oevermann’s revised theory of professionalization, the relationship between an architect and his/her client is a working alliance (Arbeitsbündnis) anchored in the “crisis” that a given client needs to resolve. In my talk, I will start out with a brief sketch of the theoretical concept of professionalization and relate it to the case of architecture. An architect will need to understand his client’s specific needs and situation. His “professionalization” does not consist in providing expert knowledge but in a “habitus” interiorized through training, a habitus that enables him to adapt his know-how to his client’s peculiar requirements. As a sample case for detailing this theoretical perspective, I will present my interpretation of a letter that architect Frank Lloyd Wright (1867-1959) sent to his client Aline Barnsdall in 1921.

COMPARING PROFESSIONS UNDER NPM INFLUENCE

Teresa Carvalho 1, Rui Santiago 1, Andreia Ferreira 1

1UNIVERSITY OF AVEIRO AND CIPES, Matosinhos, Portugal

Abstract: Public policies and transformations in institutional and organisational arrangements developed under the New Public Management (NPM) are expected to promote changes in professional groups and professionalism.

The objective of this paper is to analyse and to conceptualise how the interplay between the ‘knowledge society’, the welfare state managerial policies and the reconfiguration of the bureaucratic-professional organisations, challenges professionalism in Portugal.

More specifically, in the framework of these interrelated changes the main purposes of this paper is to try to understand how the new epistemological, political and organisational intersected contexts may be producing transformations in the academic profession in comparison to health professions (such as medicine and nursing); reciprocally, in an agency perspective, how these professionals position themselves comparatively to these intersected contexts and its implications for each occupational group, specialized knowledge and professional bureaucracies.

The main idea that underpins this paper is based on the argument that traditional professionalism notions (based on the interplay between the organisation and the professional logics) are, possibly, being affected by the state political and managerial pressures to change the professional knowledge and the traditional ways professionals behave and perform. Public institutions (referred as post-bureaucratic organisations) are assumed in these processes as an intermediate element between state policies and professions. However, changes in professionalism can not be analysed only based on a ‘top-down’ and linear way. There are co-determinants and co-constrains between professions and state policies which take place in the micro-organisational field. In this sense, by contrasting the academic profession with the medicine and nursing, it is possible not only to apprehend what is particular and contextual in academic profession actual changes (as well as in medicine and nursing), but also what is common, allowing to a wide reflection on potential deprofessionalisation processes. The paper intends to reflect on present changes in university professors, physicians and nurses regulatory framework as a way to better understand changes in professional groups within the NPM context.
OUT OF THE FRYING PAN INTO THE FIRE? LEGAL PROFESSIONS IN POST-SO社會IST CONTEXTS

Rafael Mrowczynski

Abstract: The paper will compare how regulatory regimes of two legal occupations developed in post-socialist Poland and Russia. ‘Attorneys’, i.e. lawyers practicing either independently or in partnerships, and ‘legal counselors,’ i.e. legal specialists employed by organizations, will be in the focus of the inquiry.

Poland and Russia constitute two contrastive cases within state-socialist/post-socialist societies. They also differ as regarding the recent history of regulating legal professions. In Poland, two strong professional associations of lawyers—not just the ‘genuine’ bar association but also an association of ‘legal counselors’ (originally in-house lawyers)—had emerged from the collapsing state-socialist order. Since then, these two associations struggle with each other over jurisdictions. They also have faced increased pressure from the broader public to downgrade their closure practices. In particular, reforms of the mid-2000s have increased the role of the state in admission procedures and have also allowed non-associated law-school graduates to make inroads into attorneys’ and legal counselors’ jurisdictions. Russian associations of attorneys which existed under the Soviet rule only on regional level were unable to maintain their exclusive positions during the first post-socialist decade. After the de-facto collapse of the late-Soviet regulatory regime, Russian attorneys faced a stiff competition of lawyers who migrated from other legal occupations (state prosecutors, in-house lawyers etc.) and who started to create their ‘parallel’ bar associations. Only in the early 2000s, a new centralized system of ‘chambers of attorneys’ has been created with a vital support from the federal government which at the same time established institutionalized channels of interference in professional matters. Russian in-house lawyers—as opposed to their Polish colleagues—never succeeded in creating their own association.

The paper will aim at answering the question whether the post-socialist transformations have resulted in a strengthening of professional self-regulation or, on the contrary, have undermined the privileged positions of these occupational groups. Debates in professional journals, analyses of public discourses in the press and documents from archives will inform this analysis.

THE ACADEMIC PROFESSION IN A CHANGING INSTITUTIONAL ENVIRONMENT

Marc Torka

Abstract: The Academic Profession in a Changing Institutional Environment

Currently we are witnessing a comprehensive shift of the institutional environment for academic professions on a global scale. This begs the question as to whether traditional self-understandings, norms, values and practices of the academic profession will be maintained or dissolved in this transformation.

The dominant discourse assumes the latter and anticipates a “de-professionalization” of the academic profession (Schimank 2005).

The general loss of trust, new social expectations (“relevance”) and the predominance of management (“New Public Management,” “New Governance of Science”) have intensified the need for justification via heterogeneous quality criteria, and the implementation of external control mechanisms. Overarching research evaluation can thus be viewed as an epitome of de-professionalization. Due to this, there is a trend of moving away from professional autonomy, a “decline in collegiality” (Martin/Whitley 2010), and a dilution of professional standards, which are even being usurped by formal indicators of performance.

On the basis of a comparative analysis of evaluation processes at international level, the aforementioned expectations are not completely supported by research conducted in the scope of the British Research Assessment Exercise, the Dutch Standard Evaluation Protocols and the evaluation of the German Leibnizgemeinschaft. Typically, academics perform evaluations with a wide degree of decision-making freedom, which is allowed for by evaluation procedures, and, moreover, the evaluators refer back to professional and case-specific standards. Accordingly, they regard evaluative activities as a further contribution to the professional community in the form of “community work,” from which one cannot and may not withdraw. Due to the fact that decisions concerning the continuity of research content as well as funding are made by expert groups the evaluators are, themselves, confronted with mistrust from the scientific community. In reaction to this pressure, they return to professional standards, which must be supra-individual and applicable across disciplines. In evaluation processes one can observe the creation, concretization, and re-stabilization of academic norms by expert groups. This observation contradicts the thesis that research evaluations lead to a de-professionalization of the academic profession.

TOWARDS MULTIPLE PATHS OF PROFESSIONALIZATION IN KNOWLEDGE WORK ERA

Lara Ivana Maestripieri

Abstract: The continental sociology of professions, starting from the well-known article of Wilensky in 1964, has always considered the process of professionalization enacted by the so called liberal profession as an idealtype, valid for every occupation who wants to develop a new form of professionalism. However, this model might look too narrow in the turbulent panorama of knowledge working, in which the indetermination of professionalisms and multiplication of the paths seem to be the new standard.

In this paper, I would like to address the attention on a process of professionalization, which is currently carried out by management consultants in Italy. Thanks to a wide range of biographical interviews I’ve highlighted four (plus one) different idealtypes, which I called biographical trajectories, that show the transformation of consultancy from an occupational condition to a professionalism, which still lacks a public recognition of its role to become a well-established profession in the sense of continental sociology of professions.

The Italian case, particularly interesting because of its strong cleavages between protected professions (as liberal ones) and non regulated profession (as consultancy), will be an ideal case study to show the need for the problematization of a basic concept like professionalization to widen the conceptual tools that sociologists can
use to study the phenomenon of knowledge workers as professionals.

**ESTABLISHING SUPREMACY IN GOVERNANCE: THE FIGHT FOR PROFESSIONAL DOMINANCE**

Adriana Vilella Nilsson¹

¹CRESC, UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: One of the outcomes of crises is an often public reshuffle of the packing order of actors involved in their causes and management, with groups associated with the former generally compelled to reinvent themselves and/or cede space to different actors engaged in the latter. In other words, turbulent times bring to light the reordering of ideas and paradigms that inform governance. This phenomenon, however, is not restricted to crises but a continuous and somewhat understudied process in governance arenas: the fight for supremacy over policy solutions. This paper discusses the ‘invisibility’ of these processes in the political science literature, where the focus on structures as a key determinant of actors’ behaviour not only hinder a better understanding of how some ideas come to dominate but also presuppose the existence of conflict free and self-legitimating ‘epistemic communities’ able to function as transmission belts that feed society at large. In contrast, work on the sociology of professions offers compelling analytical lenses by considering how competition and cooperation among professional groups play a role in governance and lead to alliances and coalitions that go beyond institutional culture and public/private dichotomies. This paper illustrates the complex and strategic nature of these interactions by looking at the building of energy partnerships.

**NEW PROFESSIONALISM IN THE MAKING - THE CASE OF HEALTH TOURISM**

Katalin Formadi¹

¹Tourism Department, UNIVERSITY OF PANNONIA, Veszprem, Hungary

Abstract: In my former research I exploded how rapidly the health tourism sector is expanding and diversifying due to the market changes and fluctuations which imply in the rise of new health tourism professions. On the one hand side the state is interested in tourism development and professionalization as a vehicle of regional development, welfare as well as a field where consumer protection is needed. Thus clearly state policies related to the professionalization of tourism may be identified. On the other hand the fast changing market conditions and consumer demand tourism professionalization is also driven by market forces, the requirements of the tourist. Unlike traditional professions, the role of the market in professionalization (and of the more and more conscious consumer) does not emerge as de-professionalization, as the shift from the professional logic to market logic. Rather it is an initially new modus of professionalization, where an inherent interrelationship and division of tasks and roles among the professional bodies, the state and the market may be unfolded. The role of actors can be outlined however the process of professionalization is embedded into the social-economic context so it cannot be stated either the duration, nor the actual order, nor the effectiveness of tasks. In the process of professionalisation the roles and reactions of the actors to the others’ activities have varying effectiveness – the law-making of the state responses to the demands of the market at the lowest speed, while members of the professional organisations are ready for new challenges to form new skills and competences to provide services for the consumers and to maintain their confidence.

This paper aims at outlining a framework model of professionalisation in health tourism which involves a multidimensional approach measuring the characteristics of professions and the level of professional authority over the clients.

**THE SUBJECTIVATION PROCESS OF PUBLIC ACTION IN ROAD SAFETY EXPERTISE: THE CASE OF QUEBEC AND FRENCH MINISTRY OF TRANSPORT.**

Geoffrey Carrere¹

¹LEREPS, CAPITOLE UNIVERSITY TOULOUSE 1, Toulouse, France

Abstract: This paper will present a comparative study between the French Canadian and French road safety experts. Also, it wants to interrogate the transformation of engineering profession through the welfare state crisis.

Indeed, during the last years, Quebec and French Ministry of Transport have incorporated a new engineering tool in order to renew the assessment methods of road infrastructures. In this way, the road safety audit has been created between 2000th and 2001st with the intention of assessing road infrastructures through technical and driver knowledge. So, road safety audit appears as a radical transformation of engineering practices by the use of interactional knowledge (Collins & Evans, 2007). We analyse this interactional expertise as the consequence of the subjectivation process in public action (Cantelli & Genard, 2007). Subjectivation process arises from neoliberal state action rationality (Rose & Miller, 1992) and modifies the way to afford expertise in decision-making by the use of expert and driver rationalities.

In this way, this paper explains how the subjectivation process takes shape in the French and Canadian road safety expertise. We aim at presenting, first of all, the interactional practices through their original epistemic cultures. Then, we will show how the expert and driver knowledge interaction gives birth to an hybrid figure in the expertise: the expert-driver. In addition, we will try to understand the subjectivation process through the crisis of professions (Donald Schön, 1983) and the transformation of state action legitimacy (Rosanvallon, 2008).

**“BRAIN DRAIN” VERSUS “BRAIN NETWORKING”: A STUDY CASE OF THE SKILLED ROMANIAN IMMIGRANTS**

Petroff Alisa¹

¹Sociology, UNIVERSIDAD AUTÓNOMA DE BARCELONA, Barcelona, Spain

Abstract: The skilled migration is one of the components increasingly important in contemporary migration and the phenomenon is explained in the context of the business globalization, the internationalization of higher education, etc. From this perspective, the impact and consequences of the skilled migration (on both, sending and receiving countries) represent a recurrent issue in the literature. Nevertheless, the explanatory power of concepts such as “brain drain” is increasingly questioned by the scholars and new perspectives (that incorporate the earnings of the phenomenon for
the countries of origin through the setting of “brain networks”) are included. In this regard, the paper is structured in two parts. The first part is based on a literature review of the concept of “brain drain” and other concepts, such as “brain gain” or “brain networking”. A second part includes the results of the case study of GSPSociety, a Romanian brain network whose members are Romanian skilled immigrants, voluntarily involved in projects aimed to improve the living conditions in Romania. Moreover, the cluster analysis presented in the second part of the paper is based on a sample of 217 individuals, members of this network who have completed an online questionnaire.

GLOBALISATION OF RESEARCHER MOBILITY WITHIN THE UK HE: GLOBAL-ORIENTED ACADEMICS OR A ‘RESERVE ARMY’?

Nabil Khattab 1, 2∗, Steve Fenton 1

1The Centre for the Study of Ethnicity and Citizenship, University of Bristol, Bristol, United Kingdom, 2Sociology and Anthropology, THE HEBREW UNIVERSITY OF JERUSALEM, Jerusalem, Israel

Abstract: According to the Higher Education Statistics Agency (HESA) data in 2004-05, there were approximately 24,751 non-UK national academic staff within the UK universities constituting about one-fifth (20%) of all university staff in the UK. In this paper we deploy an analytical model to count for the presence of overseas-origin research staff in UK universities. The principal factors in this model reflect a number of empirical generalisations:

1. Research staff are concentrated in research-intensive universities and these are typically relatively large, internationally-known, prestige institutions;

2. We examine/offer three explanations of the presence of overseas staff in the UK HE system. The first of these three models could be characterised as reflecting high demand, research intensively filled by a ‘reserve army’ of overseas researchers. Equally the second reflects a reserve army of non-UK staff filling posts in weak-supply subject areas for teaching. The third model reflects an elite market for global-oriented academics.

In the paper we discuss and empirically examine these models by using data obtained from the Higher Education Statistics Agency for the academic year 2004-05 (HESA 2004-2005). The data include individual and institutional information on 124,378 academic staff employed in a 165 different higher education institutions in the UK. Due to the hierarchal nature of the data, in the analysis we use a multilevel techniques with individual staff constitutes Level-1 data and universities constitute the Level-2 data (Snijders and Bosker 1999; Bryk and Raudenbush 1992; Hox 2002).

According to the data that are presented in the paper, it has been found that overseas staff are most likely to be attracted to the most prestigious universities in the UK (such as Oxford, Cambridge and UCL) to fill mainly research posts in a narrow range of subject areas such as engineering and IT studies and in arts and humanities on the basis of fixed term contracts. However, we found some significant differences between the old and most prestigious university and the new post-92 universities in the way the overseas staff are being incorporated within the university system supporting some of our analytical (theoretical) models. These differences will be presented and discussed in the conference.

NEGOTIATED FEELING OF BELONGING AMONG DOCTORS WITH IMMIGRANT BACKGROUND IN SWEDEN

Lisa Maria Salmonsson 1

1DEPARTMENT OF SOCIOLOGY, Uppsala, Sweden

Abstract: This paper focuses on preliminary analysis of in-depth interviews with 3 doctors who have immigrated to Sweden. The word ‘immigrant’ is central in these professional stories and is related to feeling of professional belonging. Preliminary findings imply that professional identity based on medical speciality is, for the interviewees negotiated together with feeling of being an outsider. I suggest that the feeling of belonging in these stories consists of different constellations of: (1)Professional identity and (2) feeling of otherness. Belonging is therefore changing. These negotiated identities are used as strategies to get fully accepted by patients, colleagues and nurses.

TURBULENT TIMES FOR SANITATION: „DOING MORE WITH LESS” POLITICS OF AUSTERITY AND (NEW) RACE, CLASS, AND SEX INEQUALITIES AMONG NEW YORK CITY’S SANITATION WORKFORCE

Natalie Benelli 1

1Centre en Etudes Genre LIEGE et Labo de Sociologie, UNIVERSITE DE LAUSANNE, Lausanne, Switzerland

Abstract: This contribution addresses material and symbolic race, class, and sex inequalities among sanitation professionals in New York City. It discusses shifts in the labor division between public and private sanitation and shows how race, class, and sex structure work conditions and discours on professionals in both sectors.

The New York City Department of Sanitation (DSNY) is in charge of residential garbage collection, street sweeping, and snow removal in the city’s five boroughs. Thanks to a strong union, wages, health care benefits, and pension plans for DSNY rank-and-file improved throughout the 1960s and early 1970s. Since the mid-1970s, resources allocated to DSNY decreased constantly, resulting in the suppression of manual sweeping in the late 1980s. However, New York City’s streets are cleaner than ever as private organizations like the Business Improvement Districts and work training programs for marginalized individuals increasingly invest in manual street sweeping.

The shift from public to private manual sweeping results in the partial replacement of public union jobs with private non union jobs. The latter are precarious, with salaries at minimum wage and often no benefits or pension plans. This labor division creates new race and class inequalities among the overwhelmingly male sanitation workforce. The skilled municipal workforce is traditionally white, whereas native and foreign born Blacks and Hispanics—often with a history of homelessness, imprisonment and/or substance abuse—from the majority of the private workforce.

Analysis of websites, newsletters, union documents, newspaper articles and interviews with sanitation management and workers in the public and private sectors shows important differences in the way the City sanitation workforce is constructed in contrast to private workers. Municipal workers are depicted as heroes engaged in the daily battle against garbage, dirt, and snow. Employment in DSNY equals being good husbands and fathers. In contrast, private
sanitation workers are depicted as individuals who thanks to their hard work (re)gain their status as deserving members of society. In their case, street sweeping is essentially a disciplinary device that will help them acquire work ethic.

CHANGING CAREER CONCEPT: ORGANIZATIONAL AND/OR INDIVIDUAL CAREER?
Vikinta Rosinaite ¹
¹Department of Sociology and Law, UNIVERSITY OF APPLIED SCIENCES, Vilnius, Lithuania

Abstract: Recent transformational changes influenced changes of the concept of career. From the historical point of view only in the beginning of nineteenth century was career defined as the progressive course of professional activity. As the environment of career development changed, so did the concept of career. In the first half of the twentieth century, the concept of vocational guidance first appeared in industrialized western societies. Its purpose was to guide people and help them to choose their profession. During 1950’s, career researchers began advocating the idea that career is not only a one-time choice of a profession, job or education programme, but instead a life-long process. Vocational guidance was replaced by career guidance and the concept of organizational career became increasingly more common. It was characterized by professional stability, loyalty to one organization, various incentive mechanisms, work longevity and security etc. Changes in social, economic, demographic, technological and organizational contexts over the last two decades facilitated the birth of the individual career concept.

Some claim that the organizational career is no longer relevant in the modern context and must be replaced by individual concept of career, along with the new forms of career that this concept would entail (Arthur, Rousseau, 1996; Arnold, Jackson, 1997; Peiperl and Baruch, 1997; Arthur, Claman, DeFillippi, 1995; Hall, 1976). Some authors (Collin, Young, 2000; Cohen, Duberley, Mallon, 2004) think that approach is still prevalent in career theory. But the penetration and adequacy of the new concept of career in the modern context could be criticised with following aspects: the irrevocable replacement of the organizational concept of career with the individual one; the limitations of the situational context on the individual’s autonomy to independently develop their career; the universality of the concept of individual career and its application to all professions and economic sectors; the tentative originality of the concept of individual career; the waning of organizational influence in developing personal careers; the marginalization of objective indicators of career success; the advantages of life-time employment to individuals and employers. Therefore the aim of this presentation is to analyse the penetration and adequacy of the new concept of career in the modern context.

PROBLEMS OF LEGALIZATION OF HEALERS ACTIVITY IN RUSSIA
Elena Pavlova Salo ¹
¹Department of International Cooperation, INSTITUTE OF SOCIOLOGY OFRAS, Moscow, Russian Federation

Abstract: In Russia, the main founding document for the healing activity is the “Fundamentals of the Legislation on Health Care.” Article 57 of the document asserts the right to engage in national medicine (healing) on the basis of a healer diploma. However, “Fundamentals of the Legislation...” are allowed to carry out medical activities only to persons with medical education, and a diploma of folk healer is not provided it.

Healers “are not engaged in treatment” from the formal point of view, their activity is not licensed and has no clear standards for certification.

Healers do not need a medical diploma; they work like any other taxpayers – businessmen, social organizations, and have proper accounts.

So far, health authorities in the Russian Federation, in practice, do not regulate national medicine and do not issue healer diplomas, although the laws in our country must govern all spheres of human activity. Nevertheless, the healing has a legislative framework. However, not all know about it. About healing and national medicine is written in the “Law on Health Care”. The diploma is the permission for the healer work. And to regulate healers work must self-regulating social organizations – professional associations in the field of healing.

Thus, the legislative framework is created, a form of work permission is provided and the procedure for obtaining permission is registered. Professional associations are better than anyone else could determine the degree of skill and quality of the healer work and decide whether to give him permission for working. But for some reason the system is not working.

In 2005 there appeared “System of Voluntary Certification” of the services in the field of national medicine initiated by Russian Health Supervision.

It was assumed that the certificate of conformity would replace permission to engage in healing. Criteria for the certification system were such that only people with medical education can be certified honestly, without violations of the law.

Resolution of legal issues in the field of national medicine representatives of social and active healing community see in the need to:

• adopting a separate law on national medicine and governmental regulations on the procedure for obtaining permissions and rules to engage in national medicine;

• running arrangements on organization and training of healers in the limits of educational programs.

QUESTIONNING THE HETEROGENEITY OF PREVENTIVE CARE PROVIDED BY FRENCH GENERAL PRACTITIONERS
Géraldine Bloy ¹, Laurent Rigal ² ³*
¹Laboratoire d’Economie Gestion UMR CNRS 5118, UNIVERSITY OF BURGUNDY, DIJON, ²Family practice, Univ Paris-Descartes, Paris, ³CESP U1018, Inserm, Le Kremlin-Bicêtre, France

Abstract: Prevention is regarded as a potential lever to reduce morbidity rates and social inequalities in health. Although the answer to these issues cannot only rest in improving people’s health-related behaviors or health care system efficiency, healthcare givers are supposed to become more involved in prevention. General practitioners (GPs) are considered as well-placed professionals to provide preventive care but their practices in this matter are still hardly known in France.
Primary care organization and GPs' training nevertheless shapes a framework which is not in favor of prevention: in France, primary care is mainly provided in private offices by GPs working alone, depending on patients’ demands, receiving fees for service and used to focus on individual and curative care. Public health concern is barely established, while GPs professional segment has historically lacked legitimacy and has never been assigned clear missions. Public policies have recently intended to remodel GPs’ conception of professionalism by promoting new financial incentives and organization innovations.

Our aim is to specify and analyze real French GPs’ preventive practices through two empirical studies:

A quantitative one, examining how main preventive cares (lifestyle and dietary rules, cardiovascular risk and cancer screenings) were offered by 52 GPs from the Parisian area to 3600 patients, demonstrated great heterogeneity among GPs, despite their belonging to the same health care and payment system. It is worth noting that usual variables describing the organization of work at the office (mainly depending on GP’s choices) only partly explained inter-GPs variability. This was an invitation to explore more precisely the features and components of different GP’s practice styles.

A qualitative study is ongoing, based on interviews with about 100 GPs to understand how one’s practice style is constructed as far as prevention is concerned. We intend to refer it to the GP’s biographical trajectory, to his/her dispositions or ideas about the GPs’ social role, participation in local and professional environment, style of relationship with patients and connection to processing scientific knowledge. The way they assume preventive care is revealing of the way they use the autonomy the French system allows them. This autonomy is precisely at stake in contemporary public regulation attempts.

RECENT CAM MANOEUVRING IN RELATION TO THE MAINSTREAM HEALTH-CARE SYSTEM IN PORTUGAL: THE CASE OF ACUPUNCTURE AND HOMEOPATHY

Joana Almeida¹

¹Criminology & Sociology, ROYAL HOLLOWAY UNIVERSITY OF LONDON, Egham, United Kingdom

Abstract: The proposed paper is part of broader research that has been conducted in Portugal about the relationship between the medical orthodoxy, the State and complementary and alternative medicine (CAM) at the dawn of the 21st century. Through an analysis informed by a social closure framework, Abbott’s system of professions and the concept of ‘countervailing powers’, this study identifies the main closure strategies of two CAM therapies, acupuncture and homeopathy, to acquire legitimacy and occupational closure within the mainstream health-care system in Portugal. Data are derived from in-depth interviews with 10 traditional acupuncturists and 10 traditional homeopaths, and also from an in-depth documentary analysis. The findings suggest three strategies, similar in both CAM therapies: compensatory strategies, strategies of professionalisation and strategic coalitions. These are strategies enacted by acupuncture and homeopathy in order to facilitate their inclusion into the mainstream health-care system and the biomedical habit. It is argued that the use these therapies make of the above strategies is contextual and contradictory and provides useful information in understanding the manoeuvering nature of CAM actions. It is argued that CAM can be thought of as attempting to ‘colonise’ mainstream health-care and its underlying biomedical model, by pressuring them to accept new rules of behaviour and alternative pathways to healing. Such CAM attempts can be conceptualised as a process of ‘CAMisation’ whereby a set of micro, meso and macro level strategies are put into action by CAM in order to acquire occupational closure and legitimacy in mainstream health-care.

THE INTERSECTING ‘TURBULENCES’ OF CULTURE AND THE GENDERED CONSTRUCTION OF THE MEDICAL PROFESSION IN SOUTH AFRICA

Angelique Colleen Wildschut¹

¹Education and Skills Development, HUMAN SCIENCES RESEARCH COUNCIL, Cape Town, South Africa

Abstract: A study investigating the reasons underlying possible gendered attrition trends in the South African medical profession, contains findings of relevance to a broader consideration of the intersecting ‘turbulences’ within the globalised professional health workforce.

The study notes the international trend of the increasing feminization, in itself a contested term, of medical education and the profession, and illustrates that this is also a reality in the South African context. It frames the feminization of the South African medical professional and educational context as being plagued by difficulties very similar to those encountered in other traditionally male-dominated fields. Employing a feminist-organisational approach, and highlighting the term ‘feminization’ as a discourse on gender and medicine, the study attempts to uncover the gendered assumptions that surrounds this phenomenon as a possible driver of attrition. Using Rao’s (1999) conceptualization of the gendered substructure, it considers whether a gendered organization of medicine, is evident in the South African case.

The study importantly finds that respondents clearly recognize the presence of a gendered substructure in medicine in the South African context, and identify some elements of this structure as most commonly linked to attrition. Furthermore, the finding illustrate respondents recognition of these oppressive institutions, not only as passive observers, but active agents involved in resisting and actually changing these institutions. However, as much as the data illustrates this resistance, it also illustrates how these women also contribute to the construction of gender in the medical profession, based on older values associated with hegemonic masculinility.

These findings provide a very appropriate vantage point for consideration of, and debate around, the responsiveness necessitated by social relations in turbulent times. It clearly illustrates the continuity and change inherent in professional institutions, and the importance of understanding the substructures/cultures that inform these institutions.

WORDS AND DEEDS: A CASE STUDY OF NURSE-D OCTOR COLLABORATION IN A CLINICAL SETTING

Majda Pahor¹, Barbara Domajnko¹

¹UNIVERSITY OF LJUBLJANA, Ljubljana, Slovenia

Abstract: Background
The paper discusses interprofessional collaboration between nurses and doctors in health care team. There is research evidence about the importance of team functioning for patients' outcomes and for health professionals' work satisfaction. In Slovenia, this topic has been studied using a survey and interviews which looked into the health professionals' attitudes and perceptions of the interprofessional relations and collaboration. To understand how a health care team really functions, also other research approaches are needed.

Methods

Case study with combination of qualitative and quantitative methods. Attitudes about collaboration were measured using scales. The process of collaboration itself was studied by unstructured and structured observation and interviews. Qualitative content analysis performed on observation and interviews data used both deductive (starting from an 'ideal type' team collaboration) and inductive approach (searching for contents that we didn't expect). The case under study is a health care team in a clinical surgical setting.

Results

The attitudes about collaboration are more positive than in the national survey performed in 2005, and analysis of data from observations and interviews points to the 'team in development'. There are differences between nurses and doctors in describing characteristics of the team collaboration. Doctors are more positive than nurses in general, but both professional groups are critical regarding the formalization tools and the role of the management in supporting the team work.

Discussion and conclusion

The research study has been an interesting and stimulating experience for both researchers and participants. After the conclusion of the study, representatives of the observed team took part at the conference where the results were presented and commented on them. It seems that some changes regarding elements of team work (common goal, internalization, formalization and leadership, D'Amour 2008) would improve clearer priority awareness, more open communication and more involvement of both doctors and nurses in the decision-making.

THE REMODELING OF NURSE - PHYSICIAN PROFESSIONAL RELATIONSHIP AND THE SOCIAL REFORMS

Maryam Mehrabi1, 2, Shirin Ahmadiana3, 4

1A Social Researcher of the Department of Social Health, the Ministry of Health, 2 A Member of the Medical Sociology Group, the Sociological Association of Iran, 3A Member of the Sociology Department, Univ.of Allamaeh-Tabatabai, 4the Head of the Medical Sociology Group, the Sociology Association of Iran, Tehran, Iran, Islamic Republic Of

Abstract: This is a sociological critical study into the nurse - physician professional relationship and the impacting factors of power and gender. We considered relational systems in the community were affected by two important elements: a. triple social structures (i.e. institutional structure, relationship structure and embodied structure) and b. Actors’ agency. This research was conducted based on a survey using a semi quota sampling method that involved 50 female nurses and 50 male physicians who were working in nine hospitals (Under Tehran and Shahid-Beheshti medical sciences Universities) in Tehran, the capital city of Iran in summer 2009. According to the research findings, the nurse-physician professional relationship models were found to be descending in the following order: First, dependence—independence model as a pattern typical of a transitional period, second, in-dominant – dominant model as a typical traditional pattern, and third, the cooperation-participation model as – the weakest pattern emerged here, which however was seen to be as an indicator of a new trend toward modern social system being formed in the community. In addition, according to results of the regression analysis, the most important factors which somewhat have regulated the professional relationships consist of occupational socialization, gender stereotypes, organizational supports concerning professional authority and the agency actors’ share of power. Moreover, our findings also show that the patriarchal system is an important factor that is impacting directly and indirectly on the vertical power relations in traditional stage and also the physicians’ charismatic authority empowerment in the current transitional stage. According to the findings, the global feminismovements and the social reforms emerging concerning gender and power equality have increased nurses’ awareness and raised the nurses’ demands towards forming of nursing' new professional content and identity.

Key words: nurse _ physician - professional relationship—hospital-social reforms- Iran

VIAGRA AS A CHALLENGE? CONSEQUENCES FOR THE PROFESSIONAL IDENTITY OF PHYSICIANS

Claudia Sontowski1

1Faculty of Social Sciences, GOETHE-UNIVERSITÄT FRANKFURT AM MAIN, Frankfurt am Main, Germany

Abstract: The human body appears to be increasingly modifiable and shapeable by the use of new medical procedures and new body related individual practices. PDE-5-inhibitors like Viagra, Levitra and Cialis – used successfully in treating erectile dysfunction for almost thirteen years now – can be described as such an enhancement of bodily capacities. Central premise of my presentation is that these drugs thereby transgress both conventional constraints of medical treatment and boundaries of the medical system.

Viagra and other PDE-5-inhibitors increase men’s ability to achieve an erection and thus alternate between medical treatment and bodily enhancement, especially for older men. As a pharmaceutical, Viagra is part of a medical context. At the same time, it has been established beyond the medical system for recreational use and as a kind of a life-style drug. My presentation aims to explore the meaning of this twofold boundary-crossing for the professional identities of physicians. How do physicians deal with Viagra in their professional routines? How do they assess the blurring boundaries between treatment and enhancement? Does the highly individualized consume influence their self-image as professionals? To answer these questions I will reconstruct the perspective of physicians on PDE-5-inhibitors drawing on interviews with urologists and general practitioners from an ongoing research project on the local appropriation of Viagra in Germany.

All participating physicians are continuously asked for PDE-5-inhibitors by their patients in their daily routine. Their ways of handling these requests differ especially in their respective interpretations of their professional role. While some of the participants, particularly clinical physicians, stabilize medical authority by insisting on professional knowledge as the only valid frame for treating erectile difficulties, others tend to describe themselves as course-
lors guiding men (not necessarily “patients”) through new possibilities of sexual enhancement. Analyzing these different patterns of interpretation allows not only to describe the everyday handling and meaning of PDE-5-inhibitors, it provides empirical insight on how transboundary medical technologies are integrated in professional identities.

**LAND, LAW AND MONEY: PROFESSION, STATE, AND KNOWLEDGE-BASE IN THE CASE OF 19TH CENTURY SURVEYORS**

Ola Agevall

School of Social Sciences, LINNAEUS UNIVERSITY, Växjö, Sweden

Abstract: Definitions and theories professions and professionalization have long been tailored on a set of professions established in England during the 19th century. Chartered surveyors belong in that group, but have not received the attention afforded to other members of the core set. This paper, conceived as a contribution to a theory of the relation between state, knowledge and profession, draws on the historical case of 19th century British surveyors. It analyses the interface between state and profession, in an age when it became increasingly important to “reconcile the principle that the domain of the political must be restricted, with the recognition of the vital political implications of formally private activities.” Surveyors were claimants to a configuration of tasks – centred on the nexus of land, law and money – which made them an important auxiliary to the state apparatus and its technologies. This paper traces, through comparison of British surveyors over time and through juxtaposition with Swedish surveyors, how these tasks, and a corresponding knowledge-base, were shaped by the inclusion of new subspecialties and a complex legal environment.

**REFORMING THE POLICE THROUGH TRAINING? THE HARD IMPROVEMENT OF NEW RECRUITS’ RELATIONAL SKILLS**

David Pichonnaz

1Dpt. of Social Sciences and CMH (ENS-EHESS-CNRS), U. OF FRIBOURG (SWITZERLAND) AND EHESS (FRANCE), Fribourg/Paris, Switzerland

Abstract: Many studies have evaluated police reforms, especially in North America. In parallel, the literature about police recruits’ socialization is relatively wide. But only few researches combine these two aspects.

My communication will analyze the obstacles that weaken a police academy’s attempts to train police recruits able to resist some of the traditional characteristics of professional culture. Formulated as objectives, the reforms are based on the promotion of relational skills. However, it appears that such objectives are rendered null and void by the interpretations that the recruits themselves make of such relational skills, by way the practice is organised within the different police corps to which they belong to, as well as by the professional doxa leading to contradictory conceptions of professionalism taught by the instructors.

Accordingly, these obstacles are internal and external. The external ones are those that are not from the responsibility of the academy. We can indeed observe that the life course and the motivations to enter the profession of some recruits lead them to have a contradictory view of professionalism than the one promoted by the instructors. Police corps’ organization can also render some relational skills impossible to use, for example in allocating no resources for community policing, despite the fact that recruits have been trained for it. The main *internal* obstacle consists in contradictory views of professionalism that are taught by the instructors. They promote a relational approach of the police’s publics, but at the same time they present the future working environment of the new recruits as overly hostile and dangerous. Moreover, the way the use of force is taught leads the young police officers to articulate danger, violence and aggressiveness in a way that is in conformity with the professional doxa but is antithetic to the use of relational skills.

This communication is based on direct observation at the police training centre, an analysis of the training manuals, a questionnaire given to the recruits at the end of their training, and interviews made with them after one year of practice.

**SCHOOL AND PROFESSIONAL IDENTITY: BETWEEN SOCIALIZATION AND PROFESSIONALIZATION PROCESSES**

David Miguel Tavares

1Sociologia, ESTESL-IPL/CIES, Lisboa, Portugal

Abstract: The purpose of this paper is to analyse the influence of school, at the higher education level, in the production and transformation of the professional identity of the group subject to study, through socialisation processes (1), and through professionalization processes and projects (2).

In terms of the first dimension (1), the results of the research revealed that the educational institution influences the production of professional identity as socialisation agent yielding structural identity values, references and forms of identification and identification inherent to professional culture. However, this influence is limited because several of these values, knowledge and forms of identification are modified in work contexts, frequently originating a rupture with school education and partially diluting the effects of school socialisation processes.

Concerning to the second dimension (2), the results of the research confirmed the influence of school in the production and transformation of the professional identity of the observed group operated both by means of the strategic guidelines defined for education and of the impulse given to professionalization processes and projects of the group centred around the new legitimacy parameters produced by the increase of the levels of formal qualification.

**THE PROFESSIONALISING OF IDENTITIES WORKERS IN ASSOCIATIONS RECOGNIZED TO BE OF PUBLIC INTEREST**

Audrey Amougou

1Economie et Sociologie, UNIVERSITE PARIS 10 NANTERRE, Nanterre, France

Abstract: Recent sociological research shows that non-profit-making organizations are experiencing diverse forms of turbulence, causing diverse and differentiating processes of change such as mobilizing professional services and professionalizing groups. These processes of change have to great extent changed the structure of occupations and the discourses of professionalism. At the same
time, the cultures of work as well as workers identities are changing.

French sociologists who study professional occupation are in the position to examine and make sense of the new trends that concern the object of their research since 2000. Question engaging researchers include: How do these turbulent times affect the contents of work, tasks and skills in a non profit making association?

A major aim of my paper is to shed light on whether these workers can be seen as professional groups. My sociological methodology is based on French qualitative study (participant observations, in depth interview and focus group) carrying out in a non-profit making association specialized on poverty. I’ve been addressing the questions of workers about the sense and nature of work, trainee and skills.

The results of my empirical research reveal there are some characteristics of occupation profession in their social life. First of all, professional careers have been developing and organizing in order to remodel occupations and organization as professional groups, attract labor qualified and keep experienced workers in the association.

Then, professional trainees have been growing so as to make develop their level of technical skills and competences in their task and also obtain social recognition of these workers. Now, their skills can be recognized by attribution of diploma based exclusively on proven professional experience (in French is validation d’acquis par experience). It gives them the feelings of being professionals.

Finally, Managers have been creating ethics groups so as to develop standard practices and behavior. It can authenticate them as professional group on labor market.

**MANAGER OF PERFORMING ARTS. MYTHS, METAPHORS AND RETHORICS OF A PROFESSIONAL MODEL.**

Valerio Zanardi

1teoria sociologica/ceccups, UNIVERSITY OF BARCELONA, barcelona, Spain

Abstract: I began my observation of theatre and festival organizations approximately 10 years ago, discovering an increasing number of people engaged in developing managing careers in the field of Arts Management. I noted that the proliferation of post-degree courses for theatre organisers was increasing the pressure on occupational demand: legions of new and aspiring theatre managers were arriving and attempting to enter into the already over supplied occupational market. This supply of new labour to theatre and festival organizations was predominately in the form of internships and work placement opportunities for volunteers. Nonetheless, in last years The narrative of economic crisis in the public sphere, has heightened the perception of the characteristics of instability and segmentation of cultural-work, boosting an increased awareness of the weaknesses of its utopianization. I carried out an empirical research on the administrative and technical staff working in different art festivals both in Italy and Spain, where the organizational structures are generally configured according to a restricted core of stable employees, surrounded by a consistent number of temporary collaborators and volunteers. Moreover, a growing number of practitioners from academic programmes have lately been joining in as stageurs.Attracted from the charisma of the festival, a very huge number of students and aspiring new managers, were beginning to build their own future career and professional network. The opportunity to access a free human resources deeply changed the structure, the values and nature of the festival organization, generating diverse and interesting consequences. In this paper, gathering evidences from the fieldwork, and discussing some critical suggestions from sociological literature, I will endeavour to illustrate that nowadays: The recent implementation of bridges between formation and employment generate perverse effects; Training period is definitely transformed in a “parking area” for the excess of occupational demand; Theatre field can be considered as an experimental laboratory, where new forms of occupational integration develop as outcomes for other labour fields; This mechanism of apparent occupational integration, can be considered a device of deprofessionalization in Arts Management.

**PRIVATE SECURITY PROFESSIONAL GROUP AND SOCIAL INSECURITY IN SHOPPING CENTERS**

Sofia Alexandra Cruz

1Department of Social Sciences, FACULTY OF ECONOMICS, UNIVERSITY OF PORTO, Porto, Portugal

Abstract: The analysis of professional groups in contemporary societies allows understanding changes trough work and organisations. The aim of this paper is investigate the relationship between private security professional group and social insecurity in shopping centers. The main question is to what degree the goal of maintaining safety of people and goods in shopping centers mobilize professional services in private security that deal daily with unpredictable and have no ability to negotiate the management of different kinds of turbulence existing in shopping center.

The private security activity has sociological interest at two levels. Firstly, the act of guard hides a balance of power that is exercised whenever and in whatever form (public or private). Secondly, security aims to address the lack of information concerning the people supposed to be guard.

The security staff at the shopping center does not have police powers. The procedures of their actions do not seek proper compliance with the civil laws, but rather to the protect shopping center (people and goods). However, they produce some restrictions on the behavior of those who visit shopping centers, for example: no smoking, no picture, no skating, among others.

This empirical study is drawn upon from a larger study that includes three other professional groups (management, marketing, cleaning), among a specific organizational context such as the shopping centre.

The empirical support is the statistical data from the Population Census (1981, 1991 and 2001), the Portuguese Classification of Occupations (1994), and research findings from 20 interviews conducted with security staff among the 5 larger shopping centers (concerning all employees existing on it) located in the second biggest city of Portugal (Porto).

The results highlight tensions and contradictions in the daily private security activity, because they have to guard people, without having power to solve problems as they have to report all things that happened in shopping centers to their superiors who take decisions. The results also show that such constraints shape insecure professional selves.
PSYCHO-SOCIAL TRAITS OF INNOVATION WORKERS: DEVELOPMENT OF A SOCIAL CONSTRUCTION OF INNOVATION (SCI) SCALE

Margarida Croca Piteira 1, Teresa Cristina d’Oliveira 2

1SOCSIUS, HIGHER INSTITUTE OF ECONOMICS AND MANAGEMENT, 2Social and Organizational Psychology, Higher Institute of Applied Psychology (ISPA), Lisbon, Portugal

Abstract: According to the literature on innovation studies there is a gap when we explore the role of social interactions in organizational scenario. Usually the innovation research has been oriented to the technical and technological processes, forgetting the relationships that occur between different organizational actors and their personal features.

There is also a lack of agreement in this topic, namely about the variables that should be included to explain the innovative effort, the nature of individuals’ interactions, and even the appropriate research methods to measure the organizational innovation. Thereby it is imperative to develop scales that address objective indicators of the social dynamics of innovation.

Recently a set of quantitative indicators to interpret the innovative activities has arisen (e.g. European Innovation Scoreboard; Oslo Manual of European Community) which included, for instance, the number of patents, the volume of scientific publications, the RD expenditures, the number of highly skilled workers...

Despite all these efforts and instruments still remains the requirement to keep innovation under critical reflections, to improve the comprehension and explanation of their social processes. Thus there are missing scales that incorporate the psycho-social traits of innovation workers.

This paper proposes a scale which aims to measure and evaluate the social processes of innovation (SCI), focusing the psycho-social traits of professionals that operating in innovation activities, and the nature of their relationships. Based on literature review several dimensions have emerged, such as: 1) Leaders and leadership skills (c.f. Scott e Bruce, 1994; McClelland, 1975; House, 1977; de Bass, 1985; 1999); 2) Innovation Climate (c.f. Goleman, 2000; Kivimaki et al., 1997; Van Dyne et al., 2009); 3) Social interactions (c.f. Weick, 1979; 1995; Feldman, 1985; Ulrich e Lafasto, 1995); 4) Corporate culture (c.f. O’Reilly, 1989); 5) Creative skills and learning ability (c.f. DiBella et al., 1996; Amabile, 1996, 1988).

To maximize the ability to manage the innovation process, organizations need to have a framework and a set of tools to drive their practices and strategy. So, it is also imperative following the quantitative approach and developing scales to help the innovation professional to mapping the dimensions of innovators profile.

THE ROLE OF TEACHER TRAINING TO PROFESSIONAL IDENTITY DEVELOPMENT: THE PHYSICAL EDUCATION PRE-SERVICE TEACHERS’ PERSPECTIVE.

Inês Cardoso 1, Ana Luisa Pereira 2, Paula Maria Batista 3, Amândio Santos Graça 3

1PhD student, 2Sport Sociology, FACULTY OF SPORTS, UNIVERSITY OF PORTO, 3Sport Pedagogy, Center of Research, Education, Innovation and Intervention in Sport, Faculty of Sport, University of Porto, Porto, Portugal

Abstract: The understanding how the pre-service teachers experienced the contact with the real practice at schools and how this process contribute to their professional identity (PI) it is a important issue to better comprehend the implications of the practical in the initial training for teaching. Thus, the research about the (re)construction of the PI assume great importance, the outcome of an interface between the personal experiences of teachers and the social, cultural, and institutional context in which they function on a daily basis (Day, Flores, 2005). The better we understand the impact of the pedagogical training represents in teacher education, the better we can respond to prospective teachers’ needs. So, the aim of this study was to analyse the perceptions revealed by student teachers at the end of their student teaching and their perceptions after getting into the job market. Additionally, we tried to inspect if there was any connection with their initial expectations. This is a qualitative study that stems from a constructivist vision to reach a better understanding of the student teachers’ perceptions. Participated in this study six Physical Education teachers that took a pedagogical training between the school years of 2000/01 and 2004/05. The participants have teaching experience in secondary education (to of them had one year of experience, two had four years and the others two had seven years). Data collection is carried out through the analysis of final reports and semi-directive interviews. The discussion of results goes through three distinct moments: 1) comparison of analysis categories; 2) comparison of opinions about the student teaching experience and the changes they suggest, as they know reality in other contexts; 3) comparison of the evolution of their concept of work through a longitudinal analysis of the initial expectations, the final student teaching reports and the interviews. The main conclusions are: a) the pedagogical training develops in the Physical Education teacher the necessary abilities that enable him/her to work with children and youngsters; b) when they get into the job market, teachers keep the same perception they used to have at the end of their student teaching.

INTERPROFESSIONAL COLLABORATION ON A WARD OF INTERNAL MEDICINE: A QUALITATIVE STUDY OF ROLE PERCEPTIONS AMONG NURSES AND DOCTORS

Virginie Juge 1, Katherine S Blondon 2, Stéphane Culliat 2, Patricia Hudelson 2, Fabienne Maître 2, Nu V Vu 2, Georges Savoldelli 2, Mathieu R Nendaz 2

1UDREM, FACULTÉ DE MÉDECINE, Genève 4, 2Hôpitaux Universitaires de Genève, Genève, Switzerland

Abstract: Studies have shown that interprofessional collaboration between doctors and nurses contributes to the quality of teamwork, a necessary condition for optimal patient care. In order for team members to collaborate effectively, they must share a common perception of each team member’s role. One of the aims of our study was to describe and compare doctors’ and nurses’ perceptions and expectations of each other’s roles, in general and in situations of interprofessional collaboration.

Preliminary results suggest that doctors and nurses may understand and conceptualize each other’s roles differently. Hence they may lack shared notions of interprofessional collaboration. Interprofessional training initiatives may be one approach to fostering such a shared vision and understanding of each other’s roles and responsibilities, and thereby contribute to improved patient-centered care and patient safety.
THE PASSIONATE PROFESSIONAL: NEGOTIATING CONFLICTING DEMANDS OF PROFESSIONALISATION AND VOCATION
Sara De Jong, Bernhard Weicht
1ALETTA, INSTITUTE FOR WOMEN’S HISTORY, Amsterdam,
2University of Utrecht, Utrecht, Netherlands

Abstract: Currently, almost everyone in the labour market is faced with the demand to increasingly professionalise in their job. This call for professionalisation, involving heightened educational and training standards for employees as well as added bureaucratic procedures for transparency and accountability, has equally touched the world of so-called ‘moral work’. NGOs for example have replaced volunteers with professionals and have been forced to adjust their organisations according to efficiency standards. Equally, the care sector is gradually shaped according to these developments with an emphasis on targets, skills and measurable outcomes. This paper seeks to interrogate how the demands of professionalisation play out in the realm of ‘moral work’, where another set of values, (com)passion, emotive approaches, helping/caring, and personal commitment including self-sacrifice, are equally expected from the workers. In other words, how do those for whom their job should be their ‘vocation’, become professionals and deal with the associated double demands?

For this paper, we draw on two sets of empirical work, a study of the construction of care work for elderly people and research on the negotiated identities of women NGO workers. We seek to identify the ‘double bind’ of contradictory pressures in these two fields and to explore to what extent and how professionals act and react to the demands for professionalisation. Do the moral workers choose one clear-cut narrative to establish their professional identity or are new (hybrid) forms of identity created? We will argue that regardless of which path is pursued, all ‘moral professionals’ have to negotiate the burden of conflicting standards.

THE SOCIALIZATION INTO THE TRANSMOBILITY (IN THE SOCIAL WORLD OF LIFE-SCIENCE LABORATORY)
Izabela Wagner
1Institute of Sociology, UNIVERSITY OF WARSAW, Otrębusy, Poland

Abstract: In some professional careers the pathways are strongly related to the international mobility. This is the case of researcher’s career. The results of my study (ethnography realized in different countries - France, Poland, Germany, USA – since 2003; almost 400 formal interviews) show that there is no one type of mobility, but there are several different types of it: a) early, b) basic, c) expert and d) late. During their careers scientists experience all these types of mobility. This constitutes a process, which I called TRANSMOBILITY. Transmobility is the crucial element of the construction of a researcher’s career. My presentation is devoted to the socialization of young scientists into the Transmobility. I will focus on experience of early mobility – showing how students who work in laboratories integrate the skills, which they perceive as typical of the international standards of research work. Those standards are nowadays necessary for pursuing of a researcher’s career in life-science. In conclusion I formulate some suggestions about the study of the process of internationalization, which concerns a career of professionals. These propositions should be helpful not only in the studies of scientist’s careers but also in the analysis of other types of career of Transnational Professionals.

PATTERNS AND CONTEXTS OF ENTREPRENEURSHIP IN PORTUGAL
Maria das Dores Guerreiro1, Alice Rosa Alexandre1, Ana Isabel Couto1, Margarida Barroso2
1CIES-IL, ISCTE – INSTITUTO UNIVERSITÁRIO DE LISBOA, Lisboa, Portugal

Abstract: Sociological approaches on entrepreneurship have increasingly been paying attention to gender as a crucial dimension of analysis. Even if in recent years the creation of businesses by women has become more common, entrepreneurship as a set of practices and representations continues to emerge as an institution characterized by profound gender differences. Why do women create businesses less often than men, and when they do so, why does it occur in quite different activities?

These gendered social dynamics are analyzed in the research project “Gender, Entrepreneurship and Qualifications in Portugal”, funded by the Portuguese Commission for Gender Equality – Presidency of the Council of Ministers. The main goal of the study is to examine entrepreneurship patterns in Portugal, how they affect the daily functioning of Portuguese SME, and how they influence the life course of individual entrepreneurs.

This paper will present the qualitative dimension of this research which was based on comparative case studies of SMEs managed by both women and men. Through the elaboration of individual sociological portraits of entrepreneurship we highlight the factors that promote or restrict their behaviours and attitudes regarding entrepreneurship. We give special attention to the ways in which gender is articulated with other factors such as age, social class and qualifications in determining entrepreneurship behaviours.

TO BE OR TO WORK AS – OCCUPATIONAL IDENTITY AS SELF-IMAGE
Ylva Ulfsson Eriksson1, Malin Linde1
1Dep of Sociology, GOTHENBURG UNIVERSITY, Gothenburg, Sweden

Abstract: During the last decade, scholars have claimed that people to a lesser degree identify with their occupation. New conditions of working life, such as an increased demand for flexibility and mobility, are assumed to lead to a more unbound relation to the occupation and to the employing organizations. The basic assumption is that an individual that frequently change jobs will not be sufficiently socialized to an occupation, i.e., the occupation do not ‘have time’ to become a grounded part of a social identity. Thus, occupation becomes only something we ‘do’

Others consider occupations to still be of great importance for people’s social identities, implying that an occupation is something that we ‘are’. The concept of social identity highlights aspects of an individual’s self-image that is affected by the context in which he or she is part of. An occupation is by all means a relevant context. Since people seek a positive self-image it may be that the prestige of a certain occupation determines whether it constitutes a source of identity. An occupation associated with high prestige may contribute to a positive self-image and therefore be more attractive as a part of an identity that an occupation with low prestige. Further,
professionals have a higher educational degree and stays within the same occupation for a longer time due to investments in education and training. One can assume that these circumstances affect questions of occupational identity. Occupational identity is also fostered by a strong occupational culture and ideology. A hypothesis is that people in high status occupations, professions and occupations with stronger cultural framing have a more stable relation to the occupation and thus also express a stronger occupational identity. The paper intends to answer questions such as: Is occupation as a source of social identity? What influences weather people adopt an occupational identity? Does occupational prestige matter? Do individual factors matter or aspects of occupational prestige? We focus on the issues self-image, i.e. if people say ‘I am’ or ‘I work as’. Empirically we approach this issue by the use of a data from two different status studies: a survey study on occupational prestige and an interview study on how incumbents in low status occupation experience their occupations.

ACADEMIC INBREEDING: CONTRIBUTING TO ENLIGHTEN THE PHENOMENON IN THE PORTUGUESE ACADEMIA

Sónia Cardoso 1, Orlanda Tavares 1, Teresa Carvalho 1, Sofia Sousa 1, Rui Santiago 2
1 CIPE, CIPE, Matosinhos, 2 CIPE/UA, CIPE/UA, Matosinhos/Aveiro, Portugal

Abstract: During the last decades, academic profession in Portugal has been under deep changes. More marked in the last couple of years, due to new legislation framing academic profession, these changes are also evident in the emergence of more informal and flexible procedures for academics’ recruitment. Nevertheless, a common practice within this recruitment has remained, translated in the enrolment of academics directly from the whole of students attending a given course or from the PhD students of a higher education institution (HEI). Usually known in the literature as inbreeding, this phenomenon assumes a high expression in the Portuguese academia, although not higher than in other European and non-European countries. Still, one can identify in the Portuguese case a shortage of research on this phenomenon. One has little knowledge on the scientific areas and type of HEIs where inbreeding is more present. Are these areas constituted by nursing and law, as suggested in studies concerning other national contexts (Fossum 2006; Kornruth & Miller 1985; McBrier 2003; Miller 1977)? As stressed by some authors (Berelson 1960; Burris 2004; Santabáñez et al 2005; Yamanaka 2005), are research oriented universities (holding the ‘monopoly’ of PhD’s) the ones where academic inbreeding is more likely to occur? Is the phenomenon more evident in ‘traditional’ or ‘recent’ institutions? Which factors reshape the features and ‘distribution’ assumed by inbreeding? Driven by the attempt to answer these questions, the paper aims at contributing to deepen the knowledge on the inbreeding phenomenon in the Portuguese academia. A quantitative study is undertaken supported by a database of Portuguese academics (N=42296) comprising information on the HEI where they have completed their highest academic degree, where they are currently employed, and on the main scientific area where they develop their activity. The results derived from the statistical analysis of data (based on descriptive statistics and variance analysis) suggest that, in the Portuguese case, academic inbreeding assumes, indeed, a relevant expression. Further, significant differences can be found amongst scientific areas and accord-

ing to the type of higher education institution to which academics belong to.

FAMOUS, RISK-LOVERS AND COMMITMENT: AN EMPIRICAL RESEARCH IN PERFORMING ARTS IN PORTUGAL

Vera Sousa Borges 1
1 Instituto de Ciências Sociais, UNIVERSIDADE DE LISBOA, Lisboa, Portugal

Abstract: In the United States, France and England there is detailed literature on famous and risk-lovers in arts. How can we explain a successful commitment in arts? What different kinds of factors are implicated or better explain the probability of success in artistic career paths?

The aim of this paper is to analyze how artists are linked to the artistic field. Specifically, we will analyze different sociological aspects that characterize the commitment of artists to the fields of theater and dance; and how this is related with the turbulent times we live today.

The results of a study with 187 artists (65 dancers and 122 theatre actors) reveal that famous and risk-lovers commitment is organized in three dimensions: an objective dimension, composed of the different incomes earned by artists with the artistic work and the degree of involvement in the profession; an subjective dimension, constituted by the satisfaction of artists with their work, their income and by the perception that their time is being invested in art; and a risk dimension, characterized by the desire to abandon one uncertain profession, by the temporary abandonment of the profession and by the amount of time without artistic work.

FRAGILE CAREER CHOICES IN ACADEMIA IN TURBULENT TIMES: “OPENNESS” AS A CAREER MANAGEMENT STRATEGY IN THE TRANSITION FROM THE DISSERTATION TO THE POST-DOC-PHASE

Heike Kahler 1
1 Department of Social Sciences, UNIVERSITY OF HILDESHEIM, Hildesheim, Germany

Abstract: Scientific careers have always been risk careers, especially in the German system of science and academia. In this scientific career system careers still are only constructed as leadership careers by politics and law. The career success of academics lies in gaining a full professorship, of course tenure. All academics who want to reach this top position are forced to vertical and geographic mobility – without having a guarantee to succeed. If one does not succeed this ‘failure’ is considered as a personal problem. So, in Germany, academic careers are risk careers. This is especially true in turbulent times when academic institutions are under pressure to change and to revise their organizational standards and career system. These changes go hand in hand with growing uncertainties in personal career management strategies of young scientists.

In my paper I will reflect on a typology of career management strategies of young male and female political scientists and chemists in the transition from the dissertation phase to the post-doc-phase. This status passage is characterized by the challenge that the young professionals have to decide whether they want to try to
become a professor or whether they want to work outside of academia. So they need an individual risk management to cope with the uncertainties in their career decisions. The most interesting type is the type of "openness". Professionals who belong to this type have not yet decided about their professional career paths in the future and want to leave it open. How they construct their wishes to leave their career choices open will be discussed in the light of institutional changes in science and academia. Special attention will be given to social inequalities as gender, social background and life style.

My arguments are empirically based on findings from the research project "Academic careers in political science and chemistry: orientation, planning and consulting in transition to the post-doc-phase". The project under my leadership has been funded by the German Federal Ministry of Education and Research and the European Social Fund of the European Union since March 2008. A Main part of the research design consist of 60 qualitative interviews with young male and female academics from chemistry and political science.

MEDICAL PROFESSION AND CAM IN SWITZERLAND

Jérôme Debons

Abstract: Complementary and alternative medicines (CAM) are growing in popularity. In modern western countries, CAM users have increased since the 1970’s. The medical profession — that is the established medicine — is therefore challenged by CAM. In Switzerland, associations of CAM-doctors are part of the medical establishment and try to promote integrated health care. The regulation of CAM by medicine and by the State is therefore an interesting issue for sociology of professions. My presentation is based on a PhD thesis in progress, which aims at analysing and understanding professional identity and careers of homeopaths in the French part of Switzerland. In this presentation, I will first focus on some historical and political events concerning regulation and professionalisation of CAM in the Swiss healthcare contest during the last twenty years. I will then give some results of my first interviews’ analysis about the professional identity of homeopaths today (here homeopaths are mainly GP’s). I will conclude with some general aspects about GP’s specialisation for homeopathy in relation to the division of labor in the medical profession.

JAPAN AND US COMPARISON OF A RELATIONSHIP BETWEEN THE SOCIAL MOBILITY AND THE INTENTION OF PROFESSIONALS

Masayo Fujimoto

Abstract: This report shows the analysis of a relation between social mobility and intention of professionals. The data in this analysis was chosen from US Silicon Valley as a high mobility area and Japan as a low flow area with interview and questionnaire before investigation. The professionals of high mobility society were the cosmopolitan who commits an occupation rather than an organization as theoretically described. Even with the similar kind of professionals, there are many professionals of the low mobility area who depends on the organization, and do not expect to change his/her job. More than half of professionals in high mobility area experienced to be discharged, and they always are nervous for the employment continuation. They cannot trust on the company for their employment continuity, and keep their individual or private connection. Though this tough conditions, there are many people who keep their motivation for the business of their company. On the contrary, Professionals in the low mobility area rarely experienced to be discharged, and trust their belonging company, but have less motivation for the business of their company. Through this study, it has become clear that the intentions of professionals are affected by the employment system, even for those professionals who are said not to be influenced by social mobility.

LABOURMARKET AND COMPETENCE OF THE EMPLOYEES

Nina M. Arsentieva

Abstract: Level of requirements to the length and quality of professional education of the specialists in the innovational sector cannot be satisfied by the existing federal standards of basic higher professional education. The problem becomes especially important when it comes to specialists in the area of engineering and technology (specific competence). The system of supplementary professional education is not always ready to meet such challenges of the innovational sector of economics. There are different solutions to this problem that are being implemented by the innovational companies: they include professional fellowships of a specialist in the leading scientific and educational centers in Russia and abroad, financially covered by an employer; etc. The problem is solved much easier when speaking about specialists in the area of economics, management, logistics, etc. (functional competence). The system of supplementary professional education of young specialists, employed in the innovational projects in this professional segment is quite well developed in the region.

Generally, difficulty of the fulfilled work in the innovational sector stimulates interest of the employees in self-education and improvement of one’s own professional skills. Thus, 43,4% of them read specialized literature, 39,5 % personally learn new technologies, methods, computer programs; 28,9 % stay informed in the area of scientific and technological innovations, and 39,5% get additional education.

PROFESSIONAL CAREERS OF RUSSIAN SPECIALISTS: FROM IMPACT OF CRISES TO NEW PROSPECTS?

Irina Popova

Abstract: The purpose of the paper is to analyze the processes of formation of new socio-professional groups through the transformation of the situation in the sphere of employment of people with higher education - workers for hire, through analyzing individual professional careers and their changes. The analysis is based on the biographical study «Institutional, motivation and individual factors of social mobility in the period of reforms», 2009-2010, N=79 (Russian Foundation of the Humanities, grant № 09-03-00626a). The paper focuses on the impact of employment structure changes on professional careers and biographies of highly skilled workers; professional career and biographical patterns in major occupational groups. The methodological basis for the analysis is an approach.
utilized in biographical research that examines the importance of studying socio-historical context in shaping of social structures through the biographies of people. We are focusing our attention on the moments of crisis in the trajectories of employment of these professionals. This point is important in various aspects. On the one hand, it is due to the special situation of societal transformations in Russia (after the regime change). Here, the external environment is a defining factor. On the other hand, it is due to the general trend of changes in the balance of spheres of employment (and their institutions) in modern societies. Here, external structural conditions also play a significant role, but, apparently, personal circumstances – motivation, ability to recognize a new opportunity and make it a part of your biography, can play a greater role. One of the research questions is – what types of prospects for professional development are created by changing patterns and structures of professional careers.

PROFESSIONAL MARKETS AND PRESENT-DAY PROFESSIONALISM IN THIRD SECTOR ORGANIZATIONS
Ana Paula Pereira Marques 1,2*, Telmo H. Caria 3, Margarida Silva 4
1 DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF MINHO, 2Research Centre for the Social Sciences (CICS/UM), Braga, 3 Department of Economy, Sociology and Management, 4University of Trás-os-Montes and Alto Douro (UTAD), Vila Real, Portugal

Abstract: Within ongoing project "SARTPRO-knowledge, Autonomy and Reflexivities: Professional work in the Third Sector" (PTDC/CS-SOC/098459/2008), we intend to discuss the "new directions" of occupational and organizational professionalism that emerge as a mechanism for controlling work and workers. Recent developments in professional practice in organizations of the Third Sector in Portugal have challenged the extent to which are we before (quasi) labour markets in the sense of the incorporation of "rules of the game", standardized procedures and logics of "closure" of professional practice. Also, the pressure to adopt management models close to the logic of the New Public Management have forced changes in the relationships between these organizations and the State and its public policy objectives, namely those of profitability and results, as well as accountability practices and their relationship with customers-users. Our basic hypothesis will consider to what extent these trends of transformation in the governance models, based on increased flexibility of working relationships, fostering both professional instability and control, are articulated with the requirements of trust, initiative and improvisation of professional practice. The question is to know how are learning capabilities regarding the regulation and negotiation of diverse and complex know-how and autonomy (re)produced, especially by professionals in multidisciplinary work teams (different training in social sciences). We will resort to structured interview data obtained of empirical work (interviews conducted to 63 professionals working in organizations of the Third Sector). Privileging a micro analysis, we intend, in this communication, to understand the inter-professional transformations and the occupational structure resulting from the growing heterogeneity of diplomas in close professionalization areas, particularly in the social sciences, anticipating the reflection about their career paths and transformations in the conditions of professional work (e.g. autonomy/ control margins; hierarchical/ collegiate relationships; orientation to goals/ quality and mission of the service provided), as well as to their benchmarks in terms of identity, status or prestige.

HAZARDS IN MANAGERS’ BIOGRAPHIES AND HINDERED PROFESSIONALIZATION
Anja Schröder-Wildhagen 1, Markieta Domecka 2, Ulrike Nagel 3, Katarzyna Waniek 3
1Institute of Sociology, Otto-Von-Guericke-Universität, Magdeburg, Germany, 2 School of Sociology, Social Policy and Social Work, Queen’s University, Belfast, United Kingdom, 3Institute of Sociology, University of Lodz, Lodz, Poland

Abstract: A core feature of professionalized managers is their ability to transcend the powerful demands of the economic ratio that accompanies today’s work tasks of managers. Executives who act in a professional way develop an integrated, mediating perspective in which they are aware of the manifold social foundations of work and agency in the economic sector. Biographical experience back-grounds that sensitize managers to the social dimension of work and life as well as social frames and processes in corporations that support non-economic action orientations of managers are crucial social conditions of biographical professionalization processes.

However, biographies of managers are often endangered: by uncontrolled career advancements that lead to losing biographical identification grounds; by not working through hurtful experiences and by distrust towards entrusted employees resulting from these experiences; by heteronomous mentality structures in the organization, and by erratic organizational processes and upheavals, as well as by the dominance of economic ratio oriented towards increasing efficiency and profit maximization. Value orientations and thus sense-making sources of managerial work become systematically undermined in such biographical developments. Under these circumstances awareness of managers for the manifold social requirements of their work can hardly develop.

The analysis of autobiographical-narrative interviews makes it possible to examine why a manager would act in a specific social situation the way she or he does and what would be effects of her or his actions both with regard to work and the development of his or her life history. In the presentation key dimensions of hazards of biographical developments of managers and their detrimental impact on professionalization processes will be outlined. In particular, the following phenomena will be looked at:

[1] Endangered biographies or chance to professionalize when managers are working abroad in new cultural contexts

[2] The difficult task of managers to maintain a sense of autonomy under conditions of constraint

[3] Trajectories of suffering in careers of managers: problems of social isolation and of ignorance of social requirements, and learning chances when dealing with these problems

PROFESSIONALIZATION OF CIVIC SECTOR AND CHANGE OF SECTOR IDENTITY – THE CASE STUDY OF CZECH CIVIL SECTOR
Magdalena Štovicková 1
1 CHARLES UNIVERSITY, FACULTY OF HUMANITIES, PRAHA, Prague, Czech Republic

Abstract: In the second half of the 90th and the 20th century we could observe formation of a professional civil sector in Czech Republic. This process was attended by discussion principally on the implica-
itions for the professionalization of the civil sector. One of the main issue was if professionalized civil sector is able to cultivate specific sector values.

Recently, it is possible to consider the civil sector in Czech Republic be professionalized on the basis of organizational forms and action of representatives. Civil section has a rich institutional base (both at the internal differentiation of roles and functions and the level of channels of communication with the society) which helps to maintain and to stabilize the identity of sector.

As the example of the conflict between professionals and volunteers, which was previously interpreted as a challenge to the identity of the civil sector, I want to show how this conflict is increasing the reflexivity of the sector contrary to its own identity (for example conflict leads to the creation of alternative activities, discourses and organizational forms in the public sphere), how the professionalization of the civil sector is changing sector identity formation (for example volunteer work in professionalized civil sector is regaining both symbolic and practical value for the identity of the civic sector and the NGOs themselves) and how the professionalization has changed the concept of what is "civic" behavior (authentic citizenship is not associated only with voluntary work).

**TWO PRINCIPLES OF GOOD ELDERLY CARE: ACTIVATION VERSUS SERVICE?**

Hanne Marlene Dahl\textsuperscript{1}, EIGIL BOLL HANSEN\textsuperscript{2}, Leena Eskelinen\textsuperscript{2}

\textsuperscript{1}Dept. of society and globalization, ROSKILDE UNIVERSITY, Roskilde, \textsuperscript{2}Danish Institute of Governmental Research, Copenhagen, Denmark

**Abstract:** NPM brings new understandings into elderly care and has recently in Denmark taken a turn towards quality. Quality has, amongst others, been implemented through a general focus upon the self-determination of the elderly and more specifically through various policy tools such as Free Choice (2003) which is a possibility for the elderly to choose a private provider. Stressing the self-determination of the elderly and the help provided as service is potentially at odds with one of the existing principles of elderly care, namely the professional principle of help-to-self help. It aims at activating the elderly person to manage as much as possible themselves and is based upon a socio-pedagogical culture, where the professional is teaching elderly people about the proper behavior. It’s based upon a formal knowledge of aging and upon different techniques to motivate and involve the elderly.

These are clearly different logics. However, no research has so far studied how these concepts are translated from a national to the municipal level to groups of home helpers and to individual home helpers. And how are these principles played out in different contexts of private firms and public providers? Different contexts that are subject to the same national legislation concerning the amount and character of the help provided, through amongst others the provider-performer model.

In this paper we use material from 12 focus group interviews and participant observations from four municipalities (both private and public providers) conducted in 2010 to investigate how these different logics are played out. Using neo-institutional theory we analyze whether a layering of principles is the case, or alternatively contradictory logics are at play in elderly care.

**HEAD PROFESSIONALS UNDER NEW PUBLIC MANAGEMENT – OLD WINE IN NEW BOTTLES? IDENTITY AND PERSONNEL POLICY OF POLISH HEAD TEACHERS IN THE RESTRUCTURED POLISH SCHOOL SYSTEM.**

Katarzyna Kopyscka\textsuperscript{1}

\textsuperscript{1}Institut für Soziologie, MLU HALLE-WITTENBERG, Halle, Germany

**Abstract:** The question under study is the identity change of polish head teachers in the context of public education reform, introduced in Poland in 1999, which brought about many elements of what in the literature has been labelled New Public Management (Hood). The most prominent of these were a decentralisation of service provision, an introduction of quasi markets and voucher based financing, and strengthening of the role of head teachers, making them directly responsible for personnel affairs in their schools. The change in institutional arrangements does not necessarily bring an immediate change in practices of the managerial personnel, though (Kitchener). Empirical evidence shows, that especially in strongly professionalized fields, such as public schooling or medicine, where professional affiliations of front line managers remain strong (Kirkpatrick, Ackroyd), the adoption of a managerial outlook will always be fragmental (Exworthy, Halford). On the other hand there is some evidence of internal vertical divisions within professional groups getting stronger (Freidson). The questions of identity change of public managers – professionals, are especially interesting in the context of possible changes in managerial practices resulting from the adoption of new ideals. To what extent is there a departure from the traditional model of internal labour markets in public professional organizations based on seniority and high employment security to be expected?

The paper rests on a study of expert interviews with 15 head teachers in different regions in Poland. Although qualitative Interviews with polish head teachers show some moderate signs of managerial identity (semantics, organizational focus), there is still a wide spread commitment to “good employer” values and the social welfare of professional practitioners still poses a major concern of the head teachers. Under the falling demand for public schooling due to demographic changes such avoidance of external personnel measures, as characteristic for professionalised fields of the public service provision, results in major labour market closure, which poses a threat to generational renewal of the teaching staff (Lutz).

**DIVERSITY IN ENGINEERING PROFESSIONS: LONGITUDINAL STUDY OF TRANSFER STUDENTS IN ENGINEERING**

Clemencia Cosentino\textsuperscript{1}

\textsuperscript{1}MATHEMATICA POLICY RESEARCH, Washington DC, United States

**Abstract:** Stubborn disparities persist in the representation of women and ethnic minorities in engineering professions in the United States. Since both groups are likely to begin their studies at a junior college and later transfer to a university to complete their degree, the transfer student population constitutes an important object of study to enhance our now-limited understanding of the factors associated with student retention and diversity in engineering. This study will contribute to the literature on transfer student retention, which relies heavily on cross-sectional data or the creation of synthetic cohorts, by using a large longitudinal data set with
over 700,000 student-level records, focusing on subpopulations that are generally not represented in sufficient numbers to be the focus of analysis (women, ethnic minorities), and comparing non-transfer to transfer students. More specifically, this paper will explore methodological alternatives to modeling factors associated with transfer student success in terms of graduation with an engineering degree and other measures of achievement (overall and by subgroups), discussing in particular limitations of these alternatives and methodological issues encountered, such as problems of endogeneity. The paper will also present a review of the existing literature, descriptive statistics on the native and transfer student populations, and a detailed discussion of the proposed analytical approach to elicit feedback from conference participants. The longitudinal database to be used for this study—MIDFIELD (Multiple-Institution Database for Studying Engineering Longitudinal Development) hosted by Purdue University—presents a unique opportunity to study the transfer student population to (a) uncover the factors associated with retention in engineering for different subgroups of students and (b) test existing and develop new methodologies to study transfer student outcomes in a longitudinal setting. This work is supported by the United States National Science Foundation.

HOW PROFESSIONAL GROUPS JUDGE AND EVALUATE THE PROFESSIONAL COMPETENCE OF OTHER PROFESSIONS

Gunnar Olofsson 1,2

1School of Social Science, LINNAEUS UNIVERSITY, Växjö, Sweden

Abstract: Within the Swedish research project “The Professional Landscape” we have new data on how seventeen professions evaluate the professional competence of a large number of professions, This paper will present data on how Swedish professions evaluate the professional competence of each other (and some other occupations as well). The number of interviews is around 5,000.

The paper will discuss how we can interpret the reciprocal evaluations — the level as well as the (a)symmetry - of the competence ascribed to different professions as a consequence of their cognitive basis (different or similar), which generation of professions they belong to, their cooperation/conflict within an occupational domain (e.g. physicians, nurses and biomedical scientists in the health care domain) and their social status.

KNOWLEDGE AND POWER IN PROFESSIONAL EDUCATION: THE IMPACT OF SOCIAL RESOURCES ON PROFESSIONAL STRATEGIES.

Gitte Sommer Harrits 1,2

1Department of Political Science, AARHUS UNIVERSITY, 2Unit for the Study of Professions, VIA University College, Aarhus C, Denmark

Abstract: Professions or professionalized occupational groups are at the centre of the Welfare State, combining high levels of education and expertise with the need for concrete discretions and practical engagement. However, it still seems as if the importance of professions and the role of knowledge in occupations more generally, are not well understood empirically — at least in a Danish context, which this paper addresses. Especially the link between knowledge, power and social resources seems to be understudied, since present research tends to focus primarily on the one and not the other.

This paper therefore seeks to contribute to the study of professions and the link between knowledge, education and power, and the point of departure is that knowledge is a form of power and that it thus should be studies together with other forms of power. More specifically, the paper presents a comparative study of Danish professional educations, addressing the research question: Is there a relationship between social and cultural resources among students recruited and the professional or occupational strategies held by these students. In other words: Is there a relationship between the mobilization of social and cultural resources qua the recruitment of students and the professional identity and “social closure” of the profession. Or is it the case that professional education (or perhaps some professional educations) in itself is the provider of cultural resources and expertise, enabling a high degree of closure and a strong professional identity.

The theoretical perspective of the paper is mainly Bourdieusian, meaning that professions and professional educations are conceptualized as a field of social and symbolic relations, in which general social hierarchies may or may not have a structuring effect. Methodologically the paper presents some of the first results of an e-survey conducted in October 2010 – January 2011 among students at different professional study programmes in the Mid-West Region of Denmark, comprising a variation of subject fields, organizations and study programmes. The research question is addressed both at the individual level and as a comparative study between professions.

TURBULENCE IN NURSING EDUCATION AND PRACTICE IN TURKEY: THE CASE OF GULHANE MILITARY ACADEMY OF MEDICINE, TURKISH ARMED FORCES, VOCATIONAL SCHOOL OF HEALTH

Leyle Simsek-Rathke 1

1Sociology, MARMARA UNIVERSITY, Istanbul, Turkey

Abstract: This study is based on the life stories of nurses who, in order to become a nurse, had four-year high school education in a certain boarding school, Gulhane Military Academy of Medicine, Turkish Armed Forces, Vocational School of Health. That school was established in Ankara —one of the major targets of rural immigrants- in 1972 and functioned until 1995 to supply the nurse demand of military hospitals all around Turkey. It was, then, gradually replaced by university level nursing schools.

Graduated from that school, approximately at the age of 18, the nurses interviewed for this study were assigned to work in a military hospital in any part of Turkey. After a three or four-year office, they could ask for their appointment to another city they wished. They were demanded to work at least for four years as a compensation for their education, as it was financed by public sources. The research is conducted in three big cities, Ankara, Istanbul and Izmir, between 2008 and 2011, and based on several unrecorded and 45 recorded in-depth interviews with nurses. While the interviews were conducted, five of the nurses had already retired and three of them had changed the profession entirely. The rest were still working in different units of the military hospitals in those cities.

Nursing in health system has long been a vital, but undervalued and not much appreciated career. With this judgement in mind some of the concerns of the research were to understand the reasons why...
young women incline to that job, the class affiliation, income level and motivation of the parents who send their children to that military boarding school, the status and mobility of nurses in class hierarchy as well as the role of gender in education and work life, the characteristics of education and practice in nursing, the level of job satisfaction and the changing dynamics in nursing education and practice in time.

Nursing education in Turkey, today, has widely been provided through university education although there are still institutions providing nursing education giving four-year high school diploma. This study, referring to changing conditions, focuses on the dynamics of a period we have almost come to an end in nursing as vocational nursing schools are widely replaced by nursing departments of public and private universities.

PROFESSIONAL AND GENDER ARRANGEMENTS IN TURBULENT TIMES. CHANGES AND CHALLENGES IN HIGHER EDUCATION AND CARE

Maria Dammayr1, Kristina Binner2

1Institut für Soziologie, JOHANNES KEPLER UNIVERSITÄT LINZ, Linz, Austria

Abstract: Recent changes in different professional fields have impacted on and resulted in parallel occurring changes of gender arrangements. Our focus is on the fields of care and higher education in Austria. We will examine if these changes affect gender in/equalities by elaborating the current state of research and analysing the professional self-understanding expressed in organisational models.

In both fields we are witnessing an "economical shift" through the implementation of New Public Management strategies. Universities search for new criteria and forms of efficiency to increase scientific "output" and challenge the androcentric professional model following the Humboldtian ideal of research and teaching. A new entrepreneurial concept of science, which is accompanied by new job profiles and career models is consistently gaining importance.

In the public sector collective welfare like care arrangements are being reduced. Their bureaucratic and administrative structure is substituted by new forms of marketisation. Hence, we consider various efforts of professionalisation as a result of distinguishing care from the medical tradition. Meanwhile, interactive and interpersonal care work becomes more and more part of a new taylorism as processes of economisation enforce managerial work.

These processes are linked to a complex reorganisation of gender arrangements: In academia we observe a historical deprivation and feminisation opposed to the contemporary combination of affirmative actions and initiatives of excellence by which women gain increasing access to universities. Indeed, the androcentric academic self-understanding erodes, at the same time we can witness new gendered segregation-lines in regard to work content and contract.

Looking at "care", a stable sex segregation in higher positions, is accompanied by new forms of ethnic segregation amongst women, hence, precarious, atypical work conditions as well as skilled and unskilled jobs are established. In both cases we can illuminate, that and in what ways, the turbulent developments of professional work are gendered. Specifically, this manifests itself in a new division of labour and new professional model of scientific and care work.

Overall we argue that economisation has effects on processes of professionalisation and deprofessionalisation. Deeper analysis reveals that these processes are related to gender.

YOUNG WORKERS: ACCUMULATION OF EDUCATIONAL RESOURCES AND PROFESSIONAL TRAJECTORIES

Galina Cherdenichenko

1INSTITUTE OF SOCIOLOGY RUSSIAN ACADEMY OF SCIENCES, Moscow, Russian Federation

Abstract: 2009 thousand young workers of industry (processing and hi-tech productions) at 13 regions of Russia were polled. Accumulation of educational resources and its influence on professional trajectories was studied.

Accumulated educational resource (school education, professional training and training during work) has a direct influence on the achieved skill level and size of salary. However, growth possibilities are limited by technological possibilities of production. It stimulates an exit of a part of youth from working profession.

Among those who became workers having a large educational resource (full secondary school or secondary professional college) intensively accumulate a human capital and achieve higher qualifications; about one third of them are not stabilized in this status and aspire to leave working profession, this position is transit for them. But two thirds of such workers remain in production. However, the highest stability of working profession belongs to workers, having a small baggage of school education, preparation at technical college or at the courses - and to whom this base education prevents to move upwards on educational and qualification levels.

Typical trajectories "Horizontal" (57 % of a massive): low school education, training of working professions at technical college and at a working place leads to mass and low qualifications. Those not stimulated to professional advancement and study make the most stable personnel satisfied with a low salary work. Here stability is sooner forced – few alternative possibilities.

"Progressing" (27 %): large volume of school capital, intensive accumulation of educational-professional resources, achieving high qualifications. Further growth is stopped by technological restrictions. Partially "transit" workers are formed.

"Vertical" (16 %): base secondary education or secondary professional college, intensive improvement of qualification, most qualified personnel. Big educational ambitions are expressed in getting higher (or secondary professional) education that leads to achieving positions of a technician or an engineer.

CHALLENGES OF PROFESSIONAL KNOWLEDGE-BASED AUTHORITY?

Jens-Christian Smeby

1Centre for the Study of Professions, OSLO UNIVERSITY COLLEGE, Oslo, Norway

Abstract: A basic assumption in the sociology of professions is that professional status, authority and autonomy rely on a specific knowledge base acquired in some kind of higher education. The inflation of educational credentials as well as a growing contestability of knowledge claims in modern society challenges the traditional
professional knowledge-based authority. Moreover, professional competence is composed of codified knowledge, practical skills, values as well as personal abilities, and more of these aspects are to a great extent developed in professional work. Unskilled experienced workers may, therefore, challenge the authority of especially newly qualified professionals. Lack of workplace or related experiences may undermine professional authority. It may also be questioned what kind of tasks that are performed more adequate by trained professionals than unskilled workers. When the professional knowledge-based authority is questioned, the very basis of the third logic is also eroding.

Kindergarten is an interesting case to explore the extent to which knowledge based authority is developed in a newer profession. Preschool teachers are not just a new but also a weak profession. Many of the tasks are quite equal to family care for children. Moreover, political reforms in Norway implying that all children older than one year applying should be accepted into a kindergarten. The result is a significant higher proportion of children less than three year old implying that the knowledge based authority may have become even harder to develop.

To shed light on the extent and how professional knowledge-based authority are challenged in kindergartens self-reported occupational certainty and competencies among pre-school teachers and unskilled kindergarten assistants are examined. The analyses also include the two groups’ assessment of whether pre-school teachers or assistants are best suited to perform different tasks. Data are based on a survey conducted in a representative selection of Norwegian kindergartens in 2009. Preliminary results indicate that there is a weak division of labour in Norwegian kindergartens and pre-school teachers assess nursery assistants’ competence as rather equal to their own. More or less the same pattern is found among nursery assistants.

**TACIT-KNOWING AND EXPERIENCE-BASED SUBJECTIFYING ACTION**

Fritz Boehle

1SF Muenchen, Muenchen, Germany

Abstract: The term “tacit knowing” is based on the idea, that there is a kind of knowledge which is “incorporated”. Which means “within our body”, and which is based on the experience of our body.

Our arguments start from this view of “tacit knowing” and are linked with a shift from the isolated view on knowledge to the relationship between knowledge and human action. In this view we prefer instead of the term “tacit knowledge” the term “experience-based knowledge”. This term expresses the relation between knowledge and bodily based sensory perception and experience.

Methodologically we refer on the one side to phenomenological theories of sensual perception and the body (Leib) (Merleau-Ponty 1966; Schmitz 1978) and theories of situated action (Suchman, 1987) and on the other side to empirical research studies in different areas of work. On this basis we developed the concept of experience - based “subjectifying action” as a basis of “tacit knowing” or as we phrase it “experience-based knowledge”.

In contrast to objectifying action a characteristic feature of subjectifying action is one in which “planning” and “execution” are not separated, but are rather highly intertwined. The characteristics of these practices can be described by procedures which are dialogical interaction. They are based on simultaneous complex sensory perception which takes place via several senses and body movements and is not detached from subjective feeling. It goes beyond an orientation to precise and clear cut features to handling more diffuse and vague sources of information. Such sensory perception is closely linked with a particular type of thinking. A current situation brings up associations to an already experienced one. Further there is a reflection, which does not occur before the practical action (planning) or “on” action but “in” action. The basis for such subjectifying action is a relationship with the environment which can be termed as “sympathetic”. The subject performing the acting experiences the environment not as unfamiliar, external objects, but as belonging to himself; in the process of taking action they form a “unity”.

The paper will present the essentials of this concept and will demonstrate empirical finding in different areas of work.

**THE ORGANIZATIONAL SENSE OF INTERNAL COMMUNICATION PROFESSIONALS**

Gaglio Gérald 1, FOLI Olivia 2

1UNIVERSITY OF TECHNOLOGY OF TROYES, Troyes, 2CELSA, Paris, France

Abstract: Contemporary organizations are shaken by constant and diverse change. Professional groups that make up these organizations are affected by these turbulences. Moreover, the intensive use of communication technologies forces them to multi-task, which sometimes results in agitation. Amongst these professionals, “support” teams are confronted with unique constraints. Beyond the inherent tensions in these environments, these teams face additional difficulty – adapting to the constraint and temporality of those they assist.

Internal communication professionals evolve in this configuration of asymmetrical interdependence. Their actions necessitate the contribution of several individuals for whom communication is not a priority. In the case of internal newsletters, proposals for topics need to be made, information needs to be transmitted, articles need to be validated, and all with tight deadlines. In addition, complex political issues – transparency regarding corporate strategies that are not always shared by senior management – are constantly evolving. At the core of this turmoil, internal communications professionals develop an *organizational sense*. This notion embraces both professional-ability (capacities allowing for the completion of one's work despite vicissitude) and professionalism (demanded professional ethics). The *organizational sense* takes three forms. First, at a micro-sociological level, one prepares to navigate situations where information flows are never interrupted, so as to keep a continuous line of action. Second, the *organizational sense* is echoed by perceptive and listening abilities. It is demonstrated in diverse situations (editorial meetings, employee comments regarding collaborative spaces, etc.). This is especially done by anticipating the sensitivity for a subject or its interest in terms of communication. Third, to possess *organizational sense* comes from professional morale, from boundaries that should not be pushed or from the representation of one’s usefulness to the organization. This dimension is expressed when dilemmas are identified by the communication professional and in the way that they are decided upon.

Our analysis is based on an ethnographic study (24 interviews with internal communication professionals, site observations, and attendance at three internal newsletter editorial meetings) that was conducted in large French corporations in 2010.
TOOL OR TYRANNY? THE USES OF FORMS AND DOCUMENTS IN PROFESSIONAL PRACTICE

Pirjo Hannele Nikander 1, Maarit Alasuutari 2

1Institute for Advanced Social Research, UNIVERSITY OF TAMPERE, Tampere, 2Dept. of Education, University of Jyväskyla, Jyväskyla, Finland

Abstract: Forms and documents are a crucial component of professional practice and people processing in various human service settings. They can easily be overlooked as neutral tools of everyday practice that represent and objectify the topics and matters they describe. However, the use of forms and documents can also be studied for the restraints and demands they pose on professionals and clients alike, and as agents in the various situated institutional practices they are part of.

In this paper we are interested in how moving between text and talk frames, facilitates and dictates the various evaluation and decision making practices of professionals. The analysis is based on data that concerns the extremes of the human lifespan: childhood and old age. The data sets consists of 1) Recordings and documents originating from 21 parent-teacher meetings in early childhood education, and 2) 42 hours of videotaped materials from multiprofessional meetings concerning elderly care.

In our analysis, we focus on 1) similarities and differences of how documents become part of the joint negation in situ of two different human service settings, 2) how the discourse and the descriptive demands of documents frame decision making and negotiation, and 3) how the structuring force of the documents becomes challenged and what the situational and wider professional outcomes of this are.

IS LAW EQUAL FOR ALL? REFLECTIONS ON THE ABSENCE OF PROFESSIONAL STANDARDS BETWEEN ITALIAN JUDGES

Luca Verzelloni 1

1Department of Politics, Institutions, History, UNIVERSITY OF BOLOGNA, Bologna, Italy

Abstract: Although written law is by definition unique, reliable and equal for all, many times the Italian judges, especially as regards to the procedural arguments, put in practice the same articles of the Code of Civil Procedure in ways so often profusely different. These behavioural differences, besides to calling into question the principle that “law is equal for all”, highlight the absence of shared professional standards between the Italian magistrates. Many times the Italian judges appear as “monads”, that work in a totally independent way, so that they don’t know effectively in which manner operates the colleague of the next door. Italian courts look like “condominiums”, physical spaces, formally defined, where parallely practice a plurality of magistrates. These judges are similar to “craftsmen”, who individually produce, experiment and translate into practice their autonomous and solipsistic interpretations of the written rules. In the light of the debate of the Sociology of professions, on the basis of the data collected during an ethnographic research developed in over two years in four Italian courts, that has considered sixteen magistrates specialized in treatment of lawsuits at first instance related to the labour relationships, this paper aspires to paint the professional activities of judges and to meditate about the practical implications, for the functioning of Italian tribunals, which derive by the absence of shared professional standards on how interpreting written rules. In conclusion, these reflections aim to represent a starting point for discuss about the possible reconfiguration of the activities of the public sector professionals and of the organizations in which these actors daily operate.

PROFESSIONAL KNOWLEDGE AND EVERYDAY PRACTICE

Camilla Schmidt 1

1Department of Psychology and Educational Science, ROSKILDE UNIVERSITY, Roskilde, Denmark

Abstract: Professional care work in preschools in Denmark is faced with a knowledge crisis, due to increasing influence by regulations from state and market. As a consequence the professionals seem more inclined to focus on how to meet demands for documentation, rather than focusing on developing their professional knowledge with regards to collective reflection and creating coherent practices and everyday lives for children and families. I propose an alternative perspective on development of professional knowledge, which takes aspects of professional knowledge and everyday practice, that are not traditionally valued, nor by “users” or the professionals themselves, into account. With inspiration from a Danish researcher of everyday life and her concept of ‘the unnoticed/unrecognized’ (det upåagtede) (Bech-Jørgensen 1994), I will discuss how understandings of professional identity and professional knowledge must involve an understanding of the importance of routines, habits and practical tasks.

The analysis takes its point of departure in observations and interviews in a combined nursery and preschool. In order to grasp the knowledge quality of the ‘unnoticed’ aspects of the professional work the field work was inspired by the German researcher Rudolph zur Lippe concept of ‘gesture’ (gestus) (Lippe 1987, Nielsen 2010). With an attention towards gestic knowledge in professional care work the attention is directed at bodily action and communication which is recognized as rhythms in everyday practice. This understanding of knowledge can only be observed in context and must be analyzed in the light of context. Gesture is part of specific situations and is in this way both part of and an answer to a situation as a whole. Knowledge in professional care work is in this perspective regarded as a constellation of several qualities of knowledge, which are in play simultaneously.

TRAINER AND TEACHER COMPETENCES – A MODEL OF EVALUATION AND PROFESSIONAL DEVELOPMENT

Sandra Isabel Saudê 1

1Education, Social and Behavioral Sciences, POLYTECNIC INSTITUTE OF BEJA, Beja, Portugal

Abstract: A lack of common criteria for comparing education and training systems makes it difficult to recognise qualifications and competences acquired in different environments and levels of training. A valid basis for defining a framework for evaluating professional performance in European educational and training contexts must therefore be established. In this context, the TEVAL project[1] presents a proposal for an evaluation model applied to training competences. The model is based on a common competence framework and on a holistic concept of the theoretical principles
that justify the evaluation process, bearing in mind professional development and system regulation – the Close Evaluation Model.

The results recognised that, despite the European objectives, teachers and trainers are often seen as remote professionals and that evaluation is mainly carried out under national regulations in a manner that differs substantially between one context and another. The conclusions confirmed also the need to establish a common basis for evaluating these professionals.

The Close Evaluation Model, developed by TEVAL European partnerships, proposes that trainers and teachers should be evaluated on their professionalism, i.e. on their capacity to mobilise a range of key competences so as to respond to situations and problems arising during their work. The survey that has been conducted on TEVAL II to piloting the model shows that the close evaluation strategy is a useful instrument for professional development.

The paper, that I’m proposing to present, considers and fully describes the process of Close Evaluation of Trainers and Teachers competences, bearing in mind their common professionalization.

VIRTUAL COLLABORATION IN GEOGRAPHICALLY DISTRIBUTED TEAMWORK: THE CASE OF FINNISH IT-PROFESSIONALS

Pasi Juhani Pyöriä

School of Humanities and Social Sciences, UNIVERSITY OF TAMPERE, Tamperé, Finland

Abstract: The paper serves as a reminder that all work arrangements, including the present case of distributed teamwork, have their costs and benefits. In addition to a literature review, the paper presents empirical evidence from two case organizations in the field of technology industries and knowledge-intensive business services. In contrast to common assertions in the theoretical literature, distributed work is not always an outcome of technological advancement or a proactive choice blessed by management, but often a necessity dictated by the competition or customers. In the case companies here, a distributed organizational structure was recognized as a necessary compromise, although the associated costs gave cause for some concern. Rather than virtual cooperation, the knowledge workers interviewed valued opportunities for face-to-face interaction and informal contact and networking. Nonetheless the benefits of distributed work were thought to outweigh its potential costs. Distributed work has the best prospects of success if from the outset all the people involved know what to expect and are prepared to deal with any problems and fears associated with the new work culture. It is also important that distributed work arrangements are designed in compliance with national labour legislation.

EDUCATIONAL QUALIFICATIONS AND NURSES’ CHOICE OF NURSING FIELD

Bente Abrahamsen

Centre for the Study of Professions, OSLO UNIVERSITY COLLEGE, 0130 Osle, Norway

Abstract: The aim of the paper is to investigate whether nurses’ early professional careers relates to nurses’ educational qualifications. Particular attention is paid on theoretical knowledge that students in nursing are offered and acquire in the college program. The main question is whether nurses’ assessment of acquired theoretical knowledge influence nurses’ future professional career, in particular their choice of nursing field. Nurses with high level of theoretical knowledge at the end of the study program, do they find all nursing fields as equally attractive? Or do they avoid specific work fields, for instance fields with few high educated colleagues or fields with few career opportunities? The nursing profession offers several different work fields, each with their own character traits and career opportunities. In the paper we distinguish between somatic hospitals, care for elderly and disabled, psychiatry and drug abuse treatment, and other employment fields.

OBSTETRICIAN-GYNAECOLOGISTS’ PERCEPTION OF THE RISK OF MALPRACTICE CLAIM

Raphaël Patrick Hammer

1 Institute of Health Research, SCHOOL OF HEALTH SCIENCES, Lausanne, Switzerland

Abstract: Over the last years, the relationship between medicine and law has become a growing source of concern for health professionals. Concept of defensive medicine appears to epitomize fear of patients’ complaints as a new feature in shaping medical work. Malpractice claims filed by patients have been considered a strong challenge to the medical profession. Empirical research in this field comes mainly from the United States, while very little attention has been devoted to the Switzerland’s situation from a sociological point of view.

This papers aims to provide insights into medical profession’s perception of the risk of malpractice claims. As a case study we focus on obstetrician-gynaecologists (OB/GYN) who are especially exposed to legal action and complaints. More precisely, this presentation addresses three issues: 1) salience of the judicial risk in the Swiss working environment; 2) causes of an increasingly litigious nature of doctor-patient relationships; and 3) assessment of the personal risk of being sued.

In 2009, we conducted 26 qualitative interviews with OB/GYN in a big city of Switzerland. All interviews have been recorded and transcribed verbatim, then coded using the software Atlas.ti.

While all OB/GYN’s attitudes regarding judicial risk are strongly shaped by a negative perception of defensive medicine in the United States, they differ as to whether Switzerland follows or could follow a drifting into an American-style of litigation. Main perceived drivers into possible drifting into an American-style of litigation refer to cultural factors putting forward changes of people’s attitudes and expectations towards medicine. Legal or judicial aspects are considered to play a minor part. Almost all participants acknowledge steadily that risk of litigation is nowadays part of their practice. However, risk of malpractice claim is seen rather as a true cause for concern than producing personal fear of litigation.

Our findings show that OB/GYN’s attitudes towards their global working conditions do not match the perception of an acute litigious practice environment. At the same time, they clearly recognize that risk of malpractice claim is nowadays part of their job. However, defensive medicine is strongly rejected as a solution. More broadly, these results based on the Swiss case provide a nu-
anced picture of how health care professionals consider risk of malpractice claim.

REGRETS ASSOCIATED WITH PROVIDING HEALTHCARE: NEW INSIGHTS INTO MENTAL HEALTH OF PHYSICIANS AND NURSES

Stéphane Cullati, Delphine S Courvoisier, Thomas Agoritsas, Ralph E Schmidt, Thomas V Perneger

Abstract: The hospital setting is characterized by high workload, high information flow, high variation in clinical demand and extended work shifts. Physicians and nurses have to deal with the complexity and uncertainty of clinical practice. Therefore, caregivers' mental health has been extensively studied. Managing regret is a key ingredient of mental health; however, the experience of regrets in caregivers has as yet received little attention.

We will present the results of a qualitative study conducted with physicians and nurses. The objective was to explore the feelings of regret associated with clinical decision making or with providing healthcare. 25 caregivers participated in semi-structured interviews at the Geneva University Hospitals, between April and September 2009.

The results showed that all respondents experienced at least one intense regret related to a situation with a patient. At the time of the event, feelings of regret were intense. Regret-inducing situations were not systematically related to a mistake or error, or to the failure of healing the patients. The impact of regrets was significant: respondents reported sleep regret-related problems, loss of confidence, concentration difficulties, ruminations, or taking sickness leave. For some respondents, the regret-elicting episode set the course of their career. Unexpectedly, most respondents reported that they had to deal with small regrets in everyday clinical practice. Small regrets tended to accumulate over time among a minority of respondents. Respondents used various type of coping with regrets. Social strategies were widely used, but physicians reported barriers with peers of the same ward or service and tended to turn to friendly colleagues.

In conclusion, experiencing intense regrets appears as an unavoidable consequence of providing healthcare and may have negative consequences on mental health of physicians and nurses. Providing skills in coping strategies during the education of physicians and nurses could help improve the mental health of physicians and nurses.

TRANSFORMATIONS IN THE NURSING PROFESSION IN BELGIUM: ABOUT MODELS OF DIFFERENT PRACTICES AMONG GENERATIONS

Céline Declère

Abstract: This communication is about transformations in the nursing profession and more specifically about relationships among different generations of nurses.

One of the major characteristics of the nursing profession stands in its history when it was performed by religious communities, and mostly by women (Collière, 1982; Nadot, 2002; Piguet, 2008). This vocation or « calling » aspect of this profession still remains in current mentalities, but perhaps more specifically among older nurses. Nowadays, choosing to be a nurse might come, in certain cases, more from a desire for job security than from a « spiritual calling ». Vocation differences could also bring more intergenerational conflicts that would modify the nurses’ team organisation.

Even if the nursing profession has evolved for the past decades, the performance of a nurse with 30 years of experience or of a nurse recently qualified does not hold the same elements. The purpose here is not to promote one from another, but to analyse the different backgrounds, professional and individual, in order to understand better the different practices among generations.

A generation gap takes place in the professional investment: the work time, the social time and the time for oneself are diverse according to ages. Therefore the care or the empathy within the work can be practiced and lived differently; then this generation gap can cause organisational difficulties.

About 20 semi-directive comprehensive interviews had been realised with nurses working in rural and urban Belgian hospitals, in a dozen different services. Only nurses aged more than 45 years old had been questioned; these results will then be more about subjective speeches from one generation to another.

Generational differences are put forward by the interviewed persons. For example, 30 years ago, the nurses’ team was present, as a family, to support its members in a difficult palliative treatment. Currently, the emotional commitment, necessary in such a case, appears to have become less automatic: the younger nurses would keep their distance from the emotional charge and from a helpful team spirit. This example illustrates the differences between generations, which lead to incomprehension and more difficult management among nurses’ teams.

These first results, about a subjective view from a generation to another, will try to understand better some parts of the possible conflicts due to this nurses’ generation gap.

DEVELOPMENT OF PROFESSIONAL ASSOCIATIONS IN POST-SOVIET RUSSIA: THE CASE OF A NEWLY EMERGING PROFESSION OF PSYCHOLOGICAL COUNSELLING.

Maria Karepova

Abstract: This paper analyses the development of professional associations in the newly emerging profession of psychological counselling in post-socialist Russia. In the Anglo-American context professional associations are seen to be the main actors of professional alization (Evetts, 1999; Greenwood et al., 2002). However, under the Soviet regime associations were weak or virtually absent because most professional matters were controlled by the state. It has been suggested (Jones and Krause 1991) that the demise of the Soviet Union will lead to an increase in specialists’ capacity to claim...
authority over professional matters and the establishment of strong professional associations, however, there has been virtually no scholarly analysis of this processes. This paper seeks to fill this gap and redress the Anglo-American bias (see Bourgeault et al. 2009) in the studies of professionalization. Using the case of the newly emerging profession of psychological counselling in Russia, this study investigates why the formation of professional bodies is still slow and problematic in Russia. Based on the analysis of professional legislation and 26 qualitative interviews with practising counsellors in two Russian cities, I argue that the challenges for the development of professional associations exist at three levels: the state, the profession and the individual. First, the underdevelopment of professional bodies is still largely determined by the persistent state control over professions (e.g. over education and title). Second, the low level of organising is shaped by the lack of professional infrastructure and the instability of the transitional economy; hence there are day-to-day challenges to the formation of professional bodies. Finally, the attitudes of specialists towards organising (e.g. apathy towards collective action, ambivalent attitudes towards regulation and the general disbelief in change) prevent the growth of professional organizations. The current situation is rooted in the Soviet past and impedes on the daily practices of specialists and on the process of professionalization. The challenges to professional representation are linked to each other, forming a vicious circle which is difficult to break. The paper is work in progress and is based on a PhD research of the newly emerging and feminized profession of psychological counselling in Russia.

INTERPROFESSIONAL RELATIONS AMONG BIOMEDICAL AND COMPLEMENTARY/ALTERNATIVE PRACTITIONERS

Merrijoy Kelner¹

¹Institute for Life Course and Aging, UNIVERSITY OF TORONTO, Toronto, Canada

Abstract: Working in collaborative teams requires a blurring of professional boundaries, new role definitions, and sharing of professional knowledge, skills and power. One instance of interprofessional collaboration that is currently receiving attention is integrative health care (IHC), a combination of biomedical care and complementary and alternative medicine (CAM). This research builds on studies of teamwork to examine the experiences and outcomes of health care practitioners working at two different integrative health care centres in the Province of Ontario. The study traces the efforts of the practitioners to adapt their professional identities and practices to the challenges of working in collaborative interprofessional teams.

We conducted in-depth, open ended interviews with all the practitioners at the two centres. The focus was on their hopes and aspirations as well as their actual experiences while attempting to work in collaborative interprofessional teams. We first analyzed the transcribed interviews line by line to identify key concepts. Themes and categories were then developed into a coding framework and applied to the data. We also made systematic observations while sitting in the waiting rooms and attending staff meetings.

The practitioners at Centre A reported that they lacked formal mechanisms to enhance collaboration: there were no formal staff meetings, shared charting patterns or common areas in which they could congregate. At Centre B, the leader has made strides to institute formal structures: monthly staff meetings, tracing referral patterns among the staff, as well as a shared kitchen area. At both centres, however, the respondents made it clear that structural measures to build a collaborative team were only at the early stage. Informal communication is still predominant among practitioners; occurring casually and spontaneously in the hallways. Our findings make it clear that collaboration requires more than co-location. We conclude that if interprofessional teams are to flourish, they require: dedicated times for sharing knowledge, a strong champion, informal opportunities for exchanging patient information, a structure that encourages collaboration, and institutionalized ways to manage potential conflicts. Without formal structures and strong leadership to guide a team towards collaboration, achieving it is unrealistic.

KNOWLEDGE, PROFESSIONALISM AND MONEY: ENGLISH DENTISTRY IN TURBULENT TIMES

Ruth Mcdonald ¹, Sudeh Cheraghi-Sohi ², Martin Tickle ², Caroline Sanders ²

¹Business School, UNIVERSITY OF NOTTINGHAM, Nottingham, ²UNIVERSITY OF MANCHESTER, MANCHESTER, United Kingdom

Abstract: Compared to medicine the evidence base for much of dentalistry is relatively sparse. This has made it difficult for the state to hold dentists to account and to exert control over the content of the work of dental professionals. This paper (using mixed methods i.e. interviews with 40 dental staff, focus group with new entrants to the profession and longitudinal analysis of national dental performance data) examines the impact of recent reforms in England, which attempt to control dental work, on the professionals concerned. It identifies a change in the nature of both autonomy and professionalism in general dental practice. We found that reforms introduced in 2006, which seek to cap activity volumes and payments, resulted in dentists engaging in gaming, by undertaking procedures which pay highly, relative to the effort involved. Whilst this allows dentists to exercise autonomy in response to efforts at control by the state, it is starting to change the definition of what it means to be a dental professional. Selection and staging of treatments to maximise income, rather than based on clinical judgment, is becoming commonplace. Being a dental professional is now not just a matter of technical knowledge and skills, it also entails knowledge of how to ‘play the system’ in order to retain autonomy and maintain income. Furthermore, the socialisation of new entrants, trained by other dentists, appears to acts to facilitate the intra-generational transmission of this new professional culture.

THE CHANGING AUTONOMY OF THE NORDIC MEDICAL PROFESSIONS

Sirpa Wrede ², Peter Kragh Jespersen ²

¹Helsinki Collegium for Advanced Studies, UNIVERSITY OF HELSINKI, Helsinki, Finland, ²Aalborg universitet, Aalborg, Denmark

Abstract: Professional autonomy is a key theme in sociology of professions and one that is constantly discussed in context of the reforms of health care delivery. Many years of experience with New Public Management reforms in the Nordic countries indicate that governments no longer accept the traditional state-protected monopolies of the medical profession. Relying on materials including secondary sources as well as primary documentation, the paper presents an analysis of long-term developments vis-à-vis the au-
tonomy of the Nordic medical professions, focusing particularly on the issue of management of health care organizations. The recent changes in management models are interpreted using a conceptual framework that highlights three conceptions of medical professional autonomy: traditional autonomy, framed autonomy and competitive autonomy.

The results show that since the 1970s, the Nordic states no longer endorsed traditional medical autonomy involving closure in the labour market and control inside the health care organizations. The subsequent NPM reforms framed medical autonomy with economic accountability so that medical decision making became subordinated to general management and political decisions. But economic accountability is not the only new value. Recent Nordic health politics increasingly emphasize the role of the public. Accountability to the public presupposes new relations with patients and more diverse and democratically oriented professional identities. This new conception of medical professional autonomy does not support a medical monopoly even in the clinical context. Instead, the medical profession enters interprofessional competition and negotiations where the boundaries of medical autonomy are disputed and changing. Using the public policies on the organization of the management of health care organizations as a point of comparison, the paper identifies competitive autonomy as a new pattern in Norway and Sweden, while in Denmark the most recent reforms have strengthened the position of doctors in management. Also in Finland, until recent years, the medical profession successfully opposed management reforms that undermine their monopoly on health care management, but the most recent reforms are changing the tide towards competitive autonomy.

CROSSING THE BOUNDARY BETWEEN PROFESSIONALISM AND MANAGERIALISM. NEW IDENTITIES AND CAREERS OF TECHNICAL PROFESSIONALS IN FORMER STATE-OWNED ENTERPRISES IN SWITZERLAND.

Peter Kels

Management and Adminstration, BERNE UNIVERSITY OF APPLIED SCIENCES, Bern 22, Switzerland

Abstract: The privatization and ongoing cultural transformation of former state-owned enterprises in Switzerland during the last decade has massively challenged the professional identities and careers of "organizational" Professionals (Adler et al 2008: 361). As a result of a raised pressure on financial performance and accelerating changes in the organizational structures and cultures, engineers and architects working in knowledge-intensive technical services are faced with the demand to acquire managerial ethics and competencies and to transform their professional self concepts.

Based on 31 qualitative interviews taken from two case studies (one of the biggest production, supply and energy service companies in Switzerland and secondly Switzerland’s biggest travel and transport company), this paper examines substantial changes in working experiences, professional identities and career trajectories of engineers and architects working in privatized, former state-owned enterprises in Switzerland. The two case studies are interim results of the ongoing MAPCA (Managing Professionals’ Careers in knowledge-based firms) research project which is aimed at the occupational, company-specific opportunities for career advancement and professional development as well as the professional biographies of specialists in knowledge and technology-intensive companies in Switzerland. MAPCA is funded by the National Commission for Technology and Innovation (CTI).

Our results show that turbulent organisational transformations have lead to massive tensions and irritations between professionalism and managerialism on the level of working cultures and professional identities. But these turbulences have also brought new career prospects especially for those technical professionals who are willing to cross the boundary between professional and managerial work. Based on our material, we can distinguish between three different career types: classical Technical Professionals, Versatilists and Generalists. These career types reflect different biographical rationalities of technical professionals trying to cope with the ambivalences in crossing the boundary between professionalism and managerialism in the light of turbulent organizational change.

DEVELOPMENT OF PROFESSIONAL KNOWLEDGE TOWARDS SOCIAL ENTREPRENEURSHIP

Alexandra Moskovskaya

Institute for social development studies, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: Exploration of social enterprises in Russian and international context shows a number of cases developing professional knowledge on the crossroad of different professional fields while creating social enterprise business model and seeking to meet clients’ needs. There are number of possibilities for professional development from this point. One is combination of professional knowledge of different professional fields playing the role of Schumpeterian combination of resources (innovation), the other is realization of professional’s social mission going beyond traditional frameworks of professional organizations, the third may be explained as a bricolage conditioned by resource scarcity. What do these possibilities mean for professional development itself?

From the standard point of view of sociology of professions business and commodification of services should oppose “professional logic”. However social entrepreneurs are mission driven. If they have professional background they might develop social enterprises as their professional mission. Can social entrepreneur be a professional project in this case? The answer should base on how the results of social enterprise activity affect clients, professional knowledge and professional status of social entrepreneurs and their professional partners.

The database is grounded on the pilot research project «Social Entrepreneurship Models in Russia» (Oxfam, UK 2009). It was carried out by the Institute for Social Development Studies of Higher School of Economics (Moscow, Russia) under my supervision and in cooperation with Russian Microfinance Center. It was the first survey on the social entrepreneurship in Russia. 10 cases from 6 Russian regions were explored based on deep semi-structural interviews with heads of social enterprises and their main stakeholders. International experience of social entrepreneurs – fellows of Ashoka foundation was also taken into account within the analysis.

LINKS BETWEEN PERFORMANCE APPRAISAL AND KNOWLEDGE MANAGEMENT: POTENTIALS AND EVIDENCE FROM THE MANAGEMENT CONSULTANCY SECTOR IN THE UK

Hadi K. I. El-Farr

Social Relations in Turbulent Times
Abstract: Many scholars claim that there has been a shift in the economy from the information age to the knowledge era. This shift is represented at the firm level by the concept of knowledge management. Some academics view that the major distinction between information and knowledge management is that the latest should be inclusive of the human factor, in addition to information technology aspects. Therefore, human resource management is potentially a strong contributor to the knowledge management initiatives, and performance appraisal is one of its main practices that scholars assert to have a lot to add.

This study aims at empirically identifying the links between performance appraisal and knowledge management. The need of this research arises due to the abundance of theoretical assumptions that such links are beneficial and/or exist, yet empirical evidence to support this claim is rare and weak.

The research has been conducted through three stages: a survey, interviews and two case studies; utilizing both extensive and intensive research approaches at various stages. The context of the research is the management consultancy sector in the UK.

Although most of the participants agree that there is a lot of potential in utilizing performance appraisal to enforce knowledge management systems, there has been a lack of formal, direct, conscious and strategic connection between both. The main justification for this result is that knowledge management is seen as a set of activities rather than a system. Even though knowledge management activities, when measured, have been considered as important in the performance appraisal criteria, they have not been explicitly assessed. Participants thought that these activities are indirectly measured under other criteria such as individual performance, teamwork, collaboration and everyday organizational activities. Moreover, knowledge management activities are aimed to be embedded in the organizational culture, with rare procedures to back their enforcement.

Therefore, the study concludes that there is a lot of lost potential in increasing the awareness and execution of knowledge management activities through not directly linking performance appraisals to knowledge management. The research has claimed that empirically the situation in practice does not match the suggestions and hopes presented by some academics in the field of management.

PROFESSIONALISM AND MANAGERIALISM IN CORPORATE COMMUNICATION

Antonietta De Feo ¹, Mirella Giannini¹

¹Dipartimento di Sociologia, Università “Federico II” di Napoli, Napoli, Italy

Abstract: This paper deals with the appeal of the concepts of professionalism and managerialism in the corporate communication. In this field, new professional groups are emerging as heterogeneous and engaged in complex tasks, that is planning and coordinating communication messages and, above all, managing the dialogue between the organization and its public (Cornelissen 2008; Hübner 2007).

Our research project addresses this issue using the Bourdieu’s praxeological approach. It considers the communication as a social field and focuses the working conditions and the employment relations of communication professional groups in some Italian corporate organizations. The case-studies involve one big company and two agencies in the sectors of Energy and Marketing communication. The results show that the distinctive logic of professionalism is combining with managerialism and market logics (Freidson 2001; Evetts 2003; Giannini 2003, 1998). The state of tension between autonomy and heteronomy seems to have a shifting effect on the boundaries of the professional field (Abbott 1988; Demazière 2009).

WHICH ELEMENTS OF VITA ACTIVA CORRESPOND WITH TASKS OF A CONTEMPORARY MANAGER?

Agata Dembek¹

¹WARSAW UNIVERSITY, Warsaw, Poland

Abstract: The paper reflects on the soft competences of a manager, particularly on management of emotions and interpersonal relationships. I will identify those competences as ‘emotional work’, in reference to the classic Hannah Arendt’s differentiation between labor and work.

Contemporary culture – and corporate culture in particular – is characterized by the mechanisms of operationalization and technification of social competences and commodification of emotions. These features, analyzed among others by Richard Sennett, Eva Illouz and Bonnie Urcioli, do not fit the typology of human activities proposed by Arendt. In my paper I will use this typology to propose an analysis of objectives and competences of master managers, based on philosophical concepts of Gianni Vattimo and Frederic Jameson. The perspective allows to identify the specificity of the relation between contemporary culture and economy and its putative qualitative newness.

The paper will specifically address such questions as: How would Arendt categorize new manager’s tasks, like managing relations or emotions management? How her work can help us to understand the cultural phenomenon of the rise of psychological expertise in work organization’s field and to explain the condition of a contemporary manager? Can we find a link between corporate organization’s self of a manager and Arendt’s diagnosis of triumph of animal laborans?
RN 20 Qualitative Methods

THE COMPLEXITIES OF ETHNOGRAPHIC DESCRIPTION: EVALUATING FIELDNOTE ACCOUNTS OF THE SAME EVENT

Robert M. Emerson

Abstract: Written fieldnotes -- descriptive accounts produced by "the ethnographer [who] 'inscribes' social discourse" (Geertz) -- provide one of the primary forms of ethnographic and qualitative data. But writing descriptive fieldnotes is more than a straightforward and mechanical process of accurately capturing as closely as possible observed reality, of "putting into words" overheard talk and witnessed activities. Moreover, because descriptions involve complex issues of perception, interpretation, and representation, different descriptions of similar or even the same situations and events are possible and probably inevitable. This paper examines fieldnote accounts of the same naturally occurring event written by different student ethnographers, identifying key similarities and differences in these accounts. It then considers the broader implications of variations between fieldnote accounts of the same event for assessing the quality and validity of fieldnote data and for ethnographic methods generally.

REPORTING ON EMOTIONS. THE ROLE OF AUTOETHNOGRAPHY IN THE RESEARCH ON CLIMBING ACTIVITY

Anna Maria Kacperczyk

Abstract: Emotions as a state experienced by climbers at the moment of ascending are immanent part of climbing activity. Considering physical circumstances of actions, calculated risk, climber's competence and skills, and control of the situation perceived by an individual -- emotions remain important conditions of climbing actions. The subjects of my interest are emotions which are inseparable part of mountaineering, climbing, bouldering or soloing high-rises. I consider possible ways of tracking emotional aspects of climbing activity: using video materials, autobiographical existed data, observations of climbing situations, interviews with climbers, and autoethnography. The base of my considerations is ethnographic research on the social world of climbing.

BETWEEN BEING, STAYING AND LEAVING: ETHNOGRAPHY WITH MINORITY GROUPS

Maria José Manso Casa-Nova

Abstract: The objective of this paper is to reflect upon research processes carried out by means of the ethnographic method. Based on 10 years of experience with reflexive ethnography, this paper will reflect upon the role of researchers, the development of a committed research (a triple commitment: to the production of scientific knowledge, to the subjects of the research, to the researchers themselves) and the enhancement/empowerment of the social actors involved by means of the use of mediation processes that are capable of developing an informed citizenship on the part of the "researched" social actors.

This paper will reflect upon the dialectics of power while building the social relations of research, revealing the vulnerability of researcher in certain contexts of interaction. It examines the issue of the ethics of researcher in the context of research and at the time of writing and disseminating the results of the research, reflecting upon the social impact of the said results.

DETECTING TRIADS IN A SWEDISH JUVENILE CARE PROJECT

Goran Basic

Abstract: In a study of a project concerning Swedish juvenile care professionals, youngsters and parents were studied by ethnographic field observations as well as interviewed. During the course of research various and shifting triads forming conflicts as well as alliances were observed.

I will analyze similarities and differences in retold triads during interviews and interactional "in situ" formed triads according to (1) different alliance formations, (2) different roles in changing constellations, (3) the temporal development of the alliances in the triad and (4) the alliance's including and excluding function in the triads.

STUDYING ‘EMOTIONS’ OF ORGANISATIONAL ELITES: THE CASE OF BOARDS IN THE PUBLIC SECTOR.

Humera Manzoor, Manuela Nocker

Abstract: This paper is drawn from a research for a doctoral study. It highlights the methodological challenges associated with observing board meetings and interviewing organisational elites while doing an ethnographic study of emotions in the specific context of ‘governance’ in the NHS FTs (Foundation Trusts) over a period of seven months. It also highlights the problems encountered during the fieldwork in terms of gaining an access and how ‘aesthetics’ helped sensemaking in order to negotiate and re-negotiate access to the research participants. The research participants had three major concerns that substantially influenced the negotiation process: presence of an ‘outsider’, the expectations of having immediate quantitative outcomes, and the lived ‘emotions’ that could be observed. Board members were hesitant for their emotions to be studied as it challenged their ‘masculinity’ and ‘rationality’ in deci-
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

sion making. However, the websites of the NHS FTs, the aesthetics of the boardroom, the conduct and behaviour of the board members in the public meetings, particularly the chair, acted as a useful guide to predict the ‘openness’ of the boards. The fieldwork was not only emotionally intensive for the first author as she lived with the constant fear of being rejected in the field due to the complexity of procedures and ‘appropriate’ conduct expected in the setting. The mere presence of the researcher as an ‘outsider’ induced strong emotions in the research participants. This revealed hidden power relationships that further identified key gatekeepers. This paper shows that negotiating access with the organisational elites for an ethnographic study is a problematic issue despite of the dominant discourses of research on governance in the NHS FTs, stating that research is crucial for evidence. The boards’ ‘visibility’ in public meetings and on other occasions does not ensure their accessibility. However, the successful completion of data collection suggests that studying emotions in the board context is difficult but not impossible.

Keywords: aesthetics, organisational elites, accessibility, masculinity, emotions, governance, public sector, NHS FTs

CALENDAR INTERVIEWING - A MIXED METHODS APPROACH FOR STUDYING BIOGRAPHIC TRAJECTORIES

Ana Isabel Barbeiro1, Dario Spini1
1Social Sciences Institut, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Biographic research relates to different disciplinary and epistemological orientations. Through the XX century and on, micro-sociology has developed a rich tradition on qualitative research, in which “ethnobiographies” (Poiron et al., 1983) have an important place. The voices of social actors and the meaning production through the narration of their lives are central in this approach (Ferrarotti, 1983). Narratives are considered simultaneously as statements of social practices and as social practices themselves (Bertaux, 1980; 1997). Hence, this research approach is characterised by in-depth interviewing and articulation with other qualitative research approaches, such as ethnography or document analysis. The interpretative work of the researcher is also a core feature.

On the other hand, the life-course research paradigm (Elder, 1995) also considers biographies under a different approach: here, the aim is the quantification and comparison of trajectories in different domains of life. In this sense, it is important to distinguish and locate in time the life-events with precision. One technique that has been successfully developed is the use of life calendars (Axinn et al, 1999; Belli et al, 2009).

Following the suggestion of Belli and Callegaro (2009), on the potential of life calendars for doing (also) qualitative research, a mixed methods instrument has been designed and is being tested. It consists on a life-calendar for collecting life-stories and trajectories. These are centered on the relationship of individuals and institutions and on the experiences of injustice and violence within this relationship. The life-calendar provides visual cues that help the recalling of events and their sequence, in different and parallel domains of life. The semi-structured characteristics of the interview guidelines allow openness for the emergence of personal and culturally imbibed meanings about the story that is being told. This combination results in two types of data: (1) a calendar that locates events in time and through different institutional trajectories, ready for quantification and (2) a tape-recorded narrative allowing for qualitative analysis. The two types of data analysis can thus be combined into an innovative mixed methods approach to biographical research.

HOW TO STUDY TRANSNATIONAL SOCIAL SPACES: EXPERIENCE FROM A PROJECT ON SECOND GENERATION SPANIARDS IN SWITZERLAND

Marina Richter1
1Sociology, Social Politics and Social Work, UNIVERSITY OF FRIBOURG, Fribourg, Switzerland

Abstract: Understanding transnational social spaces has become an important challenge for social scientists for many reasons. The thematic and theoretic interest is followed by a methodological challenge. Presently, there is some debate going on about methodological approaches in addressing transnational questions. One example is the concept of multi-sited ethnology (Marcus 1995; Amelina 2010). Others propose methods that stress the simultaneity of events and effects in transnational networks and propose therefore a method with various simultaneously working research groups (Mazzucato 2010).

The project on the transnational social spaces of the Spanish Second Generation in Switzerland I present here, tries to develop forms of researching the constitution, maintenance and perception of these so-called transnational social spaces. For the data collection I proceeded in four steps: (1) biographical interviews including the notion that space can never be conceptualised without a time component; (2) a combined interview that included ego-centred network maps and geographical maps in order to systematize the informants’ networks and the places of importance in these transnational social spaces; (3) a field-trip to Spain in order to interview network members and observe places, take pictures etc.; (4) a last interview with the second-generation Spaniards to address spatial questions. The presentation will mainly develop the methodological approach and address problems and experiences derived from the empirical work.

THE VOLUNTARY ON THE CIVIL SERVICE: THE STRUCTURE OF METHODOLOGY FOR A CASE STUDY

Beba Molinari1
1Universita di Genova, Genova, Italy
Abstract: Volunteering in Italy has deep roots, it is a phenomenon that becomes a liquid reality in continuous evolution in a variety of value-expressive forms with different connotations. Both in terms of ideal and on the economic front, voluntary organizations represent an important landscape in the Italian civic society, but above all are interpretive lens to better observe the changing needs of services, thanks to a continuous dialogue with different actors which define the policy. We study the national civil service (SC) regarding its role that is implemented, practiced not only nationally, but particularly at the regional level, the undisputed instrument designed to enhance and promote the values of active citizenship.

The objective of this paper firstly is to put highlights in the structure of the research and to highlight the contribution that a qualitative methodology makes to the quantity and vice versa, secondly which data can be collected and through what means? With this double interpretation was possible to establish the different connotations that volunteering can have in organizations that make up the third sector, effectively creating a link between reality completely different from each other and defining social partnership between the government and the private social sector.

The choice of instruments was made according to the number of aspects to be explored with many social actors involved, so the research methodology used has mixed the potential of detection to allow a debate that would combine both the quantity and the quality information. The various research tools used (in-depth interviews, focus groups, questionnaires, participant observations) these were conducted in an interlaced manner. As a first step survey was carried out out of context to draw the boundaries for secondary data research. This were organized in parallel with a series of focus groups within all stakeholders at national and local system of the SC, this phase has identified a number of issues upon which to build the first questions in the questionnaire to be administered to young people who have participated the SC. This collection, divided over the outcome of the experience of young volunteers, was repeated twice (2007 and 2009), thereby enabling a longitudinal analysis of data. Finally, thanks to qualitative and quantitative analysis may have allowed to develop an assessment of the SC in a path across the SWOT analysis.

THEIR DATA, OUR ETHNOGRAPHY, MY ART PRACTICE, YOUR STORY: SPEAKING AS AN ARTIST PERFORMING ETHNOGRAPHICALLY-INFORMED RESEARCH WITHIN A SOCIAL SCIENCE CONTEXT.

Jane Bailey

1Faculty of Art, UNIVERSITY OF THE WEST OF ENGLAND, Bristol, United Kingdom

Abstract: This presentation will offer insight into art practice led research, that is research in which art practice is the chief vehicle of the research rather than a way to represent its findings, as performed within a social science context. The primary focus will be discussion of my doctoral project, which uses ethnographically-informed creative research methods to explore older adults’ conceptions of their lived landscapes. This research is being undertaken within a multidisciplinary team led by Dr Iain Biggs at the Department of Art and Design, University of the West of England (UWE), whose work forms part of a work package within a larger research programme: ‘Grey and Pleasant Land? An interdisciplinary exploration of the connectivity of older people in rural civic society’. Within this, social-science based interdisciplinary framework, funded via the UK’s Economic and Social Research Council, what issues arise when working from the position of a contemporary artist? For example, how do the processes, assumptions and terminology employed in this research context interact with ongoing art practice? What are the implications for what may variously be understood as the data / interpretations / artworks / stories which are at the core of this research? And what is the relationship between art practice and ethnography in this particular research, and how does it extend contemporary dialogue between art practice, innovative ethnography, and critical gerontological research?

HOW QUESTIONS ABOUT TIME TURN INTO ANSWERS ABOUT AGENCY: COMBINING THE LIFE GRID WITH BIOGRAPHICAL NARRATIVES

Magda Lalanda Nico

1 CIES-JUL, ISCTE-UNIVERSITY INSTITUTE OF LISBON, Lisbon, Portugal

Abstract: The methodological pluralism advocated by the life course perspective is far from being achieved. Although there are numerous possibilities to study the course of a life such as life history, life story, follow-up studies, historical demography, event history analysis, sequence analysis, etc., the potential for mixed solutions within this variety is underdeveloped. Because “research methods are the product of times and places” and reflect disciplinary barri
cades, researchers tend to have militant affiliations to their quantitative or qualitative comfort zones. This is prejudicial to the full understanding of processes of continuity and change through individual life courses.

Although not frequently used outside medical sociology researches, follow-up studies or the ones involving elderly individuals, it has been argued that the context of a biographical interview for the fulfillment of the life grid is favourable to the accuracy of the data collected. This beneficial relation has thus been implicitly described as unilateral. In this sense, face-to-face interviews have been said to improve the quality and increase the consistency of the life-grid information by providing an aide-memoire and an “entertaining challenge” for the interviewee.

In this presentation, it is argued that this beneficial relation is not merely unilateral, but bilateral, and that these potentialities should be employed to researches beyond health, follow-up and/or aging subfields. This combination should be employed in researches that “take temporality seriously” and are interested the intentionality of action. The process of interviewing while fulfilling the life grid (or the other way around), provides a history of events linked to a history of decisions; facilitates the relation between events; boosts the dynamic of the interview, stimulating explanations and justifications for past actions; makes a connection between individual life and historical context and provides an holistic understanding of one’s life. Nonetheless, for a successful mixed and simultaneous application of these methods, the life grid must be transparent and interviewee-friendly (although the researcher is registering the information), registration for the data must be flexible and informal; and confidence should be established before the introduction of the grid (examples of these aspects will be given). Life grid is thus an excellent pretext to reflect and talk about life.

FORMALIZATION OF J.ST. MILL’S METHODS BY MEANS OF MATHEMATICAL LOGIC, OR TWO WAYS OF FORMALIZED QUALITATIVE ANALYSIS

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: The aim of the paper is to show, how methods of casual relations analysis, introduced by J.St. Mill, were formalized by means of mathematical logic in two methods of data analysis in sociology. That are qualitative comparative analysis (QCA) and JSM-method (named after J.St. Mill).

First of them, QCA is an approach (introduced by C.C. Ragin in the late 1980-s), including several techniques of formalized comparative analysis for small- and intermediate-N research designs. Second, JSM-method is a method of automatic hypotheses generation in intelligent data analysis, that is used for analysis of respondents’ opinions (introduced by V.K. Finn in the early 1980-s).

Both of them are defined as formalized qualitative methods, which combine elements of quantitative and qualitative research. From the one hand, these methods imply analysis of rigidly structured data, description of objects through a set of variables. From the other hand, these methods implement inductive strategy of data analysis: individual cases are examined in order to find out similarities and differences, empirical regularities. So it is a process of generalization, during which hypotheses are not testing, on the contrary, they are generated, what accords to the logic of qualitative research.

ADOLESCENCE, SEXUALITY AND COLLECTIVE IMAGINATION. HOW TO BUILD A RESEARCH STRATEGY ABOUT THE CONSTRUCTION OF THE SELF AS SEXUAL BODY

Alessandro Porrovecchio

Abstract: 1. The aim of this paper is to explain the methodology used in the research for my Ph.D. The research is intended to describe how adolescents build up their self-body image. In order to do so, I analyzed the process of adolescents’ self-representation;
2. Some sociological research fields are characterized by delicate issues. For this reason it is necessary to use a qualitative approach with flexible research strategies and techniques;
3. A delicate field, like the one of sexuality research, brings up some communication issues that can be overcome thanks to the Internet and virtual communities. In this context, the possibility of anonymity allowed the adolescent to express himself freely;
4. The data, collected during the research, can be placed into an ideal model based on two axes: syntagmatic and paradigmatic. Data coming from the analysis of blogs and clinical interviews have been placed on the syntagmatic axis, while data coming form online forums and performed focus groups, have been placed on the paradigmatic axis;
5. I have chosen a research path based on a convergence of: quantitative and qualitative methodological approach; online and offline research field; syntagmatic and paradigmatic axis model;
6. Through this research, I achieved two results. First, I reconstructed both the dynamic process of self-body image construction and various aspects of the adolescent sexuality. Second, I have been able to compare the different techniques used for the research through a work of epistemological reflection about the different kind of collectable data and the different socio-cultural contexts in which they could be applied.

FROM EMPIRICAL DATA TO THEORY CONSTRUCTION

Roberto Cipriani

Abstract: The classical approach in sociology concerns the use of hypotheses testing processes to determine what, if any, effects can be attributed to particular factors in the field being studied. But other scholars suggest a procedure which eliminates the presence of previous hypotheses and privileges an interpretive approach to data analysis. However, in the latter approach crucial questions appear: how does one approach the data to ensure the credibility of findings? Blumer’s suggestion about “sensitizing concepts” seems to be appropriate in order to reach not only a reliable interpretation of data but also the possibility of “building theory”. This process could be supported by computer-assisted research.

CREATIVE AUTONOMY: EARLY INFLUENCES IN THE EMERGENCE OF CLASSIC GROUNDED THEORY METHODOLOGY

Judith A Holton

Abstract: Barney G. Glaser is widely recognized as co-originator (with Anselm Strauss) of grounded theory methodology, perhaps the most widely cited method in social science research. In this paper, I discuss early influences that have shaped the course of Glaser’s scholarship and its manifestation in the development of classic grounded theory (CGT). Glaser has frequently acknowledged the influence of both Paul F. Lazarsfeld and Robert Merton on his conceptual ideation of CGT. This paper explores as well other early influences including sociologists Richard LaPiere, Hans Zetterberg, Herbert Hyman, Alvin Gouldner, David Reisman, Daniel Bell and Edward Shils. I suggest that these and other influences in Glaser’s early life stimulated an autonomous creativity that would progress and develop throughout his scholarly career and foster his determined advancement of CGT. Indeed, many of the methodological principles that distinguish CGT from other research paradigms can be glimpsed in the work of these early influences.

I contend that autonomous creativity enabled Glaser to transcend the predominant positivist tradition by effectively rejecting that paradigm’s premise of preconceived theoretical bases for hypothesis testing and verification in favour of developing theory from empirical data. In so doing, Glaser had begun to lay the foundation for the development of CGT while still a student at Columbia University where he worked to capture essential ideas of methodological innovation in the work of Lazarsfeld, Merton, Zetterberg and contemporaries. This ability to conceptually transcend the dominant view would enable him to approach Anselm Strauss’ qualitative paradigm with its rich possibilities for data without imposing the strictures of positivism; an intellectual stance that not only facilitated the emergence of CGT but also supports Glaser’s contention of
grounded theory as a distinct paradigm and a general methodology for research open to any epistemological perspective and using any type of data (Glaser, 2003, 2005).

**ZNANIECKI 2.0. THE IDEA OF BLOG RESEARCH**

Mateusz Stopa

1UNIVERSITY OF INFORMATION TECHNOLOGY AND MANAGEMENT, Rzeszów, Poland

Abstract: The growing interest in new communication technologies must have consequences in more and more important role of qualitative projects taking into consideration Internet content and its relations with reality.

This paper presents the idea of qualitative on-line research project among graduates of higher education system in Poland. However, in the main scope there are technical and methodological problems, obstacles and their solutions. The project’s title is “Znaniecki 2.0. The Internet diaries of graduates”.

As the title suggests, the whole idea is to recall the methodological legacy of Thomas and Znaniecki “Polish Peasant”. The main method is a diary content analysis, however in this particular case, written on-line, as a blog, by the graduates.

One can presume, that on-line content is not only of textual kind, but the graphical solutions and hypertext links matter as well. This conclusion leads to more sophisticated analysis concentrated on text, graphics and links in a time. The possible area of problematic questions may also include time periods of activity, the intervals between entries etc.

What is even more interesting, comparing to the original is that in this case the diaries are open to unknown readers who can comment and generally interact with the authors. It constructs totally new relations between all interested participants and gives more complex data to analyse.

**VERNACULAR SOCIOLOGY AND NETNOGRAPHIC EXPLORATIONS**

Martin Berg

1GOOD OLD, Malmö, 2School of Social and Health Sciences, Halmstad University, Halmstad, Sweden

Abstract: Although the history of the internet, and the social web in particular, is comparatively short, numerous publications have strived at establishing an understanding of what it means to undertake qualitative research on the internet. Early accounts of virtual ethnography or “netnography” focused mainly on the possibility to make use of web communities for researching identity performances and consumption patterns among other themes. During the last few years, the emergence of social network sites (SNS) has heavily redefined the social landscape of the internet since it involves a shift from thematically orientated communities to networks that are centred around the activity of the individual actor. Increasingly, these networks form the basis for a new way of interaction by means of user-generated content since people engage in social activities such as sharing, reviewing and commenting upon the information that each and other user generate. Taking these fundamental changes into account, Beer och Burrows (2007) point at the importance of adjusting research strategies to the conditions of the social web while at the same suggesting that users of SNS are to some extent already involved in a sort of vernacular sociology as part of their social practices. Taking these thoughts further, this paper sets forth to understand in what ways recent developments of SNS have provided a shift in the ways in which the social actor can possibly be delineated. Since SNS allow for a self-presentation and social interaction that largely depend upon the social connections to others, the conditions for communication and social interaction have fundamentally altered and this state of affairs challenges the assumptions that underlie qualitative research in general and ethnography in particular. Theoretically elaborating on these thoughts, the overall objective with this paper is to explore the tensions between ethnographic practices on the internet and the fact that users of SNS are not only preoccupied with a vernacular sociology but are also, and more importantly, to a large extent delineated by their interpersonal actions and social connections.

**SOCIO-SEMIOTIC ANALYSIS AND THE FOUR MODALITIES WHEN ANALYSING AGENCY OF UNEMPLOYED YOUNG PEOPLE**

Jaana Tuulikki Lähteenmaa

1Research Collegium, University of Tampere, Tampere, Finland

Abstract: What are the options and limitations of the socio-semiotical method of text-analysis, when analysing peoples’ descriptions of their own life-situation and feelings? The socio-semiotical text-analysis has originally been developed by the Paris-school of semiotics, especially Greimas. Later the method has been used when analyzing novels, advertisements and other very purposefully produced texts, or cultural products – but not peoples’ colloquial language, rather chaotic and unfinished (self-) descriptions. Is it possible to analyze systematically the modalities (les modalite’s: pouvoir; devoir, savoir faire, vouloir, in French) from the latter kind of texts?

I am currently using the method when analyzing answers (N 440) to an open-ended question in an online-survey (done year 2009). The question was: “Describe your everyday life as an unemployed. You can also tell about your thoughts about the situation.” My research concerns the agency vs. structures in the life-situation and lived experience of the young unemployed people during the current recession in Finland (data gathered in 2009).

On the basis of my own experience (from my ongoing research) the socio-semiotical method is a promising "tool", when looking for the agency of the writers from their texts. Looking for the basic modalities and analyzing them tell about writer’s agency, both reflected and more or less subconscious one. Yet, the method has also problems and limitations. Some of the problems can be solved by deconstructing certain expressions from the point of view of modalities. Certain other problems look more severe. For example analyzing feelings with this method is difficult, if not impossible. Also the differences between languages is more or less a problem. Too often the sociological discourse on agency is highly abstract and without
empirical content. Socio-semiotical text-analysis helps to analyze agency from self-written accounts in a promising way. In my paper I will give concrete examples from my ongoing research, and discuss both the strengths and the weaknesses of this analytical tool.

BIOPGRAPHICAL STORIES OF OSTARBEITERS’ LIVES
Elena Rozhdestvenskaya

Abstract: The paper focuses on the “not connected and not completed” as the biographical trauma as well as on the efforts of biog- raphants on its compensation and the return of the meaning. It is based on the life stories of Ostarbeiders. The concept of trauma is linked to the catastrophic experience and desubjectivation. The analysis of the interviews reveals not only the destructive effect of the socio-historical events in the biographies of the narrators, but also their strategies in overcoming the biographical gaps, which can be traced both at the level of their life courses and on the plane of the stories.

Our project is based on materials of the international documentary project, “Forced and Slave Labour.” They are the biographical inter- views with those who were forcefully taken to work in Germany and have experienced the burdens of the forced labour. The biog- raphies of Ostarbeiders that are collected in the tradition of Oral History, are gradually taking their place in the common space of symbolic memory of war which, however, is not uniformly repre- sented or given value.

Sociological approach required us to see the life stories of our biog- raphants not only as a source of oral historical knowledge, but, more importantly, as “testimonies,” which were placed within the space of life with the everyday background of microsocial history.

ANALYZING FRAME SWITCHING IN ETHNOGRAPHIC DATA
David Wästerfors

Abstract: To reframe interaction or combine two frames simultane- ously is an everyday occurrence in many contexts. George Herbert Mead even implied that our competence to do so is essential for human sociality (“sociality is the capacity for being several things at once”). In this contribution I try to outline some methodological aspects of attending to and analyzing frame switching in ethnographic studies. As a point of departure, I describe Gary Alan Fine’s observations in “Shared Fantasy” of how actors in fantasy role playing shift frames, for instance from engagement in fighting a monster to mundane discussions about politics or the latest science fiction novel. Then I compare Fine’s instances with my own observa- tions of how youth in institutional treatment go in and out of play frames, as they tease or fight each other and staff “for fun” during meals, lessons or other situations. I will especially discuss problems in identifying frame switching, the importance of including them in qualitative studies, and what to with them analytically in the case of “troublesome” youth in residential treatment.

"WHO IS ‘TRUE’ RESEARCHER HERE?” DYNAMICS OF THE RELATIONSHIPS BETWEEN HARD AND SOFT SCIENTISTS.

Izabela Wagner

1 Institute of Sociology, UNIVERSITY OF WARSAW, WARSAW, Poland, 2Centre d’Etude des Mouvements Sociaux, EHESS, PARIS, France

Abstract: This presentation focuses on dynamics of the relationship between an ethnographer and participants in a specific context of the life-sciences laboratory. This particular field was largely studied in the past, but publications rarely concerned the multi-site ethnography and the situations in which a sociologist is a transnational professional - exactly as it is presented in the case of these partici- pants.

My paper focuses on the process lasted eight years, during which I passed through several stages - some typical for several ethnographic work and some different. Presenting each of these stages, I will underline the specificity of ethnographical work conducted among other scientists. I would like to show the tension which are the consequences of different scientific cultures. I will prove that in this specific field the long lasting (several years) ethnography is better if not unique method of sociological inquiry, when the topic of research concerns the international culture of work, the impact of culture of origin in the multicultural work places as well as the career making processes in the scientific and internationalized envi- ronments.

GATEKEEPERS AT THE GATE – RESEARCHER AND GATEKEEPER RELATIONS IN A CHARGED FIELD

Markus Hansson

1 Department of Sociology, DEPARTAMENT OF SOCIOLOGY, UNIVERSITY OF LUND, Lund, Sweden

Abstract: This paper deals with researcher – gatekeeper relations in the highly opinionated and sometimes dogmatic field of the re- search surrounding irregular immigrants in Sweden, but the under- lying conflicts of interests can easily be translated to most research areas where the access to the field is being limited and conditioned by the help of gatekeepers. The gatekeepers in this particular setting, the representatives of the NGO:s and underground clinics catering to the irregular immigrants, are imperative for the re- search of this segment in society. The inherent conflict in this relation- ship is foremost the engagement and commitment to help this vulnerable group on the behalf of the gatekeeper, and the endeav- or of the researcher to examine and cover the multifaceted exist- ence of the group being examined. During the fieldwork of this study it has become apparent that the selection of “suitable” sub- jects for interviews picked by these gatekeepers are particularly well educated, verbal and have what you could call “spectacular” life histories. This paper will raise the question how to deal with this well intentioned skewed selection and still maintain scientific integ- rity. Another inherent risk in this relationship is that since these gatekeepers are perhaps the most knowable persons outside the research community about this group of interest and are well versed and active in the public debate, their problem formulations and explanations might influence the work of a less cautious re- searcher. I short this paper deals with the problem of being de- pendent of intimate relations to the field while still keeping the emotional, intellectual and scientific distance necessary.
THE ROLE OF GENDER IN FIELDWORK EXPERIENCES. 
AN INTERSECTIONAL ANALYSIS OF CHALLENGES AND OPPORTUNITIES IN CROSS-GENDER RESEARCH INTERACTIONS
Klaartje Van Kerckem¹, Anna Virkama²,³
¹Department of Sociology, Ghent University, Gent, Belgium, 
²Department of Education, University of Tampere, Tampere, Finland, ³Institut Magreb-Europe, Université Paris VIII, Paris, France

Abstract: In qualitative research, the interaction between informa- tion and researcher is the key to success of the project. This interaction does not take place in a vacuum, but in a specific social context in which both parties act out their role as researcher and informant, but also other – perhaps more latent – roles related to gender, ethnicity, class and educational background. How these roles are displayed in the interactions can influence the data and the field relationship, sometimes even aspects of the personal life of the people concerned.

Existing research on the relevance of gender for ethnographic fieldwork has primarily focused on problems of cross-gender interaction. A first possible challenge – both for male and female researchers – is limited access to spheres dominated by the other gender, due to a strong connection between gender, power and knowledge. A second difficulty that might arise is what Gurney calls ‘sexual hustling’, ranging from flirtatious behavior to overt sexual propositioning or harassment.

Despite a vast and growing body of research on qualitative/ethnographic methods, few studies thoroughly problematized challenges and possibilities of cross-gender interaction between researcher and informant. Our study contributes to the existing debate by examining in detail fieldwork-based experiences in inter- sectional perspective. Based on a review of existing literature and a reflexive analysis of our own fieldwork experiences we give an analytical account of how gender is constructed in interview and fieldwork settings and how it shapes fieldwork experiences and relationships. We pay particular attention to how different contexts and interaction styles lead to different outcomes in terms of challenges and opportunities. Based on our own experiences as female researchers who study men, we examine the role of gender in the fieldwork process while taking into account other important aspects such as age, class, educational background, sexual orientation and ethnicity. The purpose of this article is (1) to give a systematic overview of gender-related opportunities and challenges women experience while doing research with men, (2) to relate these challenges and opportunities to different gendered interactional styles and contexts and (3) to develop strategies to deal with difficulties related to cross-gender research interactions.

METHODS FOR APPROACHING THE GEOGRAPHIES OF HANGING-OUT
Noora Pyryy³
³Department of Teacher Education, University of Helsinki, Helsinki, Finland

Abstract: This presentation is based on my ongoing dissertation work, which sheds light to teenage girls’ hanging-out practices and the effects of the regulation and privatization of urban public space. My research is based on poststructuralist feminist geography, but it also draws from sociology, youth studies and pedagogical science.

Urban space is studied through the themes of democracy and public life.
My research questions are as follows:
1. How do teenage girls use and appropriate urban public space?
2. How do the hanging-out practices of teenage girls reflect their position in the society?
3. How do girls (re-)produce social identities and gender through the use of urban space?
4. How can we integrate young people’s everyday personal geographies into the teaching?

I am conducting field work both in Helsinki (Finland) and in San Francisco (US), in order to examine cities of different scale and context. In both cities, urban space is approached through observation, photo documentation and stakeholder interviews. In Helsinki, additional data collection happens as a part of geography studies at school. The methodology draws from ethnographic research practice and participatory research epistemology. The participants will first map their hangout places. They will then collaboratively produce a participatory diagram of their views about hanging-out, after which the diagram will be “interviewed”. The participants will take photographs of urban spaces of special importance for them and collect these as photo-diaries of one week. These will be used for photo-elicitation. The methods and outcomes of the project will be evaluated together with the participants. This will be followed by presenting the photo-diaries at school and by collecting them together as an art exhibition. My aim is to further develop methods for approaching everyday life and the ways in which young people are active and socially productive in their urban environments. I also hope to introduce new ways to integrate personal urban geographies to education. The choice of methods can be understood in the ethical light of understanding young people as active subjects in our societies. Their place in the research is thus central and I as a researcher will be working with them rather than on them.

METHODOLOGICAL CONSIDERATIONS IN ETHNOGRAPHIC FIELDNOTES
Katia Cigliuti¹
¹dipartimento di sociologia, UNIVERSITÀ DI FIRENZE, fiorenze, Italy

Abstract: The present essay is inspired by my PhD thesis in ethnographic fieldnotes and my Master thesis, namely an ethnographic study of ‘Collettivo Autonomo Viola’, the leader group of Fiorentina supporters.

Starting from the consideration that textualization does not characterise only the last step of ethnographic research, that is when the ethnographer writes about his/her field experiences in essays and monographs, but the whole study process during which the ethnographer writes fieldnotes and his/her personal journal, it is evident that there is a deficiency on the topic of ethnographic notes.

Ethnography originates in orality and then makes the transition to writing (Geertz 1998).

Ethnographic notes represent the first transition from the oral to the written code.

Methodological texts give tips about how to enter and work in the field and write a monograph, but they tell very little about empirical base formation. If we look at fieldnotes as the professionalising
strategy for ethnography and the empirical documentation of the research, this loss of information leads to a sense of disorientation. The issue of fieldnotes is of primary importance in the field of ethnography, which is often accused of not being apt to be thoroughly inspected and subject to researchers’ inclinations.

This paper deals with the definition of fieldnotes that, at an international level, is not as predictable as it may seem according to textbooks. What does the definition of fieldnote include or cannot include? Its definition is based on the well-known difference between ‘writings about others and writings about oneself’ (Jackson 1990). The attempt to define ethnographic fieldnotes is preliminary and essential in order to collect and analyse empirical data.

CHALLENGES IN END OF LIFE RESEARCH: THE STORY OF A JOURNEY

Ana Patricia Hilario

DEPARTMENT OF HEALTH AND SOCIAL CARE, ROYAL HOLLOWAY-UNIVERSITY OF LONDON, London, United Kingdom

Abstract: This paper is concerned with the design and ethical aspects of conducting research on end of life. The first part describes the design of the study. Data was obtained by ethnographic research strategies. Intensive fieldwork was carried out over 10 months in two palliative care units. Semi-structured interviews were conducted with ten terminally ill patients, twenty relatives and twenty palliative care professionals. These techniques allowed the researcher to understand the experiences of terminally ill patients and those who care for them in their last weeks and days of life. Indeed the researcher had the opportunity to record aspects of the lives of patients and their careers in a detailed way without disturbing the internal dynamics of the place where the study was being conducted. The second part discusses the ethical issues of conducting research with vulnerable subjects. Information consent was obtained from terminally ill patients, their relatives and palliative care professionals on the understanding that participation is voluntary and that it can be withdrawn at any time. The right to anonymity, privacy and confidentiality of research participants were also respected. The third part highlights the idea that conducting research on sensitive topics such as end of life can have a profound impact on the researcher’s well being. For example, a prolonged contact with the subject of a terminal illness can raise fears about mortality for one self and for one’s family and friends. The methodological issues of involvement, detachment and personal responsibility have an added significance when studying topics of an emotive nature. Hence the purpose of this paper is to offer guidance on how to conduct sensitive research in end of life scenarios.

ENCOURTING THE UNEXPECTED --ETHICAL REFLECTIONS ON INTERVIEWS

Susanne Elisabeth Boethius

Sociology, LUND UNIVERSITY, Lund, Sweden

Abstract: It takes a lot of preparation to set up the best possible ethical condition for an interview. Knowledge of the field, informed consent and having an ethical approval are some very important factors the interviewer must be aware of and take into concern while preparing for an interview study. But what happens when situations becomes different from what the researcher expected? When the researcher have to struggle with feelings that was not expected? Follow me through a discussion of my experience of interviewing men and women in violent relationships, both in the direct interview situation but also afterwards. I discuss how to handle unusual situations such as being kissed by an interviewee, feeling disgust by an informer and how one may find oneself in the middle of an argument between an abused woman and her offender. I reflect over how I processed my experience during my research and how I tried to handle the inner struggle of having unexpected feelings. This paper focus on ethical concerns both in relation to the interviewer and in relation to the interviewee.

WRITING RESEARCH WITH/IN SOME POSTSTRUCTURAL THEORIES

Hanna Guttorrn

Unit of Cultural and Feminist Studies in Education, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: How to take the poststructural theories into account not only in reading or analyzing ‘data’ (texts, phenomena or practices, to name some) but also in writing about/in/along the research? While language and discourses are understood to (re)produce differences, how can we write so that the texts would be deconstructive and careful, moving and open for different interpretations and the multiplicity of life and world? How to write, say, argue, and simultaneously refuse knowing ‘better’, ‘revealing’ some certain kinds of things, making “relevant”, or giving “evidence” on something especially? How to accept the messiness, multiplicity, rhizome-likeness of subjectivity of oneself and others, or the getting lost of methods of describing or analyzing them? Walking and writing on the hanging bridge between poststructuralist ways of (not/post)-knowing and the (still often traditional) demands on scientific writing?

I’ve come to these questions through (pretending to) investigate the gender contract of Finnish craft education. Even though the pupils are “free” to choose either textile or technical crafts in schools, they choose fairly gender-based. My ‘data’ consists of an ethnography in two schools, and various kinds of cultural texts (curricula and media texts plus all kinds of transgressive ‘data’) around craft and gender. I’ve been reading them discursively and deconstructive.

MANAGING ETHICS IN RE-ANALYSING QUALITATIVE MATERIAL

Katarina Jacobsson

Dep. of Social Work and Social Policy, LUND UNIVERSITY, Lund, Sweden

Abstract: The idea of pre-approved research projects, assessed by a central ethical vetting board, sits poorly with the imperatives of fieldwork, given that their fixed design runs contrary to the rationale for fieldwork – unpredictability. According to Jack Katz, this has led to ethnographic research being forced underground, since for much ethnographic data gathering it is impossible to seek prior approval. In this paper, I will discuss yet another dilemma that faces the researcher who wishes to present a re-analysis of material that has already been collected. Qualitative researchers sometimes return to ‘old’ material in order to examine a new research question. The interest in re-analysing written-up material is often prompted...
by new analytical concepts or theoretical insights that make it possible to tackle a lingering puzzlement. However creative (and fun) this may be, it is a practice that raises specific ethical considerations. Can old material be revisited with a new research question in mind – and thereby departing from the original plan and application – without violating ethical rules? What might be the ethical objections to a re-analysis of material collected long before, and how could such objections be met and, perhaps, countered? Apart from protecting the rights of the research subjects (the original object of the ethical vetting process), qualitative researchers’ moral work now also include how to manage the ethical vetting board itself.

COMMUNICATIVE METHODOLOGY FOR RESEARCH WITH SOCIALLY VULNERABLE GROUPS

Ramon Flecha¹, Lidia Puigvert¹, Gisela Redondo¹

¹Sociological Theory, UNIVERSITAT DE BARCELONA, Barcelona, Spain

Abstract: During the last decades of the 20th century the presence of dialogue has greatly increased affecting many traditional structures in the political, economic, sociocultural, and personal domains. This dialogic turn in our societies has already had a deep impact in the social sciences and in its research methodology. The communicative methodology (CM) responds to the new social context of dialogic transformations in which increasing importance is granted to the contributions from every person in the construction of scientific knowledge, particularly referred to those traditionally silenced voices. The main characteristic of the Communicative Methodology is the continuous and egalitarian dialogue held throughout the research process among researchers and people belonging to the reality investigated. Through this dialogue, researchers contribute -on the one hand-, the scientific knowledge that humanity has accumulated throughout history and the researched subjects on the other hand, contribute their investigated realities from their lifeworlds. Through this process of dialogue, knowledge is constructed in a collective way about communities and realities being studied. It is then when new elements of analysis emerge providing a better understanding and new solutions to different social realities, particularly those in contexts and communities which are more socially vulnerable. This paper presents the CM, its main characteristics and its impact in transforming situations of inequality and exclusion. We intend to deepen, most particularly, on the second aspect putting forward how research conducted through this methodology has already presented significant results about the analysis and improvement of the situation of the socially vulnerable groups.

EXPLORE THE ETHICAL QUESTIONS OF QUALITATIVE RESEARCH APPROACH IN THE FIELD OF LEADERSHIP IN EMERGENCY THROUGH DEPTH AND NARRATIVE INTERVIEWS

Barbara Lucini¹

¹Department of Sociology, Catholic University of Sacred Heart, Milan, Italy

Abstract: In the last decades the attention paid to disasters and catastrophes whatever their origin be and in different fields of study and research was becoming a core question, because inter-

ests many fundamental human desires as security, safety, satisfaction of primary needs and improvement of life conditions.

In the contest of complex societies as the contemporary one, natural, man made or technological disasters hold a central role in the life of many people, not only as the potentially victims of these events and their damages, but also as leaders, policy and decision makers, volunteers aimed to respond and cope with a crisis process.

Leadership during all the phases of disaster, preventive, planning, response, reconstruction has been studied by sociological authors and many theories about this constitute the theoretical framework in which comprehend the possible style of leadership, its adequacy and efficacy in a specific disaster.

Different styles of leadership depends on many elements: personal, individual, societal and collective; in particular they are connected in a strong way by personal skills, psychological attitudes, organizational resources, professional training and experiences and last but not least by gender.

The role of gender in the question of leadership in disaster represented a multidimensional concept as shown by its importance and influence during the disaster process and in particular in response phase.

Understand the motivations of because and how a person becomes a leader and the different paths go through by a man or a woman in their professional life is made possible with an applied research and the use of qualitative methods as depth interviews and in particular story telling biographical methods.

The attention will be focused on the interview situation and its importance to tell the story of the participation in the field of crisis management and the ethical issues and implications arise from this kind of situation; another methodological component known as “autobiographical pact” will be analysed through biographical sequence and its operative instruments.

Use biographical and narrative interview according their specific techniques allow to look into closely world of leadership in disaster and ethical qualitative research issues so significant, thinking to the decision of alarm, evacuation, relocation of a population stricken by a disaster.

TWENTY STATEMENTS TEST: A TECHNIQUE TO MAKE THE QUALITATIVE DATA MORE CREDIBLE

Irina Trotusk¹

¹Sociology Chair, PEOPLE'S FRIENDSHIP UNIVERSITY OF RUSSIA, Moscow, Russian Federation

Abstract: The Twenty Statements Test (TST) was developed by M.H. Kuhn and T.S. McPartland as an operational interpretation of ‘Self’ – the symbolic interactionism basic concept: during 12 minutes the respondent has to write 20 self-identifying nouns (answering the question “Who am I?”) in a spontaneous order – just as they come to his mind. The data obtained is coded using different schemes but they all tend to look like the model suggested by L. Zurcher – physical, social, reflexive and transcendental features. More than a half-century history, unfortunately, didn’t make the TST a popular method of sociological research (it was accused of being too ‘psychological’ and of classifying interrelated self-descriptions into different codes), but methodological experiments identified its possi-
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

Abstract Book

bilities (a simple and fast test procedure) and restrictions (due to the social desirability phenomenon, situational context and impossibility to ‘weight’ the subjective meaning of the same self-identifications). The years of TST practical application allowed to design the typologies of self-identification nominations: we can either conduct content analysis or refer to the existing theoretical models that assure of social, group and ‘role’ identifications dominance over the purely personal. What seems to be quite astonishing is some sociologists critique accusing TST of not ‘measuring’ the ethnic identification — that’s why they announce TST meaningless and useless within any sociological study with strong ethnic emphasis. Such accusations are irrelevant for the TST wasn’t developed for such purposes (statistics shows that only up to 10% of respondents name their ethnicity at all). That’s why we shouldn’t use TST as the main or the only research method, but it’s informative and effective as a supporting technique in the qualitative study. Firstly the TST questionnaire filling process itself is indicative (‘level’ of difficulty for different ethnic groups and the time spent to fulfill it). Secondly we can compare ethnic groups by their identifications structure detected by the TST, for instance, focusing on the category ‘ethnicity’ itself. Thus the TST is a necessary technique for any qualitative research where ethnic component seems to be of a great importance. We’ll illustrate this statement by the qualitative research conducted in 2007 in the Caucasian region (the project “Caucasian Youth: between Past and Future”).

VALUE AND VALIDITY IN A SOUTH AFRICAN STUDY ON MEN’S SEXUAL AND REPRODUCTIVE HEALTH: INTEGRATING TWO ANALYTICAL APPROACHES USING QUALITATIVE DATA MANAGEMENT SOFTWARE.

Asta Helen Rau 1, Kevin Kelly 2

1Centre for Health Systems Research & Development, UNIVERSITY OF THE FREE STATE, Bloemfontein,. 2Centre for AIDS Development, Research & Evaluation, Rhodes University, Grahamstown, South Africa

Abstract: Qualitative researchers are no strangers to validity anxieties. This is partly due to criticisms that analyses cannot be easily interrogated or tracked. Also, techniques for increasing validity such as triangulation may not be possible, particularly in deep qualitative approaches. The value of qualitative work is less contested, being long recognised as a means to understand the ‘why’ and ‘how’ of people’s perceptions, experiences and actions. At the policy level qualitative findings tend to exert less influence than quantitative results. But at the operational level, qualitative understandings become invaluable, even essential. Notions of validity and value are explored in the context of a study on men’s sexual and reproductive health, which aimed to better understand sexuality as a key factor underlying gender inequities and the high HIV prevalence in South Africa.

In-depth audio-recorded interviews were used to gather sexual life history narratives of forty men and women from a wide range of localities and socio-cultural contexts. Data were transcribed, translated where needed, then imported into nVivo—a software program for qualitative data management. The research needed to identify and report to funders on key ideas and issues that can be used to formulate interventions targeting men, so a thematic analysis of data across all participants was conducted. But research team members were also invested in a different research outcome: an analysis of each narrative that would track and explore individual experiences from early sexual awakening through to adult sexuality.

Collecting data via sexual life history narratives was appropriate for both analytical approaches. In terms of value, the thematic analysis worked well for identifying key issues to use in new HIV and reproductive health communications for men. But the deep qualitative work of narrative analysis yielded far more complex insights into the evolving sexuality of individual participants, which has implications for interventions design. Qualitative data management software made it possible to conduct parallel analyses simultaneously. Validity was greatly enhanced because the software allows for the rigour of analyses to be cross-examined and their logical construction tracked. It also enhanced the capacity of multiple analysts to bring their different interpretations into a dialogue.

CREATING NEIGHBOURHOOD NETWORKS: WHY SCIENTIFIC FOUNDATIONS OF QUALITATIVE RESEARCH MATTERS?

Romana Xerez 1

1Centre for Public Administration & Policies, INSTITUTE FOR SOCIAL AND POLITICAL SCIENCES, Lisbon, Portugal

Abstract: While there has been a strong influence on the qualitative methods on the emergence of Social Network Analysis, this framework’s influence declined for a relevant period of network perspective construction. The author discusses the qualitative roots of urban networks and examines the contemporary trend of making qualitative research credible on the growing application of qualitative data on the process of telling about the neighbourhood network. This paper examines theoretical arguments in accordance with a reflexive process of an empirical study. It shows the qualitative methods of collection and analysis of social networks in an inner city neighborhood. The paper suggests the relevance of key aspects to strengthen and improve qualitative research and making it credible in sociology in general and in Social Network Analysis in particular, such as: (1) theory and linkages to the literature (2) analysis; (3) validity and reliability; (4) sample; (5) and ethics.

This research aims to explore, from an empirical perspective, a variety of qualitative methods of a non-traditional nature such as films and archives, as well as ethnographic observation, virtual ethnography and semi-structured interviews to report data on cities and neighborhood communities’ social networks and discuss qualitative data. Based on the recent experience of research social networks neighbourhood, the article draws on semi-structured interviews (N=25), ethnographic observation as well as photos, newspapers and film archives. The ethnographic observation and interviews were the beginning of qualitative research. The knowledge of the area - the analysis of the existence or absence of community neighborhood, the interaction between the neighbours, was elements of observation.

The qualitative approach defines and enriches the cultural context of a neighborhood community social network, the social traditions and specificities of connecting and social support. Findings report relevant data and explore the integration of this material triangulation to design a mixed method framework.

TO INQUIRY INTO POWER NETWORKS: ETHICAL AND METHODOLOGICAL CHALLENGES
JOANA RAMALHO
1
1Institute of Social Sciences, UNIVERSITY OF LISBON, Lisbon, Portugal

Abstract: This paper focuses on the methodological and ethical issues present in an inquiry into the process of design and implementation of a public policy. In particular, we focus on research exercises whose core method consists of a set of interviews conducted within the network of actors identified as having the power to directly or indirectly influence the policy-making process under scrutiny.

This paper discusses the difficulties with the aggregation of empirical data and the development of the follow-up interpretative narrative. These difficulties hail from three key aspects: (i) the specificity of the universe of interviewees. The latter consists of a small number of individuals, mostly public figures with previous interpersonal and professional relationships, whom have agreed to be interviewed on the basis of anonymity and confidentiality; (ii) the purpose of the interviews which is not simply to verify concrete facts or behaviours, but also to unveil the actors’ agendas, values and beliefs; (iii) the nature of the issues under analysis: the politicization and personalization of the policy-making process, the power games and conflicts of interest.

In this sense, this paper delves on how to mitigate the aforementioned difficulties and develop solutions that allow: to articulate the interview-based data collection with an additional documental analysis; to assess the truthfulness of the collected data and to decipher implicit information; to guarantee confidentiality; and to distinguish the interpretation of the researcher from that of the interviewees.

Although this paper builds on a concrete case study hence arguably affected by its context-dependency there are nevertheless lessons to be drawn that can be useful to those who engage similar qualitative analysis of power networks and face comparable difficulties that may hinder the researcher’s credibility.

DOING QUALITATIVE ANALYSIS USING THE PHENOMENOLOGICAL SOCIOLOGY OF ALFRED SCHUTZ: A PROPOSAL
Gianfranco Giuntoli1
1Faculty of Health and Social Sciences, Leeds Metropolitan University, Leeds, United Kingdom

Abstract: Several aspects of the phenomenological sociology of Alfred Schütz have been analysed and discussed in the literature, from his methodological principles to his analyses of the world of everyday life. However, there are only very few examples in the literature of empirical applications of phenomenological sociology, both as a methodology informing specific research projects and as a method of data analysis. This paper proposes an approach and a step-by-step procedure to use Schütz’s phenomenological sociology as a method to undertake qualitative data analysis of interview transcripts. It does so by first reviewing and critically discussing the analytical procedures followed in grounded theory and in other phenomenological approaches to qualitative data analysis, for example interpretative phenomenological analysis, descriptive phenomenological analysis, and hermeneutic phenomenological analysis. Consequently, it poses questions such as: Is bracketing needed both at the level of data collection and data analysis? If so, what is the role of Schütz’s analyses of the structures of the lifeworld and of the systems of relevance when carrying out qualitative data analysis? Is ‘coding’ of transcripts the best way to approach data analysis in phenomenological sociology? Does sociological phenomenology imply an hermeneutic approach? What are the analysis outputs, are they themes or ideal types? Is there a role for computer assisted qualitative data analysis? If so, are specific softwares needed? Answering these questions is important to identify the best ways to explore how social actors construe the meaning of their experiences in their life-world. The life-world is the cognitive and subjective place where the external environment and the others are perceived, so where opportunities, barriers, disadvantage, etc. are experienced. The development of sociological methods aimed at its analysis can help to strengthen our understanding of several social processes and dynamics, in particular those related to social and health inequalities.

TRIANGULATION OF QUALITATIVE AND QUANTITATIVE METHODS IN A CONTEXT OF INSTITUTIONAL RESEARCH
Uwe Flick1
1Qualitative Research Methods, ALICE SALOMON UNIVERSITY OF APPLIED SCIENCES, Berlin, Germany

Abstract: Studying the life situation of vulnerable populations like institutionalized people in nursing homes may need to employ a combination of research methods. On the one hand we should use methods for identifying the relevance of certain problems in the institutional routines, on the other hand we need methods for identifying the knowledge and routines referring to these problems. The first approach can be based on quantitative methods – for example by using assessments and statistics for analyzing how often a problem like residents’ sleeping disorders occur in the population of and institution. The second could be based on qualitative methods – for example interviews addressing the staff’s awareness of such a problem and their concepts and routines of managing this problem. Such a combination of methods can either be conceptualized as a mixed methods approach mainly focusing on the methods that are applied. Or it can be conceived more substantially and comprehensively as a triangulation of research perspectives. In this paper, I want to spell out such a triangulation of perspectives on several levels including theoretical approaches by illustrating this methodological discussion with examples from a research project addressing both sides of sleep problems mentioned above. This methodological presentation intends to discuss the needs for triangulation, the challenges of applying it and the differences to pragmatic methods mix in times of mixed methods research.

DOING QUALITATIVE RESEARCH WITH RENEW ARCHIVAL AND BIOGRAPHICAL SENSITIVITY
Miguel S. Valles Martínez 1, Mª Ángeles Cea D’Ancona 1, Cecilia Eseverri Mayer 1
1Sociology IV Department, UNIVERSIDAD COMPLUTENSE DE MADRID, Pozuelo de Alarcón (Madrid), Spain

Abstract: In what ways does our researching and teaching experience innovate qualitative methods? We claim that it is the archival sensitivity put into practice; related to the backstage research activ-
ity and the biographical circumstances (generations, belongings or identities) of the research teams. We offer illustrations regarding the concrete transcription and first analysis of qualitative interviews, discussion groups; preceded by a practice of autobiographical writing (linked to the story-telling group technique); and complemented by parallel ethnographic observations in our daily lives via anthropological and sociological note taking. All with a purpose of recording and interpreting phenomena related to migration experience.

In the projects MEXEES I: 2006-2008, and MEXEES II: 2010-12, conducted both as a research and teaching activity, we decided to combine the more applied conversational methods (interviews and discussion groups) with less applied autobiographical and ethnographical methods. Being sociology our mainstream discipline, we have found useful certain proposals of reflexivity or author visibility (Marsal), the debate on autoethnography (in journals such as ICE, FQS...), autobiographical sociology (Friedman), and focus ethnography (Knoblauch), among other concepts and authors. Our adoption (and adaptation) of autobiographical, ethnographical and conversational methods has been done with a special emphasis on archiving the process of researching; both the backstage and frontstage of it. And the process of becoming a researcher within the field of sociology (and other social sciences); or the process of evolving as researchers and methodologists. From learning from the field (Whyte) to learning from researching (on migration or other topics) and teaching qualitative methods, would be another way to communicate this sort of methodological experiment. Following the tradition of methodological appendixes, but also other more autobiographical testimonies by researchers of different generations, countries and disciplines, we feel it is an avenue for the acquisition of the meaning of qualitative methods with a historical and biographical perspective. A key aspect being a hands-on approach, with junior and senior researchers, sharing the (present and future) benefits of archiving the forementioned various processes.

OPERATIONALISING SEN’S CAPABILITY APPROACH. A MIXED METHOD PROPOSAL FOR THE EVALUATION OF EUROPEAN EMPLOYMENT AND SOCIAL PROTECTION PROGRAMS

Joan-Miquel Verd 1, Carlos Lozares 1

1Department of Sociology, UNIVERSITAT AUTÔNOMA DE BARCELONA, Barcelona, Spain

Abstract: The paper will present some of the most important methodological aspects of the empirical research carried out in the European project Resources, projects, and capabilities: in search of social foundations for Europe (financed by the VIth Frame Program of the European Comission). This project uses the capability approach (CA) promoted by Amartya Sen as an “enriched informational base of judgement” in evaluating European employment and social protection programs. More concretely, the features that will be presented in the paper are the result of the work aimed at identifying what social protection resources can guarantee occupational security, in a European context where involuntary career fragmentation seems to be increasing.

It is important to note that in general the capability approach has been developed and applied empirically from a quantitative perspective. This should not be surprising if we remember that Sen and most authors who have applied the capability approach come from the field of economics. Robeyns states this predominance of quantitative approaches within the capability approach, but also mentions the existence of qualitative approaches oriented towards descriptive analysis and “thick description”. In our opinion, qualitative approaches have quite a lot more to offer. A qualitative development of the capabilities approach can realize the full analytical potential of Sen’s work.

Thus, a qualitative identification (by using semi-directed interviews and a formalised qualitative analysis) of either turning points and critical events or transitions and stages where social protection measures and resources have a significant role redressing or channeling personal and labour trajectories can improve the already mentioned quantitative approaches. This qualitative development was combined in the above mentioned project with a quantitative life-course perspective, producing what in Creswell’s terminology would be called a sequential mix method design. The basics of this design, together with the kind of analysis carried out (and the results obtained) will be at the core of the paper.

THE PRESENTATION OF SELF AS A WRITER, IN EVERYDAY LIFE AND IN FICTION

Leonor Graser 1

1Sociologie, Cerlis / University Sorbonne nouvelle Paris III, Paris, France

Abstract: If it has been sociologically proved that literary practices are related to social experiences, could we say that literary experiences take directly part to the socialization process? Could we consider the writing as a way, for the novelists, to confirm themselves as thinking and acting subjects over the social determinations? Does the literary creation, as a work of symbolization, lead to social accomplishment?

An empirical survey, established on a double qualitative corpus - interviews with twenty-two parisan novelists of the 21st century and analysis of their complete fictive work –, allowed us to examine the many interactions between the socialization and the creative process, especially on how novelists tell, lively or fictively, their own story about reading and writing experiences.

We would like to present the methodological characteristics of our research, suggesting to study how literary texts can be used by the polster to go further into discurses analysis, and how it can certainly open new horizons to the writers’ sociological knowledge.

USING FRAMES AS A BOUNDARY OBJECT IN MIXED METHOD RESEARCH

Ksenia Tenisheva 1, Daniel Alexandrov 2

1Sociology of Education and Science Laboratory, Higher School of Economics, Saint-Petersburg, Russian Federation

Abstract: The proposed paper offers a reflexive discussion of our attempt to overcome the gap between quantitative and qualitative methodologies in mixed-method design. We will discuss our study of educational choice in one rural district. The project was set to analyze the relationship between chosen educational pathways and socio-economic positions, aspirations, expectations, and other factors: over 100 interviews with students and parents and a survey of all 500 students and their parents living in the district.

We use the concept of ‘boundary object’ (Star and Griesemer, 1989) to discuss the translation problem across the divide between
NEW QUESTIONS REQUIRE NEW METHODS - A METHODOLOGICAL APPROACH TO MATERIALITY: WARDROBE STUDIES

Ingun Grimstad Klepp

Technology and Environment, SIFO/ NATIONAL INSTITUTE FOR CONSUMER RESEARCH, Oslo, Norway

Abstract: In the effort to make clothing studies more material, the attention has been directed at the relationship between body and clothing. As an alternative approach we propose the study of the relation of clothing to other pieces of clothing within a greater whole as a way to highlight the materiality of clothing. The theoretical point of departure for this approach is a practice theory in which the material enters as an integral part. The methods combined and developed in wardrobe studies are discussed. The emphasis here is on the weaknesses of the individual methods in practice-oriented clothing studies, but also on how they jointly can contribute to the wardrobe study. This is illustrated with examples from studies from The National Institute of Consumer Research (SIFO) in Norway, where the method is being tested. Research, like all other practices, is not just about what we say and think, but also about what we take for granted, do and have. Research, too, has a spatial organization and an infrastructure. Interdisciplinary collaboration and access to both social and natural scientific traditions and infrastructure provide the possibility to develop methods that allow for the updated understanding of reality that is found within practice and materiality studies. Just as the material culture that is the object of our studies carries in it distilled ideology, so does the materiality of the research world. These material structures contribute to constraining and opposing the changes that these theories open up. The method has been developed within the field of clothing but is relevant for practice-oriented consumer research in other fields of consumption.

DRAWING MAPS AS AN ELICITATION INSTRUMENT IN LIFE STORIES TO COLLECT SPATIAL DATA

Marta Margherita Cordini

Sociology, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: This paper aims to discuss an empirical method consisting in the collection of spatial data through life stories including visual materials utilized as elicitation. The research was focused on the understanding of the housing pathway in the migratory experience. A quite noticeable amount of research on housing conditions and careers, of migrants and non migrants, has been characterized by quantitative methodologies which, even if were able to provide a general and wide framework, weren’t able to reach an exhaustive knowledge on a set of features strictly linked to housing: daily implications of housing conditions, non structural factors characterizing the housing pathway, the role of the agents in their experiences, the cultural implications, the decision making process, the meaning construction and the life style.

This kind of research implies the collection of spatial and daily data that are often taken for granted by individual who are dived in the reality studied. Asking and speaking about home and neighborhood can result difficult and meaningless. Many elements are forgotten and the emotional and cultural relevance of the spatial organization can toughly emerge. To overpass these obstacles an elicitation instruments is introduced in the middle of the life stories, exactly in the moment in which these kinds of difficulties seem to appear: participants are asked to draw a map of their home, in the host country and in their country of origin, in order to use also the comparison as a further helping instruments. In this paper the effects of the introduction of this mixed technique are shown with the purpose of discussing its efficacy, its limits and other potential utilization of the maps drawn, besides as elicitation devices.

CENTERING THE PERSON WITH DEMENTIA IN LIFE STORY NARRATIVE: AN INTEGRATIVE METHODOLOGICAL APPROACH TO ANALYSIS

Jocelyn Angus, Sally Bowen

Faculty of Arts, Education and Human Development, VICTORIA UNIVERSITY, Melbourne, Australia

Abstract: This paper is drawn from a larger study based on traditional qualitative thematic methods, which explored the use of secondary biographical stories as a strategy in conversation with an older person who has dementia. The aim of this paper to re-examine the data to facilitate further discussion in gerontology about the ways in which the ideals of Kitwood’s (1997) personhood and narrative inquiry can be used keep life story of the person with dementia intact By drawing upon narrative writers such as Mishler (1986); Gee (1991); Ramanathan (1995) and Riessman (2004; 2007), we describe a methodological approach utilising structural and thematic forms of narrative analysis to keep the person with dementia ‘centre stage’ in their own life story narrative. This paper demonstrates that by integrating a person-centred approach to interpretative and structural narrative analysis, people living with dementia can be the centre of their own story and communicate with their community what is important and why it is worth telling.
USING CONVERSATION ANALYSIS IN EVALUATION RESEARCH: TWO 'EXPERIMENTS' WITH EVALUATING HEALTH PROMOTION INTERVENTIONS AT THE WORKPLACE

Johanna Ruusuvuo*1,2
1FINNISH INSTITUTE OF OCCUPATIONAL HEALTH, Helsinki, 2School of Social Sciences and Humanities, University of Tampere, Tampere, Finland

Abstract: The presentation will examine the potential of conversation analysis (CA) in evaluating the implementation of health promotion interventions. In evaluation research, multi-method research designs are widely at use. In particular, they are relevant in evaluating interventions where a potential change in the practices of whole organizations (rather than in the behaviour of individual employees) is under scrutiny. A typical combination of methods involves a quantitative survey supplemented by qualitative interview data. Such combinations of methods contribute to our knowledge about the experiences and views of the participants with regard to the process and outcome of implementation of the intervention examined. Yet, they leave open the question of how the practices and procedures introduced in the intervention are actually adopted and immersed in the organizations’ practices and everyday life. In order to successfully repeat an effective intervention elsewhere, such knowledge would, however, be essential.

In examining the potential of CA in evaluation, I focus on participation as one important prerequisite of successful implementation. With the help of two research examples of health promotion interventions at the workplace, I will seek to show what sort of knowledge about participation is attainable with CA, and how this knowledge can be complementary to evaluation of processes of implementation.

MEDIA SCANDALS AS DISCursive MUZAK: THE USES OF THE CULTURALLY FAMILIAR

Malin Åkerström1
1sociology, LUND UNIVERSITY, Lund, Sweden

Abstract: Media Scandals as Discursive Muzak- the Uses of the Culturally Familiar

Scandals reported in newspapers and on the TV and radio can comprise a form of discursive ‘background music’ or muzak; brief references in everyday conversations, debates and arguments. In this paper I suggest that one may investigate the uses of such media-disseminated knowledge in conversations about something else.

Almost invisibly, the media furnish us with topics of conversation, metaphors and discursive shortcuts that we are all expected to be familiar with, like background music at a restaurant or in a shopping centre, that floats in unnoticed in the general blanket of noise.

In a series of studies of exchanges, sometimes defined as gift-giving, sometimes defined as petty corruption, it became clear that well-known scandals, offered a concentrated form of knowledge often expressed in a single word, followed by ‘scandal’, ‘story’ or ‘affair’, that were used by the interviewers and the interviewees. The ‘Clinton scandal’ may thus constitute a form of generic example. Such examples may be used to confirm, challenge or otherwise elaborate arguments. The scandals constitute summarised or condensed examples; they are used as ‘proxies’ [i] intended to produce allusions and associations. Such implicit meanings form part of a general cultural familiarity, which is assumed to be so widespread that we use them as a kind of code or abbreviation.

In the investigated interviews, the scandals were not discussed in detail but often mentioned briefly: still they were used rhetorically and interactively in an efficient way. They accomplished comparisons, they were used to exemplify phenomena with a pedagogical aim; they were used as invitations for reflections, as aligning rhetorical tools, and finally, as has been shown by Drew for idioms, used as conclusions in conversations.

Scandals are a rewarding phenomenon as crystallized common knowledge when researchers search for items that may be used rhetorically in talk or text. Other forms of such shared cultural items may be well-known popular culture objects: names of artists, films or books that can be used as a conversational resource when people reflect on their own or others’ experiences or on various social phenomena.

A DISCOURSE ANALYTICAL APPROACH TO INSTITUTIONAL DISCRIMINATION IN THE GERMAN EDUCATIONAL SYSTEM: THEORETICAL AND METHODOLOGICAL CONSIDERATIONS

Maike Koschorreck1
1BIGSSS/UNIVERSITY OF BREMEN, Bremen, Germany

Abstract: The discrimination which immigrants and their children continue to face in German society cannot exclusively be understood as a ‘fringe question’, as the product of racist attitudes and enactments of individuals or marginal groups such as extreme right-wingers (although these forms of racism remain). The analytical perspective must also shift to more complex and subtle causes and mechanisms of discrimination which are embedded inestablished everyday practices of social institutions. In the German educational system – where discrimination because of a student’s ethnic background becomes especially conspicuous – institutionalized discrimination can be located in schools’ programs, unwritten laws, informal agreements and modes of operation which take their legitimation from the available discursive knowledge of immigration/multiculturality/integration which circulates in German society and which members of educational institutions process in a self-referential way in their everyday work. The mechanisms of institutional discrimination are more difficult to detect than overt forms of discrimination because they originate from established social and political forces in society and hence receive less public condemnation. Precisely because institutional discrimination is difficult to detect, its study constitutes conceptual and methodological challenges.

Taking the discriminatory practices in German educational institutions as an example, the paper argues that a discourse analytical approach can provide a valuable analytical tool for the study of the mechanisms of institutional discrimination. It firstly introduces the concepts of institutional discrimination and discourse analysis in their usage and relevance for this paper. The paper then presents some ideas on where institutional discrimination and discourse analysis can be analytically linked and why these theoretical intersections provide an important starting point for the analysis of institutional discrimination. Thirdly, the paper discusses the method-
Field Role and Language Skills

Geir Tore Brenne

Abstract: Fieldwork in a foreign culture usually implies a different situation of language use, than fieldwork at home. A discussion is made concerning the influence of language knowledge in qualitative data collection, based on background from two different contexts of data collection – as a foreigner with basic knowledge of Russian in Russia, and as a native Norwegian in Scandinavia. An important aspect of language skills concerns its importance in defining identity in relation to one’s field role as “insider” or “outsider”, which has a considerable impact on how subjects relate to oneself. In either case, there are both advantages and disadvantages. The use of a shared meditational second language (i.e., English), can increase ones possibility of interacting alone but can at the same time increase the distance to subjects in the field. The use of an interpreter can alleviate some of the disadvantage of low language skills, as well as contributing as an important informant in relation to contextual information, however, it has consequences for ones field role, as this becomes linked to the role of one interpreter. Being a “full participant” is almost impossible in contexts where one does not have a near native mastery of language.

How to Bring the „Institutional“ Into Ethnography and Ethnography Into the „Institutional Ethnography“-Approach

Eva Nadai

Abstract: Transcending social situations, local contexts and the ‘micro-social’ level is a perennial problem of ethnography with theoretical as well as methodological aspects. If ethnography is built on the core method of participant observation, how can this kind of research transcend the analysis of local, observable contexts and the micro-social level? In anthropology, there is an intense debate on multi-sited ethnography with a focus on constructing an ethnographic field across multiple sites from the local to the global sphere. In contrast, sociological ethnography is more concerned with the micro-macro link: how can we reconstruct macro-social phenomena from observable practices in a specific setting? In my paper I will discuss the “institutional ethnography”-approach to this problem, developed by Canadian sociologist Dorothy Smith. Institutional ethnography aims at reconstructing institutional order from analysing everyday activities in local contexts. Institutional order (“ruling relations”) is seen as the effect of the coordination of people’s activities, which is observable by following sequences of work processes and the intertwining of texts and actions. Smith emphasises that the term institutional ethnography does not designate a method, thus it is not limited to participant observation and interviews. Institutional ethnography’s concern with ‘working up’ from concrete actions instead of imposing abstract theoretical concepts on empirical data is shared by ethnographic research with roots in ethnomethodology (e.g. workplace studies, science and technology studies and the like). However, compared to this kind of sophisticated analysis of minute details the “ethnography” in institutional ethnography is underdeveloped, for instance in analysing exactly how actors engage with texts. On the other hand, research that is focused on the micro-foundations of social facts and processes is often limited in its reach. The question therefore is how we can make institutional ethnography more ethnographic while not abandoning its potential for transcending local contexts and reaching out to social structures. I will address these questions with empirical examples from my own research on the practices of activating social politics.

Possibilities and Challenges of Doing Ethnographic Research on Family

Kristina Göransson

Abstract: This paper addresses the use of ethnographic methods in family research. While ethnographic methods are fundamental in the anthropological study of kinship and family, quantitative methods have long dominated the field known as family studies. An ethnographic approach contributes to an in-depth understanding of family practices, but it requires a high degree of self-reflexivity with regard to fieldwork relations and the interpretation of data, since the ethnographer’s social position, including gender, age, class, and ethnicity/nationality, inevitably shapes the access to the field. Based on the author’s experiences during long-term fieldwork on intergenerational obligations and expectations in Singapore, this paper discusses how the role of the researcher, as well as the accumulation of ethnographic data, is partly shaped and constructed in interaction with informants. In doing so it illustrates the different possibilities and challenges of doing ethnographic research on family and intergenerational relations.
don’t but are of limited value when it comes to the day to day practice of long lasting participation. Saying that studying religious movements may give rise to ethical problems seems almost stating the obvious. Although for instance protecting the (anonymity of) respondents is still a thing to be considered, the relation between researcher and his subject has changed the last few decades, a change that could be denoted as emancipation. Respondents of today know how to protect their interest. Nowadays religious movements have their own agenda regarding research. They know how to control access to information, how to use modern news media (internet, websites) to bring their opinion to the fore. A demand to read every written research report about them before publication is not uncommon anymore. Many ethical research problems of today have changed in strategical ones. Researchers have to negotiate over access, over publications, over how to use the media.

MEANING, VALUES AND METHOD AT A FAIR-TRADE COFFEE COOPERATIVE: REFLECTIONS ON THE FIT BETWEEN RESEARCH STRATEGY AND ORGANIZATIONAL OBJECTIVES

Piotr Prokopowicz1
1Jagiellonian University, Kraków, Poland

Abstract: Organizational anthropology has developed a wide variety of research methods that provide appropriate understanding of how do human beings create, transform, transfer and reproduce meanings in the organizational context. How, and through which means, is the organizational reality defined at a democratic workplace? What kind of narratives and presentation rituals are enacted in every day operations of the company in order to create a shared understanding of the complex organizational reality? What are the fundamental differences in the perceptions of the organization between different occupations, locations, managerial and membership roles within the company?

In order to address these research questions, and working within the reflexive paradigm, I conducted my fieldwork between September and December 2009 at FairCoffee, a small coffee fair-trade worker co-operative in Western Canada, employing traditional set of ethnographic methods and techniques of document analysis, ethnographic interview, participant and non-participant observation.

The study described in this paper started as a general inquiry into the meaning of work at a participative workplace, evolving into an exploration of the discrepancies and tensions between two views of work at a worker co-operative. The paper, however, focuses on methodological and theoretical ramifications of such complex research project. I present how developing a valid, convincing story of an organizational phenomenon must engage a series of research iterations that ultimately do not necessarily lead to the fit between the personal and professional goals of the researcher, the goals of the organization and the goals of the study participants. The unique theoretical and methodological contribution of the paper stems from the analysis of post-fieldwork reality and the influence of the study on the researched organization.

ON THE LIMITS OF A CONVENTIONAL SOCIOLOGY OF SPORT AND THE POSSIBILITIES OF QUALITATIVE SOCIAL RESEARCH

Ajit Jacob Singh1
1Institute of Sport Science, UNIVERSITY OF BAYREUTH, Bayreuth, Germany

Abstract: In the German sociology of sports only few discussions can be found on the methodology of qualitative research and its appropriate empirical implementation. One of the reasons may depend on the ambitions attitude of sociology to the embodied practice of doing sport. Because of the rapid differentiation of sport-related fields, the spaces of experience in sociological research are as diverse as problematic. The range of contents extends to “incoherent issues” of lifestyle and body culture or different contexts of competitive, leisure, extreme or fun sports. While a broad empirical tradition of ethnographic research in sports and in other fields is well established in the Anglo-Saxon-area, the German sociology of sports primarily is determined by a great deal of theoretical discussion, which entails a subordinated processing of systematic fieldwork.

In this respect, the problem is not embedded in the (sports) sociological conceptualization but rather in the matter of a capable methodological approach, which measures the complexity of “sport worlds” In terms of Garfinkel, a “conventional” Sociology of Sport, which only transforms existing theories, run the risk to retype its subject by ignoring the (ethno)methodical practice of doing being sports women and men. A phenomenological turn to sports through ethnographic methods opens the view to the local practices and its regularity of social order. For this purpose methods are needed to describe the features of sport fields closely by preserving verbal and non-verbal, visual and audible data. On this account there are finally two questions to deal with: Which techniques are adequate to investigate the embodied practice of sport? And which consequences are implicated for the adequate practice of sport sociological research?

According to these methodical reflections, my thesis is related to the context of competitive youth sports. It deals with practices of mediating knowledge between coaches and young athletes and how these interactional processes are organized in real situations. Which implicit and explicit resources of communication are used for instructing and learning embodied skills? Within a focused ethnography, by using video, audio and other descriptive forms of data collection, I try to get a closer view on some aspects that are rarely linked in sociological research: the relevance of body and knowledge during social interactions of teaching sport.

OPTIMIZING THE EPISTEMOLOGICAL POTENTIAL OF FOCUS GROUPS IN RESEARCH ON CONTESTED ISSUES

Jan Karel Coetzee1
1Sociology, UNIVERSITY OF THE FREE STATE, Bloemfontein, South Africa

Abstract: This paper explores the epistemological benefit of the interaction between participants during focus group sessions. It departs from the fact that the focus group is not primarily aimed at problem solving or decision making, but at opening out ways of knowing. For this reason strong emphasis is placed on creating pos-
sibilities of maximum group interaction during the focus group interview.

This paper draws from a series of focus groups conducted among students on the campus of a South African university currently in the throes of significant transformation. Formerly an Afrikaans-language institution for white South Africans, the post liberation University of the Free State is now a non-segregated, parallel-medium institution. The research probes the way students from different cultural and racial backgrounds generate critical comments on how directed transformation processes impact on intergroup relations and personal well-being.

In the focus groups their experiences, frustrations, fears and hopes are explored. This happens within the context of the focus group as a space for constructing a different way of knowing. Departing from the assumption that these focus groups provide an interactive setting for the expression of synergy, conflict, dispute, dialogical exchange and reconciliation, the paper explores negotiated knowledge. How does the interactive setting of the focus group contribute to formulating opinions, expressing views, declaring beliefs and managing polarities?

"I'VE NEVER HAD TO THINK OR EVEN TALK ABOUT IT": EXPLORING THE UNFAMILIAR USING VIGNETTES WITH FOCUS GROUPS

Sarah Deedat ¹, Charlotte Kenten ¹, Myfanwy Morgan ¹

¹Department of Primary Care & Public Health Science, KING’S COLLEGE LONDON, London, United Kingdom

Abstract: Vignettes involving short scenarios have mainly been employed in quantitative research to explore respondents’ preferences and choices. In qualitative research the vignette technique is sometimes used as an ‘ice-breaker’ or to explore topics considered potentially ‘sensitive’ by participants. This paper describes a further use of vignettes in the context of focus groups as a tool to facilitate discussion of the ‘unfamiliar’, with ‘organ donation’ and ‘transplantation’ forming concepts that people tend to have heard of but often have no direct experience and limited background knowledge.

The scenarios aimed to enable participants to conceptualise the topic and address key issues. They were informed by the literature and campaigns to promote organ donation, with feedback from our lay advisory group to ensure that they represented situations that appeared plausible and comprehensible.

The vignettes were introduced after providing limited factual information about organ donation to allow participants to become comfortable with the topics. The complexity of the vignettes increased incrementally. The first consisted of one character and required participants to advise another about the practicalities of registering as a donor, permitting an assessment of baseline knowledge. In contrast, the final vignette comprised a narrative of the diagnosis of brain death for a patient, with participants asked to discuss the different views held by their relatives when deciding whether to consent to organ donation.

The paper draws on specific examples from 22 focus groups to reflect on the use of vignettes to study unfamiliar topics, including the ways in which they enabled the participants’ to guide the discussion to address issues of particular salience beyond the original aim of the vignette, and the value of a uniform tool in enhancing possibilities for comparison. We conclude by considering how vignettes may be integrated more broadly into qualitative methods when studying unfamiliar topics.

EUROPEAN, REGIONAL AND NATIONAL IDENTITIES IN BIOGRAPHICAL INTERVIEWS

Kristzina Bernáth ²

²PARTIUM CHRISTIAN UNIVERSITY, Oradea, Romania

Abstract: In the context of permanent societal changes the structure of the identity is also permanently challenged. Biographical interviews offer a glimpse to the imprints of personal life-events that could give us answers to some of the questions raised in terms of regionalization, nationalism, and Europeanization processes. The main questions of our paper are: What does it mean to live in a specific region, to belong to a nation or the European community? How are these different levels of identity/identities present in personal values and actions? Based on nearly 50 biographical interviews realized in the North Western Region of Romania, our paper focuses upon the evaluation process of biographical research results and gives some answers on how these interviews can provide a better insight into the meanings of European, national and/or regional identity/identities.

BETWEEN REALISM AND DISCOURSE: A THIRD LOGIC FOR INTERVIEWS?

Lara Ivana Maestripieri ²

²Laboratorio di Politiche Sociali - DIAP, POLITECNICO DI MILANO, Milano, Italy

Abstract: According to the opinion of Cardano (2007), the ontological point of view of the researcher approaching a corpus of interviews can be resumed into two position, which are incompatible between each other: some scholars, for example Beartaux, consider interviews as sources of real facts that can be found into the texts and that can reflect a more generalized social and historical situation, while others, like Demazière and Dubar, treats texts only as a discourse, as a personal definition of lived situation made by the interviewee.

Making reference to the methodological approach of triangulation, set up by Lazarsfeld and his colleagues in the classical research in Marienthal (1932), I would try to show an example of how this apparently incompatible positions can be used as different points of view to study different aspects of a phenomena, in this case the professional identity of management consultancy in Italy, considered emblematic of knowledge workers. Using two techniques inspired by the two positions (positioning and biographical models) I will show how a third logic of analysing interviews can be found in combining different qualitative methods and how they can be effective in underlining different aspects of the same stories.

COMMUNICATION WITH DEAF - A MATTER OF ETHICS OR JUST QUALITY? GENERAL LESSONS LEARNT FROM A SPECIFIC EXAMPLE OF QUALITATIVE INTERVIEW RESEARCH

Angela Kuehner ¹, Katja Sachsenhauser ²

¹Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: In our presentation we would like to outline a psychosocial perspective on specific aspects of the research encounter. We propose to view the “research encounter” as a “research relationship” which is very much based on mutual trust. This implies a closer look at aspects like

- transparency
- recognition
- power dynamics.

Trust as a key issue of qualitative research still seems to be under-estimated in methodological debates. In our opinion transparent communication is fundamental for trust not only in the actual interview itself, but during the whole research process. According to this, it seems obvious that a productive research encounter would require a careful reflection of the (pre-)conditions of communication. To show this, we use an example of qualitative research with deaf interviewees. This specific case of communication possibilities should help to illustrate questions which are important to any research that involves communication with researched subjects:

- How do people agree to be subjects of research?
- Why and when do they want to “participate” in a qualitative study?
- How can you facilitate that researcher and participants get to know each other and establish a research relationship?
- How can you provide an atmosphere of confidence for the interview?
- How can the fear of being stigmatized be dealt with?
- How can you organise communication?
- How do you choose - or better: use language?

Reflections on such questions, which touch power asymmetries in the research process, are frequently discussed and framed as “ethical” questions or as a matter of “critical methodology”. Our perspective is indeed greatly inspired by critical traditions like disability studies, feminist methodology, psychoanalysis and postcolonial critique.

However, it seems important to emphasize that such considerations are not only relevant to specific problems of communication like in this example, but to any qualitative research that involves a research relationship: Thus, the lessons learnt from “communication with Deaf” in this study were not only about ethics but point to important issues of quality of qualitative research in general.

VIDEO ANALYSIS AND PRODUCING NEW FORMS OF PUBLICATION

Rene Tuma

Abstract: During the last years methods for analyzing audio-visual data - recordings of ‘natural situations’ as well as video data produced by the actors in the field have been pushed forward. Methodologies like the documentary method, hermeneutic approaches and video interaction analysis have been developed and begun to be adapted by researchers for a growing number of empirical studies. Introductions have been - or are currently being written for students and novices and the procedures seem to be set.

Video analysis heavily draws on experience and tacit knowledge, but this knowledge is also necessary to read and understand the findings from research: the publications often are hard to apprehend not only for outsiders: heavily drawing on very detailed transcripts, that convert rich visual material into text and signs (sometimes accompanied by a number of stills) that are hard to understand for everyone that has not watched the video-sequences on which the analysis is based.

For qualitative methods a key criterion for good research it that the process has to be made transparent to the reader. This however is complicated due to the video material, that is not available in print. However, putting the video files into the internet can help, but then still produces a gap between the process of analysis and the results.
The paper addresses the practical question, how findings from video research can be presented in a way that on the one hand accessible to the reader and does not lose the analytic detail necessary. It will also address the question, in how far new forms of publication can be adapted using tools available in other fields (e.g. Multi-media-Design, Sports Analysis) and how those can be integrated into the research-process without distracting the researchers from their analytical focus too much.

REFLECTING UPON BEING A PHYSICAL EDUCATION TEACHER: THE VISUAL METHODS AS A WAY TO CAPTURE MEANINGS AND THOUGHTS.

Mariana Amaral da Cunha 1, Inês Cardoso 2, Paula Batista 2, Ana Luísa Pereira 3, Amândio Graça 3

1Pedagogy of Sport, 2Pedagogy of Sport, 3Sociology of Sport, University of Porto, Porto, Portugal

Abstract: The visual methods – the handling of images and video content – might allow pre-service Physical Education (PE) teachers to access to a type of knowledge which, verbally, is not available and, consequently, to instigate them to reflect upon their professional identities. The main propose of this study was to understand how six pre-service PE teachers from the Faculty of Sport, University of Porto (Portugal), constructed their meaning of being ‘a teacher’, and most significantly, the idea of being a ‘PE teacher’. In order to capture their point of views, it was adopted a participatory action research approach, including focus group and photovoice employed in a workshop session. In the process, the participants were asked to: (i) collect visual material (photographs and videos) related to their professional daily practices during a period of one week; (ii) participate in a workshop to present their own images (eight per each); (iii) comment and reflect upon the meaning of being a teacher, in general, and a PE teacher, in particular. Data was submitted to thematic analysis using the Nvivo9 software. The research findings reveal that: (i) Images and videos are embedded with meanings related to teaching practices and the ways that pre-service PE teachers understood their craft; (ii) The visual stimulation prompted them to discuss their views and gauge their thoughts about being a teacher and a PE teacher; (iii) Participants emphasize that a teacher must be someone open to the innovation and in constant development. Consequently, (iv) he/she must be a reflective person; (v) The participants also consider that the teacher is crucial in the learning success thus, he/she must be someone that makes the difference among their pupils. In relation the PE teacher, (vi) they highlight the distinctive interaction with the pupils, as well as the motivation to the profession. Furthermore, (vii) they refer that a PE teacher must be a specialist and an enthusiastic person.

AUTOPHOTOGRAPHY AS AN INTRODUCTION TO PHOTO-ELICITATION INTERVIEW: RESEARCHING SOCIAL ASPECTS OF PRACTICES OF LOOKING.

Łukasz Rogowski 1

1Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY, Poznań, Poland

Abstract: Photo-elicitation interview is undoubtedly one of the most popular visual research methods in sociology. In my speech I would like to argue that the best and the most effective way of conducting photo-elicitation interviews is basing them on pictures taken earlier by respondents within another visual research method – autophotography. Autophotography provides empirical data (pictures with short descriptions), which can be not only analysed but also used as pictures in photo-elicitation interview.

The most important aspect of my speech will justify mentioned thesis. Some of the arguments confirming it are:

• Photo-elicitation interview depends on earlier actions of respondents and becomes even more dynamic and eliminates respondent’s and researcher’s boredom.
• Pictures taken within autophotography extend respondents’ influence on interviews, which increases their commitment.
• Taking pictures allows to make reflexive those practices, which are usually habitual or based on “practical consciousness”. This allows to enter new research fields and explore new problems.
• Photo-elicitation interviews identify macrostructural aspects of individual practices depicted earlier in autophotography, what allows to research relations between agency and structure.

The last two aspects were very important in empirical part of my doctoral dissertation - “...Social visual competence as a research problem of contemporary sociology”. My speech will be based on experiences from this research. Its main research problem was focused on social aspects of practices of looking and their role in constituting social inequalities. 40 respondents participated in autophotography and took pictures, which were later analysed and used in photo-elicitation interviews. This allowed to investigate practices of looking, which are very hard to research (or even un-researchable). In my speech I would also like to mention some issues connected to organizational aspects of visual research:

• Appropriate period for taking pictures within autophotography.
• Appropriate period between autophotography and photo-elicitation interview based on pictures taken by respondent.
• Differences in autophotography between using disposable photo-cameras provided by the researcher and digital photo-cameras owned by respondents.
• Appropriate time of autophotography (depending on e.g. holidays).
• Appropriate forms of contact between researcher and participant of autophotography.

FOR A DIALOGUE BETWEEN DOCUMENTARY FILMMAKERS’ PRACTICES AND VIDEO DATA ANALYSIS IN SOCIAL SCIENCES

Mathias Blanc 1

1Faculty of Sociology, UNIVERSITY OF STRASBOURG, Strasbourg, France

Abstract: The French sociologist Pierre Naville (1966) exorted to regard camera as a microscope of social relationships. In his perspective, taking into account oral, visual and body dimensions of social situations would not be possible without an audio-visual recording. More recently, Thomas Luckmann invites to a multimodal sequential analysis (2006). However, any produced image is related to a point of view; in other words, image is located. In fact, the question of the conditions of acceptability of visual data remains open. Can one accept visual data recording as more relevant than a
traditional ethnographic approach founded on notebooks and re-transcriptions of verbal interactions? Which additional interpretative possibilities appear with audio-visual instrumentation?

These problems do not only relate to social sciences. French documentary filmmakers also seized some of them. In the line of the « direct cinema », documentary filmmakers question the production of the authenticity of their approach to suspend the disbelief of the spectator.

How to proceed so that the final viewer recognizes the veracity of the situations represented? How to exploit the image without confining it to a naturalistic vision of the filmed phenomena?

Filmmakers Jean-Luc Godard and Chris Marker admit being themselves inspired by Jean Rouch’s anthropological cinema to develop their practices of filming. Then, why couldn’t social scientists be inspired by documentary filmmakers’ practices to develop visual sociology?

According to these practitioners, it appears that the recognition of the spectator’s position in the filmmaking process becomes essential. As it would be illusory to believe in the objectivity of the represented situations, the bet of a marked subjectivity of the filmmaker would be necessary to support an intersubjective situation of knowledge validation.

From this approach rises several methodological consequences whose interest is:

- To facilitate the access to social situations which are difficult to film
- To support the reflexivity of the actors in situation
- To support the reflexivity of the researcher with his object
- To privilege the transmission of observations and analyses

This communication will develop these methodological (and epistemological) aspects for the creation and the analysis of visual data.

QUALITY OF EXPERT CODING SYSTEMS FOR EXPERT APPRAISAL OF SURVEY QUESTIONNAIRES

Valentina Hlebec¹, Teja Cerar¹, Nina Konavec¹

¹UNIVERSITY OF LJUBLJANA, FACULTY OF SOCIAL SCIENCE, Ljubljana, Slovenia

Abstract: Expert appraisal is one of most often used qualitative methods for pre-testing survey questionnaires. This method is often used ambiguously and imprecisely in early phases of questionnaire development. Expert coding systems should reduce subjective and ambiguous application of expert appraisal, however little empirical evidence is available to support this claim. In this paper we compare and evaluate precision of two expert coding systems in several experiments (Designing questionnaires: Checklist,Statistics Sweden, 1992; Questionnaire Appraisal Coding System, Forsyth in Lessler,1991) using Friedmans’ test. It turns out that only one criteria distinguish between the coding systems (number of errors). As coding systems focus on different issues, both should be used simultaneously to maximize the results of expert appraisal.

QUALITATIVE WORK AND THE TESTING AND DEVELOPMENT OF THEORY: LESSONS FROM A STUDY

COMBINING CROSS-CASE AND WITHIN-CASE ANALYSIS VIA RAGIN’S QCA

Barry Cooper¹, Judith Glaesser¹

¹School of Education, DURHAM UNIVERSITY, Durham, United Kingdom

Abstract: The paper reflects on methodological issues that have arisen during an ongoing three-year ESRC-funded project focusing on the effects of family background and of the organisation of secondary schooling on educational achievement in Germany and Britain. This employs Ragin’s configurational and case-based Qualitative Comparative Analysis (QCA) as a means of combining the cross-case analysis of secondary longitudinal survey data with the cross-case and within-case analysis of some 80 in-depth interviews with young people, i.e. it employs a specific form of mixed methods which aims, by taking a case-based rather than a variable-based analytic approach, to transcend the quantitative/qualitative divide that bedevils much sociology. The focus of QCA, which aims to apply Boolean logic systematically in cross-case analysis, is to establish the relations of sufficiency and/or necessity between configurations of putatively causal conditions and some chosen outcome. QCA assumes that there is likely to be causal heterogeneity differentiating types of cases, with multiple causal paths to any outcome. It does not, however, provide, in itself, knowledge of underlying causal social processes. Here, one might turn to existing theory for candidate causal processes. Alternatively, one might undertake the inductive or theoretically informed analysis of relevant qualitative data. Our interviewees have been chosen to represent configurationally defined types of cases that have been found to capture the causal heterogeneity underlying educational achievement in the longitudinal datasets, our aim being to undertake process-tracing (George & Bennett) to explore some of the complex causal processes generating the set theoretic relationships of necessity and/or sufficient between configurations of class, gender and early cognitive capacities and later achievement characterising the cross-case analyses. In this paper, once we have described our particular way of combining quantitative and qualitative work via QCA, and reviewed its strengths and weaknesses, we wish to use our experience of relating the analysis of the interviews to the prior and subsequent QCA analyses to discuss, critically, some of the methodological arguments made by Goldthorpe (in his two-volume On Sociology) concerning the relation of qualitative work to theory testing/development as well as his critical view of QCA itself.

QUALITATIVE RESEARCH, MODELIZATION AND ECONOMETRICS

Stéphanie Cassilde¹

¹Liens Sociaux, CEPS/INSTEAD, Differdange, Luxembourg

Abstract: Researchers have even more opportunities to study and practice qualitative and quantitative researches. Some ways to combine them are already known and shared; some others relies on the needed creativity regarding a specific object of research. The main purpose of this presentation is to document a methodology used to integrate qualitative and quantitative data and to combine methods to construct a theoretical model and to test it. This methodology is based on a research where sociology and economics are combined.

The presentation is structured as follow. First, I consider main known ways to combine qualitative and quantitative research. The
point is to underline how the methodology I used can be similar or different from these articulations. Second, a brief description is done regarding the context of the research: the analysis of skin colour declarations in Brazil. This helps to anchor in practice the methodology, then presented in a more conceptual way. Third, the four main steps of the articulation between qualitative and quantitative research are presented. Interviews analysis open and close the process, while the second and third steps correspond respectively to the microeconomic model and to the econometrical part. Fourth, the presentation focuses on a specific pattern inside the first step, where the researcher herself is a support of qualitative data collection. Finally, the methodology is discussed, notably regarding the possibilities to use it for other research object.

"MISSING DATA" IN QUALITATIVE RESEARCH

Graham Crow1, Rose Wiles2
1National Centre for Research Methods, UNIVERSITY OF SOUTHAMPTON, Southampton, United Kingdom

Abstract: This presentation discusses the findings of a study of “missing data” in qualitative research. There is an extensive literature on “missing data” in quantitative research, and the project reported on here explored whether and in what ways the idea of “missing data” can be applied usefully in qualitative research. Interviews and focus groups were conducted with qualitative researchers, in addition to conducting a literature search. Different types of “missing data” identified included material edited out of interviews by translators or transcribers; words or passages in transcripts of interviews where what was said is reported as ‘inaudible’; material made known to researchers but which research participants do not consent to being made public (e.g. ‘off the record’ remarks); material made known to researchers but which they judge to be unusable on ethical grounds or that require changes to achieve anonymisation; and, most generally of all, non-participants such as those members of a community who an ethnographer decides not to focus on or cannot gain access to. In addition to reporting on the findings relating to these themes, the presentation also considers the question of whether the terminology of “missing data” is the most appropriate for these aspects of qualitative research, or whether other terms (such as “missed data”) are more appropriate. We will also explore how qualitative researchers respond to criticisms that their data are insufficiently systematic to stand up to the same sort of scrutiny to which quantitative data are subjected.

THE FORM OF DATA: CONCEPTUALIZING THE UNITY OF QUALITATIVE AND QUANTITATIVE METHODS

Achim Brosziewski1
1Research Department, UNIVERSITY OF TEACHER EDUCATION THURGAU, Kreuzlingen 2, Switzerland

Abstract: For a long time, qualitative and quantitative methods were seen as completely different epistemological endeavors, striving for the “real” representation of social reality. Meanwhile the tone has changed. One seeks to conceptualize the relationship as complementary. "Mixed methods" became common topics of advanced research designs. But regardless whether seen as opposing or complementary, each decision leaves one question unanswered: What is the reference point or criteria, which could guide the decision? Is there any kind of ‘common ground’, which makes both possible: conflict and cooperation between qualitative and quantitative research? What identity might allow mutual understanding; or might at least explain its failure?

My paper proposes a constructivist approach to the relationship between qualitative and quantitative methods. This implies the rejection of the idea, any “reality itself” can serve as a reference point. Therefore, we cannot draw on an outside guarantee of “relevance” or “adequacy.” But constructivism never assumes, constructs could be arbitrary. Some constructs function better, some worth, some do not function at all. The task of constructivism is to discover the genetic mechanisms of constructions and of the conditions, which distinguish between success and failure.

The mutual reference point within the difference of qualitative and quantitative methods can be identified by the form of the datum and by the conditions, which make this form constructive. The main part of my paper will focus on a closer characterization of this form and on the constraints, which must be realized to claim any construct empirical. A second part will exemplify, how quantitative and qualitative methods use the same form, but under different conditions. The concepts of measurement and of interpretation will be explained as different operationalizations of the form of the datum.

ON EXCEEDING DICHOTOMY TO QUALITATIVE AND QUANTITATIVE RESEARCHES IN CONTEMPORARY SCIENTIFIC METHODOLOGY

Uros Vojislav Suvakovic1
1Faculty of Philosophy/Department of Sociology, UNIVERSITY IN KOSOVSKA MITROVICA, 11070 Novi Beograd, Serbia

Abstract: Argumentation in favor of the attitude on exceeding the long ago established dichotomy of scientific researches to qualitative and quantitative is discussed in the work. Considering the attitude of materialistic dialecticians that every scientific research must deal with a subject, the attitude is represented according to which it is impossible to perform any quantitative research without prior establishing the quality that is being investigated. Since nothing cannot be investigated, but always only something, it means that it is necessary to establish precisely (to define) the quality that is being researched and to do this it is necessary to perform an adequate research.

This is valid for all researches, including measuring, for which it is considered in the literature that these are only quantitative researches. It is shown on the example of designing two instruments for measuring successfulness of political parties – the scale and the index of party successfulness. These instruments are used not only for establishing the relevance of parties, by which Sartori was occupied with, but also for analyzing and for comparing their successfulness on basis of objective criteria. On the other hand, even the expressively qualitative research methods (e.g. content analysis, case study, method of biography, etc.) as the rule comprehend certain quantifications.

Therefore, aiming to methodological correctness, it would be the best to consider the existing dichotomy to qualitative and quantitative researches as exceeded and to establish a typology of scientific researches as prevailing qualitative and prevailing quantitative, depending on the dominant element in a research.

Key words: qualitative and quantitative researches, exceeding dichotomy, measuring instruments, successfulness of political parties
SOCIAL WORLDS AND INTERACTION ORDER: VIDEOGRAPHY OF SOCIAL EVENTS AND GATHERINGS

Bernt Schnettler¹, Bernd Rebstein²

¹Sociology of Culture and Religion, UNIVERSITÄT BAYREUTH, Bayreuth, ²Sociology of Culture and Religion, UNIVERSITÄT BAYREUTH, Augsburg, Germany

Abstract: Video data of natural interactions are of enormous value for the social sciences. Over the past years, we are witnessing increasing interest in using video analysis in qualitative studies. There has been substantial progress in developing appropriate methods for interpretive video analysis. However, still we face a number of methodological problems. One of the major challenges is the question of how to relate the precise and somehow ‘microscopic’ analysis of locally produced interaction order to a broader videographic analysis of social worlds. Whereas the first is well grounded in an ethnomethodological approach, the latter is stemming from methodological principles of sociological hermeneutics. Both approaches are firmly rooted in the interpretative paradigm. They share core methodological principles and we suggest that combining procedure from both enhances significantly the quality of interpretive video-analysis, with particular benefits concerning its sociological outcomes.

In order to discuss this methodological question, we will draw on video data from our current research on migration and knowledge. It focuses on social events and gatherings organized by migrant associations in three urban regions in Bavaria. Public events like festivals, concerts or meetings exhibit typical locally observable, situated structures. They are, however, embedded in larger arenas and social worlds. They constitute spatially and temporally situated zones of encounter and interchange between migrants and the resident population. Hence, we pay special attention to processes of communication taking place in these public events and gatherings. Video enables us to study with detail the complex orchestration of body movement, speech and other communicative modalities used in social interaction and we pay particular attention to the dimension of embodied forms of knowledge. In addition, we explore the wider context using more classic methods like participant observation and ethnographic fieldwork. The presentation will include audio-visual recordings from our project.

TOWARDS A SOCIOLOGICALLY GROUNDED VISUAL ANALYSIS

Mirko Petric¹, Inga Tomic-Koludrovic¹

¹Department of Sociology, UNIVERSITY OF ZADAR, Split, Croatia

Abstract: Towards a sociologically grounded visual analysis

This paper discusses the implications of various current uses of the term “sociology” in collocation with the term “visual”. Namely, with a growing prominence of various methods of visual analysis in what has been referred to as a “visually-driven culture” (Gottdiener), the term “visual sociology” has begun to apply to a number of studies and practices that – in the opinion of the authors of this paper – do not necessarily warrant the use of such a label or fail to exhaust its potential scope.

The paper departs from an annotated catalogue of current definitions of visual sociology, as outlined in the materials of professional organizations or course descriptions. Most frequently, “visual sociology” is nominated as a field preoccupied with the analysis of the visual manifestations of social life or with the use of documentation and research tools not necessarily specific to sociology. Added to this should be an occasional emphasis on the “production of images” for the purpose of social activism.

The authors of this paper consider such approaches to be lacking in what they feel should distinguish a sociologically-inspired analysis from other forms of analysis in a broader field of visual studies. To delineate what they think should be a fruitful grounding of analysis in the field of visual sociology, they discuss aspects of sociological approaches such as symbolic interactionism and sociological phenomenology, followed by a discussion of some more recent tenets of constructivism. Far from being a nominalistic exercise, the discussion aims at increasing the scope and efficiency of visual analysis by means of addition of a specific perspective and reliance on the strengths of a disciplinary tradition. Current developments in “visual grounded theory” are also invoked, to illustrate the fruitfulness of such a general position.

BEYOND NARRATIVES: ‘FREE DRAWINGS’ AS VISUAL DATA IN ADDICTION RESEARCH.

Justyna Iwona Klingemann¹, Harald Klingemann²

¹Department of Studies on Alcohol and Drug Dependence, Institute of Psychiatry and Neurology, Warsaw, Poland, ²Research & Development, Südhang Clinic, Kirchlindach, Switzerland

Abstract: Post-modern societies can be understood as ‘visual cultures’. However the relevance of visual data in social research so far remains an unmapped territory even within the framework of qualitative research: little attention is paid to benefits, in terms of increased validity, of combining visual and traditional methods. From a research perspective, visual anthropology and visual sociology proceed methodologically by making visual representations (studying society by producing images), by examining pre-existing visual representations and by collaborating with social actors in the production of visual representations. The review presented here focuses on the interaction with social actors.

Visual data in the form of drawings or paintings have mainly been used in therapeutic or diagnostic contexts. Using visuals as specific data source might tap new realms not accessed by other methods. However, with few exceptions, know-how from visual studies have gone unnoticed in the addiction field. The paper describes the first cross-cultural attempt to explore the methodological and theoretical relevance of ‘free life-course drawings’ produced by Swiss and Polish alcohol ex-users in the context of earlier studies on self-change from problem alcohol use from Poland (2006-2009) and Switzerland (1988). Drawing upon this example from research, a window opens to visual sociology in addiction research and to complement dominant questionnaire based data collection methods.

FITTING IN WITH THE HELP OF IMAGES. PHOTO-DRIVEN RECONNAISSANCE AS A SUPPORT FOR INTERVIEW

Maciej Frackowiak¹

¹Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY, Poznan, Poland
Abstract: The main objective of the paper is to discuss the title method and its use in large, nation-wide Polish research project. The ‘Invisible City’ project aims at analyzing targets and consequences of spontaneous forms of space-modifying activity that occurred in large Polish cities and takes into consideration methodological problems of investigation into such a creativity with the use of visual data. The task of this reconnaissance was firstly, to supply the places of our interest (eg, spontaneously created playgrounds, gardens or places for informal and sometimes illegal meetings, see: www.niewidzialnemiasto.pl) with images and information which would facilitate interviews with place-creators/users and allowed adjustments in photo-elicitation interview driven by the specificity of the particular examples of “Invisible City”. Secondly - to further a contact with potential respondents and encourage them to participate in such an interview. The practice of this kind significantly differs from the classic observation method accompanied by with photographic recording. It was not designed to be a stand-alone answer to the research questions, but rather to deepen the knowledge gained at earlier stages of the research (eg, content analysis) and served as the preparation for appropriate wording of those questions in a following conversation with the respondent. Considered tool therefore suits to the field-grounded theory approach that involves constant interweaving of the collection of material, its analysis, returns to the field for additional material and further deepening of the analysis. It also responds to the formula of “focused ethnography” (Knoblauch 2005) – photo-driven reconnaissance can be used as a supplement for such methods as a content analysis or an interview, in almost all research settings, especially when one does not have the time or resources to conduct a classic long-lasting observation. The author will present and analyse the reconnaissance scenario and observation log in relation to the research problems and other techniques used in above mentioned inquiry; analysis will also take into account the results of the evaluation of the technique, based on surveys carried out among a dozen or so researchers who used the considered tool in the “Invisible City” project.

A QUALITATIVE “VISUAL NARRATIVE” APPROACH

Guido Di Fraia

1ISTITUTO DI COMUNICAZIONE, UNIVERSITÀ IULM, Milano, Italy

Abstract: This paper aims to describe an innovative qualitative research model based on a visual-narrative approach.

The goals of the research was to investigate how people visually represent themselves and how they decode visual clues as signs of personal and social identity. Starting point of the research was the Mc Adams’ concept of imagos (1988). According to Mc Adams, imagos are internal projections of fragmented identities the subject assimilates by culture, social context and personal experiences. Imagos are cognitive constructions based on visual and narrative components. On one hand, they lead us to interpret other persons’ appearance and to attribute them a “prototypical” story of life (Burke, 1945). On the other hand, they are sources of inspiration for the construction and reconstruction of the Self (Bruner, 2003; Jedlowski 2000; Di Fraia, 2004).

Moving from this model, the research investigates three main questions: how people use imagos to interpret other person?; what characteristics have imagos (in narrative and visual sense)?; what are their origins?

The paper focus on methodological aspects of the investigation. The research (carried on with a graduate class of students at IULM University of Milano) was conducted following tree steps. At first, we invited students to use photo shuttering to capture the most common Imagos mise en scene by people in their social context. Secondly, the 720 photos taken were classified in six different families of stereotypical “human types”, further divided internally into 14 types and 32 subcategories. Finally, we realized 89 narrative interviews, facilitated by photo elicitation (Harper 2002), to a representative sample of the different “human types” identified in previous phases.

The paper describes in detail the technique used to conduct the “narrative photo elicitation interviews” (N-PEI) and discusses the strengths and weaknesses of this particular qualitative research method.

NATURAL OCCURRING DATA AND INTERVIEWS: A NOTE ON METHODOLOGICAL ORTHODOXY AND ROMANTICISM.

Anne Ryen

1Department of sociologi and social work, UNIVERISTY OF AGDER, 4604 Kristiansand S, Norway

Abstract: The ethnemethodological scepticism of interview data relates to their researcher-provoked nature and settings they argue make them less natural and more staged compared to natural occurring data. Also, the romantic and authentic of the “the interview society” (Atkinson and Silverman 1997) have rightly become standard criticism of the qualitative interview method. On the other hand, in their criticism Holstein and Gubrium (2002) refer to the assumptions of natural occurring talk as bias-free.

If we are to take our QR history seriously (Cicourel 1964, Sacks 1970, Atkinson and Coffee 2002, Silverman 1998 and 2006) qualitative inquirers should explore into the standard descriptions people use and the “taken-for-granted” we attach to them. To cite Cicourel (1964) we need to address “how a researcher goes about categorising the events and activities described” (cited in Silverman 2006:46). I argue that all talk is produced in settings that bring an element of staging with them. So, rather than jumping to conclusions about methods, we should explore the collaborative and active of interpretive practices across settings, stages and contexts.

To illustrate the active of talk over methods, I will draw on data from classic natural occurring settings to show their staged nature and from my own cross-cultural ethnographic interviews to show the interpretive practice of ethnographic interviewing.

I argue that methodological orthodoxy and romanticism are problematic not solely in interview research, but in all qualitative inquiry.

INTERVIEWING ELITES IN GERMANY - FIELD ACCESS AND INTERVIEWING

Sarah-Elisa Nees

1BIGSSS, UNIVERSITÄT BREMEN, Bremen, Germany

Abstract: The interview method is widely used in PhD projects; yet, there is little literature on the interviewing of elites. Based on my PhD project, which focuses on the career paths of people in leader-

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
ship positions with a migration background of the first and second generation, this paper concentrates on two stages of the research process, access to the field and the actual interview. The first part is an evaluation of different access strategies to obtain interviews with politicians, businesspeople and labour unionists across Germany. The most efficient strategy used was snowballing and direct contact at group specific events such as public lectures; to a lesser degree telephone contacts were successful. The second part addresses the preparation and conducting of interviews with people who are trained to answer questions for a journalistic/medium audience. The findings are based on 40 semi-structured interviews, which include narrative elements, focusing on the interviewees’ life course trajectories. Central to a successful interview are the establishing of trust, managing the unequal interviewer-interviewee power relationship and interviewing under time constraints. Strategies include the personalization of interview guides to the interviewee, ‘going native’ and explaining the interview structure at the beginning of the interview. Overall, this paper gives first hand methodological insights into a single PhD-project study and provides best practice examples for elite access.

**USING CHILDREN AS RESEARCH SUBJECTS: HOW TO INTERVIEW A CHILD AGED 5 TO 7 YEARS**

Taina Hannele Kyönnłampi-Kylmänen

1Faculty of Education, HELSINKI, Jääli, Finland

**Abstract:** As the number of studies focusing on children has increased, it is important to consider the children themselves as research subjects. This presentation focuses on the children’s voices. The children’s experiences were addressed by means of an interview. This presentation is based on doctorate research (Kyönnłampi-Kylmänen 2007).

This presentation investigates the following areas: 1) how to encourage 5- to 7-year-old children to talk, 2) how a researcher, as an adult, can understand the child’s world, and 3) how a researcher can free him/herself from the adult-centered perspective. This presentation clarifies the features of a method for child interviewing, and demonstrates how vividly and easily Finnish daycare children (N = 29) are able to talk about their experiences in a research interview.

To set up the interviews, a file had been made for every child that included the subjects of drawings related to the research themes as well as papers inside a plastic folder. A coloured paperboard was glued to the inner binding of the file, on which the children drew a self-portrait and wrote their name. The work with the files represented building up a confidential relationship between the child and the researcher. The subjects of drawings were ‘My Family’, ‘What I do at Home’ and ‘My Mom’s and Dad’s Work’. The children were interviewed one at a time. The interviews were recorded and then typed up.

The phenomenology analyzes and illustrates the ways how the world appears to us as an experience (Merleau-Ponty, 1988). The phenomenological research approach manifests itself as a series of self-critical questions, stopping, and wondering in front of a child’s experiential world. The demanding questions guide the various phases of the research work: How as a researcher should one encounter a child? Did such a space between a researcher and a child occur where the child became confronted? How close can a researcher reach the child’s experiential world?

The phenomenological approach provides a good starting point for a child-centred research, because a researcher is to extricate and separate himself/herself from the prejudices and attitudes concerning the children’s experiential world that he/she has as an adult. The phenomenological research approach makes the researcher to look from a child and at a child. (see also Leeson, 2007.)

**JOINT BIOGRAPHICAL NARRATIVE INTERVIEWS: AN INNOVATIVE METHOD FOR NARRATIVE RESEARCH WITH COUPLES**

Eloise Radcliffe, Karen Lowton, Myfanwy Morgan

1Division of Health and Social Care Research, 2Institute of Gerontology, KING’S COLLEGE LONDON, London, United Kingdom

**Abstract:** A method for conducting and analysing joint biographical narrative interviews is presented and illustrated by a study of stroke survivors aged 75 years and over and their spouses. This approach is shown to enable a detailed understanding of the shared creation of meaning in relation to a particular experience or event but also presents particular challenges.

Interviews began with an open question asking participants to tell the story of their stroke, allowing both participants freedom to co-construct a detailed narrative, indicating how they made sense of the stroke, what meanings they attached to it, how they presented themselves as a couple and how they attempted to locate the stroke in their overall biography. Analysis of interview transcripts examined both the content of the narrative as well as the style and structure. First, drawing on Rosenthal’s (2004) case reconstruction method, we focused on the events and experiences talked about (‘life history’). This involved the construction of timelines of experienced events discussed in the narrative, and participants’ selection of the topics of their narrative (‘life story’) such as informal care and retirement. Second, we drew on Veroff and colleagues’ (1993) coding scheme based on conversational analysis to analyse couple’s co-presentation in terms of narrative structure involving coding shifts in speaker as one of six types of interaction.

A challenge for couples related to how comfortable they felt in narrating their story with minimal subsequent verbal interaction from the interviewer, leading to variations in length and detail of narratives. A challenge for the researcher related to the detailed double level of coding required. However this provided an innovative approach with its focus on both the narrative style and structure (conflictual or collaborative), as well as the themes of self-presentation in relation to the social world (eg. ‘hard worker’) and as a couple (‘united front’, ‘dutiful carer’). This method enables a detailed understanding of the dynamics of social interaction and the nature of relationships, as illustrated by our research on older people’s shared interweaving biographies and their interactions and identity as a couple.

**THE PROBLEM-CENTRED INTERVIEW – METHODOLOGY AND PRACTICE**

Herwig Reiter

1INSTITUTE OF SOCIOLOGY, UNIVERSITY OF BREMEN, Bremen, Germany

**Abstract:** The problem-centred interview (PCI) is among the systematically elaborated and recognised techniques of qualitative
SOCIOMETRY OF SOCIAL PRACTICES: METHODOLOGICAL IMPLICATION

Diana Lengersdorf

1Institute of Sociology, TU DORTMUND, Dortmund, Germany

Abstract: In the last years sociology of social practices is discussed increasingly. While there are sophisticated efforts to systematize the different theoretical movements to one Theory of Social Practices, the methodological implication of such a research program are less debated. The "least common denominator" in empirical studies is the use of qualitative methods.

The presentation will firstly discuss three different frameworks – ethnomethodology, discourse analysis and praxeology – regarding to their impacts for a practice-theoretical methodology. Secondly, methodological implications which have to be questioned by discussing the object of research will come into focus, such as the analysis of involvement of cultural objects, incorporation of knowledge or practical sense. Thirdly, proposals of solution will be presented by bringing in findings from an ethnographic study of social practices in an internet agency.

STUDYING SOCIAL COMPLEXITY THROUGH QUALITATIVE RESEARCH

Fabio Introini

1UNIVERSITÀ CATTOLICA MILANO, Milano, Italy

Abstract: Global society is often described as “complex”. Complexity is a key word in cybernetic and systems theory languages, in which it receives a rigorous and precise formulation that enables its empirical use. But nowadays “complexity” has begun also a suggesting term, a sort of metaphor used to describe chaos and disorder of contemporary society. In such a fashion, the concept of complexity doesn’t carry any pretensions to become a “new paradigm” for social sciences; on the contrary it is used to underline, in a radical postmodernist way, the impossibility to grasp a scientific understanding of contemporary society because of its lack of order.

This contribution raises the question if a non-systemic definition and conception of complexity may be used in a more scientific way to understand some features of contemporary society as complex society. My hypothesis is to consider, firstly, complexity – in opposition to linearity – as a property of social actor’s life course as reconstructed by the actor himself in a history of life. At this point complexity and linearity, as well as their mix, become properties of a text – the transcription of actor’s life history – and can be investigated with the means of narratology and semiotics.

Besides, because it can be supposed that the way in which social actors narrate their life is shaped by the media and large social discourses diffused in society, it becomes possible to return to “society” and gain some information about its complexity.

This kind of analysis – that recalls in several fashions Actor Network Theory as described by Bruno Latour – has been experimented by myself in a research about Italian young adults (20-34 years old people) biographies (Introini, Pasqualini, Complexiss-età, 2005). In this research actors’ life courses have been classified into four different typologies generated by crossing the continuum linearity versus complexity and the continuum social versus individual which describes if the actors, in the effort to plan their life, rely mainly on social or personal resources.

Starting from this example the aim of this contribution is to show, in a more theoretical and epistemological way, how useful qualitative research can be in studying complexity in a non-systemic but nevertheless scientific way.

VISUAL SOCIOLOGICAL METHODS IN MEMORY STUDIES: INTER-SUBJECTIVITY VERSUS OBJECTIVITY

Derya Firat, Melike IŞIK DURMAZ, Tuba EMİROĞLU

1SOSIOLOGY, MİMAR SINAN FİNE ARTS UNIVERSITY, ISTANBUL, Turkey

Abstract: Visual sociological methods are commonly used in field researches since the emergence of new technologies and offer various data when applied with methods as participant-observation and in-depth interviews, as we see in our research, namely “Collective memories of the coup d’Etat of 1980 in Turkey”. 30 years passed, the fact that the memory needs a stimulus directed us to use an innovative method which concerns the production of past-time images in a fictional newspaper, so to the “sociology with images”. The fictional newspaper which is used instead of a questionnaire and the selection of images and titles of the newspaper lead us to form a new sociological interpretative frame in an effort to better understand the construction of the collective memories.

To make a fictional newspaper would also refer to the role played by the daily press and the journalistic field in the political life of the seventies in Turkey, as each newspaper had become the symbol of political commitment and the source of political mobilization. Following our archive research on newspapers of the period in question, we found that besides the images, titles and subtitles of the articles were also important to stimulate memory on the discourse level.

Images, titles and notions to appear on the newspaper selected by the research group and their interpretations by the interviewees exposed the problem of inter-subjectivity. Inter-subjective confrontation between the point of view of the researcher and the subjects produced a sociological knowledge which enables us to analyze the construction of the memory based on an objectification of the inter-subjectivity proposing also a new sociological interpretation frame concerning the present-lives of the collective memory groups.
In this paper we aim to focus on our research experience and discuss the credibility of this use of visual sociological method in memory studies.

**CROSS-CULTURAL QUALITATIVE RESEARCH**

Katharina Ulbrich

Abstract: Cross-cultural comparisons based on qualitative data are still rare within the field of qualitative research. This holds especially true for empirical studies based on qualitative interview material. The scarce engagement of qualitative researchers in comparative studies of different cultural contexts is somewhat surprising since qualitative methods are particularly appropriate for generating a comprehensive and in-depth understanding of the cultural variety of social phenomena. On the other hand, there is a proliferation of cross-cultural studies based on statistical data due to the fact that there is an increasing number of large scale international surveys and statistical techniques are continuously improving. However, the limitations of standardized methods and instruments in capturing culturally variable layers and dimensions of meaning are obvious. The openness and context sensitivity of qualitative approaches have a great potential, not only to contextualize quantitative findings or help develop standardized instruments, but also to establish a genuine approach to answer cultural comparative research questions. For this purpose however, it is necessary to systematically and comprehensively reflect on the methodological and methodical potentials and limits of qualitative cross-cultural research, something which is still lacking in the literature. This paper aims to help narrow this gap by reflecting thoroughly the methodological implications as well as practical challenges of research in different cultural contexts. Doing field research in a foreign-language context and analysing qualitative interview data in different languages are two of these features. This paper refers to a qualitative research project from the field of family research within which 19 individuals belonging to three German and three Italian families have been subject to in-depth interviewing. Interviews have been conducted both in German and Italian and the interview material has been analyzed in a reconstructive and hermeneutical manner with the aim to reconstruct (culture specific) processes of familial role differentiation.

**DISSOLVING INTERVIEWS INTO CONVERSATIONS: PARTICIPATING IN THE EVERYDAY LIFE OF INTERNATIONAL MIGRANTS**

Elson Menegazzo

Abstract: Connectivity between source and destination points is an inherent aspect of international migrations, and in the contemporary age, the use of the Computer Mediated Communication (CMC) links "here" and "there" in a daily basis. This paper explores the strategies for data collection in interactions with and between international migrants and their descendants in synchronous CMC systems, such as webcam and instant messenger. An important aspect of these systems is the interest of people to talk rather than being interviewed, and another is that as communication through these systems differs from that face-to-face, a different etiquette is required of the researcher, that should avoid that the act of posing questions during the written communication resembles an interview. Thus, the interview and its features must be dissolved into conversation. However, this method requires the establishment of contact with many people over a period of time and the ability of the researcher to talk and to ask open-ended questions in order to obtain spontaneous responses, unexpected revelations and stories. The advantage of this method is the maintenance of contact with people, which enables the grounded theorist to participate in the everyday life of international migrants or their descendants, combining data collection and data analysis.

**CRITICAL DISCOURSE ANALYSIS: METHOD AND APPLIANCE IN THE STUDY OF BODY-REPRESENTATION**

Anabela Conceição Pereira

Abstract: Discourse Analysis implies the analysis of discourse. Usually Critical or Discourse Analysis is defined as a deconstructive reading and as an interpretation of a problem or text. According to van Dijk (2001: 352) it allows to focus on the relationship between power and discourse, studying the way in which social power is performed, reproduced, and (un)accepted by textual and oral conversation in the social context. Consequently, it is not easy to present a single definition of Critical or Discourse Analysis as a research method. Indeed, Discourse Analysis can be define as a way of approaching and thinking about a problem not by providing unequivocal answers but by allowing asking ontological and epistemological questions. Additionally, it is more than a methodology tool because it always conveys an interpretation.

Thus, this paper draws attention to the relation between multiple types of discourse in case-study research project where self-representation has a significant meaning. In this study on self-representation concerning two specific Portuguese artists, Photography, Paintings and Installations expose artists’ symbolic presence and often artists’ self is confused with its visual (re)presentation. Gradually no clear distinction between the iconic sign and its referent was possible to ascribe. A subsequent divergence between artists’ personal discourses – this is not my body – and the evidence of the images i.e. artists’ self-representation, is detectable resulting in apparently contradictory observations. Accordingly, and since the evidence of the visual icon (artist’ body-image) was not enough to deconstruct his associated discursive (aesthetic) institutionalized character, it has been decided to analyze textual discourses (through MAXQDA) as documental attestation of those divergences, presenting an analysis of what is seen and said, and what is actually interpreted and reproduced in discourses. In other words, it focuses on the differences between personal discourses and other (legitimized) discourses about these specific cases comparing them with evidences of visual images.

**FROM CONTENT TO CONDITIONS OF POSSIBILITY: DISCOURSE ANALYSIS IN THE SOCIAL SCIENCES**

Lea Sgier
Abstract: Discourse analysis claims that discourse is the result of “conditions of possibility” that both constrain and enable this particular discourse. What this concretely means, however, often remains unclear. This article is an attempt to lay hands on this abstract concept in its concrete functioning in a particular context. In this article, I present an analysis of a series of student texts on the topic “Being a PhD student” produced by my own students in different circumstances: as my regular students in an ordinary institutional context for some, as my summer schools students or short-term workshop students for others. Although the contents of these various texts are quite similar in terms of contents, I can show that the conditions and power relations under which they were produced deeply affected them in terms of genre, style and range of ideas that could be expressed. These differences will illustrate the meaning of the concept of “conditions of possibility” in this particular context and show how they concretely materialise in texts. From there I will reflect on their importance for other forms of data generation, namely interviews.

CROSS-NATIONAL QUALITATIVE PROJECTS:
TRANSLATION-RELATED CHALLENGES

Danuta Przepiórkowska
UNIVERSITY OF WARSAW, Warsaw, Poland

Abstract: This paper reflects on the experience of a cross-national research project called ‘Legal Cultures in Transition - The Impact of European Integration’ which covers 5 European countries and investigates their legal cultures and changes resulting from the turbulences of EU accession (Poland, Bulgaria), the EU neighbourhood (Ukraine), the ‘old-member’ status (UK) or the EEA membership (Norway).

Within the project, dozens of focus group interviews and face-to-face in-depth interviews were conducted in the five countries in local languages, then they were transcribed and translated into English, thus producing a very large body of recontextualised discursive data for analysis.

Based on a subsection of data (Polish and Ukrainian transcripts and their translations), the paper will demonstrate the challenges that such a research design pose for researchers who work with the final output. In this process, some agents (researcher team, fieldwork staff, respondents) are visible whereas others (transcribers and, above all, translators) remain invisible (L. Venuti) yet they are very active agents in the process (‘intervenient beings’ – C. Maier), their interventions having an important bearing on the research process, sometimes creating confusion and sometimes supporting the process. Different translator selection methods at various stages of the process also played an important role.

Considering that relatively little has been written about the role of translation in social research (some important contributions coming from R.W. Brislin and B. Temple), the paper will draw on Discourse Analysis (N. Fairclough, T. van Dijk) and Translation Studies (L. Venuti, C. Maier, B. Hatim & I. Mason) to look at this particular aspect of qualitative research process which seems to be often neglected or taken for granted.

HOW TO ANALYZE IDENTITIES AND THE SUBJECT POSITIONS IN INTERVIEW MATERIAL?

Jukka Antero Törrönen

Centre for Social Research on Alcohol and Drugs, SORAD/STOCKHOLM UNIVERSITY, Stockholm, Sweden

Abstract: In my presentation I introduce analytical tools for analyzing ‘identities’ (the self and others) that emerge in the interviews. I approach ‘identities’ as historically, socially and culturally produced ‘subject positions’, as processes that are in a permanent state of becoming and which receive their temporary stability and meaning in concrete contexts and circumstances. I suggest that we can analyze the identities and subject positions that materialize in the interviews from four different perspectives. We can approach them by paying attention to (1) classifications that define the attributes of “us” and “them”, to (2) participant roles that express the positive and negative values in action, to (3) structures of viewpoint and focalization that give meaning and order to opinions and experiences of the world, and to (4) positions of interaction that articulate the roles taken by the interviewer and interviewee during their communication.

DISTINGUISHING DISCOURSES. ON METHODOLOGICAL CHALLENGES OF DISCOURSE ANALYSIS.

Florian Elliker

Institute of Sociology, UNIVERSITY OF ST. GALLEN, St. Gallen, Switzerland

Abstract: This presentation will focus on a discourse analysis, based on the sociology of knowledge approach to discourse (Wissenssoziologische Diskursanalyse). The case study examined the public debate in the field of politics and the mass media focused on a so-called ‘popular initiative’ that proposed a change in the Swiss constitution concerning the acquisition of citizenship (i.e. naturalization). The initiative was decided upon by a nation wide plebiscite. It was launched by one of the major Swiss political parties, the conservative right-wing party Schweizerische Volkspartei (known for their provocative use of symbols, e.g. in promoting a ban of minarets).

In the tradition of interpretative sociology, the study analyzed printed texts and images, using theoretical sampling and two approaches of qualitative methods – ethnographic semantics and the analysis of patterns of interpretation – to reconstruct the interpretive repertoire of the discourses at hand. Discourses are understood as being constituted by a central frame of interpretation and multiple patterns of interpretation that relate to that frame. The reconstruction provides evidence that four discourses structure the debate: (1) ‘democracy as (absolute) popular government,’ (2) a ‘non-fitting’-discourse, (3) ‘democracy in a constitutional state,’ and (4) ‘inclusive democracy.’ Most actors use one or two of these discourses.

The paper will illustrate some of the methodological challenges encountered in the process of interpretation. It will touch upon the relation of visual analysis and text analysis, i.e. the relation of image and text, and will discuss specific ‘text qualities’ such as vagueness, equivocality, and ‘mistiness.’ While they constitute methodological problems, they are also specific characteristics of the discourses at hand, constituting relevant, but often implicit horizons of interpretation.
Furthermore, the interpretive work of distinguishing two prominent discourses will be discussed: Contrary to the popular notion, the populist discourse at hand is adequately interpreted as a radicalized version of the Swiss tradition of conservative thinking (Mannheim). While it shares a nativist affinity with the ‘non-fitting’ discourse, the latter – promoting skepticism about migrants – is identified as a distinct discourse, whose use is not restricted to right-wing ‘populist’ parties.

**THE CHALLENGE OF STUDYING CONTEMPORARY INNOVATION IN QUALITATIVE METHODS**

Rose Wiles 1, Graham Crow 1, Andrew Bengry-Howell 1, Melanie Nind 1

1National Centre for Research Methods, UNIVERSITY OF SOUTHAMPTON, Southampton, United Kingdom

Abstract: Researching innovation in research methods presents a number of challenges, such as how to define innovation, how to assess the usefulness of an innovation, how to identify the person or people behind an innovation, and how to explore the factors which enable some innovations, but not others, to ‘take off’ and become established as credible. Our presentation reports on an ongoing study of innovation in qualitative methods. Drawing on case study material of three innovators who make claims for the development of three different innovations in qualitative methods, we explore the nature of the claims being made, the uptake of the methods or methodological approaches across disciplines, and the social processes leading to the development and legitimation of these methodological innovations. In this presentation we are particularly interested in discussing the nature of the claims for methodological distinctiveness that are made, the strategies used to market and promote uptake of the method by other researchers, the role of champions in legitimating the method, the ways in which control and ownership of the method in its pure form are maintained, and the importance of the social and cultural context in influencing what innovations ‘take off’. More broadly we are interested in the ways that trends in research reporting have encouraged the proliferation of claims for novelty and innovation in qualitative research methods. We argue that many claims to innovation in published papers in practice involve the adoption of existing innovative methods, adaptations to existing methods, or the transfer of methods from other disciplines. Our case studies exemplify some of the subtle processes in teasing out how innovation in methods is constructed.

**SELF REPORT METHODS IN EMPIRICAL SOCIAL RESEARCH - OPPORTUNITIES AND RISK OF AN UNREGARDED RESEARCH INSTRUMENT**

Alexa Maria Kunz 1

1Institute of Sociology, KARLSRUHE INSTITUTE OF TECHNOLOGY, Karlsruhe, Germany

Abstract: Although self-observation and self-report being an indispensable element of human world perception and thereby being essentially connected to the anthropological ability of positioning oneself in relation to oneself, to the world and to others (see Plessner 1981) – or in brief: although self-observation and self-report being every day life practice, there is – excepting the ethnographic debate about self reports produced by a researcher – almost no methodically motivated and methodologically reflected adaption of these practices in terms of empirical social research techniques (see Krotz 1999). At the same time, while doing so called qualitative research, one often is confronted with the problem of trying to gain data about dimensions of personal experience which are not directly observable (see Rodriguez/Ryave 2002) and which accordingly to this are reliant on self-reports from the ones being researched.

Based on the own empirical research about the every day life of university students, where (among other methods) self report methods were applied, there will be given first methodical and methodological insights on the range and the quality of data, or in general: on the prospects and risk when using self report methods.

"**ONLINE AND OFFLINE** QUALITATIVE METHODS: SOME METHODOLOGICAL CONSIDERATIONS ON FOCUS GROUPS AND INTERNET OPPORTUNITIES**

Valeria Pandolfini 1

1Department of Anthropological Science (D.i.S.A.), UNIVERSITY OF GENOA, Genova, Italy

Abstract: The paper analyses the impact of the use of computer technologies on qualitative research methodology and data analysis (Perrott 2000; Evans, 2006), focusing in particular on online focus groups (Krueger and Casey, 2000; Stewart and Williams, 2005). After a brief historical excursus of the development of this technique in social research, the paper describes and compares the methods of conducting a focus group in “traditional” (face to face) and online environments (Walston and Lissitz, 2000; Mann and Stewart, 2000). In doing so, some methodological issues are considered, like the recruitment of participants, the size and composition of groups, the role and skills of the moderator, the interactivity among participants as well the data recording, their analysis and validity. Taking into account how choices between offline and online setting as well as design decision should be made in relation to the aims and goals of a research study, it is underlined how and under which circumstances the focus group might benefit from computer mediated communication technologies, both in synchronous and asynchronous modalities. These issues are deeply discussed drawing on practical examples of conducting synchronous online focus group concerning evaluation activities of an adult training course, showing various practical benefits both for researchers, both for participants, as well as some potential drawbacks and problems. Finally, the paper summarizes the advantages and limitations associated with online focus group and speculates on the possible evolutions of this method exploring the opportunities offered by the most recent developments of new technologies (like Second Life and various video conferencing applications). Taking into account also the debate around the possible perplexities and the criticisms advanced by some authors (Greenbaum, 2002; Denscombe, 2003), it has to be underlined that, beyond any tribe, Internet methodologies offer interesting possibilities for conducting qualitative research using online group discussions and confirm themselves as valuable new tools for the social researchers.

**‘ABDUCTIVE CASE STUDY’ STRATEGY: AN ‘INNOVATIVE’ APPROACH IN UNDERSTANDING CREATIVE LEADERSHIP IN HIGH-TECH FIRMS**

Anis Amira Ab Rahman 1

1Department of Anthropological Science (D.i.S.A.), UNIVERSITY OF GENOA, Genova, Italy

Abstract: Although self-observation and self-report being an indispensable element of human world perception and thereby being essentially connected to the anthropological ability of positioning oneself in relation to oneself, to the world and to others (see Plessner 1981) – or in brief: although self-observation and self-report being every day life practice, there is – excepting the ethnographic debate about self reports produced by a researcher – almost no methodically motivated and methodologically reflected adaption of these practices in terms of empirical social research techniques (see Krotz 1999). Abstract: This paper discusses the abductive case study strategy as an ‘innovative’ method to understand creative leadership in the high-tech firm based on the empirical study as part of doctoral research, conducted in high tech and low tech firms in the information sector. The purpose of this study is to understand the root factors that influence the phenomena of creative leadership in high-tech firms, which is not only, focused on the factors influence but to investigate in-depth the root issues that influence creative leadership. The backbone of this study is the ‘phenomenological’ paradigm. Recurrent of the research on creative leadership, especially which relates with entrepreneurship mainly uses a quantitative method with a positivist paradigm or qualitative method with the realist paradigm. Both approach set up the theoretical framework that is developed by the researcher. Therefore, the understanding of the phenomena is restricted to the researcher’s theoretical framework and not based on the knowledge that emergence from the field. Furthermore, this study also takes into account other voices such as expert and other entrepreneurs. The role of a researcher in the Abductive strategy is to abduct the knowledge which is reflected in actors’ language through actor’s lay language into technical language. However, the criticism in the literature on the credibility of the interviews can be addressed by using case study method as it put the phenomena in a context. Furthermore, case study approach can increase the reliability of the study as it allows the data sources to be triangulated. This study is not a comparative study as such because it does not use variables to compare the two extreme cases. The involvement of the low-tech firm is rather used to increase the understanding of creative leadership phenomena in the high-tech firms. The factors that influence the creative leadership in high-tech firms are explored first, and then investigated in low-tech firms to see the similarities and differences, and also their extent. This study therefore, emphasises the adoption of Abductive case study strategy as it gives the opportunity to the researcher to investigate the phenomena in-depth.

Keywords: Abductive case strategy, phenomenology, creative leadership, entrepreneurship, high and low technology firm

QUALITATIVE EXTENSIONS OF SOCIO-COGNITIVE MAPPING: CAN WE MOVE FROM ETHNOGRAPHIC SOCIAL STRUCTURE TO CULTURAL CATEGORIES?

Malcolm Laurence Alexander, Daniel Chamberlain

Abstract: Socio-cognitive mapping (SCM) (Kindermann 2007) maps respondents’ perceptions of social clusters and group boundaries. It asks respondents ‘Who hangs around together?’ and collates responses to form a composite, collective (‘socio-’) map of these separate cognitive maps of (sub-group) social structure. The method has been used and proven in ethnographic studies of schools and small communities. SCM collates its composite maps through aggregating, and then scoring, all the dyadic pairs implied in each respondent’s identification of groups. It pays little attention to the respondents’ qualitative descriptions of the groups.

This paper suggests how this ontology of informal group structures can be investigated with qualitative interviews in non-ethnographic studies. Starting with established procedures of social network, ego-centric data collection, a researcher employs name generator questions to identify members of a respondent’s (ego) social circle (their alters). The interviewer then prompts the respondent about activity groupings (people doing things together) across the list of alters and elicits further descriptions of the activity and the social connections it generates. This data collection procedure gives direct (cognitive) perceptions of the fragment of group structuring around the respondent. The experience of SCM suggests that this will be reasonably close to collective perceptions. Qualitative analysis of respondents’ descriptions of these activity groups and social clusters then allows us to tease out the types of group activity and social clustering characteristic of the population represented by the respondents. The paper gives some examples of interviews using this method and the early findings they suggest.

Krzysztof Tomasz Konecki

Abstract: The paper deals with the problem of perceiving and experiencing the body during the process of constructing identity of yoga practitioner. The author conducted the ethnographic research on the problem using several methods of qualitative research (participant observation, unstructured interviews, narrative interviews, video recordings, photography, video – elicited interviews). Ethnographic research has been made in the Western cultural context of practicing hatha - yoga (the place of research, Lodz city in Poland). The process of becoming of “yogi” is connected with the practice of “body work”, with achieving specific definition of the practice and body and experiencing the specific body feelings. “Body work” can change “Western” perspective of body definition as an element of material existence (Cartesian dualistic view) to the vision of body as a spirited substance (Eastern philosophy view). The process of becoming yoga practitioner consists of the major three phases: 1/ first steps: constructing of motives, first “exercises” and looking for the effects; 2/ the phase of fuller recognizing of psycho-physical effects and an attribution of meanings to them; 3/ the phase of fuller recognition of spiritual aspects of hatha – yoga. The practitioners have got problems with defining the effects of practice while not fully accepting the assumptions of Eastern concepts of yoga and refusing the religious context of practice (e.g. still keeping the catholic beliefs). The last phase is associated with constructing privatized and secular kind of religion by yoga practitioners dealing with the discrepancy between conventional religion beliefs that they still keep and new beliefs coming out from the body experience (constructing of private and quasi-religion) and from a new language that they learn during practice.

RESEARCH UNDER FIRE? METHODOLOGICAL CONSIDERATIONS OF STUDYING THE GERMAN ARMED FORCES IN AFGHANISTAN

Phil Langer, Anja Seiffert, Carsten Pietsch, Bastian Krause

1 Economic and Social Sciences Department, Potsdam University, Potsdam, 2 Bundeswehr Institute of Social Sciences, Strausberg, Germany

469
Abstract: Exposure to violence marks a fundamental characteristic of armed forces in conflict and war contexts. The questions, how to empirically examine the ways soldiers experience military violence in combat situations, the strategies they make sense of these experiences, and the consequences they have to cope with, pose considerable challenges for sociological studies. They require innovative research strategies, as e.g. Randall Collins’ micro-sociological analysis of visual material has recently demonstrated.

The paper aims at contributing to the debate by discussing methodological strategies to qualitatively research experiences of violence. It refers to the study “ISAF 2010”, which was carried out on behalf of the Department of Defence to examine the perceptions and attitudes of German soldiers currently deployed to Afghanistan. The qualitative elements of the study comprise over 160 interviews and focus group discussions, participant and non-participant observations and visual data collection by the project team in Northern Afghanistan in May 2010.

The following issues will be outlined in the presentation: 1.) How do experiences of violence as research subject influence the research dynamics, and vice versa: what can we learn from these dynamics about the subject itself? The arguments will be based on the observation that the loss of control that soldiers report with regard to their combat experiences is reflected in a transgression of the interview situation. 2.) How do meaningful narrations about fighting experiences develop among soldiers of small task force units? The arguments will be exemplary based on a larger focus group discussion with elite soldiers that have just returned from an encounter with insurgents to the German camp. 3.) How do combat experiences shape the deployment reality of German soldiers in Afghanistan on a material level and how can we interpret these materials? The arguments will be based on qualitative analyses of photographs of the camp, the soldiers, and the living environment of task forces.

It will be argued that the discussed issues transcend the research on violence and may lead to insights into other areas of qualitative study by critically reflecting, how the analysis of interaction dynamics contributes to a deeper understanding of the research phenomenon itself.

RESEARCH RELATIONS IN MILITARY CONTEXTS. HOW DOES GENDER MATTER?

Helena Carreiras

1ISCTE- UNIVERSITY INSTITUTE OF LISBON, Lisboa, Portugal

Abstract: The question of how the researcher’s gender impacts on the research process has frequently been addressed in the methodological literature of the social sciences. Much less has been written on gender interaction patterns between researchers and their research subjects in a particularly gendered organization such as the armed forces. This paper develops around three methodological assumptions: a) all research relations are social relations; like any other interaction, research relations take place in gendered contexts; b) the military is a particularly gendered context where research relations are potentially more affected by gender (amplification effects); c) the extent to which research relations become more or less gendered depends on the interplay of a variety of factors (cognitive and social), which requires a context-sensitive analysis. Based on these assumptions, and drawing on the authors’ experiences of research in a variety of military contexts, the paper addresses the impact of the researcher’s gender on aspects such as negotiating access or discursive interaction during interviews, as well as the trade-offs involved and forms of control required to minimize interference.

BUILDING UNDERSTANDING BETWEEN STREETWORKERS AND FUNDING INSTITUTIONS THROUGH A QUALITATIVE RESEARCH.

Piotr Zbigniew Bielski

1INSTITUTE OF SOCIOLOGY, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: The text will outline the ethnographic study of streetworking taking place in major Polish cities and applied methods. The research focus is on streetworkers who work with the youth from urban poverty hot spots in the situation of a newly emerging institutional framework and lack of established practices. My study is based on mix methods and ethnography. It consists in interviewing and shadowing streetworkers in their work and analyzing their diaries, as well as interviewing the officials who subside and evaluate streetworking projects and kids who work with streetworkers.

The streetworkers apply the logics of relations and care. They perceive their job and duty as constructing relations with the youngsters based on mutual trust and friendship. The core feature of such relations is the reliance, their availability in the unpredicted moments when kids fall in danger and regularity of interaction.

The funding institutions are important actors in shaping the social world of streetworking as they subside projects and evaluate them. They apply a logics of efficiency and focus on specific results. Moreover, the municipalities subside projects only in certain months of the years basing on the budgetary year. They focus on products (e.g. theatre play performed by kids) while the streetworkers focus on the processes such as building long-term relations, they evaluate their progress in work basing on feelings and perceptions. The streetworkers measure results in a qualitative way while the institutions focus on the quantitative indicators.

The institutions assume that the streetworking can be shaped to fit the necessities of the project reality with the results known and scenario declared beforehand in the moment of applying whereas the streetworkers assume that they deal with an unpredictable and risky process.

The result of the clash of logics is that streetworkers see themselves forced to develop strategies of survival. An example of such strategy is saving money for pizzas from the months where they were paid to keep on with the work in-between the projects. The streetworkers encounter a moral dilemma of creating double narratives about their work – one for people from the organisation and another for the funding institutions to comply with their requirements.

This is an example of a qualitative research that aims at forming part of the public sociology and facilitating mutual understanding between the two groups.

THE CONTRIBUTION OF QUALITATIVE DATA TO SOCIAL REPORTING

Andreas Heinen, Helmut Willems

1UNIVERSITY OF LUXEMBOURG, Walferdange, Luxembourg

Abstract: Our contribution introduces a special topic related to the use of mixed methods approaches in social sciences. It deals with
social reporting, which is traditionally based on quantitative data, and shows how qualitative data can further enhance the social reporting evidence base during the process of data collection and analysis. Starting from various types of available qualitative data (interviews with experts, focus groups) we outline different functions and benefits these provide to the quantitative oriented system of social reporting.

First of all, we examine how qualitative data can lead to a verification of knowledge emerging from quantitative analysis. Secondly, the qualitative data’s function of deepening knowledge is addressed, i.e. how can specific and differentiated findings be yielded. A third function refers to the complementarity, the additional contribution of qualitative to quantitative data, i.e. specific contextual knowledge based on qualitative data. Finally, the process of interpretation will be outlined as a fourth function, dealing with how qualitative data can help examining and interpreting the quantitative findings.

In this respect, two key questions and challenges will be discussed. (1) What if qualitative data either confirms or contests the quantitative findings, how can one deal with one or the other in the process of analysis and interpretation? (2) Regarding the heterogeneity of qualitative data collection methods and sources, what are the quality criteria to produce research findings that are meaningful, valuable and provide reliable evidence?
ENTERPRISING ONESELF OUT OF WORK. THE USES OF SELF-GOVERNMENTALITY BY RUSSIAN WORKERS IN THEIR SEARCH FOR EXIT ROUTES FROM PRECARIOUS FORMAL EMPLOYMENT

Jeremy Morris

Abstract: The nature of insecure work continues to attract debate, particularly in the context of neoliberal reform in many developed countries. A growing body of work focuses on in-work poverty and attempts of households to secure a livelihood by recourse to informal economic activity. This research provides ethnographic data on mobility patterns between formal and informal employment in Russia. Findings show that standard formal employment is no less precarious than informal work despite the uncertainty of the latter.

The temporary and permanent movement of people from standard to own-account informal work can only be understood by examining the multi-faceted evaluation by households of relative risks. By examining ‘normative’ worker exit strategies from waged employment we can reappraise the meaning of the ‘reflective worker’ under neoliberal governmentality; the creation of ‘enterprising’ workers can lead to the rejection of the very formal work places and structures that are formative of such subjectivities. In spite of the advantages of own-account informal work, economic, cultural and social push and pull factors towards this sector are observed (respectively these are security of household reproduction, self-esteem, and informal labour network reciprocity).

FACE AUX MENACES DE FERMETURE D’INDUSTRIE : UNE PERCEPTION DIFFÉRÉNCIÉE DES RISQUES.

Herve Flanquart, IRENEE ZWARTEROOK

Abstract: L’agglomération urbaine de Dunkerque compte 200.000 habitants et 13 sites Seveso, souvent très proches des habitations.

La question que nous traitons ici est la différence de perception des industries et de leurs externalités négatives dans une période marquée par les fermetures récurrentes d’usines. Pour les salariés des sites Seveso, le principal risque industriel encouru n’est-il pas alors ces fermetures, qui les priveront de travail et de revenus ? L’analyse des réponses au questionnaire dessine en effet un partage des opinions non plus horizontal (d’un côté les personnels d’encadrement, fortement diplômés et bien rémunérés ; de l’autre les simples exécutants, moins formés et moins payés), mais vertical, c’est-à-dire séparant les salariés selon leur secteur de production : ceux du tertiaire, toutes positions hiérarchiques confondues, contre ceux du secondaire, simples ouvriers ou cadres.

De même, les entretiens réalisés auprès des syndicalistes montrent que les ouvriers font corps, à certains moments, avec leur direction pour maintenir l’activité industrielle sur le territoire. Et si ces syndicalistes, pris dans un contexte de montée des préoccupations écologiques ne peuvent plus ignorer celles-ci, ils ont tendance à privilégier celles qui ne remettent pas en cause l’existence de sites Seveso. Comme les mesures accroissant à la fois la sécurité et le niveau de l’emploi dans les entreprises : la lutte contre la sous-traitance et pour des pompiers en interne en constituent des exemples éblouissants.

Aussi, semble-t-il se dessiner une tension entre, d’un côté les catégories ayant un intérêt économique (surtout l’emploi) à s’accommoder de ceux-ci, et, de l’autre, celles n’y ayant pas d’intérêt direct et se montrant moins conciliantes. Le défi des syndicats ouvriers est alors de protéger les salariés tout en donnant des gages au reste de la population que les risques sont contenus au niveau le plus bas.

MALADIE, RISQUE(S) ET PROFESSION. LE CAS DES PROFESSIONS INDÉPENDANTES FACE AU CANCER.

Vincent Rubio, Monique Hirschhorn, Philippe Amiel, Lionel Pourtau

Abstract: Nous présenterons les premiers résultats d’une recherche en cours, menée en France et soutenue par la Ligue contre le cancer et le Régime Social des Indépendants (RSI).

La population des indépendants en France, au sens des professions éligibles au RSI (2 millions de cotisants, en croissance globale de 22,5 % sur dix ans, pour 3,5 millions de bénéficiaires en 2009) compte parmi les plus exposées aux conséquences socio-économiques du cancer : le retour au travail est contraint plus précocement ; avec les ouvriers, les indépendants déclarent la plus forte perte de revenu du ménage consécutive à la maladie.

D’une manière générale, il faut relever que :

• La couverture assurée par le RSI est équivalente à celle des salariés, mais les indemnités journalières restent le plus souvent insuffisantes pour compenser la perte de revenus.
• Les dispositifs assurantiels de protection volontaire, coûteux et mal adaptés, restent difficilement accessibles aux petites entreprises.
• La maladie emporte souvent la santé de l’indépendant et l’existence même de son activité. La reprise de l’activité ou sa cessation sont également problématiques, de même que la reconversion.

La position des indépendants face au cancer permet de poser la question de la pertinence des modèles de gestion du risque et des responsabilités, en même temps que celle des arbitrages individuels face au risque de la maladie et de ses conséquences. Alors que
le statut d’entrepreneur individuel connaît un succès indéniable en France, elle met par ailleurs en lumière le développement de la précocité et de la vulnérabilité, ainsi que la persistance et la transformation d’inégalités sociales fortes (y compris à l’intérieur de la catégorie elle-même). Elle appelle enfin à l’innovation et à la création en matière de dispositifs de prévention et d’accompagnement qui font aujourd’hui entièrement défaut.

ARE WE REALLY ON THE WAY OF THE SOCIAL TRANSFORMATION OF RISK ANALYSIS ?

Michèle Dupré

1Centre Max Weber, UNIVERSITY LYON 2, LYON cedex 07, France

Abstract: The sociological analyses of the technological accidents in the last years, such as Diane Vaughan’s work, emphasize how important it is to take into account not only the technological, but also the organizational dimensions of these events.

That means that sociologists have to enter areas of production in which the engineers are the only ones professionals engaged in risk analysis and managing risk by technical means. As James F; Short explained it in 1984, “perhaps the chief risk for sociology, if we do not make a major effort to engage the discipline more fully in this area, is that we will increasingly be seen as irrelevant to an area of extreme importance to all of human kind – an area in which all the major institutions, all societies, and all nations are daily affected by analyses and decisions which remain largely uninformed by sociological theory and analyses.” (p.721)

The aim of this paper, grounded on an empirical research in French chemical enterprises (Dupré/Le Coze, 2006), is to debate about the difficulty to enter as sociologists such enterprises where the knowledge recognized as valuable is “driven by scientific and technical considerations based on physical and biological sciences and applied mathematics.” (p.711) It will also question the social theory as long as it is unable to build a bridge between technology and social actions, or between physical and social sciences.

CAN TECHNOLOGICAL FIX IMPROVE PRACTICES IN HIGH-RISK ORGANIZATIONS? THE CASE OF PHARMACEUTICAL INDUSTRY.

Cynthia Colmellere

1département sciences humaines et sociales, ECOLE CENTRALE PARIS, Chatenay-Malabry, France

Abstract: The technological fix is the idea that all problems, even social problems have technological solutions. In high-risk organizations, technological fix is used to improve performance and practices even if it introduces risks. This assessment raises questions: How risks are constructed? How technical, social and organizational issues and their embeddedness are considered?

To answer these questions, we studied design of main modifications in high risk organizations.

We carried out a two-year research in a chemical plant that produces intermediates for active pharmaceutical ingredients. Pharmaceutical industries are particularly interesting to study, because faced with an increasing worldwide competition, due to the expansion of generic drugs manufacturing. In this context, improving the quality of products since keeping in line with increasingly stringent regulations is considered as a competitive advantage.

Using observation and interviews, we studied a project aiming to replace the computerized control system of a shop in order to comply with regulations[1]. This project was also a way for the shop supervisors to change operators’ practices with respect to safety. Operators had indeed established non-compliance as a common practice to keep production schedule and to overcome dysfunctions of an old computerized control system. As a result, these practices threaten safety in activities and quality of products. We mainly focused on the shop-starting phase, which lasted eight months. During this latter, we could observe project team and shift operators faced with system breakdowns and material incidents. These problems led to postpone project activities and production planning. Moreover, the shop never really recovered profitability and was closed at the end of the year 2009.

In this contribution, our analysis emphasizes two main points:

1) Design of the new computerized system and the localized reorganization effort were based on a cursory analysis of operators’ practices and social relations in the shop. Actually, project team and supervisors regarded operators’ practices as the consequences of bad habits and outdated technologies.

2) As a consequence, organization that pertained to be modified was reduced to operation and supervision of chemical processes. Neither maintenance nor quality control was considered, even if they play a main role in the shop reliability and risk management.

"HUMAN ERROR": A PHENOMENON THAT IS SOCIALLY CONSTRUCTED BOTH IN SCIENTIFIC RESEARCH AND WORK ENVIRONMENTS

Karen Rossignol

1CENTRE DE RECHERCHE PUBLIC HENRI TUDOR, Luxembourg, Luxembourg

Abstract: “Human error” is the most frequently used cause for explaining accidents in human activities. For the last fifty years, human error has become a major subject of scientific research in the field of work safety. This paper applies sociological analysis to the use of the notion of human error both in research by so-called experts of the human factor and in a specific work environment in which personnel apply risk prevention tools to pyrotechnic activities in a military armament testing center.

This research was undertaken through semi-structured interviews with 25 pyrotechnicians (individuals responsible for the safe storage, handling, and functioning of pyrotechnics and pyrotechnic devices), direct observations of their daily practices (e.g., safety meetings, work activities in firing ranges to test shells, missiles and...
anti-mine systems), and a review of documents that guide their practices. We used the concept of social representation as the system of values, ideas and practices which serve to establish an order which will enable individuals to orientate themselves in their material and social world and to enable communication to take place among the members of a community by providing them with a code for social exchange and a code for naming and classifying unambiguously the various aspects of their world and their individual and group history. As social representations are depicted as both the process and the result of social construction they are constantly converted into a social reality while continuously being reinterpreted.

In this study it is found that the expression human error is never used by the staff at any level of the hierarchical organisation including in the different documents. I will present some explanations for this omission which is surprising because risk prevention procedures constantly refer to a great number of rules and calculation methods that aim to avoid subjectivity, approximation and personal initiatives of staff. This omission of the use of the notion of “human error” does not mean that errors are not taken into account in the work environment. They are integrated into the testing procedure in order to avoid individual pinpointing mistakes by staff members.

I claim that “human error” is a phenomenon that is socially constructed both in scientific research and in work environments.

CAUGHT BETWEEN HEALTH AND ILLNESS. AN EXPLORATION OF THE SOCIAL ROLE OF BEING GENETICALLY AT-RISK FOR CANCER

Maria Caiata Zufferey

Département de Sociologie, Université de Genève, Genève, Switzerland

Abstract: Since fifteen years, genetic tests are available to identify the predisposition for cancer due to specific mutations in genes. Sometimes healthy, asymptomatic individuals get tested. In case of adverse results, asymptomatic individuals receive a probabilistic information: they know that they carry the mutation associated with the illness, but they don’t know if the illness is going to develop, nor, in that event, when in their lifetime this is going to happen.

Being genetically at-risk involves receiving a new health status which differs from just being at risk from a specific health hazard: once the at-risk health status has been determined, people are supposed to manage it. In other words, they are required to act in the present in relation to the potential developments that have come into view. Yet, managing genetic risk is an overall and long-lasting process: it is an overall process, because people are supposed to manage both the health risk and its numerous implications for the daily life; it is a long-lasting process, because people are supposed to manage the genetic risk continuously until the disease develops.

If individuals genetically at-risk for cancer are required to become active in order to manage their condition, it is not clear the way they are supposed to do it. As potentially sick, they have to try to avoid, delay or reduce the development of the illness. As substantially healthy, they have to continue assuming their usual social roles. The at-risk label places therefore the individuals in an ambiguous position, somewhere between health and illness.

In this paper we will investigate the social role of being genetically at-risk for cancer. Firstly, we will show that the ambiguity of the at-risk role is not due to a lack of norms, but to an excess of contradictory rules which are simultaneously promoted by different social institutions. Second, we will explore the challenges that individuals have to deal with when they act in this paradoxical situation. Particularly, we will suggest that the main task of genetically at-risk people is to construct their own way of management and to validate it through a process of legitimization.

These considerations are drawn from a qualitative study on self-management of genetic cancer risk which is currently on-going in Switzerland.

RISK STATUS AND THE MANAGEMENT OF DANGEROUS OFFENDERS IN MENTAL HEALTH SERVICES

Bob Heyman1, Lisa Reynolds2*

1Centre for Health and Social Care Research, UNIVERSITY OF HUDDERSFIELD, Huddersfield, 2City University, London, United Kingdom

Abstract: In every field of organised social life, societies which are oriented towards risks attempt to manage decision-making in conditions of uncertainty by assessing their severity - the estimated probabilities of categorised and selected harms occurring over implicit or explicit time-frames (Heyman et al., 2010). As brutally exposed by the Great Financial Crash of 2007, risk status based on an official consensual account of risk severity needs to be rigorously differentiated from underlying riskiness, a more nebulous property which cannot be captured even retrospectively by observing single events. This paper will illustrate the significance of risk status in a context of particularly difficult decision-making, concerning the release from secure forensic mental health services of offender who have committed serious crimes against the person. Qualitative data will be drawn from a completed research study undertaken in London, UK. The data presented will document the difficulties faced by staff and patients attempting to manage risk assessment. It will be argued that risk status was often equated in practice with compliance, giving rise to concern about patients who were ‘too good’, or was calibrated through a ‘suck it and see’ approach involving progressively more risky steps. It will be argued that risk cultures invest heavily in the rationality of risk assessments which allow complex or intractable uncertainties to be pragmatically operationalised in manageably simpler terms. This risk rationality breaks down whenever fissures between risk status and riskiness are exposed through the unanticipated occurrence of adverse events.

THE UTILITY AND LIMITS OF HOPE: EXPLORING THE MANAGEMENT AND ROLE OF EXPECTATIONS IN THE CONTEXT OF MENTAL HEALTH CARE

Patrick R Brown

1Department of Sociology and Anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: There are a number of approaches for dealing with uncertainty in the midst of vulnerability, as noted in the literature which often describes these in terms of their more or less calculative formats. One approach which is less well researched is that of ‘hope’.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
This paper will explore this concept theoretically in the light of qualitative data; initially seeking to delineate and contrast it with trust before moving on to describe the way notions of hope were invoked by service-users and professionals in the context of mental health services. If trust involves positive expectations in spite of an awareness of the possibility of failures, hope can in one sense be considered to refer to circumstances where the potential for positive outcomes is focused upon even where these may be deemed unlikely - or even highly improbable. In this format hope is useful and significant even where trust is not possible, yet the management of the tension between a focus on positive outcomes and awareness of failure is far from straightforward. For service-users as well as professionals there are negative longer-term outcomes likely where hopes are too high, or where they are not sufficiently drawn upon. Thus the latter part of the paper refers to the limits which are established by actors around hope as a way of managing aspirations - thus balancing possibilities for motivation against concerns over disappointment.

EXPERIENCES OF RISK AND UNCERTAINTY: OCCUPATIONAL ACCIDENTS AND THE PORTUGUESE SYSTEM OF RISK REGULATION

Teresa Maneca Lima 1, António Casimiro Ferreira 1

1Centre for Social Studies, UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: Actually, we live in a period of a severe crisis that assume in the labour world insidious forms, manifested in the way assumptions about work and their rights have been transformed and evaluated. These transformations changed the notions of work time and space and contributed to the emerging of new employment forms, to labour market flexibilization and deregulation and to precariousness of labour relations, which intensified social inequalities and insecurity experienced by workers. At same time, these changes have undermined the labour rights and increased the number of workers exposed to situations of vulnerability and uncertainty.

Portugal doesn’t come of this global trend, particularly with regard to individuals whose social and economic ties depend on work. This diagnostic has been made in several studies that present a direct correlation between deterioration of working conditions, precarious employment and occupational accidents. Nowadays, millions of workers continue to face serious risks at work, and occupational accidents regulation is justified not only because the number of lives lost, but also because they are an indicator of social injustice.

Thus, the law has an important role on the regulation of labour risks. However, in the Portuguese case we have a private system of protection, based on the conception of risk responsibility. This responsibility is transferred from the state to the employers and from them to the insurance companies. In other words, in Portugal the regulation of labour risks, understood as a collective and public risk, is managed by market standards.

Therefore, the objective of this communication is to discuss how the Portuguese model of occupational risk regulation creates unique experiences in Portugal, and reveals the weaknesses of a state unable to ensure the risk reparation and regulation, leaving uncovered a set of risk and uncertainty experiences exacerbated by a weak and private social protection model.

RISKS ARISING FROM THE UNDOCUMENTED WORK. THE CASE OF ROMANIAN WORKERS IN THE EUROPEAN UNION

Ciprian Panzar 1

1Sociology, THE WEST UNIVERSITY OF TIMISOARA, Timisoara, Romania

Abstract: This paper examines the risks and the vulnerabilities on social security. Therefore, the paper is focused on the evaluation of the amplitude and characteristics of undocumented work of Romanian migrants in the European Union. The undocumented work produces the financial imbalances of social security systems and prevents the development of coherent social and economic policies. The analysis shall use official statistical data from OECD, complemented with data from national statistical offices from European Union countries. The paper highlights the risks generated by this segment of undocumented workers by affecting the tax base, state budget revenues and especially affecting the sustainability of social policies.

SOCIAL RISKS OF HUMAN DEVELOPMENT IN RUSSIA

Zemfira Ivan' Yunna Kalugina 1

1Department of Sociology, INSTITUTE OF ECONOMICS & IND.ENGINIREENG SB RAS, Novosibirsk, Russian Federation

Abstract: The paper presents her analysis of the resource supply for reproducing human potentials both in regions and sectors. Social risks in this context are likely consequences of social policies which are detrimental to the level of human capital development. Empirical data showed that only 3 percent of employees in the Russian labor market had wages that ensured developing standard of consumption, and absolute majority of the workers were only able to regain their capacity for work. The current system of remuneration of labor in the commercial and state sectors of economics, as well as public policy on income distribution in Russia have resulted in an unprecedented stratification of the society. With time the chasm between the poor and the rich in Russia has been only increasing: Gini index has grown from 0.289 in 1992 to 0.422 in 2009. In order to ensure extended reproduction of human capital (at the level of modern standards) in all sectors of economics, the average nominal wage has to be at least two times as high, and minimum three times as high in the social sphere and in the agriculture. The comparative position of Russian regions in human development is shown. In spite of the positive tendencies in the human development, Russia has not reached its pre-reform level, when its HDI was 0.821 in 1990. Life expectancy of the Russians (which was 66.2 years in 2007) is of a particular concern. It is the lowest index among the countries with developed HDI. According to an international experts’ estimation, there is a probability that every tenth Russian citizen (10.6%) from the 2005-2010-yearcohort will live less than 40 years! The financial and economic crisis has increased the social risks of human development in Russia in connection with a greater unemployment rates, policy of wage freezing, welfare expenditure cuts etc. The author concludes that most of Russians, due to their low wages or salaries, have not enough resources available to human reproduction while the public expenditures on education, healthcare and culture do not cover the lack of individual investments. The author, being based on the works of well-known economists, tries to answer the question whether a vicious circle of “a low labor productivity – low wages and salaries” could be destroyed.
and whether priorities of Russian social policy addressing contemporary challenges could be found.

**BEYOND THE EXPERTISE BOUNDARIES: THE CASE OF THE QUEBEC AND FRENCH ROAD SAFETY AUDIT**

Geoffrey Carrere¹

1LEREPS, CAPITOLE UNIVERSITY TOULOUSE 1, Toulouse, France

**Abstract:** In The Risk Society: Towards a New Modernity (1986), Ulrich Beck is interested in setting out a sociology of knowledge for the understanding of the risk society in its political dimensions. Anthony Giddens seems to answer Ulrich Beck’s studies when he underlines, in The Consequences of Modernity (1991), the importance of expert systems in reflexive modernity. In this way, risk and expertise appear like coextensive notions in the risk society. This paper aims at presenting a comparative study of experts, carried out in the French and Quebec Ministry of Transport. Also, we aim to go beyond the simplistic division between experts and the lay-public.

During the last years, Quebec and French Ministry of Transport have incorporated a new engineering tool in order to renew the assessment methods of road infrastructures. In this way, the road safety audit has been created between 2000th and 2001st with the intention of assessing road infrastructures through technical and driver knowledge. So, road safety audit appears as a radical transformation of engineering practices by the use of interactional knowledge (Collins & Evans, 2007). We analyse this interactional expertise as the consequence of the subjectivization process in public action (Cantelli & Genard, 2007). We define subjectivisation process as the consequence of the emergence of sub-politics and as the use of expert and driver rationalities in order to control driver’s behaviours through infrastructures.

In this way, this paper explains how the subjectivization process takes shape in the French and Canadian road safety expertise. We aim at presenting, first of all, the interactional practices through their original epistemic cultures. Then, we will show how the expert and driver knowledge interaction gives birth to an hybrid figure in the expertise: the expert-driver. In addition, we will analyse the role of driver knowledge in the drawing up road safety audit report. We will underline a return of technical tradition (Giddens, 1994) which translates driver knowledge into engineering knowledge.

**MODELS AT WORK IN INTELLIGENCE**

Vanessa Dirksen¹

¹Sociology, UNIVERSITY OF CONSTANCE, Constance, Germany

**Abstract:** This paper is about the role of models in risk assessment practices. It is not so much concerned with how models represent and idealize reality, but more with how they serve as sources of knowledge and contribute to processes of discovery and intervention. In order to reconstruct the performance of ‘models at work’, this study will take a closer look at modeling practices in police intelligence. To date, the study of formal procedures anticipating the future in applied contexts in general and in crime intelligence analysis in particular are highly underexposed fields of inquiry. It is a particularly interesting field of application for the enactment of models in this field preeminently reveals something about the appliance of social scientific inquiry and methods.

The empirical work of the study consists of the ethnographic observation of the constitution and use of contemporary forms of modeling in the assessment of terrorist threat at the Dutch police. The specific kind of uncertainty ‘modeling against terrorist attack’ has to deal with is a consequence of a complex combination of known and unknown uncertainties as well as a high interpretative and normative ambiguity. The case of the terrorist threat, furthermore, poses a particular challenge to risk assessment. This is because the historical data on terrorism are limited and it has to take into account a so-called ‘thinking adversary’, i.e., someone who can anticipate, frustrate and adapt to governmental decisions and interventions. Contemporary forms of modeling in the assessment of terrorist threat include scenario analysis and data-mining and simulation techniques. Investigating how risk is identified differently across these methods will reveal the ontological plurality of the epistemic cultures of intelligence.

**RISK AS A DISCURSIVE STRATEGY IN THE CONFLICT OVER GM FOOD: CONCEPTUAL AND METHODOLOGICAL ISSUES**

Renata Campos Motta¹

¹Lateinamerika-Institut, FREIE UNIVERSITÄT BERLIN, Berlin, Germany

**Abstract:** This paper deals with the issue of how actors shape public discourse and policy decisions by using frame risks in the contentious politics over genetically modified (GM) food in Brazil. It is part of my PhD research, which is in progress. In presenting the first descriptive outcomes at the RN 22, I am interested in discussing the conceptual approach, the analytical framework and the methodology.

As for the conceptual and analytical choices, risk is defined as a discursive strategy to oppose the political decision to adopt a new technology. Using the analytical framework of contentious politics, risk will be treated as an element of a political claim, namely, a frame. Risk is thus a choice, among others, by actors as how to frame their arguments about GM food. This definition focuses on the social construction of risk as a form of communicating dissent over a political decision and avoids treating risk as a material phenomenon to be measured. In other words, for the present study it is not in dispute whether GM food are risky or safe, if it may bring future damage to health or environment; rather, the research question relates to how risk can be part of a discursive strategy to contest a political decision, what structures enable the use of such a recourse to which types of actors and what can be the effects of using this strategy on the policy field under study.

The methodology draws from political communications and social movements research. Based on the assumption of the fundamental role of mass media in the public sphere of contemporary societies, the study uses method of political claim-making identify and measure risk in the public discourse about GM food. Newspaper articles from the biggest nation-wide daily newspaper are collected per keyword search from years 2000-2008 and submitted to content analysis.

The outcomes to be presented concern the description of the discourse about GM food as it appears at the mediated public sphere: what actors take part on it, what are their policy positions and what are their frames? I will identify types of risk frames and measure their salience in order to answer the questions: what is risk dis-
course over GM food policy, who are the actors that use these ideas and how do they use (how often, as proponents of risk arguments or by ignoring or rejecting them)?

RISK REGULATION OF EMISSIONS FROM BASE STATION TRANSMITTERS FOR MOBILE PHONES: THE CAUSES OF AN ITALIAN EXCEPTION

Paolo Crivellari¹

¹HSE, Toulouse 3, Toulouse, France

Abstract: Many different countries worldwide have adopted a specific regulation of the risk for human health related to non ionising emissions from base station transmitters (BST) for mobile phones. In most countries, the regulation of such a risk has been undertaken due also to social widespread opposition to mobile phone masts, conveyed by national and/or local citizens associations. On the contrary, Italy’s government tried to anticipate ‘social turbulences’ through a specific regulation, when the electromagnetic risk related to mobile phone masts electromagnetic emissions was not publicly perceived as diffused and harmful for the population. Italy is characterised by what we propose to call the “Italian exception” in the electromagnetic risk regulation, which consists in a unique combination of three factors: 1) the adoption of specific norms very early in comparison with other countries (1998), 2) in the absence of structured mobilisations against mobile phones masts, 3) opting for establishing the lowest levels in the world concerning human exposure to electromagnetic radiations from BST.

The proposed paper is based on an empirical sociological study that has been conducted on the national and local level in Italy, using qualitative research techniques. It aims at explaining the causes of such an exception, through the reconstruction and the analysis of Italy’s electromagnetic risk regulation. Conclusions will focus on the politisation of risk, on the importance of the politico-institutional structures in the construction of risk regulation (especially when these structures try to protect themselves from what has been called elsewhere “institutional risk”) and on the (sometimes paradoxical) outcomes of governmental efforts trying to anticipate social opposition to a technological risk.

DEADLY RISK: HOW THE GERMAN ARMED FORCES RATIONALIZE UNCERTAINTY IN AFGHANISTAN

Phil Langer ¹, ²

¹Bundeswehr Institute of Social Sciences, Strausberg, ²Economic and Social Sciences Department, Potsdam University, Potsdam, Germany

Abstract: Armed conflicts imply the possibility of getting wounded or killed. For soldiers within peacekeeping operations violence is part of their profession. They have to deal with the potentially deadly implications of their deployment.

In Afghanistan – the paradigmatic present international conflict – military conditions have changed significantly within the last years. Combat situations are a daily occurrence and bring about increased numbers of soldiers killed in action of ISAF contributing nations. With regard to Germany in 2010, eight soldiers were killed and docents have been wounded, over 300 have already been diagnosed with post-traumatic stress disorder.

On a political and organizational level, this development poses considerable challenges for the German armed forces, as they have to enforce offensive operations for the first time since World War II. On an individual level, soldiers have to integrate the contingency of getting wounded and killed and the requirement of killing others into their professional identity.

The paper aims at examining the strategies of coping with military uncertainties that German soldiers are confronted with in Afghanistan. The study this paper refers to was carried out on behalf of the Department of Defence to sociologically accompany the 22nd ISAF contingent. Using a quantitative questionnaire survey and qualitative methods, data collection was conducted in 2010 at three times before deployment, during field research in Afghanistan, and after returning to Germany. 3.827 returned questionnaires, 181 interviews and group discussions and daily observation protocols form the empirical basis of the presentation.

In the presentation it will be analyzed, how military risks are defined and operationalized on different levels to enable soldiers to manage the uncertainty to be subject to violent acts. On the organizational level pre-deployment training in violent scenarios will be examined. On the group level it will be focussed on the dynamics of making sense of combat situations by commonly developing meaningful narrations and in-group rituals. On the individual level discourse patterns will be outlined that rationalize experiences of violence and death, when the other strategies fail. Finally, the question will be discussed, how the construction of operational risks contribute to political decision-making processes and, therefore, influence the course of war.

MIGRATION, SOLIDARITY AND INTERACTIONS IN DIVERSE NEIGHBOURHOODS

Sören Petermann ¹, Karen Schönwälder ¹, Dietlind Stollie ², Thomas Schmitt ³

¹MAX PLANCK INSTITUTE STUDY OF DIVERSITY (MMG), Göttingen, Germany, ²Political Science, MCGILL UNIVERSITY, Montreal, Canada

Abstract: In the past few years, the consequences of the increasing migration-related diversity in the cities of Europe and North America have been the subject of controversial debates. While some assume disintegrative effects on solidarity and social cohesion others expect that bridging contacts will develop and help counteract insecurities, anomia and negative responses to diversity in the social environment.

The paper tests these hypotheses by using a large-scale empirical study in German cities entitled “Diversity and Contact”, which is currently conducted at the Max Planck Institute for the Study of Religious and Ethnic Diversity in Göttingen. The study investigates the relation between contextual diversity and interaction between migrants and non-migrants as well as their impact on selected attitudes that measure solidarity and social cohesion. The study uses a longitudinal (three-wave) survey with 2500 participants as well as qualitative methods. The unique stratified random sampling design which selects individuals from 50 neighbourhoods (ca. 7500 inhabitants) located in 16 cities enables us to represent “urban normality” in Germany rather than the exceptional situation of neighbourhoods with very high shares of immigrants.

The paper presents results from the first wave of the survey. It focuses on links between contextual diversity, interactions and their effects on indicators of social and political integration (levels of
trust, individual and collective efficacy). The data reflect different modes of interaction (from strong ties to everyday casual encounters) and their sites. Our assumption so far is that the relatively strong negative effects of contextual diversity in the United States might not be reflected to the same degree in the European context. If this is correct, our paper will also consider why such differences exist, e.g. character and scale of the existing diversity, welfare state differences and other aspects of civil society.

**SENSE-MAKING OF EVERYDAY RISKS AMONG GAYS IN SWEDEN**

Susanna Öhman

1dep or social sciences, MID SWEDEN UNIVERSITY, Östersund, Sweden

Abstract: By analysing people with specific life contexts and experiences we aim to see how they make sense of everyday risks compared to new and traditional risks. There are groups in modern societies, such as gays and lesbians, who do not experience their life and their life conditions as secure as others do. This does not mean that structural variables such as gender or sexual orientation by themselves can explain these differences. It is more likely that individual life experiences such as hardship or discrimination lead to these variations in sense-making of risk. Sense-making of risk is a sociological term, which demands the addition of various contextual/social considerations, both physical and relational, to individual risk perceptions. The individual’s ‘sense-making’ of risk means examining the individual’s social relations within their micro-systems and local context and how these inter-personal interactions affect their perceptions of different types of risk. By that, we mean day-to-day experiences, where family, friends and working colleagues play an important role, together with the physical setting and community relations determined by the locality in which the individual lives. Though there is little knowledge about the interactions between these factors and sense-making of risk, there is sufficient research to indicate that minority groups can be stigmatised and have a low status in society. Sense-making of risk can, therefore, provide a deeper understanding of risk in everyday-life situations. Further, it can be assumed that there are latent factors expressed through these structural factors, e.g. experiences of vulnerability, risk exposure, lack of power, sub-cultural allegiances and exclusion. The empirical analyses are based on national surveys 2005, 2008 and 2011 (random samples of 2500 people each year). The results confirm differences in sense-making of risk between homo/bisexuals and heterosexuals. The results also show that earlier experiences are important to understand these differences.

**NO RISK – NO FUN? THE PERCEPTION OF RISK AND SECURITY IN THE WORKING RELATIONSHIP**

Pamela Wehling, Sonja Teupen

1Institute of Work Science, RUHR-UNIVERSITY BOCHUM, Bochum, Germany

Abstract: Flexibility is an epiphenomenon of the transition from an industrial to a service and knowledge society. Globalization as well as developments in information and communication technology are causing this process, resulting in new forms of organization, work and employment being created. Organizations react by reforming their structures in order to enhance their innovativeness. Bureaucratic forms of coordination are replaced by process-oriented organisational units. Beyond the level of work organization, the inter-company division of work is likewise changing: corporate sections are being outsourced, value-adding networks are gaining importance, intra- as well as inter-company tasks are increasingly being carried out as projects. With regard to employment there are growing numbers of different employment relationships. Although the extent and scope of destabilization is in fact being controversially debated, it is, however, indisputable that the standard employment relationship is becoming more flexible. In a nutshell: flexibility replaces continuity and the self-evident knowledge of everyday life is being increasingly questioned, resulting in a growing perception of ambiguity.

Against the background of these changes, we analyze the impacts of this development on the mental models of employees as well as employers. The questions which arise in this context are whether the changes described also lead to an increased perception of risk in the working relationship and how do the concerned actors deal with this?

To answer these questions, we have chosen a contrast group design: We first analyze the perceptions of independent professionals and their contracting entity. This highly flexible form of cooperation is supposed to be more risky. We will compare them with the cognitions of employers and their employees in long-term working relationships, which are supposed to be less perilous but with a greater interference of the organization which structures the actions.

The data is generated from a current research project funded by the German Research Foundation; the project includes a total of 40 interviews being conducted with highly qualified employees, as well as 20 interviews with employers. The data collection is carried out with the aid of a semi-structured interview, which also encouraged narrative passages. The evaluation of the interview material is based on qualitative content analyses.

**PROJECT-BASED ORGANISING AND INDIVIDUALISATION**

Jillian Yeow

1Manchester Business School, THE UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: It has been argued that people are becoming increasingly individualised and self-reliant in order to cope with the increasing risks and uncertainty faced in society today. Individualisation posits that individuals must actively construct their own lives, and become self-reliant in order to protect themselves from the dangers of uncertainty. ICT-enabled work combined with project-based ways of organising offer not only more choices and opportunities for individuals, but also bring with them challenges and, inadvertently, risks. Proponents of individualisation argue that such innovation and progress should be viewed for the positive opportunities it offers, by allowing individuals to create their own life biographies instead of following one that is traditionally dictated to them.

This paper presents a qualitative case study of ICT-enabled project-based organising based on semi-structured interviews with fifteen knowledge professionals in a large telecommunications organisation. It examines the increasingly individualised nature of such distributed ways of working on knowledge professionals and the mechanisms employed by individuals to cope with it. It highlights the paradoxical existence of project teams in which the individual is
emphasised and collectivity takes a backseat. Although these professionals are organised and work in teams, the quality and characteristics traditionally associated with teams was absent. In line with individualisation arguments posited by several authors, this study found that individuals became increasingly self-reliant in order to cope with the ‘projectification’ of work and their lives. One key finding of the study was that the intensification of work and the proliferation of ICT-enabled ways of distributed working, which lessen the opportunity and time available for people to be located to develop and build (social) relationships, led to sociality that was fleeting, ephemeral and intense, and increasingly technologically-mediated, thereby contributing to the weakening of social bonds. This paper also considers the implications of such increased individualisation on relationships in the workplace.

SUBJECTIVE TACTICS FACE TO EXISTENTIAL PRECARITY
Denis Giordano¹

¹Università degli Studi di Trento, Trento, Italy

Abstract: The aim of my intervention is oriented to talk about the tactics used by precarious and intermittents workers (Corsani and Lazzarato, 2008) to manage their existence face their existential precarity (Bourdieu, 1998).

My qualitative research is based on French context and the focus is on Paris and its neighbourhood, where I consider the ways of life of people that works in fragmented and non-continuous temporality as consequence of contemporary situation of market labour. I centred my attention on everyday practices acted by people who mostly work on an informal situation.

The contemporary capitalist phase of crisis push more and more people face to deep existential precarity. They have to confront with new forms of work characterized by reduced guarantees. During the last decades, we’ve seen also a pervasive action of individualization logics on people (Beck and Beck-Gernsheim, 2002), in particular within the welfare state organization. These logics of governmentality (Foucault, 1979) are used to promote the rhetoric of self-employed man and to reduce the possibilities of economic helps dedicated to the people, replaced by mechanisms of work’s activations.

In this situation, I want to describe the everyday life of mechanics who act in an informal way in the streets of the banlieue of Paris. They have to organize their everyday life in such creative and tactic ways (De Certeau, 1990) to practice their working activity and also to gain personal income to live. Face to the difficulties of their life, the “street mechanics” use a subjective bricolage (Levi-Strauss, 1962) of resource, enacting creative practices both to organize their work in such precarious conditions, and also to manage their lives. In this context, we can see people using their activities and the welfare state’s devices as different sources to earn money for living. This can be considered an interesting field to look to the ways of life acted by people that face both to the diffuse precarity and the imposition of market rules on people’s body.

The research questions will be tackled by pursuing two analytical directions: the practices of the “street mechanics” and their subjectivity coming out from their own living and working conditions.

INTERNAL CONVERSATION AS MEANS OF COPYING WITH UNCERTAINTY AND CREATING KNOWLEDGE

Alexander Pivovarov¹

¹Department of Sociology, SAINT-PETERSBURG STATE UNIVERSITY, Saint-Petersburg, Russian Federation

Abstract: Uncertainty as one of the leading features of “liquid modernity” is manifested in particular in appearance of numerous contradictions in human conscious that are related with a very large number of positions co-existing in information space. The contemporary uncertainty, depriving one of capacity for action, is due to the fact that an information flow doesn’t turn into knowledge. Knowledge solves the problem of uncertainty since it implies an inclusion of individual in the communication network, members of which share meanings of interconnected notions.

One of the best solutions of the uncertainty problem is offered by communication networks of intellectuals (R. Collins) where the process of knowledge creation occurs by definition. However, communication networks of intellectuals might seem as mysterious expert systems to an outside observer (A. Giddens). An ordinary person surrounded by these closed network communities feels increasing uncertainty. To cope with it he has no better alternative than to attempt to be integrated into available networks of intellectual communication.

Without a direct way of joining to intellectual networks, a common person can start this process with his or her deliberations, i.e., with internal conversations (M. Archer) between different semantic positions, which are expressed in appropriate communication networks. If this internal conversation occurs, it means that it is possible to obtain answers to questions, acquire knowledge and, consequently, cope with uncertainty.

Under information pressure, there is a great temptation to rely on someone else’s opinion or to surrender to desire to resist any attempts to influence us in order to avoid uncertainty. This way of increasing the value of one position and belittling the others is not effective in terms of adaptation to the rapidly changing globally interconnected world. The opposite strategy of coping with uncertainty is to establish a communicative relationship with the participants of intellectual networks, entering into at least an internal dialogue with them, and thus to become involved in the process of individual and collective knowledge creation.

I believe that the process of involvement of wide sections of the population in intellectual networks, in particular through the mechanism of internal conversation, certainly deserves special attention in the context of building knowledge societies.

SELF-GOVERNANCE, CONTROL AND LOSS OF CONTROL

Margaretha Järvinen¹, ², Lars Fynbo¹

¹UNIVERSITY OF COPENHAGEN, DEPARTMENT OF SOCIOLOGY, ²SFI, The Danish National Centre for Social Research, Copenhagen K, Denmark

Abstract: Set within a framework of governmentality theory, the paper analyzes driving under the influence (DUI), control and loss-of-control, as experienced by a group of convicted drink-drivers in Denmark. In late modern societies, individuals are seen as ethical subjects if they are capable of regulating the pleasures and risks related to consumption (of e.g. alcohol) in accordance with prescribed standards. Drink-drivers may be seen as “disordered consumers”, challenging the ideals of rational and responsible citizenship by not practicing self-monitoring and self-discipline and by not
protecting other people from the risks associated with their alcohol (and drug) consumption. The paper describes four groups of convicted drivers: regular heavy drinkers who regard themselves as addicted; regular heavy drinkers who claim they are in control of both their alcohol use and their drink-driving; occasional multi-substance users who associate their DUI with loss-of-control; and occasional drinkers or drug users who say they are in control of their substance use. The paper focuses on the relationship between risk-management and self-control in a group of interviewees who struggle to come to terms with their DUI-conviction, typically by presenting themselves as responsible and rational "despite everything".

THE INDIVIDUALS MOTIVE FORCE TO PREVENT ACCIDENTS AND CRISSES IN EVERYDAY LIFE

Erika Wall

Abstract: The aim of present study is to investigate young adult’s sensemaking of risk regarding risk situations in everyday life. Even though risks in everyday life are a common and serious problem, there are remarkably few studies made in this area. Instead most research is made with focus on especially risk-taking groups (e.g. risk behaviours among young male drivers), or people who are exposed to risk in a greater extent than others (i.e. marginalized groups). Therefore this study focuses on how young adults make sense of accidents and crises appearing at home. A focus group interview study have been made (total number of five interviews, four interviewers in each group) with young adults (18-30 years old) living in a middle-sized town in Sweden. The results demonstrate various mechanisms (social, spatial and motivational) influencing the individual’s motive force to prevent accidents and crises at home. By that, the study deepen the understanding of how social and spatial mechanisms, as well as individual motivation influence how people materialize meanings of risk and what motivate people to prevent accidents and crises within the context of everyday life.

ENVIRONMENTAL RISKS ON SPANISH TELEVISION NEWS

Eva Espinar-Ruiz, Erika Masanet

Abstract: Mass media play a fundamental role in the dissemination and construction of social threats and risks. All in all, mass media contribute to emphasize the importance of certain the risks, and the association of particular characteristics with such risks, as framing theories explain. Taking as a start point these theories, the present paper examines media discourse about a particular risk: the environmental risk. On the one hand, we can’t deny that, in its various forms, it is one of the main risks that societies face. On the other hand, much of what people know about environmental issues come from the media. Thus, mass media have an essential role in a topic like this, when direct assessment of the processes is not a simple question. In order to perform this analysis we have selected the three Spanish television channels that have the highest national ratings: TVE1, Antena 3 y Tele 5. From these three channels we have selected 105 news programs, all broadcasted between November 1, 2007 and March 31, 2008. This sample of programs has been recorded and viewed in order to select the news we wanted to analyze. Exactly, we have selected all the pieces of news that either directly relate to any environmental problem (pollution, climate change, global warming, etc.) or refer in any other way to the environment and the nature (from news about the weather to news about earthquakes, hurricanes or other meteorological event). Finally, we have applied qualitative techniques of analysis to a total sample of 138 pieces of news. Specifically, in order to carry the analysis, the information has been ordered, coded and classified looking for common and divergent discourses around three major dimensions: causes; consequences and affected people or sectors; possible solutions; discourses around nature; and actors involved. Speaking in general terms, news tend to focus on specific events, without explicit relation to more global issues (As other authors conclude, news are event centered and not issue centered). Television news programs display their preference to emotional contents, entertainment, fun or anecdotal facts, compared to the explanation of consequences and, above all, causes.

FEAR OF CRIME AS A SOCIAL COST OF CRIME

Senem Burkay

Abstract: Crime is one of the significant phenomenon and problem of urban areas of modern world. Increasing urban crime rates are associated with social, economic and technological changes. Crime is a multidimensional subject. Occurrence, result, prevents and costs of crime are important research areas for criminal investigations. High crime rates bring about some costs for urban life. The cost of crime can be both material and social. For instance, fear of crime is one of the social costs. Most of people can’t dare to walk on a dark and empty street in the nights of an urban. Does this fear result from high crime rates or social cost of crime? How do researches and statistics about crime rates and fear of crime answer this question? Is fear of crime based on a moral panic? Are crime rates really high insofar as it leads people to have the fear of being a victim? In this paper it will be pointed out what fear of crime is and how it turns into a social cost of crime.

MORAL PANIC AND PAEDOPHILIA IN THE RISK SOCIETY. FINDINGS OF A RESEARCH ON SATANIC RITUAL ABUSE

Morena Tartari

Abstract: This paper highlights some findings of a research carried out in Italy on moral panic, culture of risk and a particular kind of child abuse, the satanic ritual abuse. Such research takes into consideration two Italian cases of alleged satanic ritual abuse and aims to identify rhetorical, symbolic and media mechanisms that lead to moral panics. The concept of children as rare good (Zelizer 1994), the parents’ social anxiety (Beck & Beck-Gernsheim 1990), the perspective of risk society (Beck 1986) and moral panic (Cohen 1972, Critcher 2003) were used as sensitizing concepts for the fieldwork access. Cases are studied through a multi-method approach in the frame of Grounded Theory: sixty in-depth interviews to social actors involved in the cases and in the national media debate on paedophilia, an ethnography of the communities involved, an ethnography of seven professionals’ conferences and public events against paedophilia, a quasi-quantitative analysis of newspapers articles.
and television programs about the cases. Findings show that the social construction of the such cases is the result of a specific interaction between local opinion and media in a society that is coping with the concept of childhood changing and parents’ anxieties. Moral panic theory (Goode and Ben-Yehuda 1994) explains the connection between macro-features of the risk society and micro-features of the social actors’ daily practices that assume a leading-role inside each emblematic case. Groups of Interest’ explanatory model suits the cases and the common sense discourse on childhood grafts in the moral panic circuit when some actors prevail on others to dictate the definition of the situation. Research findings highlight that the analysis of such moral panics is compatible with risk society theory. As Critcher (2009) argues, moral panics are compressed expressions of risk consciousness.

REFLEXIVE MODERNIZATION, TRUST AND THE POLITICS OF RISK SOCIETY: POLITICIZATION OF SWINE FLU EPIDEMIC IN TURKEY

Kayhan Delibas
SOCIOLOGY, ADNAN MENDERES UNIVERSITESI, Aydin, Turkey

Abstract: Vaccination described as the single most effective health intervention after clean water and sewage disposal, and have an extraordinary safety record (Leslie K. Ball et al, 1998). With the introduction of nation-wide vaccination campaigns several killer diseases eradicated in Turkey too, and many epidemics were prevented consequently saving many millions of lives. After all, the immunization programs have been one of the most important causes of rapid population increase since the 1950s. Consequently, the national attitude towards vaccines has always been very positive one. Until very recently, they never being questioned or challenged as they are nowadays. The swine flu debate suddenly politicised and caught the government unguarded. Following the WHO’s alarmist calls, the Ministry of health have been promoted a vast vaccination program in order to protect the so called “risk groups” from this approaching “terrible epidemic” (swine flu). However, normally a low key vaccination campaign turned in to an explosive, nationwide political battle. It seems all sorts of political actors from right to the left, all political parties, civil society organisations, and various health professionals locked into this conflict.

The religious concerns and perceptions surfaced have complicated the situation. The fact that epidemic, H1N1 influenza, has been popularly named as “pig flu” and pigs are considered as dirty, forbidden to touch and to consume has created an additional variable needs to be considered. Politicization of risk issues are relatively new phenomenon in Turkey. More so the politicization of religious worries and risks. In this study we are aiming: to contour the key stages of this unprecedented phenomenon; to chart the politicisation of risk issues as a new phenomenon, especially with regard to the religious perceptions of certain kind of worries in Turkey. As Beck argued risks have become a major force of political mobilization, often replacing references to, for example, inequalities associated with class, race and gender (1999). The date collected in this study will be used to test the validity and applicability of risk society theory as suggested by Back and Giddens. It will provide us a unique opportunity to test the risk society theory in the context of a majority Muslim country.

Keywords: Risk society, uncertainty, Trust, Religious worries, Swine flu Epidemic, Risks of Vaccine

INCLUSIVE AND MULTI-LEVEL GOVERNANCE: A NEW CONCEPT FOR COPING WITH GLOBAL RISKS

Ortwin Renn
SOCIAL SCIENCE V, STUTTGART UNIVERSITY, Stuttgart, Germany

Abstract: The notion “risk governance” refers to an integrated concept on how to deal with environmental problems, and so-called complex, ambiguous and uncertain impacts in particular. These ideas have been informed by interdisciplinary research drawing from sociological and psychological research on ecological behaviour, Science & Technology Studies (STS) and research by policy scientists and legal scholars about regulatory styles, institutional regimes and structural impediments to more inclusiveness. The notion of governance pertains to the many ways in which all relevant actors, individuals and institutions, public and private, deal with interventions that impact the environment and its service to human societies. It includes formal institutions and regimes and informal arrangements.

The term inclusive governance refers to a policy style by which different actors, in particular, governmental actors, experts, private companies and representatives of civil society are invited and welcomed to consult decision makers or even co-determine key policies and decisions for risk reduction and mitigation. For this purpose new procedures for stakeholder involvement have been developed and partly tested. Beyond this horizontal level of inclusion environmental policies have to be aligned to the vertical levels, starting from the local, over the regional, national to the EU or even international level. Both directions, representing the vertical and horizontal governance dimensions, face many challenges and problems.

The lecture will introduce the major governance functions in a multilevel political and social environment particularly for global risks such as climate change, water scarcity, technological innovations and others. It will summarize the attempts to secure support for collective action, feeding in plural preferences and designing cooperative measures. It will conclude with some general lessons for future research and practical applications.

RESPONSIBILITY AS A RESPONSE TO RISK IN TURBULENT TIMES? A CRITICAL REFLECTION ON THE PURPOSE OF RESPONSIBILITY IN MODERN SOCIETIES.

Nikolas Gebhard, Eva-Maria Klinkisch
Sociology, UNIVERSITY OF HOHENHEIM, Stuttgart, Germany

Abstract: Responsibility is a widely discussed subject today: Corporations communicate their CSR activities, politicians call for responsible management practices, managers stress responsible consumers, NGOs address a responsible treatment of humans and environment and so forth. Responsibility seems to offer an answer to the search for orientation in modern society. Compared to the high presence of responsibility in most social and political debates sociologists treat this topic often on the sidelines. This contribution deals with the sociological impacts of responsibility: In which context does responsibility occur in recent debates and what is the origin of the modern notion of responsibility? How can the increasing economical, social and political emphasis on responsible acting be explained? And to what extent does responsibility structure social relations especially in times of perceived uncertainty, economic crisis and large social transformation processes?
In order to discuss those questions the paper begins with an exploration of the public responsibility discourse. The nature and inherent implications of these discourses and their framing contexts will be outlined. Following up those general observations the sociological discussion of responsibility will be sketched out. Beside classical sociological involvements on responsibility as it was done e.g. by Weber or Durkheim, recent debates of the sociological dimension of responsibility will be depicted. As an example of the latter the “responsibility frame” outlined by Piet Strydom (1999) will be revisited: Assuming the concept of risk society Strydom develops an idea of a discursive responsibility frame and pleads for an understanding of co-responsibility.

Based on those remarks in the last part of the paper we will discuss how far responsibility structures social action and which implications derive for social relations in times of huge economical and social transformation processes today. Especially the notion of responsibility in an institutional context will be regarded: we will argue that responsibility is no longer bound to an individual actor or group but anchored in the collective sphere of society. We close by a critical reflection and give a perspective on further discussions of responsibility in respect of risk and uncertainty in modern societies.

UNCERTAINTY AND SOCIETY: ORIGINS, SOCIALIZATION AND REGULATION OF UNCERTAINTY
Efim Fidyra

Abstract: The attempt to outline theory of society as regulatory device for ‘anthropological’ uncertainty is made in this paper. For this purpose, some contemporary social theoretical tools are conceptually integrated: the concept of the multiple forms of capital and the concept of the orders of worth.

The notion of uncertainty, its different interpretations and types, and also some related phenomena are analyzed. The notions of uncertainty, indeterminacy and risk are distinguished from each other and analyzed. The anthropological uncertainty (i.e. indeterminacy of human behavior and unpredictability and unknowability of reality for human beings) is regulated by various coordinating arrangements (sense, objects, institutions, organizations and capitals). There are different types of uncertainty, related with human needs it concerns. Each type of uncertainty forms correspondent evaluation and action logic which are listed and considered in paper.

Capitals are resources engaged in social life appearing in various forms (economic, cultural, political, social capital etc.). Every form of capital corresponds with specific logic depending on the type of uncertainty this resource helps to handle. These logics (each corresponding to specific type of uncertainty) incorporated into objects, institutions, social regulations, organizations etc. Individual practices of incorporation, accumulation and objectification are described and considered as main social practices.

Social life in conditions of uncertainty seen as two dialectically related processes rooted in one intention of coping with uncertainty. First one is maintaining current social order providing actors with stable set of capitals, rules of their exchange, evaluation etc. The second process is transformation of current social order by means of struggle (both social and symbolical) for better social positions allowing reducing uncertainty.

Different regulatory tools for uncertainty provide reproduction and survival both of actors and communities. This process requires coordination of different and controversial logics, constant “reality test” of subjective prospects and social structures and cultures. This theory allows evaluation of actual threats for society from specific types of uncertainty by analyzing types and nature of typical conventions and conflicts, prevailing evaluation logics and engaged resources (capitals).

RISKS OF OLDER PEOPLE – A SPIRAL MODEL
Matic Kavčič

Abstract: Demographic changes and increasingly aging population bring along also a shift in the structure of prevalent everyday risks. Old age and the new lifestyle that accompanies retirement involve specific risks (e.g. deterioration of physical and mental health, reduction in formal income, breaking-up of social networks, etc.), making older people one of the most vulnerable groups. Special research attention needs to be paid to this growing body of risks.

Our aim was to take an emic account using the ‘bottom-up’ approach to inductively identify the fundamental risks faced by the elderly. Therefore we conducted a grounded theory study. We have analyzed 32 in-depth interviews with vulnerable elderly people in Slovenia and 3 additional expert interviews. Findings show a basic difference in risks among generations and a diverse structure of risks among elderly people. We have identified the loss of independence as the fundamental ‘meta-risk’ for the elderly. Many paths and different risks lead to the loss of independence. We have classified them into 4 major categories, i.e. health, financial, social and structural risks. However, together with different intervening conditions, several social agents contribute decisively to risk exposure through various pathways and influences. We have developed a spiral model illustrating the dynamic process how risks emerge and are realized, how they are amplified and also how risks become managed and reduced – thereby showing the process of losing and retaining a certain individual level of quality of life.

TEEN ROAD ACCIDENT RISK: AN ANALYSIS OF THEIR BEHAVIOURS AND RELATED REPRESENTATIONS
Eliette Randriantovomanana, Mouloud Haddak

Abstract: In the road traffic domain, highway codes define the formal standards of risk. Some practices such as speeding, non-use of helmet in motorized two-wheelers, etc. are considered as risky behaviours as they may cause an accident and may affect the injury severity.

By paying attention to teenagers, our aim is to understand the process whereby an individual integrates or wanders away from road traffic official standards. If young people from 18 to 24 are over-represented in road fatalities, we suppose that adolescence is a period during which risky behaviours take place progressively. The phase between childhood and adulthood when the individual tries to find his/her own social circle and needs to experiment contains probably warning signs of the strong involvement of young people in road accidents.
Abstract Book

How do teenagers behave in mobility situations? How do they construct their representations of road accident risks?

Two-hundred and four teenagers from French secondary schools participated in focus-groups where their daily mobility and road risk representations were explored. The secondary schools’ diversity (public/private; urban/suburban/rural) reflects teenagers’ various profiles and allows us to understand the potential importance of social or territorial background on teenagers’ mobility behaviours and road risk representations. The inclusion of four modes (passenger vehicle, walking, cycling, motorcycling) is a constructive contribution to the sociology of road traffic which is so focused on car and motorized two-wheeler drivers.

The results show that, among these teenagers from 10 to 16 years old, road risk representations and mobility behaviours are shaped by family socialization and peer-to-peer socialization. Peer-to-peer socialization may encourage teenagers to go against the legal standards of road safety.

THE INTERPLAY OF INDIVIDUALISM AND STRUCTURAL SOCIAL FORCES IN THE JOURNEY TO ADULTHOOD: FINDINGS FROM A RESEARCH ON YOUNG PRECARIOUS RESEARCHERS IN SOUTHERN EUROPE

Lefteris Kretos1

1FACULTY OF BUSINESS, ENVIRONMENT AND SOCIETY, COVENTRY UNIVERSITY, LEAMINGTON SPA, United Kingdom

Abstract: Different studies seem to confirm that in the European context there is a certain degree of convergence of the processes of transition to adult life of young Europeans. The precarization of employment and the delay of economic and family independence, as a result of the so-called globalization and individualization processes, characterize this ambivalent process. However, in the case of EU Mediterranean countries, the existence of certain characteristic traits of the transition process to adult life stands out. These characteristics are related to the development of the Welfare State, and as a result, to the policies developed in this context, to the labour market and to the familialistic culture, a factor that is still very important for the strategies adopted by young people in Greece, Italy and Spain. The sum of all these factors explains some of the idiosyncrasies that define the contradictions of the transition process to adult life among young people, a process characterized by family dependence and precariousness in a context of growing individualization. However young people develop other individual mechanisms based on their networks of support, information access and solidarity to cope with these idiosyncrasies and the precarious youth labour markets. This article analyzes the main factors that characterize the acquisition of economic and family independence (emancipation process or transition to adulthood) of young academic researchers from a comparative perspective across Greece, Italy and Spain. The economic and labour situation of young people as determining factors in this process is examined. At the same time, economic and labour precariousness undergone by young people during their journey towards independence to the incidence of policies developed by the Welfare State and the importance of family, not only as providers of resources for young people, but also as a place of socialization in the framework of the familialistic culture of dependence is combined. Therefore, the main objective is to draw a contextual and interpretational framework that will allow us to highlight not only the structural characteristics, but also individual responses that define the process of acquisition of independence of young academic researchers in a comparative context in Southern Europe in the context of the current economic crisis.

FALLS AND FALLS PREVENTION IN OLDER PEOPLE: ACCIDENTS OR LIFE EVENTS? MARKERS OR TURNING POINTS?

Stéphanie Pin1,2, Pierre Arwidson3, Dario Spini2

1Direction of Programs, INPES, S-Denis, France, 2Center for Life Course Studies, University of Lausanne, Lausanne, Switzerland, 3Direction of Scientific Affairs, INPES, S-Denis, France

Abstract: Background. The falls in the elderly are seen as a public health priority: they are frequent in old age, they cause directly or indirectly loss of autonomy, they are defined as a “risk” and led to the establishment of primary or secondary prevention programs. However, the fall is mostly unreported by the elderly, as during medical consultations as in specific research on life events; and studies on the perception of fall showed that it evokes for many older people declining physical capacities and entering the final stage of the life course, which could partly explain the lack of attraction represented by the messages and programs of prevention.

Objectives. I wish to use the fall as case study for analyzing trajectories and strategies of adjustment to life events in old age. Related with the concept of vulnerability from environmental science and with the paradigm of the life course, I would like to better understand how falls - and life events- influence the trajectories of life and health in the elderly.

Methods. My communication will use the results of a systematic review of literature in public health and social sciences, as well as a comparative study of prevention programs for the elderly in France and in industrialized countries.

Results. Main concepts have been identified in studies and programs selected for analysis; they have been described and discussed in terms of disciplines and theoretical fields. Falls in older people are predominantly studied in epidemiological researches; this discipline also dominates in prevention programs. Some psychological researches assess the perception and the impact of falls on mental health (through “fear of falling”). Falls are considered by most researchers and by the populations (health professionals, older people, and families) more as the marker - among other signs - of a previous transition than as a turning point and as the beginning of a new stage of the life course. Finally, I will present a framework for analysis and research to follow the analysis of falls as life events, their impact and their regulation.

CORPORATE SOCIAL RESPONSIBILITY AS THE MECHANISM OF ADOPTING ENTERPRISES TO CHALLENGES OF RISK SOCIETY: THE EXAMPLE OF ENERGY SECTOR IN POLAND

Aleksandra Natalia Wagner1

1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: The concept of energy crisis has been widely discussed in the public debate and the media recently.

According to sociology of risk and uncertainty approach (f.e Beck’s papers), still appearing crises could be perceived as new signals that
civilisational potential has already been exhausted. The theory of
reflexive modernisation interprets crises as a symptom of the ap-
proaching termination of the society that we know. We faced the
problem of inability to reorganise the existing economy system and
in the consequence- social order.

On the other hand Niklas Luhmann’s system theory underlines the
system’s ability of observing and adapting to changes in its envi-
ronment. It directs our attention towards the mechanisms of the
system operations. Mechanism of trust in experts systems –
described by Giddens as a reaction on increasing complicating, di-
versifying of the world, and in result increasing uncertainty, is un-
dermined by the “crises discourse” referring to new particular are-
as.

This paper faces both the theoretical and practical problems:
1) The first one could be expressed as a question: are there any
kinds of functional system mechanisms of increasing reflexivity in
terms of theory of reflexive modernisation? The first part of pro-
posed paper aims in presenting the increasing significance of idea
of CSR as some kind of mechanism of observing and self revitalisa-
tion inside economy system. We consider potential of social re-
ponsibility idea in context of creating new semantic of capitalist
conomy which is necessary to effective self describing and govern-
ning the system operations in risk society. The dialogical relations
between enterprises and social environment will be underlined
(responsibility as response to identified social needs). Hence, the
idea of CSR will be analysed not in terms of charity but rather by
redefining economic purposes and strategies (innovations, cross
sectors networking, consumer consciousness etc)

2) In the second part of the paper we are going to present the re-
sults of analyses of annual reports published by the enterprises
from energy sector. Then we will discuss the example of CSR activi-
ty as the real mechanism of observing and adapting to the changes
of external environment. The results of qualitative content and
rhetorical discourse analysis will be enriched with results of Social
Representation of Energy Crises and the results of national survey
data.

INSTABILITY AND CONSTRAINT, ON THE ORIGIN OF
SOCIAL INNOVATIONS

Nikos Fokas¹

¹Sociology, EOTVOS LORAND UNIVERSITY, Budapest, Hungary

Abstract: Within the framework of the present paper we are inter-
ested in the circumstances of the origin of (social) innovations. We
suppose that dramatic changes affecting the whole of a (so-
cial)system (or subsystem) do exist. The question is: How are they
possible?

Presenting and analyzing the interdisciplinary literature concerning
the question of the origin of the Western civilization, the changes in
bureaucratic organizations, the mechanism of paradigm’s changes in
science and so on, we may conclude that there really exists a
general model in the circumstances of the origin of significant inno-
vations impacting on the whole of some level of a hierarchic sys-
tem. The innovation may emerge amid the dissolution, disintegra-
tion, anarchy, crisis, anomaly, revolution, or bisociation. Henceforth
instability will be used as a collective for these conditions.

I prefer to use the term unstable in order to exploiting its exact
dynamic meaning. The connection with the modern chaos theory is
particularly exciting, since in the course of the so-called chaotic
behavior the system approaches always new unstable conditions.
Chaos is, therefore, permanent instability. It is also noteworthy that
complex systems may be permanently in a state of nonequilibrium
(instability), which may serve as a fundamental source of endoge-
nous creativity in the system.

Furthermore, the fact that unstable chaotic systems are extremely
sensitive to external influences is decisive in making virtually im-
possible the prognostication of the long-term consequences of
highly significant social innovations. At this point systems-theory
references became very important. I would like to pair Niklas Luh-
mann’s biology-inspired systems theory with the so-called chemo-
ton theory derived from systems chemistry.

TURBULENT TIMES: SOCIAL UNRESTS AS SYSTEMIC
RISKS

Regina Schröter¹, Ortwin Renn ², Aleksandar Jovanovic ³

¹Dialogik g GmbH, ²Institute for Social Sciences, University of
Stuttgart, ³European Virtual Institute for Integrated Risk Manage-
ment, Stuttgart, Germany

Abstract: In this paper we develop a framework of social unrest
within a complex understanding of systemic risk. The term ‘system-
ic’ describes the extent to which any risk is embedded in the larger
contexts of social and cultural aspects that shape our understand-
ing of risk, influence our attention to causal relationships and trig-
gger our activities for handling these risks. Social unrest can be
grouped into this framework of systemic risks. It can be a cause of
risk to others, it can be a consequence of experiencing risk or the
manifestation of such a risk or it can be a promoter of a risk chain
that is located in other functional systems of society.

Since social unrest is more a process of escalation than a finite state
of the world we have conceptualized the term in from of a step-by-
step escalation scheme. Each step makes social unrest more severe.
We assume that people who will engage themselves publicly on any
subject have to be dissatisfied with their situation or perceive a
problem that they would like to address. Even if people are dissatis-
fied nothing will happen unless that dissatisfaction is displayed in
some kind of public arena Unsatisfied people have to become ac-
tive. If public expression of dissatisfaction and the organization of
protest does not help to improve the situation the probability for
further social mobilization increases. Social mobilization goes be-
yond expressing dissatisfaction. It comprises all activities that re-
quire an organizational effort to concentrate forces, to develop and
enact a strategy for gaining public attention and for putting pres-
sure on those who are targeted to make changes. In the course of
this process, activities may get more and more radical, in particular
if these collective protest actions are ignored or even oppressed.
Then the continuum enters the next step: violent outbreak. This can
ultimately lead to civil war.

In order to identify relevant drivers we will investigate three case
studies with the following topics: Pandemics, natural Hazards and
financial crises. In a second step we outline an analytic model. In a
third step we will apply the IRGC risk governance model for explain-
ing the risk of social unrest. Finally we will develop guidelines for
normative recommendations with respect to social unrest.

AN INTERSECTIONAL ANALYSIS OF RISK PERCEPTION
SOCIOLOGY’S CONTRIBUTION TO THE STUDY OF VALUE OF LIFE IN RISK PERSPECTIVE: THE CASE OF “PSYCHOPHYSICAL NUMBING” EFFECT

Kirill Gavrilov

Faculty of Sociology, Higher School of Economics, Moscow, Russian Federation

Abstract: The “value of life” concept has been used implicitly in many studies of risk. It is possible to outline two research approaches where the value of life in risk perspective is the main issue. In the first approach, the value of life is estimated based on the person’s willingness to pay for the reduction of his risk of dying from different causes (Mishan, 1971; Viscusi, Aldy, 2003). The second approach focuses on the analysis of value of other people lives by studying the choices of different life-saving programs among alternatives (Tversky, Kahneman, 1981; Levin, Chapman, 1990). Sociologists rarely pay attention to these fields of research, although sociological perspective can raise some important questions and give a hint at possible answers.

In my paper I will focus on sociology’s possible contribution to the study of value of life by analyzing studies referring to the “psychophysical numbing” principle and the “identifiable victim effect” (Fetherstonhaugh et al., 1997; Jenni, Loewenstein, 1997; Slovic, 2007). The main idea of these studies is that the perceived value of life is not a constant value, but depends on such factors as the amount of victims, their identifiability and reference group size. Sociological analysis not only allows posing additional questions (for example, about the link between decisions taken and a culture-related notion of justice, about the context of evaluation, or about social characteristics of victims or subjects), but also proposes alternative explanations of experimental results. For example, the reference group can take the form of a community, which is of particular and separate value to the subject (disregarding the value of life of its members), and thus affect the decision. So it becomes possible to explain the finding that people are more willing to save 90% of a reference group than to save 10% of another group (the absolute number of lives saved held constant) not only by referring to “proportional reasoning”, or to “a general tendency to confuse relative and absolute risk” (Baron, 1997; Friedrich et al., 1999), but by assuming that the reference group per se may be of some value to the subject. In this paper methodological issues concerning this hypothesis will be examined using functionalist model of explanation in sociology and resources of “folk sociology” particularly the notion of lay theories of groups and society (Lickel et al., 2000; Hirschfeld, 2001).
What are the lessons in terms of participatory governance in the cases of Ignalina nuclear power plant in Lithuania as well as Kozloduy and Belene in Bulgaria? Have they, based on 25 years lessons from Chernobyl and cultural trauma stemming out of these events, triggered environmental and energy policy making towards more inclusive, participatory mode? Have these processes, coupled with EU accession and adoption of a number of EU directives and international treaties, not least the Aarhus agreement, induced societal and political shifts towards more democratic deliberative governance? By contrast, this paper concludes on the basis of empirical evidence from Lithuania and Bulgaria, the processes point to the opposite direction. This direction is geared towards privatization of the public domain, towards new emergent forms of state-private oligarchy, epitomized by the establishment of LEO LT nuclear power development conglomerate in Lithuania. Instead of witnessing any new off-springs of participatory governance, as paper indicates, there are clear tendencies of the opposite. Inter-twined with the recent nuclear power “initiatives” by Russia and Belarus, these tendencies could be described as leading towards emergence of new “nuclear triangles” or – more generally - nuclear “renaissance” as some observers have termed it, e.g. around Lithuania. This corresponds with, e.g. total undermining of democratic governance in the case of Bulgarian nuclear “renaissance”.

The project tests some key assumptions of societal risk theorizing such as a shift from “danger” to “risk” (Luhmann 1993), the change of the understanding of risk towards harm (Douglas 1992), and a change from active “risk-taking” to “being at risk” (Furedi 2002). The presentation will also outline to what extent Beck’s assumption that new risks are the driver of the development of the risk society can help to understand observable increase in the usage of the term ‘risk’ in the news coverage of the New York Times. Even though Beck develops an objectivist argument regarding the impact of new risks and does not develop an argument how this might impact the usage of the term ‘risk’ itself, there is evidence that there is no significant increase of other semantics than “risk” after WWII (Zinn 2010). The project therefore currently tests what extent this increase in the usage of the term ‘risk’ in the media is linked to new risk as Beck claims or whether reporting about other phenomena such as economic risks, health risks or the growing importance of actuarial risks in all kinds of social areas is responsible for this shift.

RISK AND THE PARADOXES OF CONTROL. CHANGING CONCEPTIONS AND CHANGING REALITIES.
Willy Guneriussen

School of Social and Political Sciences, UNIVERSITY OF MELBOURNE, Melbourne, Australia

Abstract: This presentation reports from the results of an ongoing study which explores historical changes in the usage of the term ‘risk’ in the New York Times. It compares a 30% sample of all articles where the ‘term’ risk occurs at least once of the volume 1900 with a 30% sample of the volume 2000.

The project tests some key assumptions of societal risk theorizing such as a shift from “danger” to “risk” (Luhmann 1993), the change of the understanding of risk towards harm (Douglas 1992), and a change from active “risk-taking” to “being at risk” (Furedi 2002). The presentation will also outline to what extent Beck’s assumption that new risks are the driver of the development of the risk society can help to understand observable increase in the usage of the term ‘risk’ in the news coverage of the New York Times. Even though Beck develops an objectivist argument regarding the impact of new risks and does not develop an argument how this might impact the usage of the term ‘risk’ itself, there is evidence that there is no significant increase of other semantics than “risk” after WWII (Zinn 2010). The project therefore currently tests what extent this increase in the usage of the term ‘risk’ in the media is linked to new risk as Beck claims or whether reporting about other phenomena such as economic risks, health risks or the growing importance of actuarial risks in all kinds of social areas is responsible for this shift.

TRUST, UNCERTAINTY AND H1N1: THE CASE OF ANKARA, TURKEY
Yonca Odabas

Sociology, ANKARA UNIVERSITY, Ankara, Turkey
Abstract: It is commonly accepted that we live in a “world risk society”. In this society, risks which are experimented at global level have three main features: Firstly de-localisation: the causes of consequences of risk are not limited to one space. Secondly, incalculability: its consequences are in principle incalculable. Thirdly, non-compensatability: contrary to modernity’s “security” principle in world risk society, there are new risks which can not be compensated. In addition to this conceptualization another word, uncertainty is also used by many scientists from particularly social sciences. Recent environmental disruptions such as SARS, avian influenza are called as uncertainties instead of risks. According to them, these events can be considered as jolts that occur randomly and probability of emergence of them can not be calculated. Secondly, the nature and form of them can be evolved or changed and finally, the impact of these uncertainties tends to be concentrated, either by sector or by geographical location. Insufficient intervention to risks or uncertainties are one of the result of socio economic and cultural compositions of societies that affect people’s attitudes, knowledge and behaviors towards risks. Because of this reason, information about societies’ characteristics can be considered as one of the basic source to decrease negative effects of these events on given societies.

In this presentation, by moving from this assumption the results of a survey conducted in Ankara, capital city of Turkey about the social effects of H1N1 in 2010 are debated. The data were gathered from high school students and their families (two adults from each family) chosen according to their SES. One of the main result of this survey is that, there is high amount of uncertainty among both young and adult participants due to the characteristics of epidemic and injection and to the attitudes of delegates of government. While the effects of this illness were experimenting, there were two different arguments made by two strong part of the government. One is the Prime Minister and the other one is Minister of Health. The Prime Minister claimed that, there is no need to be injected, on the contrary Minister of Health asserted that all people have to be injected. This kind of dilemma led to increase in uncertainty and trust destruction among public.

BETWEEN UNACCEPTABLE RISKS AND TOLERABLE UNCERTAINTY. LAY AND PROFESSIONAL EXPERIENCE OF PRENATAL SCREENING

Claudine Burton-Jeangros 1, Samuele Cavalli 1, Solène Gouilhers 1, Raphaël Hammer 2

1Department of sociology, UNIVERSITY OF GENEVA, Genève, 2Institute of health research, School of health sciences, Lausanne, Switzerland

Abstract: Even though the success of the concept of risk in recent decades has provided an illusion of control on many activities and events, uncertainty remains inherent to human life. Today, pregnancy provides a good example of the current tensions existing between risk and uncertainty. The scientific approach revealing more and more potential risks, and offering some strategies to tackle them, the part of uncertainty that continues to surround pregnancy is most often deemed unacceptable.

This paper is based on 91 interviews with pregnant women and health professionals (gynaecologists and midwives), conducted in Switzerland between 2008 and 2009. Today, the risk approach promoted by the medical surveillance of pregnancy (providing a personal probability of birth defect) implies an individual decision process for each pregnant woman: prenatal screening provides a personal probability of a birth defect in the foetus, it can be followed by a diagnostic test (amniocentesis) that eliminates uncertainty but induces a risk of miscarriage. Our aim is to describe the experience of prenatal screening and diagnosis of both mothers-to-be and professionals, as a way to examine how they respectively deal with risk and uncertainty.

The analysis will focus on two aspects. First, we will describe the diversity of interpretations given to the risk of birth defect, this will show a gradation of attitudes going from affirmation of control (with a reliance on medical tools) to acceptance of uncertainty (placing pregnancy into a personal experiential sphere). Second, we will account for the expectations that surround the lay-professional interactions around the decisions to be made, with a description of the demands pregnant women have towards professionals and, inversely, of the ways professionals engage in the decision process.

This paper will discuss how the importance given to risks transforms the relationships between patients and professionals: oscillations between striving for control and acknowledgement of uncertainty can lead to either consensual or conflicting relationships between them. Besides, the analysis of these tensions at the microlevel will highlight how much the emphasis on risk transforms the accountability for bad outcomes, shifting it back and forth between lay and professional actors.

RISK AND PARENTAL FEEDING PRACTICES IN EVERYDAY LIFE

Erik Löfmark 3

3Sociology, SÖDERTÖRN UNIVERSITY, HUDDINGE, Sweden

Abstract: “How can we live on the volcano of civilization without deliberately forgetting about it, but also without suffocating on the fears – and not just on the vapors that the volcano exudes?” Ulrich Beck (1992:76) raises this rhetorical question when elaborating his notion of life in Risk Society. At the practical level of everyday life, this is indeed a valid question to ask. Parents obviously manage to feed their children in the age of risk without suffocating on the fears. How is this achieved? In this article I explore the different strategies mothers use when incorporating information about risk and food into their everyday life practice.

Drawing on qualitative interviews with urban Swedish mothers of children 6 to 18 months old, I find six preliminary strategies. In short, they are: [1] The Cellarier’s Strategy - what is good for me is good for my child, [2] Dispersion – a varied intake of food provides for an acceptable dose and level of exposure, [3] Trusting regulation – harmful products will be removed from the supervised market, [4] Adapting – bringing food practice in line with new information, [5] Peer review – making sure that on the whole, food practice is equal or superior to that of other parents, [6] Counterbalance – “my view on risks is balanced by that of my partner (the father), and that provides for a more nuanced practice”.

Theoretically, I depart from the risk sociology of everyday life, but also from the growing body of research labelled parenting culture studies. This article is part of a broader research project considering everyday risk construction and management in the empirical field of food and parenting in Sweden and Poland.

Keywords: risk, food, parenting, strategies, information
THE EMERGENCE OF THE FOETUS-AT-RISK - DEBATING THE IN VOLUNTARY COMMITMENT OF PREGNANT WOMEN WITH ALCOHOL PROBLEMS

Anna Leppo

Abstract: The scientific discovery of Foetal Alcohol Syndrome (FAS) in the early 1970s made pregnant women’s heavy alcohol consumption problematic. A growing concern over prenatal alcohol intake has made FAS a major public health issue in the developed western countries and led to the proliferation of practices that aim to prevent it, such as health education campaigns, warning labels, and specialised treatment services. The Nordic countries have come up with an original solution to the question of FAS prevention, namely the involuntary commitment of pregnant women with substance abuse problems. So far, such coercive measures are in use in Norway and Sweden. This paper sets out to explore the trajectory in which the idea of involuntary commitment of pregnant women gained wider recognition and became a disputed political issue in Finland. The analysis is qualitative and makes use of discourse analysis. The data consists of medical journals and political documents between the late 1970s and the 1990s. The paper shows how the emergence of the foetus-at-risk took place in medical and political discourses in the 1980s and 1990s and how this discursive change became the basis for demands for involuntary commitment of pregnant women. In this process pregnant women with alcohol problems were demonised and blamed for FAS. The paper argues that the medical profession has had a key role in the promotion of coercive measures and that the strong status of the medical profession and the position of the foetus as an “ideal victim” have given weight to demands for coercive measures. However, the paper suggests that the public health approach that has characterised Finnish alcohol and welfare policy more generally has made the compulsory care of pregnant women a politically controversial issue. Ultimately, the ongoing Finnish debate on the involuntary commitment of pregnant women with substance abuse problems women touches upon questions of solidarity and citizenship.

EXPERIENCING AND COPING WITH UNCERTAINTY – STRATEGIES OF UNEMPLOYED AND PRECARIOUSLY WORKING WOMEN IN EASTERN AND WESTERN GERMANY

Melanie Booth

Abstract: Over the last decades labour market induced uncertainties have increased in Germany. Ever since the late 1970’s the number of unemployed rose steadily. This is especially true for base unemployment. However, compared with other countries, Germany took a long time to establish activation programmes in the labour market. The turnaround was only implemented with new legislation introduced in the year 2005. Those reforms, which are widely known as ‘Hartz reforms’, are seen as a crucial and (when compared with other European countries) an abrupt paradigm change, from a welfare-oriented to a workfare-oriented labour market policy. This development is linked to a second change which started before ‘Hartz IV’ but has been influenced by the recent reforms – the expansion of precarious work on the German labour market. This is especially true for low-wage employment which has increased and which at its current rate is used more frequently in Germany than in any other European country. Both changes add to an overall feeling of uncertainty. Yet, the risks of unemployment and precarious work are distributed unequally according to gender, age and region, to mention only three.

In my contribution I want to focus on those recent changes (activation and precarization) from a comparative perspective between women in Eastern and Western Germany. Analyzing qualitative interviews from a longitudinal research project, which focuses on individual effects of the new labour legislation on work orientations, I want to put a particular emphasis on how women working in low-wage employment or who are unemployed cope with their situation. Do they perceive their situation to be uncertain and if so, what impact does this have on their lives? What strategies do they develop? And what do they regard as ‘good work’? I will argue that 20 years after reunification there are still major differences between women in Eastern and Western Germany. Structural differences such as public child care and wage disparities as well as variations in gender contracts result in dissimilar ways of dealing with uncertainty in low-wage employment and joblessness.

GENDER AND SOCIAL VULNERABILITY TO CLIMATE CHANGE-RELATED EXTREME WEATHER EVENTS IN REGIONS UNDER FLOOD RISK: EXPLORING CASE STUDIES IN MEXICO AND GERMANY

Libertad Chavez Rodríguez

Abstract: The increase in frequency and strength of “natural” disasters related to the global Climate Change pose huge challenges for the reduction of social vulnerability, for the achievement of an integrated disaster risk management, and to the adaptation strategies to Climate Change in general. The differential impacts of disasters on individuals evidence the social construction of vulnerability and reveals pre-existent inequalities regarding diverse but intersectional linked categories such as gender, class, and race, as well as age, ethnic origin, nationality, command of language, mobility, and different ways of life.

Empirical findings about gendered bias regarding disaster risk perception, social vulnerability and managing and coping with climate change-related disasters from two case studies in Yucatan, Mexico and in the Elbe riverside of Low Saxony, Germany will be discussed. Fieldwork has been conducted through expert interviews and focus group discussions with resident population of regions affected by floods.

GROWING UP IN AN URBAN POCKET OF POVERTY AS A RISK FACTOR

Wielisława Warzywoda Warzywoda-Kruszyńska

Abstract: A large body of research provides evidence that poverty, and particularly poverty in childhood, determines life opportunities. Growing up in a pocket of poverty makes life opportunities even more limited. It is a result of combined influences of family and neighbourhood. Four theories explain neighbourhood effect on children: stress theory, social organization theory, institutional the-
ory and epidemic or "contagion" theories. All of these explanations find support in research findings obtained in large Polish city where study on poverty started in 1993 and continues up current. Defining the poor as the recipients of welfare and calculating their share among inhabitants of street blocks, in 1998 seventeen pockets of poverty were uncovered in the city where the proportion of the poor accounted in each of them to at least 30%. 12 of the pockets of poverty were located in the inner city. Narratives among 90 adult respondents belonging to 30 families were collected to reconstruct processes and factors slipping people into poverty and to get deeper understanding how they manage poverty. Ten years later all inner-city pockets of poverty continued to be poverty pockets. Loïc Wacquant theory on advanced marginality seems to explain the best persistence of poverty pockets in the city.

Panel study was conducted with previous narrators including their children who have grown up and currently are adult. All of them but one young woman followed up the path way of their parents. Factors keeping them in poverty are teenage motherhood, incarceration during the adolescence and disability. This result provides evidence that social intervention was not efficient. Social services worked more as a control institution and could not be enough supportive to move young people out of poverty. The role of municipality governance is also evident as a factor keeping people in poverty.

IDENTITY, POPULAR KNOWLEDGE AND ENVIRONMENTAL RISKS

João Luiz de Moraes Hoeffel 1, Nayra de Moraes Gonçalves 1, Almerinda A. B. Fadini 2, Sônia Regina da Cal Seixas 3

1Centro de Estudos Ambientais, Universidade São Francisco, Bragança Paulista/São Paulo, 2NEPAM, Universidade de Campinas, Campinas, Brazil

Abstract: The deterioration of ecosystems, the diversity of health problems and the expansion of urban areas are examples of the increasing social complexity that demands new ways of scientific and technological understandings and often requires that people resort to traditional practices and solutions. Thus, knowledge of medicinal plants is often the only therapeutic resource of many social groups, but its continuity may be threatened by environmental degradation and introduction of new cultural elements that increase the risk of their disappearance. At the same time, the increased use and collection of medicinal plants have endangered the maintenance of many natural environments. In this context fall the Environmental Protected Areas - Fernão Dias/MG and Cantareira/SP, located in southeast Brazil, that still have a significant rural population and remnants of Atlantic Forest, used as sources of medicinal plants, but in recent decades pass through a intense process of socio-environmental changes, due to its proximity to the Metropolitan Region of São Paulo, which has required studies to analyze the risks and consequences of changes in the identity of the population and in the regional socio-environmental aspects and to assist in formulating appropriate public policies. Through secondary data collection, field surveys and semi-structured interviews, up to the now the use of 164 medicinal plants were identified, and that knowledge is basically maintained by persons over 55 years and that young people lack interest in these practices. In Fernão Dias EPA most of the plants used are found in forested areas, known mostly by men, and in Cantareira EPA they are grown in gardens, usually by women. It was also indentified that there is a need to develop strategies for sustainable local development, to assist in the conservation of natural resources, strengthening identity and cultural value. At the same time it was perceived as important to sensitize the local population, particularly youth, about the importance and maintenance of this knowledge.

INTERPRETING RADIATION THREAT: INFORMATION PROCESSING AND RISK PERCEPTION IN SOVIET TIMES AND TODAY

Trini Vihalemm 1, Maija Kiisil 1

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

Abstract: The paper discusses the connections between risk awareness, “sophistication” of media usage and response to the information concerning the realized threat/crisis. The empirical analysis bases on the survey conducted in 1986 and quantitative and qualitative studies conducted in 2008. The survey carried out in the Soviet Estonia in 1986 is rather unique as it contains detailed data about usage and trust of official and unofficial information about Chernobyl disaster, as well as remedial actions and concern about the consequences. It shows that one part of population had a very critical attitude towards the biased information and high concern about the future risk. This experience is called communicative trauma. The qualitative study carried out in contemporary Estonia shows the reflection of this trauma in the current risk perceptions.

The contemporary quantitative dataset contains variables indicating general concern about technological risks like radiation, variety of media usage and trust in the media as well as imagined reaction to a warning about radioactive pollution. A statistical regression analysis of “historical” and contemporary survey data enables to elaborate the discussion about interrelations between media usage variety, criticism of / trust in media and risk perceptions. The paper discusses the question about the impact of general media usage practices on risk perception and its change over time.

POLITISATION DU RAPPORT À L’ENVIRONNEMENT DANS DES TERRITOIRES EXPOSÉS À DES CATASTROPHES NATURELLES

Vallette Chloe 1, Colbeau-Justin Ludvina 2, De Vanssay Bernadette 3

1CERREV, Université de Caen, Caen, 2Département de psychologie environnementale, Université de Nîmes, 3Académie de l’Eau, Paris, France

cloration de Hyogo EIRD, 2005 ; Comité Andin pour la Prévention et Gestion de Catastrophes, 2004).

On assiste à un tournant dans la politique de réduction des risques et catastrophes dites naturelles vers une vision intégrée, multifactorielle, prenant en compte la relation homme et environnement. Les résultats de ces politiques apparaissent à différents points du globe. Nous les aborderons par l’exemple de la gestion d’inondations au Costa Rica, de la tempête Xynthia en France métropolitaine et du risque sismique à La Martinique. Dans ces contextes, le rapport à l’environnement, la perception des solutions préventives techniques et l’enracinement local sont autant d’éléments qui viennent influencer la mise en place de politiques de prévention et convoquer des approches originales sur les territoires exposés. Ainsi, l’amélioration des facteurs anthropiques des risques dits « naturels » associé à la réorientation des politiques publiques de mitigation induit un changement du rapport à l’environnement des acteurs en termes de perception et de pratiques.

RISK, UNCERTAINTY AND SUSTAINABILITY
Jens Hälterlein¹

¹Sociology, UNIVERSITY OF JENA, Jena, Germany

Abstract: In my paper I want to address sustainable development as a form of risk-management. Besides its possible benefits to ecological and social problems, sustainable development can be understood as a promising solution for the economical problem of combining risk minimisation and opportunity orientation.

Risk minimisation and opportunity orientation are not combinable without further ado, because both risks and opportunities are requiring an open future respectively insecurity. Thus, the regulation of development processes would not only minimise risks. It would as well minimise opportunities. And hence entrepreneurship is always an opportunity orientated behaviour, the minimisation of risks through regulation would minimise the attractiveness of entrepreneurship. This problem was early identified in economics and gave reason to criticisms of the welfare state and its politics of socialising risks.

In contrast, sustainable development now seems to allow or even bring forward entrepreneurship, while sustainable consumption is seen as a form of individual risk management. The choices of consumers are regulating the choices of entrepreneurs in accordance with market conditions. Consumers themselves become social entrepreneurs by spending their money for social and ecological innovations.

The paper not only reveals the economic side of the concept of sustainability. It also makes it possible to connect current ways of risk perception and risk management with the neoliberal politics of deregulation and individualising responsibility.

A CARROT FOR CHILDREN AND A CREAM FOR INDUSTRY: AN INSTITUTIONAL ANALYSIS OF HEALTHY FOOD PROGRAMMES IN POLISH PRIMARY SCHOOLS
Piotr Matczak¹

¹Institute of Sociology, Adam Mickiewicz University, Poznan, Poland

Abstract: Obesity is recognized as serious health risk, especially in the developed countries (Schwartz and Puhl 2003; White Paper on Food Safety, 2000). It is increasingly adequate to children. During the last decade special policies have been introduced regulating food quality in schools, in several countries. To design and implement an efficient food policy dedicated to children is a complicated issue - taking into account the controversies about the private-public spheres division, market pressures, impact of advertisement, and the large amount of existing policies (at different levels and of different scopes). Additionally, cultural values and traditions play also an important role in this respect. Thus, it is an important question whether, and in which conditions, policies promoting healthy food in schools are successful.

There are several streams of research on the food choice in the school context. There are studies on food supply (Hair et al. 2008); role of media in setting the food regulations agenda (Naik 2008); studies on the awareness and risks connected with food (Eurobarometr 2006). There are also studies on food standards (Henson and Reardon 2005); alternative food networks and chains (Jarosz 2008; Selfa et al. 2008); sustainable consumption (Spaargaren and Mol 2008). The studies do not offer clear picture how a successful policy should be designed and implemented, and are focused on the most developed countries. For a country like Poland, the functioning of healthy food policies in schools is unknown.

In the paper the new institutional economics approach is applied to the two healthy food programmes ("A glass of milk" and "Fruits in school") carried out in Polish primary schools. Demand and supply of food standards in primary schools in Poland is analysed through review of documents and interviews. More than 30 in-depth interviews were carried with representatives of different interest groups (school teachers, pupils’ parents, food suppliers, and representatives of various public agencies and authorities). The origins of programmes, the role of particular actors in the design and implementation were investigated.

The data show that health risk play marginal role in the introduction of the programmes. Instead, financial incentives and power relations are the crucial factors. Parents have almost no voice in shaping the programs. This is a result of existing institutional setting of the education system.

MATERIALISING HEALTH RISKS, ENACTING STANDARDS OF HEALTH: EARLY RISK ASSESSMENT PRACTICES OF PRIVATE LIFE INSURANCE COMPANIES IN FINLAND
Mikko Jauho¹, ²

¹NATIONAL CONSUMER RESEARCH CENTRE FINLAND, ²Department of Social Research/Sociology, University of Helsinki, Helsinki, Finland

Abstract: The paper looks at the emergence of the concept of ‘risk factor’, central to the current mode of governing public health, in a specific setting, life insurance.

The risk factor approach in medicine and public health aims at early identification and prevention of potential cases of illness. For this purpose it singles out a number of physiological, behavioural, social and hereditary factors that bear on the probability of the future illness of an individual or a group, and tries to influence these multiple factors in ways that reduce risk levels. Often it builds on the co-operation of the individuals, which are expected to modify their lifestyles in the name of risk management.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Private life insurance companies were instrumental in the evolution of this approach. They had an economic interest in identifying applicants with early signs of illness, gathered a large amount of data where specific risk factors and –groups could be identified, and assigned monetary values to different risks. Insurance medicine adopted new diagnostic tools (e.g. blood pressure measurements, chest X-rays), established standards of health, and helped to calculate the spread of risks in various populations. These developments had important repercussions on practices in other fields of medicine, public health, and individual health care.

Drawing on the theory of performativity as developed by Michel Callon and others, I study how in practices of insurance medicine a new scientific object, the risk factor, was established and stabilised for further use in other networks. This means looking at the ways in which dangers to population health were made visible and calculable as well as the ways in which they were acted on and managed – i.e. the simultaneous emergence of practices of representation and intervention with regard to health risks.

My empirical focus is blood pressure, which emerged as an important predictor to various medical conditions in the early 20th century. The emphasis is on the formative years of the risk factor approach in insurance medicine before WWII. In the analysis, I use historical archival material, e.g. insurance applications, physical examination forms, guidelines for insurance doctors, and discussion in professional journals.

**PATHWAYS TO SOCIAL REINTEGRATION: A 1-10 YEARS FOLLOW UP OUTCOME STUDY IN A PORTUGUESE THERAPEUTIC COMMUNITY**

Susana Henriques 1,2*, Pedro Candeias 1

1 CIES-IUL, ISCTE – UNIVERSITY INSTITUTE OF LISBON, 2 Universidade Aberta, Lisbon, Portugal

Abstract: Substance abuse involves a wide variety of products, forms of use and associated life styles. Although substance abuse characteristics have been changing, some of these consumptions still can become problematic and resulting in physical and psychological dependence. One of the possible ways of overcoming this situation is using formal help. Therapeutic communities have been offering solutions in this area since the 1940s adapting to new demands. However, it is known that recovery is a life-long process with implications regarding social (re)integration of ex-consumers.

Based on the examination of patients clinical records from a therapeutic community with international range located in Portugal who have been medically discharged between 2000 and 2009 and an ulterior follow-up phone survey we aim:

1. to present these patients characteristics concerning patterns of consume, social networks and motivations at the treatment entrance moment.

2. to evaluate the effectiveness of long term treatment regarding social reintegration, mapping the trajectories of these ex-patients regarding their residential, professional, educational and familiar situation, as well as their sociability networks, hardships and present substance use. I.e. realizing their everyday experiences, and life course after treatment.

These results will be critically discussed in the context of nowadays society, where risk and uncertain are daily present. Identifying the strategies activated by these individuals with the aim of their social integration or reintegration. At the same time, we will try to reflect about the methodological strategies defined to appropriate the experiences and hardships felt by the individuals in these contexts.
INTIMATE CITIZENSHIP REGIMES AND THE TENACITY OF THE COUPLE NORM: A CROSS NATIONAL ANALYSIS

Sasha Roseneil 1, Isabel Crowhurst 1, Tone Hellesund 2, Ana Cristina Santos 2, Mariya Stoilova 2

1BIRKBECK, UNIVERSITY OF LONDON, London, United Kingdom, 2Rokkan Centre, Bergen, Norway

Abstract: In recent decades profound processes of normative transformation have affected both lived practices of intimacy and personal relationships, and the cultures, laws and policies that shape them. Increasing numbers of people are living alone, remaining unmarried, divorcing, cohabiting, and living openly in same-sex relationships, facilitated by women's increasing economic independence, the liberalization of family and criminal law, and the individualization of welfare policy. Movements for gender and sexual equality and change, and the feminist, sexual liberationist and gay rights discourses they have seeded, have been fundamentally intertwined with these processes of social change. Yet amidst these radical upheavals in personal life, there are significant continuities of norms and lived experience, even amongst those most affected by these shifts. It is our argument that the “couple norm” comes sharply into focus against the backdrop of these changes. In this panel, which comprises five interlinked papers, we present findings from our comparative research on intimate citizenship that has impressed upon us the tenacity and ubiquity of the couple norm in contemporary Europe. Our aim is to explore the multifarious ways in which the couple norm serves to construct and regulate the lives of even those whose intimate lives are ostensibly “unconventional”, and in so doing we seek to demonstrate the centrality of the couple norm to understandings of intimate citizenship. Our cross-national research with a diverse range of interviewees also, however, highlights the variability in the operation of the couple norm across “intimate citizenship regimes”.

The first paper in the panel, by Sasha Roseneil, sets out the central argument of the panel, introduces the research on which the panel draws (which was carried out as part of the EU FP6 project, FEMCIT), and explicates the concept of “intimate citizenship regimes”, arguing for the importance of a comparative analysis of its constitutive norms. This is followed by short four papers which explore the differing ways in which the couple norm was experienced and narrated by interviewees in the four contrasting national contexts studied: Bulgaria Mariya Stoilova, Norway (Tone Hellesund), Portugal (Ana Cristina Santos) and Britain (Isabel Crowhurst).

LIMITS OF PLEASURE: RECREATIONAL SEXUALITY AND CLASS

Dana Kaplan 1

1Sociology, OPEN UNIVERSITY AND HEBREW UNIVERSITY, Raanana, Israel

Abstract: In a recent issue of ‘Sexualities’, dedicated to class and sexuality, many amongst the contributors stressed the importance of investigating the heterosexual middle class in order to better understand mechanisms of cultural domination and social exclusion. In line with the contention that sexual and class privileges need to be more robustly researched and theorized, this paper asks how sexual pleasure is being ‘distributed’ between the new middle class and the lower class in Israel and how recreational sexuality redraws class boundaries.

A prevailing cultural discourse, recreational sexuality refers to the maximization of pleasure through sexual acts that are deemed sophisticated. Because in recreational sexuality pleasure is a ‘right’ and a condition for self-fulfillment, it signals property and ownership, thereby delineating class boundaries. This paper demonstrates the nuanced differences distinguishing between middle and lower class subjects in their appropriation of recreational sexuality. Middle class heterosexuals endorse recreational sexuality as a means to exercise cultural sophistication and manifest their networked selves, while lower class interviewees tend to morally distance themselves from the upper classes. Where middle class interviewees accrue value to sexual pleasure, opposing it to both sexual conservatism and vulgarity, commodified sex, lower class interviewees claim moral worthiness by adhering to what they perceive as ‘natural’, mainly marital sex life. Similarly, whereas middle class sexuality is mainly about being knowledgeable in recent sexual trends, experimenting with many of the trends, and showing an interest in being sexually-updated, lower class interviewees reject notions of promiscuity and consider particular sexual acts as inappropriate for people ‘like us’. These classification struggles are related to two types of class-based distinctions; lower class respectability and a middle class experientialism.

(HETERO)SEXUAL LANDSCAPES: CONTINUITY AND CHANGE IN PORTUGUESE SOCIETY

Dulce Morgado Neves 1

1ICS.UL, Lisboa, Portugal

Abstract: This paper results from an ongoing PHD research in Sociology and its aim is to identify the plurality of (hetero)sexual conducts and representations in the contemporary Portuguese society. Based on narratives of heterosexual men and women from different generations, we will try to point out the changes taking place in both individuals’ sexual attitudes and practices over the last few decades. In order to do so, we will privilege both the singularity of biographies and the importance of social and generational contexts.

Supported by the argument of an increased plurality of individual dispositions and structural contexts, our analysis intends to capture the ambiguities and antinomies, commonly observed between actual sexual trajectories and normative discourses. We are arguing that the multiplicity of socializations and affiliations actually endorses the internal complexity of the self, with particular (and not always linear) effects on the way each person lives, talks about and performs sexuality.

Nonetheless, and despite the signs of fragmentation affecting the mainstream (hetero)sexual landscape, regularities based on gender and generation will emerge from the analysis supporting the continuing significance of these societal categories for the study of sexuality and intimate lives in turbulent times.
POLYAMORY: RELATIONSHIP IDENTITIES FROM SEX TO FEELINGS
António Fernando Cascais¹, Daniel Santos Cardoso¹
¹Communication Sciences, FCSH - UNL, Lisbon, Portugal

Abstract: In times of changing sexualities and identity politics, some people are changing the way they define relationships, from sex-related words, and to feelings-related words. Polyamory, meaning literally “loving many”, is one such case. Polyamory makes sex a peripheral subject in defining a relationship, but the original referential is still there: monogamy as a normative institution, against which polyamory stands. From the analysis of e-mails exchanged during 2009 in alt.polyamory, the first mailing list ever about polyamory (and one of the birth-places of the word), we attempt to analyze the ways in which polyamorists talk about themselves and how they perceive polyamory by welcoming and interacting with newcomers to the mailing list, by looking at how identity and community-building is enacted in these emails. We then defend the need to talk about the concept of ‘relationship identity’ to better address social identities like polyamory. How do poly-identified people understand sexuality and emotional work within the frame of polyamory? By using content analysis and a foucauldian approach to the ethical considerations underlying polyamory, we present polyamory as a different and queer sexual and relationship ethics, aimed at dealing with the systemic contradictions of contemporary love/sex relationships, that intersects the contemporary pressure for individualization with a need for intimacy in the context of a pure relationship, as Giddens put it.

SINGLEHOOD SPACES. AN INVESTIGATION INTO THE CONSTITUTIVE ARRANGEMENTS OF TWO SWEDISH SPACES FOR SINGLES
Andreas Henriksson¹, Henrik Fürst²
¹Department for social studies, KARLSTAD UNIVERSITY, Karlstad, ²Department of Leadership and Management, SWEDISH NATIONAL DEFENCE COLLEGE, Stockholm, Sweden

Abstract: Sweden is often said to be one of the countries with the highest share of single households. Today, different single sexualities are emerging, some being co-produced together with different on- and offline spaces. By comparing two of these spaces, one offline and one online, we show how sexuality and space are connected. We also suggest a number of concepts to help in the further investigation of such interrelations. In particular, on the ground of our data, we wish to promote the combination of Actor-Network Theory’s concept of arrangement and the more generally used concept of situation, found in Adele Clarke’s Situational Analysis and the Sociology of Emotions.

We combine observations from two related single events and online interviews with members of a Swedish dating site. In the analysis, we use extensive coding and content analysis. The logic behind our comparison should be understood as what George Marcus has called juxtaposition: finding real world connection between cases and increasing the stringency of theoretical concepts by describing similarities and dissimilarities between them.

We conclude that there is a utopian character to both cases. Single sexuality is portrayed as a transition period of many sexual choices, but these choices are not part of everyday life. The spaces investigated are arranged to emphasize their distinction from the everyday and to maximize the number and variety of choices. But while the single events emphasize commitment to the moment and intimate and intense (if short) meetings, the dating site arrangements encourage reflexive distance.

THE USE OF PSYCHOACTIVE SUBSTANCES IN THE NEAPOLITAN LG COMMUNITY
Flavia Menna¹
¹Sociology and social research, Federico II of Naples, Naples, Italy

Abstract: This paper proposes the results of a survey conducted on the Neapolitan LG (gay, lesbian) community. In particular, the object of this work is the use of psychoactive substances in gay and lesbian population in Neaples, because the sexual orientation - as race, age or profession - has an important role in the study of social behavior (Graglia, 2002).

The theoretical framework of this study is the concept of Minority Stress proposed by Ilan Meyer (2006). In Meyer’s opinion the homosexuals are a different minority because are exposed to additional stressor (internalized homophobia, experiences of discrimination); for this reason, the use of psychoactive substances is a way to overcome the fears and above all about the sexuality (Rosario, Hunter, Gwadz, 1997).

With the results of the survey it was possible to define, on the one hand, the preferences, styles, places and reasons of the use, in the other hand, the relationship between sexual orientation and use of psychoactive substances and to identify the other important variables to describe the phenomenon.

ANTIGAY VIOLENCE AND THE CULTURALISATION OF CITIZENSHIP IN THE NETHERLANDS
Laurens Buijs¹
¹Amsterdam Institute for Social Science Research, UNIVERSITEIT VAN AMSTERDAM, Amsterdam, Netherlands

Abstract: Recently, several scholars have analyzed how the remarkable Dutch position regarding acceptance of homosexuality is used in the construction of national identity: ‘we’, the native, progressive Dutch versus ‘them’, the others who are backwards.

Incidents of violence against homosexuals play a central role in this process. In line with their anti-immigration agenda, populist right-wing politicians with strong anti-Islamic viewpoints (incorrectly) claim that the violence against homosexuals is ‘almost always’ committed by (descendants of) Moroccan migrants who, because of their Islamic background, insufficiently recognize ‘Dutch’ values of tolerance.

The right-wing, until 2000 generally opposed to gay marriage and adoption, now declare the immigrants’ relatively negative attitudes towards homosexuality as a threat to the ‘Dutch tradition of tolerance’.

By combining a broad survey of Amsterdam youth with in-depth interviews with smaller groups and individual attackers and reviewing recent cases, I conclude that traditional norms of gender and sexuality present in broader society, and not Islamic religion, form the breeding ground of the violence.
I will show that perpetrators generally have similar opinions on 'acceptable forms' of homosexuality as many young Dutch gays themselves, showing the ongoing dominance of heteronormativity in Dutch society.

The gay-friendly narrative that dominates discussions on citizenship in the Netherlands — opposing the liberal ‘Dutch’ to the Muslim ‘Other’ — coexists next to traditional norms of gender and sexuality, thereby not challenging the heteronormative roots of homonegativity.

Surprisingly, even some perpetrators duplicate the prevailing gay-tolerant rhetoric of Dutch society, and many ‘autochthonous’ perpetrators consider Islam, and not themselves, as a threat to the ‘typical Dutch’ tolerance towards homosexuality.

PUBLIC ATTITUDES ON RAPE AND RESPONSIBILITY
Suvi Kirsi Ronkainen1, Marianne Silen1
1Faculty of Social Sciences, University of Lapland, Rovaniemi, Finland

Abstract: How rape and other forms of sexual violence should be defined in criminal law, was a public debate that was extremely topical in Finland in spring 2010. The core of the debate was whether the criminal law should stress more the question on agreement or coercion. This debate formed the background for a series of surveys that focused on attitudes on rape, responsibility and agency attributed to victim and offender. The first survey was collected using face-to-face street interviews (N = 1640), the other was a web-survey (N = 2073). The third one was based on traditional postal questionnaire (N= 531). The research was designed for to provide tools also for analyzing non-response and biases in responding. The design was also an attempt to answer to the fact that discourses on sexuality, sexual autonomy and individual agency are fragmented, turbulent.

In the paper I focus on the main results of the research. Theoretically, I open up the gendered logic the respondents use while making distinctions between rape and other kind of sexual conduct and dividing responsibility. However, I also analyze the disruptions of gendered logic in relation to sexual violence. Methodologically the paper aims to shift the consideration of non-response, which is often understood as statistical representativeness to the level of theoretical discussion on qualitative representativeness. The results show clearly how these different data-collection techniques ‘invite’ different responses, which affects strongly to the picture that researchers could interpret as the public opinion. This has implications also on ideas of active citizenship and governance

SEXUAL VIOLENCE AGAINST WOMEN: A PORTUGUESE STUDY
Joana Aguiar Patrício1
1ISCTE – UNIVERSITY INSTITUTE OF LISBON, CIES-IUL, Lisboa, Portugal

Abstract: This presentation focuses on sexual violence committed against women based on information collected in the National Survey on Gender Violence, a survey commissioned by Comissão para a Cidadania e a Igualdade de Género, a committee set by the Portuguese Government, as well as from the research carried out in my master dissertation.

Amongst the 1000 women surveyed, 112 were victims of sexual violence. Altogether, these victims reported 453 acts of sexual, physical or psychological violence, socio-cultural discrimination and other acts that they considered as violent.

The communication is a quantitative analysis of the contexts of violence, whether sexual or of other type, committed against women victimized by sexual violence. It focuses on types of violence, settings and perpetrators.

Sexual violence practices are shaped by factors such as age. Younger women are victimized by less severe forms of violence, while older women are victimized by more serious violence. Both victimization scenarios converged towards the idea of a violent experience being part of a chronological and escalating process.

THE NON-EMOTIONAL DRONE: VIOLENCE, RATIONALIZATION OF EMOTION AND EXPRESSION OF SEXUALITY
Henrik Fürst 1, Karin Hagren Idevali2
1Department of Leadership and Management, SWEDISH NATIONAL DEFENCE COLLEGE, SöDERTÖRN UNIVERSITY, Stockholm, Sweden

Abstract: Warfare technologies, such as drones, are in part distancing the actor from the consequences made by the technology. I argue that the development of warfare technology is part of a rationalization of emotions and instrumentalization of human actions. The attachment to technology misses out on the fine grain of conceptualizing, feeling and understanding the moral and emotional dimension of a violent act. The technology has both closing in and distancing effect. The technology closes in at a target, but it also morally and physically distances actors from the consequences of action. In this respect, the technology does make the actor manage the violent situation. Moreover, this poses questions about the nature of feelings, where artifacts come to reconstitute both human actions and emotions. Furthermore, video clips of the acts of warfare technology are re-distributed on video sharing sites. In this respect the acts are framed by the viewers.

In this paper I analyze various cases where the warfare technology, with an emphasis on mediating technologies such as drones, was used. The material is derived from available descriptions from different conflict zones. Various available video clips distributed through video sharing sites are also studied. The study is thus two-fold, in one respect focusing on the dimension of managing emotion but as well how the distributed clips of the acts of warfare technology is framed by some viewers. The preliminary result indicates a phenomenon to be called “drone porn”. The acts of warfare technology get articulated in a discourse of sexuality.

IS THE DISCOURSE ON HOMOPHOBIA A WAY TO REGULATE HOMO- AND HETEROSEXUALITIES? SOME HYPOTHESIS FROM A FIELD RESEARCH IN ITALY
Tatiana Motterle1
1Department of Sociology, Università degli Studi di Padova, Padova, Italy

Abstract: The term ‘homophobia’ was born as a psychological definition focusing on anti-homosexual violence and discrimination. This concept received critiques that stressed the social and structural aspects of the phenomenon (heterosexism, sexual prejudice).

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
However, the pathological meaning of homophobia is still widespread in different contexts: the public debate, (part of) the gay and lesbian rights movements’ discourse, the legal debate. According to these narratives – and to commonsense thinking as well – the problem is referred to ‘deviant’ people or social groups. This perspective underestimates or erases the structural causes of homophobia and discrimination based on sexual orientation, which, in our opinion, are connected to the heteronormative system and the gender norms it entails. Reading this phenomenon from a Bourdieusian standpoint we define the use of ‘homophobia’ as described above as a symptom of symbolic violence; in fact, it hides the existence of a gender normative system that includes us all and punishes every act of gender nonconformity, be it hetero- or homosexual. We will try to prove this hypothesis through the analysis of about 60 interviews with hetero, lesbian and gay people, collected in Italy within the framework of the European Project Citizens in Diversity: A Four-Nation Study on Homophobia and Fundamental Rights.

SEXUALITY AND THE BEGINNING OF LIFE – SEPARATE OR RELATED DIMENSIONS OF MORALITY?

Tilo Beckers

1Institute for Social Sciences, HEINRICH-HEINE-UNIVERSITÄT DÜSSELDORF, Düsseldorf, Germany

Abstract: Background: This contribution relates the fields of sociology of sexuality and research on beginning-of-life issues. In the last decade we have witnessed an increasing attention for new debates which frame sexuality in new contexts of technological progress. This development has been advanced due to the advent and application of new reproductive biotechnologies at the beginning of human life, i.e. in-vitro fertilisation (IVF) and pre-implantation diagnosis (PID). These technologies have provoked public debates about finding socially shared answers and (legal) regulations in order to set standards for the possible range of applications.

Research Question: With regard to beginning-of-life issues, there have been culturally specific discussions in European societies about limiting or allowing abortion. With prenatal diagnostics (PND) medical research has already invented a technology to assess the health status of the fetus. The “moral status of the embryo” (cluster of cells or person with human rights) is an ethical issue linking the discussions on abortion and PND with changes in sexual reproduction. This problem is related to the idea of the naturalness of conception and reproduction which has also shaped the moral understanding of sexuality and the definition of deviation, e.g. homosexuality. Besides heterosexual couples lesbians use the new technologies of IVF (and PID) to become biological mothers. Thus, two domains of moral evaluation, sexuality and the beginning of life, are possibly linked. This paper evaluates if these two are separate or related dimensions of morality and which factors (values, age, gender, SES) predict the acceptance of these issues.

Data & Methods: The multivariate analyses (MG-CFA and regression) are conducted on the basis of data from the European Values Study 2008(-2010) (items on abortion, IVF, homosexuality etc.) and a specifically designed survey in Germany, allowing an analysis of the effect of the sexual preference of involved partners on the legitimacy of applying IVF. Thereby, it is possible to identify the moral distinctiveness of sexuality and beginning-of-life issues.

Relevance & Added Value: The domain of sexuality will become linked in a new way to the question of beginning-of-life issues due to changing evaluations and regulations of reproductive technologies as well as heterosexual and lesbian couples’ interest in using these options.

STIRRING IT UP – AGAIN: SEXUAL POLITICS OF DIFFERENCE IN THE NEW MILLENNIUM

Sally Hines

1sociology and social policy, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: Stirring It Up – Again: Sexual Politics of Difference in the New Millennium

Over the last decade a wave of critical sexualities citizenship scholarship has emerged (Richardson, 1998; Stychin; 1998; Bell and Binnie, 2000; Monro; 2003; Hines, 2007c), which highlights how citizenship is dependent upon sexual and gendered normativity. A common thread running through the literature is the regulation of queer practices as assimilation becomes a pre-requisite of sexual and gendered rights; giving rise to homonormative (Duggan, 2002) sexual values and practices. Central to a neo-liberal sexual assimilationist agenda is law and policy around ‘equalities and diversity’. Thus, in recent years, there has been a proliferation of sexual and gendered equalities policy in the UK. Moreover, rights-based discourse culminated in the UK ‘Civil Partnership Act’ (CPA, 2004) and the ‘Gender Recognition Act’ (GRA, 2004), both of which sought to enhance citizenship for sexual and gendered ‘minorities’, and both of which have been subject to critique for the normative conditions attached to their framework of rights. From this backdrop, then, it is reasonable to lament the demise of ‘queer times’; to position the 1990s as a golden age of queer activism against a new millennium of sexual conservatism. This paper seeks to question such a linear reading by addressing emerging movements against the CPA and the GRA. In this way, the paper considers individual and collective resistance to the normative underpinnings of equalities and diversity law and policy. I will suggest that this rising tide of legislative refusal signposts a renewed queer politics in which sexual and gender dissidents are stirring it up – again.

UNDERLYING FACTORS OF HOMOPHOBIA - THE ATTITUDES OF UNIVERSITY STUDENTS TOWARDS GAY PEOPLE -

Cihan Ertan

1Sociology, Akdeniz University, Antalya, Turkey

Abstract: Homophobia is one of the most complex forms of prejudice which is towards LGBT (lesbian, gay, bisexual and transgender) people. It is not only a prejudice but also racism. Defining homophobia is not easy due to its complex structure that comprises both psychological and cultural background. Homophobia, in general, is directed to gay males rather than lesbian women. Prejudices, negative attitudes, hostility and hatred towards LGBT people, in other words homophobia, can stem from various reasons such as adherence to traditional gender roles, masculinity. In this study it will be illuminated the variables leading selected university students to have homophobic attitudes. The method of focus group interview will be applied to 8 sociology students in order to determine what factors are playing role in their homophobic attitudes.
A QUESTION OF “FAIRNESS”? NEGOTIATIONS IN RISK MANAGEMENT AND REGULATION OF COMMERCIAL SEX IN SWITZERLAND

Agnes Földhazi1
1HETS - HAUTE ECOLE DU TRAVAIL SOCIAL, GENEVE, Geneva, Switzerland

Abstract: Health risks associated with commercial sex gained new visibility with the emergence of the AIDS epidemic. Also, being at risk of HIV infection is situated within a context of overlapping forms of violence linked to sex work – social, emotional, and physical. Attitudes regarding risk are socially constructed, therefore, to define effective prevention strategies, health policy makers need to understand how acts involved in commercial sex perceive risk related to their occupational hazards in prostitution. Due to the stigma attached to prostitution, traditional – top-down – risk prevention messages are considered as insufficient public health strategies and are increasingly completed by new approaches elaborated by bottom-up initiatives. The paper examines to what extent such new risk management policy modifies power relationships among various partners, discussing risk definitions and appropriate reactions. A case study of a project, called FairSexWork (FXW), elaborated by Aspasie, an advocacy group for sex workers in Geneva, Switzerland helps to analyse evolutions in risk management regarding the sexual health of populations involved in the sex trade. The paper highlights the limits of empowerment through prevention politics in this particular context: it investigates if the management of the public risk, taking the form of regulating politics to monitor the concerned population, instead of empowering sex workers might even have the opposite effect.

MOST OF THE TIME: A QUEST FOR INTIMACY BETWEEN CLIENTS AND ESCORT-GIRLS

Bernardo Soares Coelho1
1CIES-JUL Lisbon University Institute, CIES-JUL LISBON UNIVERSITY INSTITUTE, Lisbon, Portugal

Abstract: Based on an ethnographic research with escort-girls and male clients combined with a biographical approach, this paper analyse and discuss the production of intimacy in the frame of encounters between escort-girls and their clients. This leads us to three different sets of findings:

First, contradicting stereotypes research easily leads us to find that prostitution as it is practiced by escort-girls is not exclusively profit-oriented; it is also pleasure-oriented and intimacy-oriented. Both escort-girls and their male clients wish pleasurable moments and actively invest in the production of intimacy. Most of the time this is a circumscribed intimacy: a) It is circumscribed in time. The intimacy produced by escort-girls and their clients is, at least temporarily, cultivated as a free area, regarded as a portion of life off the routine. It is a deliberately set off in time (lunch breaks, evenings, nights, weekends). b) It is limited in space. It is segregated in space (home, bedroom, hotel, bed); often located in places deliberately set aside and especially designed for it (bars, pubs, clubs, hotel rooms). c) It is stage-set (music, sexy clothes), by the use of psychotropic substances like alcohol and some drugs, and by pharmacetics oriented to enhance sexual performance. d) Both escort-girls and their clients circumscribe intimacy by being extremely vigilant about their self disclosure discourses.

Second, the circumscribed nature of this intimacy can be disrupted. In the commercial, erotic, sexual and intimate scenario produced by escorts and their clients it isn’t uncommon to find romantic relationships. Such romantic relations imply a connection between love and material interests that must be managed by the protagonists on everyday basis.

Third, both versions of intimacy produced between escort-girls and their client’s impact on their everyday intimate lives outer commercial sex contexts, affecting the ways they experience and transform romantic relationships.

BETWEEN EAST AND WEST - POLISH STRUGGLES FOR SEXUAL FREEDOM

Justyna Struzik1
1Department of Philosophy, JAGIELLONIAN UNIVERSITY, Cracow, Poland

Abstract: The gay and lesbian movement in Poland is still very young, but it has become quite visible in public discourse in recent years. Throughout the last twenty years many organizations and more or less formal groups working for sexual minorities have been formed in the biggest polish cities. Because of the fact that various political strategies and academic approaches (e.g. politics based on essential approach to sexuality, queer politics, reformist and radical politics) have occurred in polish academia and social movement in the same time, a"we deal with a mixture of ideas taken either/both from queer theory (or hidden under this term) or/and from traditional gay and lesbian studies (i.e. essentialising, fixing, and naturalising the category of ‘homosexuality’ that queer theory questioned and historicized). Then, analyzing the LGBT movement in Poland we might meet with some difficulties in describing the specific strategies used in the political struggle by the individual organizations. Without a doubt, a centre of that activities of the movement has been situated in the capital city - Warsaw, which has the best opportunities to organize events, festivals, marches etc. It is also the city where a lot of young people migrate from small towns to study or find a job there. Not surprisingly, in July 2010 international, the European gay and lesbian festival EuroPride took place in the capital of Poland. At the same time, also in Warsaw, another queer festival Pomada was organized. My analysis will be limited to the case of Warsaw festivals. I would like to note that the following analysis is based largely on visual and text material, provided by the organizers of both events, and media. The approach of this project is to present the way in which identity is created and performed during the action of social movements and how in this process exclusion and hierarchy based on sexual identity are formed. I’m going to consider a language which is used to talk about sexuality (heterosexuality, non heterosexuality), meanings of visual presentation of movements and also political context of activities of gay and lesbian communities. In this paper I’m going to focus on critical analysis of both queer festivals.I will focus on a different attitude towards the EU policy, symbolizing better world for non heterosexual people. I will try to deal with a special condition of Polish LGBT movement located in-between East and West.

CITIZENSHIP, COMMUNITY, DIVERSITY – OR DEATH

Yvette Taylor1
1NEWCASTLE UNIVERSITY, NEWCASTLE Upon Tyne, United Kingdom
Abstract: Citizenship, Community, Diversity – or Death

This paper considers moments of European and US sexual citizenship situating this in terms of LGBT campaigning groups’ actions, institutional reactions and broader public relations. It suggests that these reactions and demands often work to re-create a dominant ‘we’, with the rhetorics of ‘diversity’ and ‘community’ strategically deployed – implying inclusivity while exercising exclusion. The argument here is discussed in relation to two significant moments of citizenship formations and disruptions: the UK Civil Partnership Act (2004) and the inter-related movement towards demanding ‘recognition’, ‘safety’, ‘protection’ and an end to homophobia. The creation of a broader ‘publics’, as called upon by different actors in the demand for citizenship, community and diversity, can be seen as contradictory, relying upon and re-creating ‘privacy’, as the proper concern and place of civil (dis)engagements. This is witnessed in responses to different ‘queer deaths’ and the affective relations – from ‘hate’ to ‘love’ – which are generated, where legislation and policies (Proposition 8, ‘Don’t Ask Don’t Tell’, Civil Partnerships) also dis-connect with these sentiments of loss and possible gain. I ask which lives are already lost to ‘public’ concern, to ‘community’ activism and institutional apprehension – this is significant to dis-junctures in diversity rhetorics and realities enacted across ‘communities’. In relocating ‘sexual citizenships’ away from intimacies and ‘injuries’ as self-evident truths, there is a need to explore further the way we are called upon to mobilise the values of ‘civility, dignity, compassion, respect,’ as well as the spaces and sentiments of ‘privacy’, intimacy and care in often very conservative ways. There are injustices associated with visibility and invisibility (Adkins, 2000) and we are all implicated in the doing of diversity, community and (in)equality. The Civil Partnership Act and the Tyler Clementi case differently reveal the links between queer politics, sexual citizenship and diversity paradigms, where certain lives and deaths are already ‘lost’ to public grieving and calls for institutional and activist ‘inclusion’: we would do well to attend to these ‘losses’ as we seek citizenship ‘gains’.

FITTING IN AND STANDING OUT: LEGAL RECOGNITION FOR SAME-SEX COUPLES IN THE UK, CANADA AND THE STATE OF CALIFORNIA.

Michael Thomas

1school of social sciences, CARDIFF UNIVERSITY, Cardiff, United Kingdom

Abstract: This presentation reports on a qualitative research study of the impact of legal recognition policies for same-sex couples in the UK, Canada and the US State of California. Marriage and civil partnership present opportunities for exploring two apparently contradictory aspects of the lived experience of married and civil partner same-sex couples: the notions of fitting in and standing out. Legal recognition can be seen as presenting opportunities for assertions of both sameness and difference as well as expressions of conformity and radicalism.

Drawing on Eving Goffman’s analysis of stigma, this presentation explores same-sex couples’ understandings of marriage and civil partnership. The data show that couples’ decisions around marriage and civil partnership raise a number of questions around their identities as gay and lesbian men. Whereas some same-sex couples in the research sample appeared to welcome legal recognition as a form of assimilation into a heterosexual mainstream, others focused on asserting their continued difference and distinctness from heterosexist norms. Legal recognition therefore requires lesbian and gay couples to manage contradictory notions of conformity and dissidence, assimilation and resistance. Despite the clear policy aim of reducing stigma and discrimination, the process and experience of marriage and civil partnership highlight the continued marginalisation of lesbian women and gay men, both as citizens and as members of family, occupational and social networks. Although marriage and civil partnership have been presented as a conclusive element of lesbian and gay equality, the initial findings of this study caution against equating legal recognition with social equality.

TOWARDS A QUEER PUBLIC SOCIOLOGY: MULTIPLE BELONGINGS AND POLITICAL ENGAGEMENT IN ACADEMIA

Ana Cristina Santos

1CENTRE FOR SOCIAL STUDIES, UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: The legacy of positivism is mirrored by the ways in which social sciences frequently operate according to dominant ways of thinking and doing. Initially advanced by Herbert J. Gans in 1988, the notion of public sociology was crucial in moving away from positivist approaches within mainstream sociology. Drawing on such notions, this article considers the importance of developing and disclosing social science’s political engagement in order to render it more plausible, accountable and useful, particularly in ‘turbulent’ times.

In the first part of the paper, I expand on the notion of public sociology inspired by the works of Herbert J. Gans (2002) and Michael Burawoy (2004a, 2004b, 2004c, 2005). Underpinning the idea of public sociology is the conviction that knowledge can contribute to processes of inclusion or exclusion, depending on how it is used. As such, the ultimate purposes of producing scientific knowledge should be to go beyond the walls of academic institutions, reaching audiences that are not necessarily related to the academy.

Considering my personal experience as a researcher and activist in the lesbian, gay, bisexual and transgender (LGBT) movement in Portugal, in the second part of the paper I explore some of the epistemological and ethical aspects related with being a disclosed activist and academic in the field of sexualities. I argue that this type of ‘double agency’ offers the opportunity to build and disseminate empirically grounded knowledge whilst maintaining a sense of ethical responsibility that recognises subjects beyond the objects of study.

Finally, against a positivist understanding of science, in the last part of this paper I advance the notion of a ‘queer public sociology’, i.e. a sociology accountable for sexual diversity, and that acknowledges its political situated character at the same time that it contributes to the dismantling of sexual prejudice and exclusion. It is argued that disclosed political engagement within academia should be not only embraced but encouraged as a way to improve the quality of scientific input, as well as the accountability and relevance of sociological findings, particularly in the field of sexualities.

“I’LL SAVE SOME MONEY FOR SOMEONE, SOMEWHERE, TO TAKE CARE OF ME...” – CARE EXPECTATIONS, HEALTH BEHAVIOURS AND AGEING IN OLDER GAY MEN
Gerardo Zamora 1, Igone Etxeberria 1, Nerea Galdona 1, Elena Del Barrio 2, Bernabé Sarabia 3, Elena Urdaneta3
1INGEMA, San Sebastian, 2INGEMA, Madrid, 3Universidad Publica de Navarra, Pamplona, Spain

Abstract: Population ageing is making new cohorts of elderly people visible and reaffirming diversity as a key feature of later life, particularly concerning sexual identities and non-heterosexuals forms of ageing. This has implications for the self, social networks, financial status, health, care, policy, etc. of older individuals, and can therefore contribute to understand not only gay, lesbian, bisexual, transgender or queer ageing, but ageing in general. Research on this field is mainly US-, UK- and Australia-based, but scarce in Spain.

This paper focuses on care expectations (CE) in old age and their relationship with health behaviours (HB) in self-identified gay man. It draws on the narratives of gay men aged 50+ on their self-rated health, their health behaviours (past and present), expected support in later life, decision-making on provisions for old age and courses on ageing seen from their specific sexual identity.

A sample of 10 individuals was assembled. They were interviewed using qualitative techniques in order to assess the 4 hypotheses of the study, briefly:

[1] CE influence health behaviours (habits, perception, etc); [2] CE sway financial management decisions (e.g., health care, housing, etc); [3] CE are influenced by socioeconomic status and social/family networks; and, [4] CE change throughout the life course by influence of major societal changes (e.g., legal or legislative modifications, institutional changes, etc.).

The results of this study can contribute to build an analytical model for a larger approach to lesbian, gay and bisexual (RGB) ageing in Spain concerning health issues, sexuality and care. Gerontology is heteronormative-built and research on RGB ageing provides an exceptional opportunity to challenge this and to strengthen the discipline’s scientific ground. Moreover, the intersections of the sociology of sexuality and of ageing are particularly relevant to understand how well-being and quality of life function in RGB identities.

BOYS WHO ARE "PLACED HORIZONTALLY": A RETROSPECTIVE STUDY
Miriam Gutierrez Otero 1,2*
1Social Sciences, Universidad Autonoma de Ciudad Juarez, Ciudad Juarez, Chihuahua, Mexico, 2Social Sciences, Université Laval, Québec, Canada

Abstract: The World Report on Violence and Health, 2002, indicates that "sexual abuse against men and boys is an important problem." This is a field that has been largely neglected in research. We emphasized in "The vicissitudes of symbolism in the law prohibiting incest, based on discourses of children who have undergone it" the difficulty, or even the impossibility, for boys – in comparison to girls who have experienced the same traumatism – to be able to articulate an experience of assault, which to them implies having been placed in a passive position. In addition, if it is true that a triple taboo has been broken (consisting of masculine vulnerability, homosexuality, and sexual relations with minors) which affects boys who are sexually abused, there is above all a double offense that weighs upon them: incest and pedophilia for which they are still awaiting revendication.

Objectives: 1 – To understand the underlying causes that lead Quebecois men to attempt suicide. 2 – To learn which factors would allow Quebecois men who have experienced sexual abuse during their childhood to be able to put it into words.

Methodology: This is an exploratory qualitative study, which will involve an analysis of the participants’ discourses, and will be carried out through a psychoanalytical approach.

Sample: 10 subjects. Selection of suitable subjects: Quebecois men who fulfill the participation criteria: 1 – Questionnaire which will determine if they experienced sexual abuse during their childhood. 2 – In-depth interviews on a voluntary basis.

This project corresponds to the advancements of research, emphasizing the critical issue of elaborating on the knowledge of the subject on his attempted suicide and/or suicidal behaviour. It will focus on the importance of the contributions of psychoanalysis on qualitative research in clinical settings concerning rape and suicide.

FIRST SEXUAL INTERCOURSE-EXPERIENCE AMONG EARLY INITIATORS AND SUBSEQUENT SEXUAL DEVELOPMENT
Katrien Symons1
1sociology, GHENT UNIVERSITY, Ghent, Belgium

Abstract: SAFE II is a research project that is set up by the International Planned Parenthood Federation-European Union (IPPF-EU). The aim of the project is to achieve a better understanding of the sexual and reproductive health and rights of young people in Europe. For that, six European countries participate in the project. In our presentation we will focus on the results from Flanders, in which particular attention is given to a less studied vulnerable group: young people who start having sex at a very young age.

Research goals: Sexual development is considered a normative developmental task, confronted by young people. Nonetheless, (too) early sexual initiation is often defined as risk behavior, because a young person is considered unable to make healthy sexual choices. A vast amount of quantitative research shows indeed a negative correlation between early age at first intercourse and negative health outcomes.

Little is known about the circumstantial factors that make the early debut prone to risk. The documented negative correlation between age and sexual health, could stem from the less ideal circumstances under which the initiation took place rather than age in itself. Furthermore, age might be a valuable but not sufficient indicator to define a sexual debut as ‘early’. Instead, it is important to consider other aspects of ‘sexual readiness’ of the young person.

This research investigates the protective either adverse factors that make an early sexual debut a positive either negative experience for the young person. Focus is being put on the relationship characteristics with the first sexual partner. Furthermore, a whole range of factors are considered to evaluate the ‘sexual readiness’ of the young person at the moment of first intercourse. Finally, the question is raised how the early sexual initiators experience their sexual encounters later during adolescence. Ultimately, this research will serve to better understand ‘healthy’ and ‘problematic’ sexual development among young sexual initiators.

Methods: To answer the research questions, 40 in-depth interviews are achieved among adolescents between 16 and 18 years, who
have had their first sexual intercourse at age 14 or younger. At the moment of writing, we are finalizing the data collection. The final report, including the results, will be finished by September 2011.

LEBIAN AND BISEXUAL WOMEN’S HUMAN RIGHTS, SEXUAL RIGHTS AND SEXUAL CITIZENSHIP: NEGOTIATING SEXUAL HEALTH IN THE U.K.

Eleanor Formby1

1Centre for Education and Inclusion Research, SHEFFIELD HALLAM UNIVERSITY, Sheffield, United Kingdom

Abstract: Lesbian and bisexual women’s sexual health is neglected in much United Kingdom (U.K.) Government policy and practice. Moreover, current ‘turbulent times’ mean that the relatively new coalition government’s stance on sexual health and broader health equality is as yet ambiguous. Drawing on sociological understandings of lesbian, gay and bisexual (LGB) human rights, sexual rights and sexual citizenship, I argue that these are useful lenses through which to explore this policy context, which has important implications for health inequalities, and human rights more broadly. This paper examines lesbian and bisexual women’s negotiation of sexual health, drawing on a small research project which employed detailed self-completion questionnaires with 54 women in a city in the North of England. The influence of homophobic or heterosexist social contexts emerged as a key issue when examining lesbian and bisexual women’s sexual health and related inequalities. The study was commissioned by a local sexual health service, with the aim of eliciting data from self-identified lesbian, bisexual women and women who have sex with women related to sexual health care maintenance and sexual health services, in order to inform local service development. Based on thematic analysis of open text survey data, subjects explored include: invisibility and lack of information; influences on decision-making and social/sexual relations, and experiences of services and barriers to sexual health care. To conclude, these themes are related to existing literature on lesbian health and sexual rights, with a view to thinking about how to address policy and practice inequalities in this area.

SPANISH CINEMA, SEX AND SOCIETY: EVERYTHING YOU WANTED TO KNOW AND NEVER DARED TO ASK

Ana Leon1, Vera Burgoz

1Department of Sociology, University Autonoma of Barcelona, Barcelona, Spain, 2Film Studies, University of St Andrews, St Andrews, United Kingdom

Abstract: Several academic works have addressed the topic of sex when analysing Spanish cinema. This is due to the prominence of sexual thematics in contemporary Spanish films, characterized by producing more explicit images of sex than most European and many non-European cinemas. Such phenomenon emerged as a critical response to the repressive context of Franco’s regime and the censorship. After the dictatorship was over, the censorship was replaced by a classification office and the use of sexual imagery continued through the so-called S films. At the beginning of the 1980s, democracy consolidated and censorship finally disappeared. Nevertheless, Spanish films became more radical in their challenge to traditional values. The work of Pedro Almodovar was clearly representative of the new trend. His films were very controversial in terms of their sexual politics as he deconstructed conventional ways of understanding sexual identities and gender roles.

Based on the idea that films mirror social reality, this paper addresses the following question: to what extend Spanish cinema reflects the actual attitudes of Spanish people towards sex? This work tries to respond it by looking at what Spanish people themselves say about sex and their sexual life. We refer to the Attitudes and Sexual Practices study, a major statistical survey of the sexual behaviours and attitudes of Spain citizens conducted in 2008. It is the most comprehensive and up to date source of information on sexual behaviour available in Spain, and it includes demographic information as well as questions concerning sexual lifestyle, health and education.

This paper highlights that two different ways of sexual openness are possible: One refers to what individuals say when being asked about sex and the other to how they actually manifest those ideas in their sexual lifestyle and behaviour. Although the first sort of openness is no doubt reflected in Spanish cinema, concluding that Spanish films reflect Spanish culture in relation to sex is a rather empirical question that remains open. To shed light on this issue, this work combines qualitative analyses of contemporary Spanish films with quantitative analysis of the survey data mentioned above. This allows us to develop a portrayal of the Spanish society from two analytical perspectives: the field of sexual behaviour and the field of film studies.

THE AMOROUS MIGRANT: RACE, RELATIONSHIPS AND RESETTLEMENT THROUGH CYBERSPACE

Nicholas Andrew Boston1, 2*

1Journalism and Communications, City University of New York - Lehman College, New York, United States, 2Sociology, University of Cambridge, Cambridge, United Kingdom

Abstract: This paper is part of a book length project, currently under review by Oxford University Press, that is the first and only empirical study of 21st-century Polish migration to the United Kingdom considered through the bifocal lens of race and sexuality. It proposes a theory I term ‘libidinal cosmopolitanism’. The paper offers a detailed ethnographic account of this theory, which describes the ways in which motivations for resettlement, and processes of migrant adaptation and identity formation were bound up with notions of interracial desire, coupling and their fulfilment.

Following the accession in 2004 of Poland to the European Union, a sizable influx of Polish economic migrants began arriving in Britain. Their presence has significantly transformed the cultural landscape, a fact to which extensive academic and journalistic attention has been given from a number of angles. However, most studies treat as given the impact on migrants’ psychosocial adaptation of Britain’s extremely multiracial demographic composition and the ways in which migrants insert themselves into a racialised society. Furthermore, no study exists in print of the subjectivities or negotiations of sexual minorities operating within the larger migrant population. And finally, very little of the existing literature pays serious attention to the role of computer-mediated communication, a significant facet of transnational flows, in migrants’ everyday lives.

Addressing these issues, from 2007 to 2010 I conducted an ethnography of gay male Polish migrants in Britain, which was initiated by a quite curious discovery. I found through personal experience that there was a not inconsequential interest on the part of one sizeable
cohort in finding black partners for sexual encounters or amorous relationships. This interracial desire they negotiated by seeking out contacts on gay sexual networking websites such as Gayromeo.com and Gaydar.co.uk. All the participants in the study, numbering in the eighties, came to the project by having initiated contact with me, the researcher, on one of these Web platforms. This activity as seedbed, the study traverses vast territory, exploring a history and present of black-Polish intimacies, both convivial and oppositional, on and offline, across sexualities, in Britain from the end of WWII to the present day, the Digital Age.

TOUCHED BY YOUR WORDS, SEDUCED BY YOUR IMAGE – SEDUCTION AND THE BODY IN TIMES OF INTERNET

Natália Cantó-Milà 1, SWEN SEEBACh 1, Pau Alsina 1
1 ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain

Abstract: New forms of electronic communication (such as mobile texting, internet, emailing) are becoming increasingly relevant in our everyday lives – not only for organisational matters, but also in the webbing of the most intimate relationships between people in love, people searching for love or people for some fun in the cyber-space. Sex in written or spoken form, exchanged intimate pictures, are crucial in the webbing of those invisible threads that bind people together – seducing and being seduced – also in the net. But what happens with the body when it becomes a written description or the sum of scattered pictures over the computer screen? Is the body thus transformed or has it disappeared? And in which ways can a sexual relation take place, how is it possible to seduce and to be seduced, when the body, which was thought to be the basis of seduction, eroticism and sexuality, is turned into a series of ones and zeroes?

This paper seeks to explore the paths opened by these questions through an analysis of 35 autobiographical interviews in which the interviewees have reported the ways in which they relate to their current and past partners – online and offline. Through the analyses of these interviews we will attempt to depict the attraction felt by the virtual love relationship online, and, at the same time, that which happens when that which happened online is brought (back) offline.

TRACING AMBITIVALENT NORMS. AGONY COLUMNS, AUDIENCE RESPONSES AND SEXUAL LEARNING.

Marjo Kolehmainen 1
1 UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: Agony columns can be approached as visible sites of popular sex education. The columns act as a major source of sexual information for their readers and thus have a focal role in ‘educating desire’. This presentation examines both the agony column of the Finnish City magazine and the readers’ online responses to the column in order to illustrate the processes of constructing and negotiating sexual norms. The column displays sexual differences and makes a variety of desires public but also participates in the mass-mediated regulation of sexualities. It also parodies the agony column convention apparently operating as a way to resist formal sex education discourses and normative understandings of sexuality – but in the end contributes to the shaping of sexual norms in a nuanced way. The research question is threefold. At first, the ambivalent construction of normative heterosexuality through emotional mediation and questions of taste is addressed. Secondly, the connections between anti-normative sexualities and other forms of cultural ‘otherness’ are examined. Thirdly, the online responses from the audience are analyzed in order to grasp the negotiations concerning sexual norms. In the data, sexual norms appear situated as a particular sexual practice which can either be approved or disapproved of. However, despite the general humorous ambiguousness, sexual norms seem to be (re)structured around intersectional categories, such as gender, class, ‘race’ and ethnicity. The presentation thus aims at discussing the importance of intersectional analysis in the construction of sexual norms as well as the methodological challenges in examining humour.

SEXUAL CULTURE OF EUROPEAN AND RUSSIAN YOUTH: COMPARATIVE ANALYSIS

Lilia Sergeevna Pankratova 1
1 Sociology of Culture and Communication, St. Petersburg State University, St. Petersburg, Russian Federation

Abstract: The beginning of the 21st century is considered as a period of intensive social and cultural transformations in the world and in Europe and Russia particularly, which especially concerned the sphere of sexuality: sexual norms and values, attitudes and patterns of behavior. Such processes as migration and globalization, spread of information technologies and development of consumer society led to great changes in young people lifestyles and pluralization of sexual practices. Despite the variety of types and forms of youth sexual culture there are some similar tendencies in different regions of Europe and Russia which is so important to identify in the era of such common threats and problems as, for example, HIV transmission and sexual trafficking. On the basis of expert interviews with specialists in the field of sexuality (NGO workers and scholars) and in-depth interviews with young people of the age 18-25, as well as analysis of surveys and literature on related topics there were sorted out some key socio-cultural factors that play crucial role in formation of young people sexual culture in contemporary Europe and Russia. Consumer culture and mobility, both between territories and between communities that may result in changing identities, transforming gender orders, religion and democratic, liberal policies influence differently on establishment or reproduction of gender and sexual norms, social attitudes towards people with queer identity and on variety of sexual scripts, etc. There are significant similarities, peculiarities and distinctions in sexual behavior and social expectations of young people in Europe and Russia.

SEXUAL GROOMING OF 16-YEAR OLDS IN NORTHERN IRELAND- EVIDENCE FROM THE 2010 YOUNG LIFE AND TIMES SURVEY

Dirk Schubotz 1
1 ARK, QUEEN’S UNIVERSITY BELFAST, Belfast, United Kingdom

Abstract: Sexual risks to young people, especially in the age of social networking, are often publically debated but have so far rarely been systematically researched.

Young Life and Times (YLT) is a study of 16-year olds undertaken by ARK, a joint initiative by Queen’s University and the University of
Ulster. At the core of the YLT project is the postal YLT survey which has been undertaken annually since 2003. each year, the survey asks a random sample of 16-year olds in Northern Ireland a range of questions about their life. In 2010, for the first time the YLT survey contained a module on sexual risks to young people. 786 16-year olds completed the survey. The results of this YLT survey module will inform the ‘Safe Choices’ project - a three year programme undertaken by Barnardos in Northern Ireland on risks that young people face from adults and other young people who want to take advantage of them sexually.

In this presentation I will report key results of this YLT survey module on sexual risks, which includes information on 16-year olds exposure to sexual grooming as well as findings on experiences of threats made to respondents for sex, and things offered to young people in exchange for sex. I will specifically look at gender and social background variables with regard to grooming and other sexual risks. Finally I will report in detail findings from an open-ended question on sexual risks perceived by 16-year olds asked within this 2010 YLT survey module.

SHARING THE SEXUAL SELF THROUGH SUBVERSIVE LEARNING COMMUNITIES

Joanne Cassar

Abstract: The desire for human connection through sexual expression is compelling and involves an array of human emotions. The presentation deals with a study about a number of girls’ writings as they occurred in the form of graffiti written on the toilet doors of a postsecondary school in Malta. These anonymous graffiti texts are mainly concerned with how their authors try to make sense of their involvement in sexual activity and romantic encounters, as they try to explore new understandings of sexuality. The writers request detailed information about decision-making processes related to conflicting emotions about romantic and erotic feelings. Their articulation focuses on how to handle emotions, such as jealousy, excitement, love, pity, anger, fear and sadness. A number of these emotions are described as disrupting some of the girls’ lives by causing them anxiety and anguish but they also serve as channels of hope and new beginnings. The study documents the phenomena of graffiti in Maltese schools, as subversive processes of learning about the sexual self, which highlight the emotional, social, cultural, personal and political worlds the students inhabit. In presenting some of these sexual and intimate writings, I have chosen “a methodological and theoretical orientation that privileges emotional and concrete details of everyday life (Ellis and Berger 2002, p.857). In the absence of sexuality and relationships education in postsecondary education curricula in Malta, these graffiti writers are considered as constructors of a hidden and at times imagined community, which offer a challenge to the silences surrounding sexual matters.

‘IT TOOK A LONG TIME TO SEE.’ WHEN THE VIOLENCE IS NOT PHYSICAL: IMPLICATIONS FOR DEFINITIONS AND RECOGNITION OF, AND RESPONSES TO, DOMESTIC VIOLENCE.

Catherine Donovan

Abstract: The Home Office definition of domestic violence acknowledges that it includes abuses that are not physical. The evidence from heterosexual female survivors suggests that the impact of these kinds of abuses is more long-term and profound than physical abuse. Yet it is still the case that most criminal justice system responses to domestic violence are to physically violent incidences. Whilst this can be understood in the context of securing evidence and an incident-based approach to domestic violence, I argue that there are consequences for not exploring ways of responding to other abuses. For example, in an ESRC study comparing love and violence in same sex and heterosexual relationships, those respondents who had experienced predominantly non-physically abusive behaviours were far less likely to have identified their relationship as domestically violent at the time; and might still be confused about it at the time of interview. These were also more typically (but not exclusively) women in female same sex relationships.

In this paper we present the accounts given by respondents to explore their experiences of non-physically violent domestic violence. We do this to promote discussion in three areas: defining domestic violence, understanding the impact of emotional violence; and the consequences for support to victim/survivors of domestically violent relationships.

SEXUALITY AND IDENTITY IN THE SPACE OF PRISON. PRESERVING AND/OR REDEFINING IDENTITY?

Petronel Mirel Dobrica

Abstract: The aim of this paper is to describe and explain some aspects of the ways of expression of sexuality used by inmates. The paper shows the results of a field research conducted in two prisons (a prison of maximum security and a prison for minors and youth), which is a part of the project "Deculturation as effect of detention. Resocialization in the context of the progressive and regressive regime of prison sentence execution," financed by CNCSIS – UEFISCDI (project IDEI PCE 2008, ID-1977). This field research was carried out in 2009-2011.

Sexual deprivation is one of the crucial problems of inmates. According to Romanian law, the inmate is able to enjoy an intimate visit three times a year. What are the consequences of this fact? What are the symbolic meanings attributed to the intimate visit by the prisoner (and by his girl friend or wife)? What are alternative ways of satisfying sexual needs? What is the influence of culture and community of inmates in choosing and using these alternative practices? To what extent these practices lead to changes in individual identity? What are the consequences of sexual deprivation for minors and especially for youth inmates? How they build their social identity?

One of the most salient aspects of my research refers to the evaluation of the consequences of the progressive and regressive system of execution of prison sentences (adopted in 2006). Some of these consequences point out various disfunctions of this law, which dramatically diminish the social reintegration of former inmates.

WOMEN IN PRISON. LOVE (PARTNER) RELATIONSHIPS
Geneva norms’ and therefore, they are trapped in illusion. On the other hand, there is a limited minority of parodic performers who, through their subversive repetitions, reveal the illusionary status of gender. These parodic repetitions, conceptualized in some formalistic way as an encounter with the “strange”, may become the vehicle through which the passive and deceived audience can be illuminated and thus emancipated so as to escape its false consciousness.

In subsequent revisions of her work, Butler turns against a causal relation between drag and subversion. She reconsiders drag as ambivalent in its relationship to power. Parody holds the potential of subversion of gender norms but at the same time runs the risk of being incorporated, subsumed by the power it opposes, reinforcing in this way that which it aims to destabilize.

Butler raises a spectrum of critical consciousness. By segregating between ‘ideal’ and ‘non-ideal’ spectators, she inscribes her theory within the limits of a binary structure “subversion vs compliance”, which is leading into a slippage between subversive receptions and unconventional sexualities in general and introduces a latent inequality among subjects. In this presentation, we are planning to raise questions of situatedness in the light of reception theory and audience research in order to show that interpretive acts of drag shows are heavily dependent upon the conditions of reception, audience expectations and subjective meaning making. We are planning to critique Butler’s account on drag which neglects a wide range of contexts (where, when, under what circumstances, to whom and by whom is the performance of drag acted) and disregards the possible and diverse “horizons of expectations”.

**PARODIC CONSCIOUSNESS: A RE-READING OF JUDITH BUTLER’S THESIS ON DRAG**

Danai Tseleni 1, Mary Leontsini 1

1 EARLY CHILDHOOD EDUCATION, NATIONAL AND KAPODISTRIAN UNIVERSITY OF ATHENS, Athens, Greece

**Abstract:** The aim of this study is to examine Judith Butler’s work on drag in the light of an audience reception theory.

According to Butler, drag disrupts the sex, gender, desire nexus in revealing all gender as parody. It openly displays the imitative structure of gender and thus its status as a performative construction. Butler conceptualizes drag as a subversive practice in itself, which signals a clear and singular message, that is to say the exposure of gender as an illusion. The author distinguishes between, on the one hand, a vast majority of subjects who unconsciously perform gender repeating unacknowledgedly the conventional gender norms and therefore, they are trapped in illusion. On the other
How do children talk about sexual content online?

On the internet, here are some research questions that this study about risk and harm as well as about children's use of and behavior on the internet. Among an extensive number of questions about risk and harm as well as about children's use of and behavior on the internet, here are some research questions that this study examines:

How do children talk about sexual content online?

What kind of narratives do they construct about themselves when talking about sexual content online?

What kind of discourses emerge from their talking about the topic?

This paper examines in specific girls’ talk about sexual content offline and online. It aims at discussing the nature of their discourses about pornography and sex through their views and through their knowledge of the public debate around the same topic.

Methodologically this paper and the overall doctoral study was conducted with the use of semi-structured interviews with young people aged 18-21 years old from Britain, Denmark and Greece who have been asked to think retrospectively about their childhood and teenage life. Although the limited sample of this qualitative study does not offer an opportunity for cross-cultural comparisons, it does on the other hand offer a deeper and detailed view of young people's experiences with and narratives of sexual content online.

Nonetheless, this paper and the doctoral study on the whole aims to go beyond the debate about whether encounters with sexual content can be risky and/or harmful for children and focus on the actual stories and the discourses, on the concerns or topics of interest for young people, regarding the use of sexual content and pornography.

Given the lack of research on the nature of young people using sexual content online and the methodological and ethical difficulties of interviewing people younger than 18 years old, I hope that this study comes as close as possible to exploring in depth young girls experiences of that kind.

SEX AND THE SINGLE WOMAN IN AN AGE OF UNCERTAINTY – MAKING COMPARISONS BEYOND EUROPE.

Stevi Jackson 1, SIK YING HO 2

1Centre for Women’s Studies, UNIVERSITY OF YORK, YORK, United Kingdom, 2Social Work and Social Policy, University of Hong Kong, Hong Kong, Hong Kong, China

Abstract: Much had been made of the impact of rapid social change on sexual lives over the last half century, often told as a story of progress, or, in Jeffrey Weeks’ words, ‘The World We have Won’. The ‘world’ however, generally means our own countries, Europe or the western world more generally. This paper will draw on ongoing comparative work on social change and intimate life in the UK and Hong Kong, set in the regional contexts of Europe and East Asia respectively. In the latter region social change has been spectacularly rapid along with its accompanying uncertainties and tensions, complicated in Hong Kong by the colonial heritage and its relationship to mainland China. Drawing on data on the lives of young women from the UK and Hong Kong, we will explore both similarities and differences in their sexual lives and attitudes, demonstrating how these are related not only to general conditions of global late modernity but to the material conditions of each locale and shifting, but culturally specific, understandings of ‘traditional’ and ‘modern’ ideas on female sexuality. In so doing we hope to contribute to moving debates on sexuality and modernity beyond their currently Eurocentric focus and to re-thinking the relationship between global change and local particularities as they impact on sexuality.

DO GIRLS TALK PORN?: YOUNG GIRLS’ DISCOURSES ABOUT SEXUAL CONTENT ONLINE

Despina Chronaki 1

1London Knowledge Lab, INSTITUTE OF EDUCATION, London, United Kingdom

Abstract: Within the context of a continuously growing debate about young people’s experiences with sexual content online, the need for further research in the field becomes paramount. My doctoral study aims at addressing the nature of young people using sexual content online. Among an extensive number of questions about risk and harm as well as about children’s use of and behavior on the internet, here are some research questions that this study examines:

How do children talk about sexual content online?

What kind of narratives do they construct about themselves when talking about sexual content online?

What kind of discourses emerge from their talking about the topic?

This paper examines in specific girls’ talk about sexual content offline and online. It aims at discussing the nature of their discourses about pornography and sex through their views and through their knowledge of the public debate around the same topic.

Methodologically this paper and the overall doctoral study was conducted with the use of semi-structured interviews with young people aged 18-21 years old from Britain, Denmark and Greece who have been asked to think retrospectively about their childhood and teenage life. Although the limited sample of this qualitative study does not offer an opportunity for cross-cultural comparisons, it does on the other hand offer a deeper and detailed view of young people’s experiences with and narratives of sexual content online.

Nonetheless, this paper and the doctoral study on the whole aims to go beyond the debate about whether encounters with sexual content can be risky and/or harmful for children and focus on the actual stories and the discourses, on the concerns or topics of interest for young people, regarding the use of sexual content and pornography.

Given the lack of research on the nature of young people using sexual content online and the methodological and ethical difficulties of interviewing people younger than 18 years old, I hope that this study comes as close as possible to exploring in depth young girls experiences of that kind.

LOOKING FOR A NEW IDEA OF “NORMALITY” ITALIAN YOUTH AND NEGOTIATION OF SEXUALITY BETWEEN MAINSTREAM MEDIA AND THE INTERNET

Cosimo Marco Scarcelli 1

1Sociology, UNIVERSITÀ DEGLI STUDI DI PADOVA, Padua, Italy

Abstract: The present paper seeks to explain part of the qualitative data presented in the author’s PhD dissertation, which deploys different methodological approaches (the latter part of the research is based on a survey, however the present work only focuses on the qualitative analysis). The data is drawn from four focus groups, forty in-depth interviews, and two focus groups conducted online, all of which involved Italian male and female teenagers in the age range of 16 to 18 years old.

Adolescents and youth are major Internet users. What has come to be known as social media, such as social network sites (facebook, myspace, twitter, etc.), blogs, and chat rooms, plays an important role in young people’s lives (Pujazon-zazik, Park 2010). Youth are increasingly resorting to such platforms to support or enhance their “off-line” relations (Drusian 2005; Subrahmanym, Greenfield, 2008).

The author’s research focuses on a field that is very much neglected by the Italian sociological studies, aiming to understand the current state of youth culture with regards to the Internet and sexuality. The work seeks to understand how young Italians use the Internet to gain access to information, visuals and debates about sexual and intimate life and activities.

The idea of sexuality that is expressed by a number of influential institutions in Italian culture, such as family, school, the Church and the media, tends to be rigid and embedded in a strictly heterosexu-
al and patriarchal representation of society. Conversely, the Internet provides young people with a variety of cultural models, as it gives access to multimedia materials produced all over the world, and to websites from other countries and continents. In other words, it allows to compare different cultures.

Thus the question “what is normal?” might take a different meaning since the labels of what is normal, straight, and so forth tend to fade in the heterogeneous setting provided by the Internet. Therefore, this work attempts to gauge whether and to what extent Italian teenagers use the Internet to negotiate the monolithic idea of sexuality that popular culture has bestowed on them.

MUSIC, TEENAGERS AND SOCIAL REPRESENTATIONS OF SEXUALITY: A CASE STUDY OF REGGAETON IN MEXICO CITY

Dulce Martínez

1SOCIOLGY, UNIVERSIDAD AUTÓNOMA METROPOLITANA AZCAPOTZALCO, México, City, Mexico

Abstract: In recent years the field of sexuality studies has increase in México; basically they have focus in young people. One of the reasons is the growth of young population, more than 50% of Mexicans have less than 30 years-old, and according to the INEGI[1] this number will be growing. This situation makes necessary to think about youth’s problems or necessities like education, health, unemployment and sexuality.

Sexuality is one of the topics that teenagers are most interested and entertainment activities too, like listening to music, going to parties or watching music videos. According to this, we want to think about the relation between sexuality and music.

In México are two elements that contribute to generate teenagers’ social and sexual problems -like school desertion because of pregnancy-, one is the limited sexual education and the other is the Mass Media. Mass Media play a significant role in this problem because spread sexual contents that show an idealized, playful and glamorous sexuality without risk, responsibility and consequences. So when young people watch these images they are not able to understand or realized that those imagines are not real life. An example is reggaeton, this music contains an explicit sexual behavior in music videos and lyrics too, and is one genre of the most distributed by Music Industry and listened for teenagers in México.

The purpose of this paper is to reflect and share information about social representations of sexuality in teenagers who listening reggaeton, to think about how these representations have influence in teenagers’ life and relationships. Specifically in social practices, processes of interaction and sexual behaviors.

Keywords: teenagers, sexuality, social representations and music.

I HAVE TO LOVE HER/HIM TO HAVE SEX WITH HER/HIM. OR MAYBE NOT. ARTICULATIONS BETWEEN SEX AND LOVE IN YOUNG PEOPLE’S DISCOURSES AND PRACTICES.

Ana Cristina Marques

1CIES, ISCTE-IUL, Lisbon, Portugal

Abstract: Nowadays, in western societies, the ideal of love is strongly implemented as a justification for sexual activity and as something that legitimizes and should guide relations between partners, into conjugality; whereas, sex is considered a vehicle through which intimacy is created and maintained.

In this paper I will reflect on the ways love and sexuality are (or not) interconnected in young people’s intimate lives. Data presented here is part of an on-going research on young adult’s sexual paths to conjugal relationships and to parenting. Interviews were conducted to 60 young adults (50 heterosexual, 8 homosexual and 2 bisexual), from Leiria (central Portugal), belonging to different social backgrounds, whose ages ranged from 18 to 29 years old.

I argue that love and sexuality tend to be interconnected in young people’s discourses and experiences, being considered sources of well being and important bases for intimate relationships. For many young people, regardless gender or sexual orientation, love is seen as the main motive for having sexual intercourse and sexuality is thought of as something that strengthens the relationship and deepens the knowledge and the feelings one as of for the partner. Notwithstanding, sex and love don’t always go hand in hand. For several young people sexuality acquires value as a form of pleasure, not always connected with profound emotional feelings, as expressed in hooking up. A “romantic” and a “libertarian” sexual ideology coexist, sometimes resulting in tension and ambiguity in the form young people represent and experience sexuality in their lives.

RECOGNITION AND REDISTRIBUTION: CLASS AND YOUNG PEOPLE’S SEXUAL CITIZENSHIP

Elizabeth McDermott

1Social Policy & Social Work, UNIVERSITY OF YORK, York, United Kingdom

Abstract: The widening acceptance and incorporation of sexual diversity within modern European societies has made possible sexual citizenship but what or who constitutes a sexual citizen? Drawing on work conducted for the UK Equality and Human Rights Commission which advised on asking young people about their sexuality for research and monitoring, this paper considers the dilemmas for social scientists in creating sexual knowledge which may legitimate particular groups of people and hence institute sexual citizenship norms.

Measuring young people’s sexuality highlights the inherent tension between the ‘fixed’ sexual identity categories required for large-scale data collection and the ‘fluidity’ and uncertainty of ‘youth’ and ‘sexuality’. Research demonstrates that young people use a profusion of sexual identity categories (e.g. queer, questioning, pansexual) in addition to heterosexual, lesbian, gay or bisexual; and they may be resistant to, and uncertain or undecided about, sexual categorization. There is also evidence that social class position and ethnicity influences young people’s sexual identification.

Both nation states and those working to improve equality argue that sexuality needs to be measured, counted and ‘known’. This knowledge becomes part of the state apparatus for the control of populations by making them understandable and governable. Furthermore, they make some sexual identities intelligible and exclude others. The danger is that we establish through quantification, homo-normative categories which only render visible white, middle class, LGB youth. In these turbulent times of widening inequalities
and increased youth unemployment, there is an urgency to ensure that sexual citizenship includes all young people.

**STUDENTS' SEXUAL BEHAVIOUR IN SLOVENIA**
Ivan Bernik,1, Tina Kogovšek,1, Alenka Švab,1, Roman Kuhar2
1Faculty of Social Sciences, 2Faculty of Arts, UNIVERSITY OF LJUBLJANA, Ljubljana, Slovenia

Abstract: The paper will present preliminary results of the first national study of sexual life styles of university students in Slovenia. The survey was conducted with on-line questionnaire on the sample of 6,800 students from three major Slovenian universities (Ljubljana, Maribor and Primorska) in the period from December 2010 to February 2011. Focusing especially on gender differences and sexual orientation the paper will present and discuss survey results related to the following two aspects of sexual behaviour: (1) the main parameters of heterosexual activities (age at first coitus, coitus frequency, number of coitus partners, etc.), and (2) the prevailing forms of social organisation of intimate relationships (from sporadic sexual encounters to stable partnerships). These data will be compared systematically to the results of the German survey of students’ sexual behaviour which was conducted in the nineties and to the results of a survey of sexual life styles of general population in Slovenia conducted in the beginning of the previous decade. The comparisons will be led by the assumption that sexual behaviour of Slovenian university students does not differ substantially from the behaviour of their German counterparts and that in comparison to the sexual life styles of Slovenian general population the students represent a dynamic sexual “vanguard”.

**YOUNG PEOPLE DISCOURSES ABOUT SEXUALITIES**
Sofia Ramos de Almeida Santos,1, Helena Costa Araújo,1, Laura Fonseca1
1Educational sciences, FACULTY OF PSYCHOLOGY AND EDUCATIONAL SCIENCES, Porto, Portugal

Abstract: This paper analyzes the way young people learn and confront sexualities in Portuguese urban and rural schools. More concretely, it focuses the importance of sex education on sexualities production, framed by educational concerns and sexual citizenship. It attempts to develop a critical and gender approach on young’s people discourses and representations, through the analysis of sixteen Focus Groups Discussion with secondary schools students (aged 13-18) (Fonseca, 2009).

To support this framework, Michele Fine’s (2006; 2009) typology about prevailing discourses of the way sexuality is managed inside schools is a central contribution. Four young sexualities ideal types are presented: sexuality as violence; sexuality as victimization; sexuality as individual morality and sexuality as desire. It is considered that school is under a sexual and gender regime, where girls (and also many boys) are educated and positioned as victims of male desire, of coercion and of moral judgments. Fine (2009) argues that hegemonic discourses and practices are an obstacle to the development of a critical approach, namely for girls, for whom equality can only be considered in more systematic way if school education acknowledge “sexuality as desire”. Therefore, the aim here is to explore and reformulate this typology, through listening to youth heterogeneity, proposing new dimensions of sexualities – sexualities as a silent pact, sexualities as “girl power” and sexualities as citizenship practice.

Under public and political pressure, schools, and especially sex education, emerge as “spaces of negotiation” confronting policies and moral interests that regulate young people desires and support social institutions, as heterosexuality and marriage. Thus, for us, to perceive schools as powerful places of sexuality learning, free of “discourse of victimization” imply the compromise of educational institutions with sexual and intimate citizenship orientations (Richardson & Turner, 2001; Plummer, 2003).

**FLEMISH TRANSSEXUALS: THEIR OBJECTIVE AND SUBJECTIVE QUALITY OF LIFE IN PERSPECTIVE**
Joz Motmans1, Petra Meier2, Guy T’Sjoen3
1Sociology, Policy Research Centre on Equal Opportunities, University of Antwerp, 2Political Science, University of Antwerp, Antwerp, 3Endocrinology – Andrology, Center for Sexology and Genderproblems, University Hospital Ghent, Ghent, Belgium

Abstract: Although hormonal and surgical gender reassignment procedures have been increasingly refined and accepted medically over the past 40 years (Green, 2010), little is known about the direct effects of changes in the gender identity and role on the socio-economic position, health and wellbeing of transgender people. Research examining the quality of life (QOL) of transgender people is exceptional (Newfield, et al., 2006; Weyers et al., 2009; Kuhn et al., 2008; Ainsworth & Spiegel, 2010) and existing studies lack an analysis of the role of major socio-demographic indicators such as age, gender, educational level, and social position in the explanation of the QOL outcomes.

To increase our understanding of the consequences of being transgender on the quality of life, we designed a survey based the European Quality of Life Survey (Eurofound, 2007). The EQLS 2007 focuses on quality of life broadly, measuring resources and living conditions through objective indicators, and also incorporates subjective indicators of general well-being.

In this paper we present the results from our QOL survey among 242 transsexuals (male and female), and compare the objective and subjective QOL indicators with the Belgian data from the EQLS 2007, with particularly attention for similarities and differences related to gender, age and income.

**IDENTITIES AND (IN)VISIBILITIES OF TRANSEXUAL WOMEN AND MEN: THE ‘GENDER’ STRIKES AGAIN**
Sandra Palma Saleiro1
1Centre for Reasrch and Studies Sociology (CIES), INSTITUTO UNIVERSITÁRIO DE LISBOA (ISCETE-IUL), Lisbon, Portugal

Abstract: The paper presents some results from the research project “Transsexuality and Transgender: Gender Identities and Expressions of Gender”, which was undertaken at CIES-IUL, with funding from the Foundation for Science and Technology. Completed in 2010, is one of the first approaches to the topic within the field of the social sciences in Portugal.

Transsexuality is fertile ground for discussions on femininity and masculinity; on what it is to be a man and to be a woman in both intimate and social levels. The biographic interviews and ethno-
graphic incursions highlighted the existence of a major difference between transsexual men and transgender women at the level of both gender identities and social trajectories. This shows that sex/gender is one of the main difference-producing variables, just as it is for the cissexual population (i.e. people for whom there is no mismatch between the sex they were attributed at birth and the gender they experience). But in the case of transsexual people, the analytical complexity is greater, inasmuch as it requires us to deal with a dual reference: the sex/gender which is attributed, and that which is expressed. When we analyse transsexual identities, we must bear in mind that we are in the presence of highly medicalised identities, and that there is a ‘classic narrative of transsexuality’ which arose in the medical sciences, and which has more recently been joined – often in opposition – by new or alternative references constructed on the basis of movements ‘from inside’. These new references, which are materialised in new expressions of gender, have the potential to change the identities and visibilities of transsexual women and men.

REGULATING TRANSITIONS: ANALYZING DISCOURSES AROUND TRANS IDENTITIES.

Carmen Romero Bachiller 1, Esther Ortega 2, Rebeca Ibáñez 3

1Dpto. Sociología V (Teoría Sociológica), 2UNIVERSIDAD COMPLUTENSE DE MADRID, 3Departamento de CTS, Instituto de Filosofía, CSIC, Madrid, Spain

Abstract: In most psychological, biomedical and judicial discourses, as well as in many activists and academic ones on trans identities, emphasis is primarily settled on a movement from one gender pole to the other. Yet there is huge criticism to this image as it does not recognise the possibility to inhabit nor one pole neither the other. In fact, there are also many activists groups and academic tradition which has taken trans identities as models for gender disruption.

In a moment where several voices claim strongly for the despathologization of trans identities, regulations of gender transists do not seem to disappear, but to rearticulate in a new fashion that perpetuates gender poles as stable nodes of identity, however transforming what counts as pathological –as it emerges from the proposal to modify “Gender Identity Disorder” in “Gender Incongruency Disorder” in the forthcoming DSMV-5.

In this paper we analyse the tensions and rearticulations emerging in actual discourses around trans identity regulation in the psychological, biomedical and legal arena contrasting them with the demands displayed from different trans activist groups. In particular we emphasise in the production and reproduction of old and new polarities that seek to contain and constrain the limits of gender poles and to set a severe control on it transists.

SOCIO-DEMOGRAPHIC CHARACTERISTICS OF TRANS PEOPLE IN BELGIUM: A COMPARISON OF OFFICIAL STATE, MEDICAL AND SOCIAL DATA

Koen Ponnet 1, Joz Motmans 3

1UNIVERSITY ANTWERP, antwerpen, Belgium

Abstract: Although many transgender people experience high levels of inequalities and discrimination in all walks and aspects of their life, few empirical studies have investigated the social position and life circumstances of transgender people. One of the major problems in this area is that transgender people constitute a ‘hidden population’ and as such, are difficult to access (Whittle et al., 2009). The population is both very diverse and very private, and many transgender people may not be visible as transgender, since not all transgender people modify their body according to their gender identity by gender reassignment surgery (GRS).

Throughout the history of medical studies on transsexuality, efforts have been made to investigate and determine the prevalence of trans people. These prevalence studies focus on transsexual people only, however defined (see for an overview, Gomez et al., 2009), so using the more narrow interpretation of who counts as ‘trans’. Within this area of work, little is written about the prevalence and/or socio-demographic features of trans people in the broader sense of word, including those who do not undergo a medical GRS.

The present paper describes the socio-demographic profile of trans people in Belgium in both its broadest and most narrow interpretation. To do so, we rely on three different data sources. First, using the Belgian National Register, data were gathered from all individuals (male and female) who officially changed their sex on their birth certificate, from 1993 till 2008. Second, we rely on medical data from the Belgian gender clinics, of both female and male transsexuals after GRS, between 1985 and 2003 (De Cuypere et al., 2007). Third, data is used from the Belgian TransSurvey (Motmans et al, 2010), which describes the social and legal situation of gender variant people in Belgium. The combination of these three different data sources, allows us to differentiate between transsexual and transgender people. In the first part of the paper, we will describe the socio-demographic characteristics and the sex ratio of transsexual people in Belgium based on the medical records, the official numbers of sex reassignments and the survey findings. In the second part, we will elaborate on the ‘grey zone’ of those who have not undergone GRS but who identify themselves as transgender.

CONSTRUCTING IDENTITIES IN NO MAN’S LAND OF SEXUAL BOUNDARIES: THE CASE OF BISEXUAL WOMEN

Manuela Beyer 1

1Cluster ‘Languages of Emotion’, FREE UNIVERSITÄT BERLIN, Berlin, Germany

Abstract: Empirical data stemming from different studies on sexual behaviour converge on the fact that a high percentage of people engage in sexual encounters with both sexes over the lifespan. This seems to contradict the comparably small number of persons identifying as bisexual since most persons rather regard themselves as either hetero- or homosexual. This paradox of sexual identities not being closely tied to sexual behaviour is taken as a starting point to investigate the following questions: which social processes and factors do prevent identifying oneself as bisexual, and which do support bisexual identification? The theoretical background is provided by classical sociological approaches such as Mead’s and Goffman’s as well as by Social Identity Theory and focuses on interactionist aspects of identity and self-categorization. Due to gendered differences in constructing sexualities, the research I report is confined to female bisexuality only. The study is based on qualitative interviews with twelve women who were either self-identified bisexuals or have had sexual experiences with men and women, or transgenders. I will report on three main obstacles for bisexual identification, all connected to a hegemony of dichotomously structured sexual identities: (a) the construction of a female heterosexual-
CONSTRUCTIONS OF THE FEMINIST (SEXUAL) SELF: INDIVIDUAL BIOGRAPHIES AND CULTURAL RESOURCES

SUE SCOTT ¹, STEVI JACKSON ¹

¹PRINCIPAL’S GROUP, BRITANNIA BUILDING, GLASGOW CATERDONIAN UNIVERSITY, GLASGOW, United Kingdom

Abstract: This paper will draw on our previous work on theorising sexuality and on constructions of the self, but will be based on recent, in depth life-history, interviews with self-defined feminists, both lesbian and heterosexual. The paper will explore the ways in which competing cultural scenarios are drawn on and appropriated in making sense of the self. In particular, we focus on the relationship between personal biography and social location in shaping reflexive self construction, and the forms of sense-making available to and appealing to particular individuals, and/or avoided by them - for example preferences for, or rejection of, psychological, biological or social self explanation. Using narrative analysis, informed by G. H. Mead’s conceptualisations of time and the self, we explore the re-making of the self, and particularity the sexual self, over time and ways in which self is continually reconstructed from the standpoint of the present.

FUNNY TALKS: SEX AND LAUGHTER IN DOING HETEROSEXUAL MASCULINITIES

Raffaella Ferrero Camoletto ¹

¹Social Sciences, UNIVERSITY OF TURIN, Turin, Italy

Abstract: The paper aims at exploring the processes by which men perform their masculinities while accounting for their heterosexual biographies and making sense of their sexual experiences. Assuming a notion of gender as something we do more than something we are, masculinities are analysed through the practices enacting them. Activities of body management, and more specifically sexual activities, are core practices in the production of masculinities. In this perspective, male sexuality is strongly regulated by homosociality: the male gaze entails a reference to a community of practices sustaining and reproducing hegemonic masculinity.

Based on the analysis of 30 in depth interviews, carried out in 2007-08, with a sample of men aged 18 to 35 living in Piedmont, Northern Italy, the paper focuses on a specific mechanism of doing heterosexual masculinity: the use of humour within intragender interviews (with a male researcher) on the topic of heterosexual biographies. Previous research has pointed out how jokes, banter and humourous stories about sex belong to a cultural repertoire shared by young men in expressing their masculinities and recalling male complicity and solidarity.

In this perspective, intragender interviews are interpreted as a particular homosocial context within which men not only tell their heterosexual stories, but also perform their heterosexual masculinities. Humour is analysed both as content (which topics it is used to talk about) and as a context (to which audience it is directed). The paper shows how the use of humour, while generally working as an organising principle of heterosexual masculinities, can assume different meanings and functions (reproducing, negotiating, challenging and subverting hegemonic models).

THE SOCIAL DIMENSIONS OF CHANGING IDENTITY AND SEXUALITY ACROSS THE WORLD

Mara Maretti ¹, Lara Fontana ², Francesca Fortuna ²

¹Social Science, UNIVERSITY OF CHIETI-PESCARA, Chieti, ²DMQTE, UNIVERSITY OF CHIETI-PESCARA, Pescara, Italy

Abstract: Keywords: gender identity, sexuality, fuzzy logic, socialization process, cross-national survey

Fluidity, uncertainty, indeterminacy, which characterize our historical age, are reflected in the growing diversity and richness of gender identity. In fact, gender and different expressions of sexuality can be thought of as fuzzy concepts in transition.

In this framework we consider an exploratory research aiming at achieving a classification of genders that takes into account both the relationships with sexuality and the role of socialization agents which might have a larger impact on the transformation of sexual and gender identity. The exploration of gender identity should take into account individual and external factors connected both to socio-cultural variables and to economic indicators.

For this purpose a cross-cultural research is being carried on by means of a web-based survey. Cross-cultural research allows the development of contingency theories in which cultural and socio-economic factors moderate key relationships in the theoretical models.

In order to consider micro- and macro-level dimensions, in the framework of Item Response Theory (IRT), a Multilevel Analysis approach is adopted. IRT models are routinely employed in behavioural and social research, where latent variables play an important role in the statistical modelling of response data measured on an ordinal scale. The multilevel analysis allows to integrate an item response model with the hierarchical structure exhibited from data.

**SOCIOTECHNICAL CHANGE AS GRADUAL TRANSFORMATION**

Ulrich Dolata

1Department of Organization and Innovation Studies, UNIVERSITY OF STUTTGART, Stuttgart, Germany

Abstract: Processes of sociotechnical change that are caused by new technological opportunities do not occur in the short term as radical upheavals that quickly lead to a new period of technological, institutional or organizational continuity. What appears, after a period of ten, twenty or thirty years, to be radical sociotechnical transformation is in fact the result of longer processes of searching and restructuring, which are impacted by a multitude of related technological and socioeconomic changes. First when these changes accumulate do they then lead to substantial modernizations of the technological, institutional and (inter-)organizational foundations of society, the economy or a sector. How can one analyze such processes of radical as well as gradual transformation? Via which mechanisms do such transformations take place, which patterns and variations do they assume? Against this background of changes to economic sectors as triggered by new technologies, this paper develops a concept of gradual sociotechnical transformation that allows for the analysis and structuring of the multi-phased and often erratic or non-linear processes of radical sociotechnical change. Over a period of time these processes consolidate into substantial sectoral adjustments. These conceptual considerations on the mechanisms and patterns of sociotechnical change are linked on the one hand to research on sociotechnical transitions, which has for several years attempted to identify varying transition contexts and – building upon this – to devise and delineate differing transition pathways. On the other hand these conceptual considerations refer back to more recent research on the gradual institutional change of modern capitalism, which is primarily represented by the work of Kathleen Thelen and Wolfgang Streeck.

**THE CONCEPT OF TRANSDISCIPLINARITY AS PROMISING PARADIGM FOR SOCIOLGY?**

Michael Staufacher

1Natural and Social Science Interface (NSSI), ETH ZURICH, Zurich, Switzerland, 2School of Management and Planning, Stellenbosch University, Stellenbosch, South Africa

Abstract: In the last couple of years, transdisciplinarity has been discussed, developed and specified in many areas as for instance environmental and sustainability sciences, human ecology, technology assessment, north-south research, and health sciences. At the core, the concept of transdisciplinarity denotes a form of knowledge production that starts from social problems, transcends disciplinary boundaries and as well goes beyond sciences, aspires a mutual learning process among science and society and wants to contribute to a transformation or solution of the problem at hand. Thus transdisciplinarity is a specific concept for the science-society interface.

In this paper I present some essential dimensions in the development of the concept since the early 1970s and give an overview on its different understandings. Doing so, I will as well visit some of the critical views expressed from the perspective of the sociology of science. In essence, these views point to the development of role conflicts for scientists involved in transdisciplinary projects. In addition to soundness of science, scientists are as well responsible for the usefulness of their results. Some scholars argue that transdisciplinarity cannot be understood as science but rather as policy advice or even more bluntly even as policy itself. It is as well argued that quality of its output cannot be guaranteed as peer review only functions in a precise disciplinary context.

Pondering these role(s) and potential conflicts I will refer to my own experiences from more than 16 years working as sociologist at the fringes of science and society in the field of environmental issues. In turn, I will review a number of handbooks of environmental sociology and try to disentangle which role(s) is foreseen for sociologists when dealing with environmental problems. I conclude with some considerations if and how transdisciplinarity could be useful for sociologists aiming to contribute to practical solutions or transformations of environmental problems.

**GIVE ME A SIMULATION AND I WILL RAISE THE WORLD? THE ROLE OF NUMERICAL SIMULATIONS IN SCIENCE AND SOCIETY**

Mikaela Sundberg

1Sociology, STOCKHOLM UNIVERSITY, Stockholm, Sweden

Abstract: Numerical simulations have come to be widely used in contemporary science, alongside more traditional scientific practices. Numerical simulations are based on transformations of mathematical models into algorithms, which are then translated into computer code. What is the status and role of this scientific practice - in science as well as in society? How can we understand this from a sociological perspective? This paper summarizes findings from a qualitative, comparative study of numerical simulations in three physics-based disciplines (astrophysics, oceanography and meteorology, including climate modeling) in order to move from the situation in these particular fields to a more general social condition.

Observing simulationists’ working days easily gives the impression of individuals sitting by themselves, tapping on keywords, switching among many computer windows, and occasionally solving equations, but to scrutinize this scientific practice sociologically involves focusing on collective work and accomplishments. This paper summarizes the analysis of two fruitful settings for such an endeavor, which also acknowledge the technoscientific character of numerical simulations. First, simulationists gather through their work with numerical codes (technology) and different ways of organizing these collaborative efforts generate different perspectives of what it means to be a user and developer, respectively. Second, simulationists gather due to common research problems (science) to create standards for what constitute reasonable results for these problems. These findings suggest how numerical simulations have become an established scientific method and simulation codes a routine technology.

Situating these findings in a broader context, this paper suggests that on the level of science, numerical simulations are related to
interdisciplinary problems and models of complex systems. The current development regarding climate science and climate models are examples of this. On the level of society, numerical simulations constitute the core of a more general quantitative logic, involving not just science but also areas such as urban planning, architecture, and bureaucracy.

30 YEARS OF THE SOCIOLOGY OF SCIENCE, TECHNOLOGY & INNOVATION IN EUROPE
Fred Steward
Policy Studies Institute, WESTMINSTER UNIVERSITY, London, United Kingdom

Abstract: 15 international conferences were held by EASST (the European Association for the Study of Science and Technology) between 1982 and 2010 involving the participation of about 5000 distinct individuals and about 1300 distinct organizations. This paper presents an analysis of the development of the field over this time. All papers presented at these conferences have been analyzed in terms of the organizational affiliation of the presenter which enables characteristics such as national location and disciplinary affiliation to be identified and the patterns and trends assessed. In addition an analysis has been undertaken of the content of the papers presented. Text based analysis of titles and abstracts has been carried out in order to follow the changing discursive structure of the field. The changing preoccupations of the field in both conceptual foci as well as empirical domains are presented.

Fred Steward is presently the President of EASST and, with the assistance of Dr Athena Piterou, has compiled a database of all conference presentations based on EASST records. Statistical and social network analysis methods are utilised in the study. Some preliminary results were published in Fred Steward & Athena Piterou (2010) 25 years of EASST conferences 1983-2008 Patterns of participation and their strategic implications EASST Review 29 (3) 8-13

SPEECH ACT THEORY AND THE COMPLEX RULES OF THE SCIENTIFIC GAME, SCIENTIFIC CONTROVERSIES AND THE CONTESTED NATURE OF SCIENTIFIC DISCOVERIES
Feiwel Kupferberg
Culture, Media and Language, MALMO UNIVERSITY, Malmo, Sweden

Abstract: A major, unresolved issue in the philosophy, history and sociology of science is how to account for the fact that scientific discoveries are always contested and that the emergence of scientific consensus is so slow and difficult to accomplish. A major contribution to this issue was offered by Thomas Kuhn who in his book The Structure of Scientific Revolutions, suggested that the main reason for this phenomenon might be that the rules of science were much more complex than previously assumed. Whereas Popper’s theory of science basically only admitted one single rule (the rule of falsification), Kuhn’s interpretation, which based itself on wide readings within the history of science, suggested that there might be other binding rules that scientists participating in the scientific game had to consider apart from the rule of falsification. What he didn’t do was to firmly base himself upon a theory of science which from the very start conceptualized science as a complex game. In this paper I suggest that Wittgenstein’s theory of language games in combination with Austin’s and Searle’s theory of illocutionary speech acts, allow us to arrive at a more precise description and analysis of what the scientific game is about and what binding rules are at stake that drive scientific controversies.

UNDERSTANDING QUALITY IN SCIENCE IN SCIENTIST’S TALK
Maria Xenitidou, Nigel Gilbert
Sociology, UNIVERSITY OF SURREY, Guildford, United Kingdom

Abstract: The paper reports on a research conducted between October and December 2010 exploring how scientists in the natural sciences construct quality in science. Twenty interviews were conducted, transcribed and discourse analysed. Quality was treated as ‘topic’ and the emphasis was on the ways in which scientists talk about quality, the resources they draw on to do so and in what context, and the ways in which they position themselves in the flow of talk.

Quality seems to be negotiated in the juncture of global, external and established metrics on the one hand, and personal, internal understandings, on the other. This is context (and task) dependent and reveals that understandings of quality in science are dynamic.

OPEN SCIENCE - OPENNESS IN SCIENTIFIC RESEARCH
Dorota Marciniak, Pedro Jacobetty, Gustavo Cardoso
Social Psychology, AUTONOMOUS UNIVERSITY OF BARCELONA, Barcelona, Spain, ISCTE, Lisbon University, CIES, ISCTE, Lisbon University Institute, Lisbon, Portugal

Abstract: Innovations in Information and Communication Technologies (ICT) are changing scientific work. Collaboration and sharing of research tools, data and knowledge among scientists is made easier by the scientific community’s widespread use of ICT. Science, as a collaborative knowledge production and dissemination system, is adopting these new resources in the daily routines of scientists, which is generating quantitative and qualitative changes in the way science is done. We will debate this issue, integrate it with our inquiries to the scientific community through questionnaires and interviews, and illustrate the new trends we observed in the direction of a more “open” model of science.

The development of ICT gave rise to new communication networks. Together with the applications developed by their users, these digital networks were the platform for communication channels with unprecedented properties. Individuals and groups adhered to the new resources in the most differentiated ways, which led to reorganization in a vast amount of human activities. Contemporary scientific work relies heavily on ICT. They are often directly linked with new scientific breakthroughs, e.g. the mapping of the Human Genome, made possible through collaboration between hundreds of laboratories and the use of large scale computation. But ICT are also in the daily routines of scientists and throughout the different research stages and practices. The increasing amount of knowledge available online structured a new informational context for scientists. The development of applications available on the networks gives scientists new tools that enable immediate, long-distance collaboration. Scientists use ICT to process and store large data volumes, but also for contacting and sharing of information among themselves. Digital tools behind research and communication, international research networks, the advent of new data sources and
large scale processing capabilities brought changes described as radical shifts in scientific practice, or even as a transformation of what is the “essence” of science.

The possibilities for collaboration and sharing through ICT strengthened the desire for a more “open” science inside the scientific community. Scientists are now pioneers in defining the strategies to attain greater degrees of openness in Science.

**CHANGING SCIENTIFIC ENGAGEMENT THROUGH INTERDISCIPLINARITY**

Mary Sue Hamann 1, Alina Martinez 2, Jacob Kraemer Tebes 3

1Dental and Craniofacial Research, NATIONAL INSTITUTES OF HEALTH, Bethesda, MD, 2Abt Associates Inc, Cambridge, MA, 3School of Medicine, Yale University, New Haven, CT, United States

Abstract: There exists a strong belief among many biomedical researchers and funding agencies that interdisciplinary methods are necessary to overcome the complexities of important medical questions and the numerous research methods available. Interdisciplinary research requires investigators not only to work within their own disciplines but also to develop at least a working knowledge of other disciplines in regard to basic concepts, terminology, research methods, and research findings. Professional interactions among scientists from different disciplines should change when they decide to work together to support an interdisciplinary structure.

The National Institutes of Health, through its Roadmap for Medical Research, funded multiple programs supporting team science, including the Interdisciplinary Research Consortium Program. The primary program goals for the Interdisciplinary Research Consortia follow:

- Encourage the integration of different scientific disciplines to develop new intellectual and technological approaches to complex health problems;
- Support interdisciplinary approaches to solving significant and complex biomedical problems, particularly those that have been resistant to traditional approaches;
- Catalyze the creation of new disciplines.

The Consortium Program was the subject of a national evaluation. Activities, experiences, and perspectives of participating faculty-level investigators were documented through individual interviews, electronic surveys, observations, and bibliometric analyses. One important feature in the evaluation of interdisciplinary team science is the distinction between standard biomedical indicators involving research quality and productivity and the additional value offered to scientific innovation and discovery by interdisciplinary research and training. Specific expected value-added outcomes (that is, attributable to an interdisciplinary approach) that should be observable in investigators at the mid-course of a program, about three to five years into a biomedical research program, include an expanded research vocabulary, the ability to work in more than one discipline, and the adoption of interdisciplinary perspectives in scientific speaking and writing. Findings from the evaluation will be discussed in the context of these expectations.

**RESEARCH UNDER PRESSURE. THE PBF IN MEDICAL FACULTIES AS AN EXAMPLE FOR GOVERNANCE OF SCIENCE**

Uta Landrock 1, Rene Krempkow 1, Jeffrey Demaine 1

1IFQ BONN, Bonn, Germany

Abstract: In recent years, performance based funding (PBF) has taken a central role among competitive elements in German universities. Links between performance evaluation and mechanisms of financial distribution are now in place not only at statewide levels, but also at the faculty level. The main ideas of the New Public Management framework, as well as New Governance literature, to some extent, are based on the assumption that output-oriented governance is the most efficient form of governance. As of yet, however, little is known about the impact of PBF as a means of managing higher education. Also, recent empirical findings do not offer clear answers about whether such a method of governance actually leads to increased performance, and to what extent unintended effects occur. An analysis of German university medicine suits this question well, given that it has been over a decade since the first PBF models were implemented nationwide in medical faculties. The Institute for Research Information and Quality Assurance (IFQ) in Bonn therefore investigates this problem though a project about the organization, perception, and effects of performance based funding.

The proposed paper will present selected results of multivariate analysis of both intended and unintended effects of PBF in relation to the intensity of publications of faculties and the amount of third party funding. It builds on the framework of our IFQ project that conducted document analyses of PBF models, analyses of statistical data from university medicine, and a survey of faculties. Contrary to the expectations, the results of our multivariate analysis established that the researched characteristics of PBF models and the actual volume of third party funding, as well as the actual publication output per professor, are not related. However, a comprehensive evaluation process and the size of financial resources are related to both third party funding and the intensity of faculty publications. Furthermore we can show interrelations between the amount of third party funding and the intensity of faculty publications; nevertheless these interrelations vary with different characteristics of PBF models.

We found intended and unintended effects of governance on the faculty level. As our aim is to find out how these effects occur in the faculty departments, we will conduct a detailed bibliometric analysis of publications per faculty.

**UNIVERSITIES, REFLEXIVITY AND CRITIQUE: CULTURES AND CONTEXTS OF RESEARCH PRODUCTION**

Seppo Poutanen 1,2*, Anne Kovalainen 2,3*

1Dept of Social Research, University of Turku, Turku, Finland, 2Gender Institute, LSE, London, United Kingdom, 3Dept of Management, University of Turku, Turku, Finland

Abstract: In the paper we will analyze two interrelated questions: first, we will explore how the organizational forms shape and formulate the conditions for and possibilities of knowledge production in the epistemic agora. Second, interrelated to that, more generally, how the new institutional rearrangements and governance in the academic institutions presently formulate the research agenda for the epistemic communities and knowledge production, through the changing work cultures and value formation, through which the epistemic communities establish their boundaries. Both these questions are related to the issues on the cultures and institutional con-
text in which researchers work, and how knowledge gets articulated within the research community and outside of it. The new organizational structures we have previously explored in the Finnish case (Poutanen & Kovalainen 2010) embody the present politics of knowledge that reign in science policies globally, that is, focusing on the usability of knowledge created, and the user-value orientation in the knowledge creation. The new organizational structures, as potentially new agoras, also epitomize several of the changes that have taken place in the science and industry landscape of the past decades all over Europe and the world. We are interested in understanding how epistemic communities are situated vis-à-vis different forms of agora in knowledge production. The empirical examples used in this paper come from Finland, where major new institutional reforms in science policy have taken place, thus changing the research landscape in a major way. In the analysis, we will not delimit ourselves on the cultures and organizational forms of research, but wish to look at the new intermediate organizations epitomizing the networks of actors that extend across universities, businesses and state.

CONSTITUTING DIFFERENCE THROUGH GENETICS: FINNISH BIOBANKS AND PUBLIC PERCEPTIONS OF NATIONAL IDENTITY

Aaro Tupasela

Abstract: During the past decade Finnish research groups have actively engaged in the use of biobank material in the study of population genetics whereby the genetic similarities and differences of populations are explored using genetic material collected for various research projects. The research presented here begins with the simple question of how does one define and characterize the borders and boundaries that constitute a population. What are the characteristics according to which groups of people can be said to belong together or differ from one another? The question of boundaries within human populations has been a central element within sociological, historical and anthropological studies of communities, identities (Anderson, 1991; Pálsson, 2007) and the classification and categorization of people using different criteria (Bowker and Star, 1999). Indeed it is also a central question relating to building Europeanness in a time of turmoil and uncertainty.

This question has more specifically been tackled within the natural sciences, namely within population genetics, through the analysis and identification of genetic differences among various human populations (M’charek, 2005; Reardon, 2004). The constitution of difference through genetic markers is playing an increasingly important role in biomedicine as it relates to our understanding of disease, the development of public health policies, as well as personalized medicine. This research explores the ways in which new knowledge of genetic variations in population structure creates – if at all – new social categories and communities and the ways in which such population groupings change our understanding of disease in Finland.

Recent publication by genetics research groups in Finland has spurred a great deal of public discussion relating to the genetic identity of Finns. The discussions reflects an attempt by Finns to come to terms with destabilizing forces relating to identity because Finns have traditionally been seen as a homogenous group of people. The more recent studies indicate large differences among various population segments, which has spurred popular debate among Finns among what it is to be Finnish genetically and how this translates to cultural and other arenas of identity. These population studies also have an important impact on the way European populations are categorized and characterized genetically.

PUBLIC PERCEPTION OF SCIENCE AND TECHNOLOGY: THE CASE OF RUSSIA

Olga Shuvalova

1 HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The paper is based on the analysis of the results of the public opinion polls held in Russia in the period 1995–2009. Surveys eliminated considerable discrepancy between the declared positive attitudes of Russians towards science (i.e., acknowledgement of its high level, general importance for society, believe in instrumental value of science) and factual alienation of the majority of population from science (which is most vividly reflected through international comparisons – in lack personal interest and involvement in S&T, insufficient level of scientific knowledge, poor understanding of differences between science and pseudoscience), certain conservative character of consuming practices and low acceptance of technical innovations. At the same time Russians is very realistic about the conditions and barriers to innovation development. On the one hand, the respondents recognize the importance of technological innovation for the modernization of the national economy. On the other hand, the economic growth and technological development is seen only as a condition for the achievement of a major national priority – the welfare of the major population, which is not possible without improving institutions of civil society. Increasingly people agree that science and engineering solutions can help to overcome environmental problems and to control the socially significant diseases. But the respondents give mostly negative assessments of the current introduction of the innovations to industry and everyday life. A significant number of respondents do not believe that new technologies will help to improve their lives in the next 20 years.

MORE THAN WORDS CAN SAY. USING IMAGES IN THE DEBATE ABOUT GENETICALLY MODIFIED ORGANISMS IN AGRICULTURE. A PICTURE-DISCOURSE-ANALYSIS

Jedrzej Sulmowski, Beate Friedrich, Daniela Gottschlich

1 Department for Sustainability Governance, Leuphana University of Lueneburg, Lueneburg, Germany

Abstract: Since the mid-1990s agro-biotechnology has become one of the most hotly debated issues. The controversy started over the promise of making this world a better place. Scientists and organizations in favour of genetically modified organisms (GMOs) argue that these organisms would help agriculture to be more effective. Opponents of GMOs, on the other hand, reject the idea, that agro-biotechnology can provide a clean technology for enhancing eco-efficient agro-production and health benefits for the poor. Rather, they refer to multiple risks: the contaminated food chain, inherent hazards for both eco-systems and humans, and socio-economic problems.

While the pros and cons are well known in the debate about genetically modified organisms in agriculture, little attention has been paid to the pictures which have been used by actors of both sides
and to the question how they illustrate and correspond to the respective point of view. Following the results of the discourse on the “visual turn” in the social sciences we analyse how pictorial messages are produced and what underlying ideas they transport. GMOs are often shown either as monsters or as the outcome of the fine art of engineering sciences. We will identify how illustrators play with the recipients’ fears on the one hand, and we will highlight, on the other hand, the attempt to give people a sense of security through images which say: “Everything is under control”. We point out that what is frequently employed for these purposes, especially by promoters of GMOs, are graphic metaphors from the medical and military areas.

WHAT TYPE OF GOVERNANCE FOR TECHNOSCIENCE? INFLUENCE OF PUBLIC ATTITUDES TOWARDS TECHNOSCIENCE AND VISIONS OF NATURE

Fabienne Crettaz Von Roten1

1SSP/Observatoire Science, Politique et Société, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Since technoscience alters everyone’s life along with our planet’s future (Hottois, 2002; Rocco & Bainbridge, 2005), public perceptions and governance of technoscience need to be scrutinised. On one side, technoscience may engender ambivalent attitudes because proponents mobilize the hype discourse of solving environmental, medical, energy or food problems and because technoscience questions our vision of nature, in particular human and animal boundaries, human and machine boundaries, natural and artificial boundaries (Wickson, 2008). On the other side, technoscience, with the change from interdisciplinary to convergence, lead to a transformation of the relations between science, technology and society, since it presupposes a political wish that assigns a goal to the production of knowledge (Bensaude-Vincent, 2009). The question of the more or less participative view of governance is therefore central.

On the basis of the Swiss data of the 2010 Eurobarometer Science and Technology, this presentation will first map out the public perceptions towards a selection of technoscience (in particular animal cloning and synthetic biology) and towards their naturalness or artificialness. It will then analyse the type of governance wished for technoscience and relate positions on governance to public perceptions about technoscience and about nature, i.e. environmental problems and naturalness of technoscience. These results will open to a discussion on the possibility to govern technoscience and on the need to dedicate more research to the relations between technoscience and society.

MEDIA REPRESENTATION OF SCIENCE AND SOCIAL CHANGES IN CROATIA

Adrijana Šuljok1

1INSTITUTE FOR SOCIAL RESEARCH ZAGREB, Zagreb, Croatia

Abstract: The media in contemporary societies are in intensive interaction and intertwined with many segments of society, including the scientific community. Researchers argue that the media are principal social arena which play an important role in the formation and transformation of public opinion about science and (science) policy options and priorities. Therefore, analysis of media representation of science can be used as one of the indicators of (changing) status and the impact that science has in a society, that is, of the broader social evaluation of science, and also to predict emerging future trends (Bauer et al., 2006).

The main research question from which we start in this paper is “mediatization of science” (Weingart, 1998) in Croatia as well as how Croatian media (daily newspapers) display and evaluate science in two different periods and socio-political contexts - the modern, “democratic”, i.e. (post) transitional and the former, late socialist context. Media images of science and their changes will be linked to the Croatian social context and the transitional processes as a potential social origin of media representation of science, as well as to global changes in a relationship between science and society. The research methodology will be based on content analysis, which will include sample of widely read daily newspapers in Croatia in the period between 1986 and 1988 (Večernji list, Vjesnik, Slobodna Dalmacija) and in the period between 2006 and 2008 (Večernji list, Jutarnji list, 24 sata).

MEDIA PRESENTATION AND AUDIENCE UNDERSTANDING OF BIOTECHNOLOGIES IN HUNGARY

Lilla Vicsek1

1Institute of Sociology and Social Policy, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: Hardly any previous research has dealt with biotechnology issues in Hungary from a social scientific perspective. In this presentation results are presented from two research projects which analyzed the coverage of two types of biotechnologies in the Hungarian media and the way the media resourced audience discussions of the issues.

The common theoretical background of the research projects included the framing tradition, perspectives on the role of “schema processing” and Gamson’s (1992) concept of media content as a “tool” or a “resource”.

For the stem cell study, all 326 articles touching upon stem cells which appeared in the five most read Hungarian dailies between May 1, 2006 and October 30, 2008 were chosen for the media analysis. Data on the diffusion of the coverage into press outlets show that the topic was present in both the political newspapers and the tabloids and both in soft and hard news. Results show that the topic was framed in the papers as scientific breakthrough and human interest stories with both frames laying heavy emphasis on benefits. 7 focus groups were conducted in 2008 to see how media resourced discussions on the stem cell topic. Although participants did rely to some degree on analogical reasoning to talk about stem cells, the dominant media frames were echoed in the focus groups.
For the GM study all 196 articles touching upon GM crops/food that appeared in the two most read political papers and two most read tabloids from May 1, 2007 to October 31, 2009 were analyzed. GM coverage differed in many respects from stem cell coverage: it was less salient, hardly present in tabloids, and not present at all as soft news. Two distinct valenced frames could be differentiated. Argumentation of the dominant ANTI-GM (Threat) frame went that GM crops which were risky and disadvantageous for economic and other reasons were being forced on people by GM producing multinational companies, the WTO, the US, and the EC. The minority PRO-GM (Advancement and Benefits) frame argued that incompetent politicians stand in the way of a technology which is beneficial and represents scientific advancement. 8 focus groups were conducted in 2009 to see how these media frames resourced the discussions. Preliminary results show that despite the low salience of the topic in the media several elements of the media frames were more or less present in the audience discussions.

VIVA LA NANO REVOLUCIÓN! A SEMANTIC ANALYSIS OF SPANISH NATIONAL PRESS

Giuseppe Alessandro Veltri

1Institute of Prospective Technological Studies, European Commission, Seville, Spain

Abstract: This study analyses nanotechnology’s anchoring and codification (Moscovici, 2000; Hellsten, Dawson et al., 2009) in the Spanish national press to determine in which thematic contexts this technology has been discussed. Within the methodological framework of latent semantic analysis, quantitative text-mining techniques were applied to identify themes based on semantic clusters and their longitudinal evolution. Predictions from the relevant scientific literature about patterns of coverage were tested on the Spanish case. This analysis was carried out on a corpus of more than 600 articles from the most important Spanish national newspapers (El País, El Mundo and ABC) and includes more than ten years of coverage (1997-2010). Findings indicate an overall positive coverage and several dominant thematic clusters related to science governance, national policies, economic development and business opportunities. There is also an emphasis on national and European policies of investments. Controversies on nanotechnology are present in early years of coverage but later become more and more marginal, a pattern that is different compared to previous studies on other countries.

A GROUNDED ASSESSMENT OF TV PORTRAITS OF HIGH SCIENCE? HOW CRIMINALS VIEW CSI

Helena Cristina Machado1, Susana Manuela Silva2

1Department of Sociology, UNIVERSITY OF MINHO, BRAGA, 2Department of Hygiene and Epidemiology, University of Porto Medical School, Porto, Portugal

Abstract: A substantial part of the information that the general public receives about science and technology in criminal investigation is conveyed by the media, in particular by high-tech crime television series, such as CSI. Some recent literature discusses the role of the media in providing to criminals or potential criminals information on how to avoid or remove traces from crimes scenes - something which is reported as variant of the so-called CSI effect, according to which the series acts as an educational vehicle for perpetrators of crime.

Instead of a CSI effect we call for a ‘grounded assessment’ of the fictionalized portraits of TV series. On the basis of interviews with prison inmates in Portugal we discuss how this group blends the media’s discourses with their personal experiences in dealing with the criminal justice system and their own perceptions about both the criminals’ activities and the work of authorities when investigating crime.

We discuss the ways in which this particular group’s representations about forensic genetics reveal modes of exposure but also distancing from the media discourses. The results indicate a convergence between the prisoners’ discourses and the representations of forensic technologies disseminated in the media’s discourses, which are close to the main trends of public understandings of science created by exposure to crime dramas. Simultaneously, the empirical data reveals the existence of a critical and reflexive stance by this group, namely when interviewees stress the discrepancies between TV fiction and reality and point out the fragilities of DNA technologies due to possible human errors or abusive uses by authorities. Criminals are not immune to the media’s capacity for constructing collective views about technology in criminal investigation, but enact agency – through their ‘criminal’ expertise – to expose some fragilities of the imagery of science conveyed by TV series.

QUALITATIVE COMPARATIVE ANALYSIS AS AN ANSWER TO THE METHODOLOGICAL CHALLENGES OF EVALUATING PUBLIC PARTICIPATION ACROSS CONTEXTS?

Janus Hansen1

1Department of Business and Politics, COPENHAGEN BUSINESS SCHOOL, Frederiksberg, Denmark

Abstract: In this paper we explore new avenues of analysis on the thorny issue of the impact of participatory technology assessment (PTA). We apply Qualitative Comparative Analysis (QCA) to data abstracted from a series of detailed country case studies of policy making on xenotransplantation to explore what factors are decisive for policy outcomes. Contrary to our expectations that PTAs would contribute to restrictive policy outcomes, we find that this is not the case and that a combination of politicisation and public vigilance is pivotal to explaining policy outcomes. Further, our analysis was symmetrical in attempting to account for both permissive and restrictive policies. We conclude that the paper makes both a substantial and a methodological contribution to the literature on public participation in technology assessment and policy making.

COULD PARTICIPATION BE TRANSLATED INTO PUBLIC ENGAGEMENT? THE ROLE OF IDENTITY.

Roberto Cibin

1Dipartimento di Sociologia, UNIVERSITÀ DI PADOVA, Padova, Italy

Abstract: The construction of infrastructures that have a high environmental impact has proved to be an interesting field for the studies on citizen participation. The communities affected often complain about the potential consequences of these technologies and how the decision-making processes usually avoid taking their opinions into account, highlighting the need for more information. Recently, the adoption by decision-makers of hybrid forums has been shown to be a possible answer to these problems. Based on the...
notions of inclusion and deliberation, these forums could be a solution to both the issues of knowledge management and political representation.

This paper draws on some preliminary results from my PhD research. Three case studies are considered, each concerning different stages of the institutionalization of participation: a “spontaneous” protest campaign, a deliberative workshop within a UK academic research organization, a citizen engagement process arranged by a local authority. The presentation aims to highlight how the discourse about the socio-technical object is co-constructed in different ways depending on the perception participants have of their role and their agency in the deliberative arena. For this purpose I will try to highlight the impossibility of a divorce between the concept of participation and that of identity. The focus on different steps on the line connecting bottom-up to top-down participation gives us also the possibility to underline the change in the relation between experts and lay people in different contexts. By this way it’s possible to give a new contribution to the debate about the risk of a repetition of the deficit model within public engagement.

The research is done through the analysis of in-depth interviews conducted with the citizens, experts and policy makers engaged in these processes, the analysis of the discussions recorded in these deliberative arenas and the analysis of newspapers.

**POLITICISATION OF TECHNOLOGY ISSUES VIA CITIZEN PARTICIPATION?**

Helge Torgersen ¹, Alexander Bogner ¹

¹Institute of Technology Assessment, AUSTRIAN ACADEMY OF SCIENCES, Vienna, Austria

**Abstract:** Over recent years, citizen participation has been acknowledged as a major means to render decision-making in technology issues more robust. This has also had repercussions on the way technology assessment (TA) is being performed today and how political decision making over contested technologies such as GM crops, nanotechnology or stem cell research is expected to be done. In particular, the Danish form of consensus conferences served as a blueprint. More recently, however, the enthusiasm for the Danish model appears to have chilled. This calls for a more thorough consideration of participation.

Among the functions in technology controversies, participation is said to enhance deliberation processes and to lead to socially more robust decisions. In addition, the claim is that it leads to an enhanced politicisation of issues technological beyond debates within statutory institutions (such as Parliaments). In our contribution, we suggest that this claim is overstated with regard to (i) the involvement of potentially relevant actors, (ii) the broadening of the range of arguments and (iii) the criteria that may influence decisions.

After an overview over different understandings of the term politicisation, we will empirically investigate in what respect its various understandings can be associated with different forms of participatory processes such as institutionalised procedures and experimental events. For comparison, we will have a look at protest-driven mobilisation leading to a plebiscite. Empirical cases are the Swiss Pubilforum events, various consensus conferences in UK (early, in1994) and Germany (later, in 2004) and the peoples’ initiative on GM crops in Austria (1997). Today, participation seems to be reduced to a pragmatic tool of exploring citizens’ preferences rather than a means to enhance politicisation.

**ETHICAL ADVISORY INSTITUTIONS IN ADVANCED S&T POLICYMAKING: PUBLIC PARTICIPATION AND POLICYMAKING FUNCTIONS**

Blanka Groboljsek ¹, Toni Pustovrh ¹, Franc Mali ¹

¹FACULTY OF SOCIAL SCIENCES, UNIVERSITY OF LJUBLJANA, Ljubljana, Slovenia

**Abstract:** The aim of our paper is to explore the public participation practices and policymaking functions of ethical advisory institutions within a specific segment of S&T policymaking that pertains to new and emerging sciences and technologies, especially ethically and socially contentious ones, such as biotechnology, nanotechnology, neurotechnology and human enhancement technologies. The focus of our interest will be on the mechanisms that are used to include the public in discussions on S&T developments within ethical advisory boards (EABs), as well as on the stated and actual functions of these institutions in regard to S&T policymaking and advising.

Emerging technologies are being increasingly debated within the broader public sphere and require regulation and detailed scientific as well as societal consideration. Thus we are witnessing growing interest within S&T policymaking for public participation or engagement as a new model of public understanding of science and technology where the public is actively involved in the practices of policymaking bodies. However, there are doubts about the effectiveness of activities intended to enhance public participation in policymaking. Some critics point out that it leads to just another debate on S&T impacts without any evident indications of whether the results of such participatory exercises are even taken into account by the policymakers. Our primary interest will be to identify and evaluate public participation practices within different ethical advisory bodies (EABs), specifically national ethics committees (NECs), as well as the stated and actual function of these bodies in S&T policymaking and advising, using the theoretical and empirical study of the output of selected NECs from different EU countries.

We will be dealing with questions like: What is the function and impact of EABs in S&T policymaking? Which advanced S&T themes are currently salient topics in EAB output documents? Are different stakeholders consulted in the preparation of these documents and on what basis? Are citizens involved in discussion within these institutions? Can public debates on particular issues trigger the debating of the same issues within these bodies?

The relevant data will be obtained by using different NEC databases and by analysing their S&T policymaking and advising functions, and mechanisms for including the broader public in their consultations.

**ACCOUNTABLE HOW, ACCOUNTABLE TO WHOM? GOVERNANCE OF CZECH SCIENCE IN TURBULENT TIMES**

Marcela Linkova ¹

¹Gender & Sociology, INSTITUTE OF SOCIOLOGY OF THE ACADEMY OF SCIENCES, Prague 1, Czech Republic

**Abstract:** Research has undergone major changes in recent decades as the traditional notion of science as a self-governing and self-regulating ivory tower has given way to a more porous notion of science entangled in a mesh of links leading to the state, private corporations and civil society with various claims made on public accountability of science. In the Czech Republic science policy doc-
Nowadays, ‘building’ a final repository is considered a technically feasible task that scientists and engineers would soon be able to solve. Currently, no solution to the waste problem has long been central to the nuclear waste conflict. One of the reasons for the nuclear waste conflict to have become a ‘scientific’ issue is the potential for generating new information that could be used to inform decisions about waste management. This will be backed by a first analysis of the already implemented deliberative elements in Germany and Switzerland, the countries analysed in this case study, based on first results of an empirical study using a hypothesis-generating approach.

One of the reasons for the nuclear waste conflict to have become so turbulent in both Germany and Switzerland is that finding a solution to the waste problem has long been considered a purely technical task that scientists and engineers would soon be able to solve. Nowadays, building a final repository is considered technologically feasible, but attempts to do so have caused major social conflicts in both Switzerland and Germany. The purely technocratic approach excluding social questions from the decision-making structure led to a deep mistrust among the public into governmental decision-making in this field.

Both in Germany and Switzerland governments now attempt to manage the social conflict by moving towards a governance approach by introducing some deliberative elements. Theoretically, introducing deliberative elements into nuclear waste governance should be an appropriate approach to integrate those societal questions into nuclear waste management, but it needs to be analysed what effects the real-world attempts at doing so in fact have. This is especially as both governments set strict rules as to who is allowed to participate and who not, leaving open the question of these attempts’ potential to mitigate the social conflict as it is present in the public sphere. Answering this question will help to understand how the success or failure of attempts at mitigating technology related social turbulence are dependent on the nature of the conflict at hand, including the nature of the technology, but also on the governance structure under which the turbulence came into being.

**BEYOND RISK GOVERNANCE – ELITE AND LAY PERCEPTION OF TECHNOLOGY GOVERNANCE**

Jürgen Hampel 1, Niels Meijlgaard 2, Helge Torgersen 3

1Social Sciences, UNIVERSITY OF STUTTGART, Stuttgart, Germany; 2Dansk Center for Forskningsanalyse, Aarhus Universitet, Aarhus, Denmark; 3Institute of Technology Assessment, Austrian Academy of Sciences, Vienna, Austria

**Abstract:** Past experiences with the regulation of technological innovations have shown that societal resistance can substantially jeopardize their development. Resistance is not only triggered by perceived risks but also by concerns over social, political, economical or ethical issues. In other words, there is an ‘internal’ boundary of technology governance: public acceptance. However, regulation mostly focused on ‘external’ boundaries constituted by international treaties. In some cases, such regulation has proved to be insufficient to solve technology conflicts. Appropriate models of science and technology governance therefore need to navigate between multiple, and sometimes conflicting, concerns and demands. Regarding internal boundaries, a variety of methods for governing technologies have emerged; prominent examples are the ‘Danish model’ and the ‘Ethical Council’ model:

Our contribution will investigate which of these models addressing the internal boundary of technology governance might become more important in the future. Based on elite-interviews in Austria, Denmark and Germany, elite perception of past and preferences for future forms of governance will be discussed and contrasted with the results from pertinent questions on preferred models in the recent Eurobarometer survey on biotechnology. We will show that members of political, scientific, and other elites differ substantially from the general public in favoring one approach over the other. The empirical material gives a unique opportunity to reflect on the central challenges for the governance of new technologies.

**BIOBANKING AND THE RECONFIGURING OF SOCIOTECHNICAL BOUNDARIES: GOVERNANCE UNBOUND?**

Martin Boeckhout 1, Conor Douglas 2*

1Department of Philosophy, UNIVERSITY OF AMSTERDAM, 2EMGO Institute for Health and Care Research, Vrije University Medical Center, Amsterdam, Netherlands
Abstract: Key boundaries along which biomedical genomics research and its governance frameworks were organized are now considered to be in flux. The emergence of biobanking, the systematic, large-scale procurement of human tissue and data for research purposes, provides a significant contribution to such boundary reconfiguration processes, since it is situated at the interface of a number of crucial destabilized interfaces. These interfaces implicate a number of ontological, epistemological, organizational and political-economic boundaries such as those between informational data and biological material, between research and care, between biobank donors as participants vs. donors as patients, between public and private spheres of action, as well as between national and transnational governance regimes.

While many of these boundary reconfigurations have been studied in isolation, their combined implications for the governance of sociotechnical change in biomedicine are not well understood. Drawing on previous work in Science and Technology Studies and sociology, we will discuss what boundary reconfiguration processes are implicated in the emergence of biobanking, how these impinge on prevalent models and arrangements of governance, and what challenges these reconfiguration processes raise for governing sociotechnical change in biomedicine.

NEW MOBILITIES AND THE FINNISH INFORMATION SOCIETY

Sakari Taipale

1Department of Social Sciences and Philosophy, University of Jyväskylä, Jyväskylä, Finland

Abstract: Various international comparisons show that Finland has lost its position as a leading information society. Finland has been criticized for underdeveloped and fragmented public sector information systems and a lack of national coordination in the field of information society development, but considerably less attention has been paid to a rapidly changing and turbulent environment to which Finland should respond with appropriate political measures, technological innovations, and scientific knowledge. This paper will analyze four national information society strategies (from 1995, 1998, 2006 and 2010), and scrutinize how they address (or ignore) new social challenges as they are framed by John Urry in his ‘mobility paradigm’. The mobility paradigm suggests that today’s most urgent social problems to which nation states should respond to are not ‘societal’ (i.e. taking place within the boundaries of sovereign nation states) by nature but rather ‘mobile’ and ‘fluid’ transgressing national boundaries. The paper will look at how the main forms of mobility, that are 1) the corporeal travel of people, 2) the physical movement of objects, 3) imaginative, 4) virtual and 5) communicative mobility are addressed in the strategy papers, and what kinds of technological and scientific solutions are presented to tackle them, respectively. It can be expected that corporeal (e.g. increased international migration and national commuting) and communicative (e.g. personal communication tools, broadband infrastructures) mobilities are more extensively addressed, but considerably less attention is paid to the challenges of and technological responses to imaginative and virtual mobilities (e.g. hostile online communities, cultural clashes on the internet). The paper is based on an ongoing research project ‘Geographical and Social Location in the Everyday Use of ICTs’ funded by the Academy of Finland. The three-year postdoctoral project takes place from 2011 to 2013.

ORGANIZATIONAL SUPPORT FOR RESEARCHERS’ PERFORMANCE IN DIFFERENT SCIENTIFIC FIELDS

Katarina Prpic

1INSTITUTE FOR SOCIAL RESEARCH – ZAGREB, Zagreb, Croatia

Abstract: The idea of this study is to establish whether theoretically expected disciplinary differences in organizational support for high publication output will be corroborated by an empirical comparison of different scientific fields. The theoretical framework of the study relies on the main theses of the organizational and cultural theories of science about the social and intellectual (cognitive) differentiation of the scientific fields (Whitley, 1984; Fuchs, 1992, Becher & Trowler, 2001). Consequently, the differences of the social and intellectual organization of sciences may be reflected in different organizational support for innovative researchers’ performance and output in the individual fields/areas.

An empirical analysis is based on a questionnaire survey of a sample of 915 Croatian researchers from all scientific areas. The questionnaire was constructed to gather data on respondents’ relevant social and professional characteristics, their publication productivity (published output), and their perceptions of organizational support for innovation measured by the use of OSIQ developed by Pirola-Merlo (2000). The 21 item OSIQ (Organizational Support for Innovation Questionnaire) consists of three scales and the corresponding underlying constructs: organizational encouragement of innovation, access to resources and empowerment.

The aim of this analysis is to explore and to compare the organizational factors that are important for high output in each scientific area/field – natural sciences, (bio) technical sciences, biomedical sciences, as well as social sciences and the humanities. In accordance with TSO (theory of scientific organizations), different contributions of organizational support factors to the innovative performance (output) are expected in the observed scientific areas (fields).

THE WAY WE ASK FOR MONEY…” A QUALITATIVE ANALYSIS OF ACADEMIC GRANT WRITING PRACTICES FROM 1955–2005

Kathia Serrano-Velarde

1Sociology, HEIDELBERG UNIVERSITY, Heidelberg, Germany

Abstract: The paper addresses the question, how the practice of academic grant writing changed over the last 50 years. External funding became a prominent issue in the academic world (Rip 1994). The phenomenon needs to be understood on the background of 1) a reframing of research and development as an economic and social investment, 2) increasing budgetary pressures on public research institutions and 3) the inclusion and institutionalization of grant writing skills in the professional repertoire of academicians. Although scholars have developed a critical understanding of the working mechanisms of funding schemes (Heinze et al. 2009) and attached evaluation procedures (Laudel 2006, Swan et al. 2010), little is known about the actual grant writing practice. “The way we ask for money” is a qualitative, longitudinal study of research proposals and funding program documentation in Germany from 1955 to 2005.

Our theoretical framework builds upon neo institutional assumptions. Thus, we understand institutional change of grant writing
practices as a (r)evolution of “institutional logics” (Friedland/Alford 1991, Thornton/Ocasio 2008). Institutional logics shape worldviews by providing relevance structures and frames to construct issues, problems, and solutions as well as script actions. As such, they supply a repertoire of legitimate arguments to scientists who wish to get funded. Preliminary findings of our content analysis discern a tendency towards the standardization and rationalization (Whitley 2000) of the application procedure. Furthermore, the research proposals we studied reveal an incremental implementation of logics of efficiency and feasibility in the scientific argumentation. This results, however, in the overlapping of conflicting logics.

THE INTERNATIONAL PARTNERSHIP PROGRAM BETWEEN PORTUGAL AND US RESEARCH UNIVERSITIES: ANALYZING THE IMPACT ON THE PORTUGUESE UNIVERSITIES

Teresa Patricio 1, Hugo Horta 2*, T. Austin Lacy 3, Helena Carvalho 1, Brigida Blasi 1, Cristina Palma Conceição 4

1School of Sociology and Public Policy, ISCTE-IUL, CIES, 2CIES, 3IST, 4ISCTE-IUL, CIES, Lisbon, Portugal

Abstract: The object is to identify and characterize the impact of the international partnership programs on Portuguese universities. This program was created in 2006-2007 by inviting several American universities (MIT/CMU/UTA) to help universities and contribute for the further development of the Portuguese knowledge base. The US research universities were selected based on their research excellence and quality of postgraduate education (engineering, information technology, medicine and business), their degree of internationalization and their links with industry. Our research question is what impact did this have on 1) organizational change 2) curriculum innovation 3) staff development 4) student mobility 5) industry-university collaborations.

Our unit of analysis is the research team level within universities. Our research procedures will proceed by stages:

1) A strategic analysis will be done to map the research teams. A preliminary study disclosed 144 institutions and teams involved in the partnerships so far, among which 87 are firms, 24 are higher education institutions and 12 are associated laboratories. This analysis already showed the consolidation of structured networks and a substantial increase in the participation of firms in R&D projects (it was 7% before the International partnerships begin and now is 42%).

2) Interviews and in-depth case studies of research teams; with the same for some research teams that were not involved with the IPS but are based in the same university and work in the same field. They will serve as a “control” group.

3) A questionnaire of all research teams involved and the activities engendered by the international partnership program will be conducted. This will include research teams from the same university and disciplinary field that were not involved in the international partnership programs.

The main objective of this project is to contribute to the science policy and internationalization of higher education, to provide policymakers with an assessment of the impact that these types of international partnerships can bring to countries that are fast developing their scientific system.

SOCIAL DYNAMICS IN RESEARCH GROUPS: NEW RISKS OR OPPORTUNITIES?

Brigida Blasi 1, 2*, Romagnosi Sandra 2

1IN+ Center for Innovation, Technology and Policy Research, Universidade Técnica de Lisboa, Lisboa, Portugal, 2Science Park Office, Università Tor Vergata, rome, Italy

Abstract: Many analyses of the recent changes in research systems converge on one point: research processes carry a large mass and variety of social elements which in the past seemed to be less important or invisible.

The paper aims to contribute to the analysis of university research groups and to consider the social and cultural dimensions involved in scientific practice, as part of “performing science” and as sources of potential risks.

The lack of awareness of the threat, as well as the absence of forms of reaction inevitably undermines the formation, development and subsistence of research groups. Instead, the presence of a strategy and governance can lead research groups to come through the present complexity of scientific and technological research, improving its quality and underpinning its potential social use.

Starting from the general assumption that social dynamics affect the life of the groups and the scientific practices (Latour and Woolgar 1979, Latour 1987), the following working hypothesis drive our analysis: the transformations of research increase the relevance of social dynamics in scientific practice; these social dynamics, if not properly managed may pose risks to the survival of groups and for the quality of research; if well-managed, social dynamics may represent opportunities for research groups.

The work is exploratory and focuses on two “excellent” Italian STEM research groups, outlining the dynamics of change and the adaptive strategies within the groups, as well as the broader social and institutional context and the individual experiences of the members.

In particular, we reconstructed their history, photographed their current state, prefigured the ad hoc socio-organizational settings and sketched insights into the management and governance of the groups’ dynamics and research practices.

CHANGING ROLES IN A CHANGING WORLD: SCIENTIFIC SOCIETIES IN CONTEMPORARY SCIENCE

Ana Delicado 1, Raquel Rego 2, Ines Pereira 3, Luis Junqueira 1, Cristina Palma Conceição 4

1Institute of Social Sciences, University of Lisbon, 2SOCIES-ISEG, CIES-IUL, Lisbon University Institute, Lisbon, Portugal

Abstract: Scientific associations are among the least researched objects in studies of science. Despite their growing number and increasing diversification, most studies still focus on the historical role of academies and societies in early modern science. And yet, they are one of the types of organisations involved in the Mode 2 of knowledge production, taking part in research, in the development of science policies, in the protection of professional standards, in government advice, in public debates and in the dissemination of science.

Drawing from the case of Portuguese scientific associations, this presentation intends to discuss their activities and functions, in
order to explore how they respond to transformations in the social context and in the scientific system. In a relatively small scientific community such as the Portuguese, the number of scientific associations is astonishingly high (over 300 associations) and has been increasing (a third created in the last decade). But does this translate into accrued influence on science governance? And what has caused this growth? Which new roles are these associations playing and how do they interact with other social actors in the S&T field?

This paper is based on an on-going research project, funded by the Portuguese Foundation for Science and Technology, which comprised a survey to scientific associations and in-depth case studies of a sample of these organisations (sustained by document analysis, interviews to governing bodies, ethnographic observation at events and surveys to their members).

ACADEMIC INBREEDING: INSIGHTS FOR ACADEMIC BASED RESEARCH AND RECRUITMENT
Hugo Horta¹
¹CIES - ISCTE-IUL, Lisbon, Portugal

Abstract: The manuscript analyzes the impact of academic inbreeding in relation to academic research practices and productivity, and proposes a new conceptual framework for its analysis. The first novel analysis that the study brings forth is the confirmation that the academic productivity and information exchange behaviors of silver-corded are similar to those of non-inbreds rather than to inbreds. This empirical finding clarifies which academics should be considered academic inbreds, while providing a sound methodological instrument for the future analysis of academic inbreeding. A second analysis, still based in untested literature assumptions, analyzes Dutton’s (1980) arguments, which hypothesized that those academics that are not inbreds but which only moved once in the whole of their academic career would have similar information exchange behaviors and scientific productivity to that of inbred academics. The analysis shows that academics that only moved once in the academic career have similar information exchange behaviors and scientific productivity to that of inbred academics. This suggests that mobility throughout the academic career needs to be fostered notwithstanding if the academic is inbred or not. The third analysis aims at a conceptual contribution to the literature. It takes into consideration that the conceptual understanding of academic inbreeding was established in the 1960s, and that science systems have changed considerably since then. In particular, the position of the postdoctorate emerged in recent decades when it was a rather unusual position several decades ago. The results indicate that mobility at an early academic career stage is absolutely critical even for academic inbreds. However, this mobility is not sufficient to mitigate the detrimental effects of academic inbreeding. The analysis of this study is based on data from a survey applied in 2008 in Portugal, which focused on all academics working at Portuguese universities that held a doctoral degree.

RECONCILING ORGANIZATIONAL DIVERSITY: INFLUENCE OF INSTITUTE GOVERNANCE ON INTERNATIONAL RESEARCH COLLABORATION
Inga Ulnicane-Ozolina¹
¹Science, Technology and Policy Studies (STePS), UNIVERSITY OF TWENTE, Enschede, Netherlands

Abstract: International research collaboration is associated not only with numerous benefits derived from access to increasingly specialized knowledge, additional information and facilities but also with difficulties and transaction costs such as need to reconcile different management cultures, financial and reward systems, promotion criteria and time scales. One potentially important type of factors influencing scientific collaborations across national and organizational borders is governance of public research institutes. While some converging trends in the institute governance can be observed in the last decades, for example, as a result of the New Public Management reforms leading to increasing role of evaluation and competitive funding, there is still a lot of diversity in a way different research institutes are governed nationally and internationally. Diversity in institute governance related to differences in institute profiles and mission, autonomy, hierarchy, recruitment and funding can affect emergence, development and outcomes of international collaborations.

In this context the following research questions are studied: What motivates scientists based in different institutes to collaborate internationally? If and how do their institute governance facilitate or hamper international collaborations? How do organizational differences get reconciled within international collaborations? And how does the institute governance interact with other types of factors influencing collaborations such as individual ideas and initiatives, self-organization and incentives provided by policy schemes?

Empirically, international collaborations of German, Dutch, French, Belgian and British institutes in an emerging field of nanosciences and technologies are studied. Emerging field of nano S&T can be particularly relevant to explore these questions as science studies literature (Merton 1968; Crane 1972) suggests that in new research fields a lot of cognitive and social dynamics take place. Methodologically, in-depth case studies of collaborations are undertaken using multiple sources of data: publication, project, organizational and CV data as well as 50 semi-structured interviews with scientists. Results of the case studies reveal that a number of characteristics along thematic, organizational and resource dimensions of institute governance influence emergence and development of international collaborations.

ADDRESSING COMPLEXITY IN LEADING AND MANAGING RESEARCH GROUPS
Maaike Verbree¹
¹Science system assessment, Rathenau Institute, The Hague, Netherlands

Abstract: Society has great expectations with regard to the ability of science and technology to develop solutions for climate change, the economic crisis, and other major societal problems. Solving such highly complex societal issues requires a change in the way science is conducted. The increase in the complexity and interdisciplinary nature of research problems has created a need for greater and more varied expertise combined in one research group. In response, research is increasingly conducted in research groups, even in disciplines were researchers traditionally do research on their own. Strong academic leadership is required to manage the collective work of individual creative and enthusiastic researchers. In earlier work, we found that research group leaders use different strategies to achieve different research goals. Group leaders have many options in steering their research group and each option affects research performance in a different way. This is what makes
the management of a research group highly complex. We elaborate on the complexity of research group management and explore the mechanisms behind the relationship between academic leadership and research performance, also in relation to the environment of research groups. Earlier bivariate analyses link individual leadership practices to different indicators of performance. We take the analysis one step further by combining the various dimensions of academic leadership in a single model. Using the results of a survey among 325 leaders of medical research groups, we examine how organizational design, group management, network management, leadership activities, and the properties of the leader affect different dimensions of group performance, controlling for differences in the group’s environment. This approach allows us to measure how academic leadership practices are interrelated and simultaneously influence research performance.

WOMEN ENGINEERS AT THE TOP CHANGING ORGANISATIONAL CULTURES IN SCIENCE AND TECHNOLOGY ORGANISATIONS

Felizitas Sagebiel¹, Ulla Hendrix¹, Christina Schrettenbrunner¹
¹Educational and Social Sciences, WUPPERTAL, Wuppertal, Germany

Abstract: The topic of institutional practices of science and engineering can provoke the question, if there are differences between women and men in leadership positions, especially in management and innovation, and how that affects the organisational culture. The hypothesis about a shift from traditional to modernised leadership styles, and if it is linked to gender is an empirical question. The question if leading women in science and technology will have an impact on management and innovation is one subject of a current German study which will be presented in the paper.

The cooperation project between the University of Wuppertal and the Wuppertal Institute for Climate, Environment and Energy, funded by The German Ministry for Education and Research, together with European Social Funds, focus on potentials of innovation, which women in leadership positions can realise and which barriers they experience and will last from April 2009 to March 2012. Power and organisational culture are the two perspectives, together with sustainability. Theoretical perspectives are taken from organisational, science and technology as well as gender studies. For empirical investigation eight case studies are done in companies, governmental research organisations, political institutions and universities. Methodological instruments are website analysis, focus discussion groups and guided interviews. Eight case studies in companies, governmental research organisations, political institutions and universities have been constructed. Homepage analyses, expert interviews and focus discussion groups have been done for fieldwork; for deeper analysis of results typological and contextual methods have been used.

First results show that top women use their power for changing content and culture of organisations, but meet at the same time obstacles of more traditional working cultures. They try to use power relations and to change organisational cultures in four ways:

1) Expectation of efficiency by a media based form of all-time-availability

2) Being a new role model of top management behaviour

3) Being a new role model in flexibility and expecting the same from their employees

4) Less delegating and using less hierarchical structures.

Their entrance to men’s networks is still hindered by power and gender stereotypes.

INTERACTIONS BETWEEN HUMANS AND APES/MONKEYS IN THE ENVIRONMENT OF LABORATORIES

Sophie Gallino-Visman¹
¹sociologie, UNIVERSITE PIERRE MENDES FRANCE GRENOBLE, 38316, France

Abstract: The aim of this preliminary work of this thesis is to increase the contribution of the sociologist’s perspective on the relation human/animal in the environment of laboratories. The utilization of animals for scientific and particularly medical research purposes, as regulated in our society, remains a sensitive subject steeped with emotion which should to be taken into consideration by all involved professionals.

Also we would like to stress that the utilization of the non-human primate takes a specific dimension due to its closeness as evidence has been supported by the evolutionary theory and disciplines such as genetics and primatology. Furthermore, in case of future experiences with other species, it would be suitable to undermine the assumption of “the unique of apes/monkeys”.

We would like to remind that the aim of the sociological study is not to establish any model. In this case, the aim is to understand the relations between human and non-human primates in laboratories and not to adapt them according to an ideological intention or design.

However, these works represent a source of innovative information. This information could be a start for reflection on the evolution of behavior/habits and working procedures and then for thinking over again these practices and for interrogation on the well-being of the animals as well as of their lab animal technicians.

The presented work is based on individual interviews and observations of the day-to-day work of veterinaries, ethologists, lab animal technicians, administrative and maintenance agents in a structure dedicated to breeding and trials with non-human primates.

The questions that have been discussed were especially about the relation with the animal, the perception of the trial, the level of understanding of the challenges of research and the concept of ethics. The results are interesting and worth being explored. The concept of empathy towards the animal and the need of working in an environment warranting its well-being come out significantly. One question mark though would be whether compassion and ethical concern don’t go along with suffering at work for some technicians, a reinforced bad-being by the negative image of these professionals which is sometimes reflected by the society. In this way, new questions will emerge and find, being investigated by the sociological prism, clarification supporting both animal and human.

GENETICIZATION OF THE FAMILY? THE USE OF DNA TESTING IN THE CONTEXT OF IMMIGRATION

Torsten Heinemann¹, Thomas Lemke¹

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: In 1991, Abby Lippman coined the term "geneticization" to designate the tendency that social structures and practices are more and more shaped by the explanatory models and rationalities of the new genetics. While the term has been used by many social scientists to analyse the social impact of genetics and genetic technologies, the debate so far has predominantly focused on the medical sphere. It is our objective to extend the discussion by exploring the usefulness of the concept of geneticization for analysing the emergence and institutionalisation of DNA testing in the context of immigration. Today, many countries around the world have begun to use DNA testing to establish biological relatedness in family reunification cases. Family reunification refers to the right of family members living abroad to join relatives who hold long-term residence permits in a given country. We will investigate how DNA technology is used to "verify" family relations and its impact on the concept of family.

In our talk, we will present arguments and lines of investigation of an ongoing research project. The project aims at investigating the social, political and ethical implications of DNA testing for family reunification. We will argue that DNA testing for family reunification subscribes to a "genetic inheritance ideology" (Finkler). Only biological relatives are eligible for family reunification – which excludes all family members who are related socially. The focus on genetic links devalues alternative forms of family that are seen as secondary. The argument is based on interviews with representatives of NGOs and immigration authorities, lawyers specialising in family and immigration law, geneticists working in DNA laboratories and those applying for family reunification.

THE POLITICS OF REPRESENTATION IN THE GOVERNANCE OF PROSPECTIVE HEEL PRICK CARD BIOBANKING IN THE NETHERLANDS

Conor MW Douglas 1, Carla van El 1, Sarah van Teeffelen 1, Maud Radstake 2

1Community Genetics, VRUIE UNIVERSITY OF AMSTERDAM, Amsterdam, 2Science Communication, Radbound University, Nijmegen, Netherlands

Abstract: The role of users in technological development is receiving increasing attention for the contributions that they can make in the innovation process (von Hippel 2005; Epstein 2007; Douglas 2009), and for the social license to operate they can bestow on emerging technologies. While it may be the case that ‘many have argued that participatory governance strategies are needed to destabilize and overthrow unsustainable and obdurate socio-technical configurations’ (SSTNET cfp 2011); caution should be taken in seeing user involvement as a kind of panoptic answer to challenges in both governance and/or innovation (Epstein 2007; Davis and Abraham 2010). Similarly, caution should be taken in substituting one vague and broad term (i.e. ‘publics’) for another (i.e. ‘users’). In an attempt to side-step this pitfall, this paper sketches out the empirical research on a case of user configuration in Dutch biobanking.

Now in the Netherlands there is a discussion surrounding the storage, management and secondary use of heel prick cards for biomedical research. Blood spots from almost all newborn babies are routinely collected and stored on heel prick (or Guthrie) cards for neonatal public health genetic screening. Given the scale of the screening, these blood samples are now being seen as a wealth of biological data for medical R&D. While not a conventional biobank, the card collection could be treated as such if there would be societal support via a management body that could deal with use policies. We will draw upon survey data of Dutch parents regarding their views on the storage, management, and use of heel prick cards for biomedical R&D. In doing so, questions arise not only regarding how users are being represented in the prospective governance strategies of this particular kind of biobank, but also on the processes of how users are governed through biobanks and biobanking endeavours (Gottweis and Petersen 2008). We will tease out the politics of representation in this prospective heel prick biobank: who represents ‘the user’ and how is ‘the user’ represented? (Nelis, De Vries and Hagendijk 2007) We then explore what kind of management body would be necessary to stabilize these stored cards as a socially responsible biobank, and what ‘participatory governance’ might look like in the storage and use of the cards for biomedical R&D.

GOVERNING BIOENERGY R&D IN THE UK

Les Levidow 1, Michael Farrelly 2

1DPP, OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: Calls for better governance of science and technology beg the question of whether or how they have always been governed, regardless of public participation or even awareness. Historically such governance has involved various relationships between public and private sectors. Both sectors have raised expectations that technological innovation will provide societal benefits, as a basis to promote specific R&D priorities. In the past couple decades, such benefits have been linked with policy frameworks for ‘the knowledge economy’, emphasising forms of knowledge that can be commercialised, even privatised.

As a more recent policy concept, the ‘bioeconomy’ emphasises more efficient conversion of renewable resources into food, feed, energy and other industrial products. This concept has gained prominence as a means to address climate change, especially by substituting renewable resources for fossil fuels. Although the bioeconomy has been promoted as a common societal benefit, there are tensions among various objectives: different R&D priorities may be optimal for efficient resource usage, for environmental sustainability or for commercialisable knowledge. And such judgements are framed by expectations aiming to mobilise institutional commitments for specific R&D pathways.

Questions: How do public and private sectors express beneficial expectations from specific R&D priorities for bioenergy? How do state agencies relate to each other and to the private sector? How have technological expectations anticipated public and/or private forms of knowledge? What path-dependence (of resources and/or socio-technical systems) shapes R&D priorities?

To explore such questions, this paper examines the governance of UK public-sector R&D priorities for bioenergy. Unlike most countries, the UK has no single R&D agency for this sector; so our study looked at several state bodies, their inter-relationships and their restructuring over the past decade. These changes have impeded some R&D pathways, at the same time as highlighting the divergences. Bioenergy R&D priorities arise from actors’ perspectives on natural resources, sustainability and economic competitiveness.
The analysis draws on the sociology of scientific expectations and imaginaries, i.e. economic and socio-technical visions prefiguring desirable, feasible futures.

GOVERNANCE OF SCIENCE AND TECHNOLOGY: RATIONALITY FORMATION IN INNOVATION POLICY MAKING

Eva Buchinger1

1Foresight & Policy Development Department, AIT AUSTRIAN INSTITUTE OF TECHNOLOGY GMBH, Vienna, Austria

Abstract: In his seminal article “The science of ‘muddling through’”, C. E. Lindblom argued that “[…]it is not irrational for an administrator to defend a policy as good without being able to specify what it is good for”. Empirical evidence shows that this is true and that “bounded rationality” – as suggested by H. A. Simon and colleagues – must be considered as a crucial element in the analysis of decision making processes. Lindblom as well as Simon and others pointed to the fact that focusing solely on mean-end-rationality and ignoring cognitive limits will be quite insufficient. N. Luhmann builds on such considerations in looking at decision premises (together with issues such as decision programs and cognitive routines).

In innovation policy making, bounded rationality is of specific importance. Not only innovation policies’ object is somewhat ambiguous (publications?, patents?, goods?, services?), but also its addressees are quite heterogeneous. This is caused by the fact that innovation is a societally distributed process, which depends on contributions not only from science and economy, but also from education, law, and mass-media (and, not to forget, politics itself).

The aim of this paper is the exploration of the main characteristics of bounded rationality in innovation policy making. The respective theoretical background will be provided by the work of Herbert A. Simon (concerning the concept of bounded rationality) and by Niklas Luhmann (concerning the concepts of self-/hetero-reference, decision premises and steering by differences).

The object of the investigation will be the process of policy making (and only partially its results). Thereby, the examples of the R&D-intensity-target of the European Union and the greenhouse-gas-reduction-target of the United Nations will be used as empirical examples. Issues such as agenda setting, discovering and choosing alternatives, dynamics in decision making, and generally organizational/institutional contexts will be examined.

GOVERNING TRANSFORMATIVE SOCIO-TECHNICAL CHANGE. TOWARDS A CLOSER INTEGRATION OF INNOVATION SYSTEMS AND TRANSITION STUDIES APPROACHES

Harald Rohracher 1, Matthias Weber 2

1IFZ - Department of Science and Technology Studies, UNIVERSITY OF KLAGENFURT, Graz, 2Foresight & Policy Development Department, 3) AIT Austrian Institute of Technology, Vienna, Austria

Abstract: The multi-level perspective on long-term socio-technical transitions has attracted quite some interest in academic as well as in policy circles over the past years, but the innovation systems approach is still the dominant perspective when it comes to devising research, technology and innovation policies, which are a crucial element on any policy agenda to support long-term processes of transformative change. A closer conceptual integration of the multi-level transition perspective and innovation system approaches promises both, to theoretically enrich our understanding of transformation dynamics and to practically enhance the compatibility of transition thinking with (and thus also its relevance for) policy discourses and framings.

Whereas the transition framework is stressing the long-term and multi-level character of sectoral transformations, the innovation systems perspective is very explicit in terms of the role of actors and institutions for the shaping of innovations, and with respect to the legitimation of policy interventions on the basis of system failure arguments. In addition, innovation system oriented policies are focusing on the improvement of organisational or institutional infrastructures to enhance innovative capabilities, while transition management approaches aim at supporting transformation processes of sectors of provision towards particular socio-political aims such as a more sustainable generation and use of energy.

In this presentation we will systematically compare innovation systems and transition approaches, particularly with respect to the implications they have for the governance of socio-technical change. We will then suggest strategies to achieve better synergies, by more explicitly introducing system concepts to our understanding of sustainability transitions while on the other hand making better use of a multi-level understanding of transitions for mainstream national and sectoral innovation policies.

KNOWLEDGE GOVERNANCE IN CONTEXT OF INNOVATION-BASED SOCIETIES

Karel Müller1

1Faculty of Humanities, Charles University, Prague, Czech Republic

Abstract: The aim of the presentation is to contribute to the discussion about knowledge governance in a transdisciplinary perspective of science, technology and innovation studies. The evolution of neo-Schumpeterian concepts is well reflecting the nature of innovation and qualitative changes in their governance (innovation policies): the scope of innovation actors, the systemic institutional setting for their support (Nelson), mobilisation of available forms of co-ordination (Hollingsworth, Boyer). Recently, the concepts have been outlined in order to interpret identified social implications of systemic growth of innovation: concepts of social production of knowledge (Hollingsworth), concept of learning organisations and learning economy (Lundvall). The study of social implications of innovation systems and events at borderlines of innovation systems with the other institutions has indicated several new factual situations: (i) innovation systems are powerful source of competitive advantage, (ii) their impact on changes of social and human environment is so extensive and intensive that the orienting power of current institutions has become eroded, institutional changes become urgent, (iii) the concept of innovation system is based on hidden assumption of techno-economic paradigm (Felt, Wynne), not on an universal discursive principle, and (iv) participatory public assessment of social consequences of innovation “systems” has problematized the concept of innovation system, and current forms of innovation of governance as well. Following this issue I intend to argue that chances for governance of innovation advances can be maintained if dilemmas in modern knowledge creation are understood - one has to count with „dilemmatic innovation systems” (certain / uncertain; reliable / risky; expert knowledge / symbolic
tokens; codified / tacit knowledge; explanation / understanding; practical / functional). Counting with such interpretative framework further argumentation will be focused on the discursive issues of institutional reflexivity and its role in the institutional change and knowledge governance. The discussion will be supported by references to some typical situations or cases in the CR having been called up by a push to radical institutional changes. Also methodological issues of institutional analysis will be addressed.

**INTEGRATED TECHNOLOGY DEVELOPMENT AND ASSESSMENT: THE CASE OF DEMAND RESPONSE SYSTEMS**

Michael Ornetzeder 1, Petra Wächtler 1, Jaro Sterbik-Lamina 1

1Institute of Technology Assessment, AUSTRIAN ACADEMY OF SCIENCES, Vienna, Austria

Abstract: Consumer-side energy management technologies (Load Management, Demand Side Management) are to be considered as essential tools for maintaining the balance of supply and demand in future electrical energy systems with higher shares of renewable power sources. However, effective demand response implementations are rare to non-existent so far. An ongoing national transdisciplinary research project approaches the problem of missing demand response implementations in Austria by analyzing demand response as a multidisciplinary phenomenon with technical, social, economic and ecological aspects, in order to identify opportunities and starting points for future developments.

Based on previous work and own ideas a set of demand response scenarios showing the range of technically feasible as well as environmentally worthwhile solutions was developed. In a next step the project team has selected 3 to 5 most promising scenarios for further analysis. The selected scenarios have been described in more detail to enable comprehensive assessments using technical, ecological, economic and social criteria. Among the evaluation methods used are Life-cycle Assessments, Focus Groups, and Stakeholder Workshops. The interdisciplinary project team as well as end-users and relevant stakeholders will be involved in the scenario assessments.

The paper will focus on (1) how the project deals with different types of knowledge production (innovation-oriented as well as assessment-oriented) and on (2) how the contributions of different disciplines (computer sciences, natural sciences, social sciences) and social groups involved (end-users, energy providers, utilities, energy experts, decision makers) in the project are managed. We will present selected results of the project, discuss some experiences as well as advantages and limits of the applied approach.

**ENERGY COOPERATIVES AS SOCIAL INNOVATIONS IN THE ENERGY SYSTEM**

Anna Schreuer 2

2IFZ, Graz, Austria

Abstract: With rising concerns over ecological sustainability as well as security of supply, the energy system has come under increasing pressure over the last years and various efforts have been made aiming at a transition towards more sustainable systems of energy provision. At the grassroots level this has included the establishment of energy cooperatives and other forms of collective citizen ownership of renewable energy technologies. Indeed, a variety of different models of collective ownership patterns can be found in different countries across Europe.

Energy cooperatives and similar initiatives have been important sites of technological innovation activities, as has been documented for the cases of self-construction groups in the area of solar thermal technology in Austria and wind turbine development in Denmark (1995; Olesen et al. 2004; Ornetzeder 2001). Collective citizen ownership of renewable energy technologies, however, also constitutes a new form of socio-economic organisation in the energy system as well as a new form of citizen engagement in energy issues. On this basis it will be suggested that energy cooperatives can also be thought of as social innovations in the sense of ‘new ways of satisfying societal needs, in particular new forms of organisation, new regulations or new lifestyles’ (Zapf 1989).

This understanding then in turn opens up the question how this particular innovation process is unfolding, i.e. how different actors, their resources and strategies, as well as different institutional framework conditions are shaping the development of energy cooperatives as a particular organisational model in the energy sector.

Based on interviews with representatives of energy cooperatives in Austria and Germany as well as on an international literature review, this paper will first examine the multiplicity of understandings (legal forms, organisational structures, roles in the system of energy provision) and rationales (empowerment, green investment, local acceptance for renewable energy technologies) associated with energy cooperatives. In a second step it will take a closer look at the ‘innovation dynamics’ around energy cooperatives, tracing development processes over time and examining interdependencies between different ownership models, institutional framework conditions and interests and rationales attached to energy cooperatives.

**REGIONAL INNOVATION POLICIES INFLUENCE ON THE THIRD MISSION IN THE UNIVERSITIES**

Irene López Navarro 1, Celia Díaz Catalan 2, Nuria Hernández Hernández 2

1CCHS, CSIC, Madrid, 2IESA, CSIC, Córdoba, 3ULL, La Laguna, Spain

Abstract: In recent years, the European Comission (2003) and the OECD (2004) have emphasized the need of a cultural change in universities to foster the so-called Third Mission. Otherwise, different researches have proved a growing role of the regional governments in regional innovation systems (Edler et al. 2003; Cooke et al. 1996; Leydesdorff, L. & Meyer, M., 2007) in these practices performance. Today, Spanish regional governments contribute, from their respective budgets, to fund the Spanish research system, with an amount equivalent to 60% of the central government’s competitive R&D subsidies (Sanz, 2005). In addition, innovation becomes the main goal to the regional systems as an important instrument for both, regional development and human capital promotion (González Ramos y González de la Fe, 2004).

This paper examines the sociological aspects of both, the researchers’ motivation and attitudes towards cooperation with the private sector. In a previous study it has been detected through in-depth interviews, that many researchers consider evaluation system as a barrier for public-private cooperation. For this reason, all the conditions are studied stressing the regional innovation policies influence. Moreover, a special attention is put on the individual evalu-
tion research system determining the scientific dynamics. The main contribution of this work is to assess the regional systems studied, according the recent turn to innovation.

The research reported is based on both, legal documents and qualitative interviews, with different professional profiles from the different regions. The profiles are experienced scientists in policymaking or R&D management, particularly those who involved in the Technology Transfer Offices and the research groups directors.

THE INTERNATIONALISATION OF PROFESSIONAL CAREERS OF MANAGERS AND ENTREPRENEURS

Ana M. Gonzalez 1, Laura Lamolla 1
1Interdisciplinary International Institute (IN3), UNIVERSITAT OBERTA DE CATALUNYA, Barcelona, Spain

Abstract: Internationalisation of professional careers is critical because of globalization in the S&T labour market, and even more relevant in the case of managers and entrepreneurs. Due to their influential position, they might transfer a new work culture, ideas or procedures from abroad. It is expected that the organization takes advantage of their international experience in terms of training, and incorporation of new technologies and innovations at the organizational level.

However, some studies show ambiguities about the real benefits of internationalisation and their contribution to promoting changes in the company. They state that repatriation is a crucial moment for these professionals, and point out that companies tend to lose them as a consequence of their negative perception of progression in the company. Moreover, despite international careers being mainly motivated by professional goals, personal aspects also play an important role in decisions regarding moving abroad or returning home, which affect the success of their careers.

This study is focused on the life course of twenty male and female top managers and entrepreneurs in high-technology firms. The objectives are focused on: 1) addressing the impact of international assignments; 2) the exploration of mutual interference of personal and professional issues; and 3) the extent to which these innovations and skills acquired abroad are transferred to the firms.

Preliminary results confirm that despite a strong orientation towards professional goals, personal reasons are intertwined when making decisions about when to go and when to return. Managers and entrepreneurs place greater importance on the high skills of workers with international experience rather than the opportunity of adopting new methods in their companies.

This study also concerns a comparative analysis between the experience of managers and entrepreneurs who went abroad and then returned, as well as those who will never return. They state the adverse context of the Spanish economy (in some cases Europe) regarding research and innovation activities. Through their opinions the study addresses the encultured knowledge derived from the socialization of different cultures in the workplace and the process of achieving mutual understanding.

VARIEDIES OF THE THIRD MISSION: MODES OF UNIVERSITY-SOCIETY RELATIONSHIP IN THREE RESEARCH AREAS

Juha Tuunainen 1, Reijo Miettinen 2, Terhi Esko 3*, Kaija Hartikainen 4
1Helsinki Institute of Science & Technology Studies, 2Center for Research on Activity, Development and Learning, 3Network for Higher Education and Innovation Research, 4Faculty of Arts, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Recently, a transformation in understanding the relationship between science, university and society has taken place. In science studies, it has been analysed in terms of changing norms of science, “Mode two knowledge production” and “triple helix” of university-industry-government relations. In policy arena, science and technology policy was transformed into innovation policy with focus on competitiveness of nations in the global knowledge economy.

The U.S. Bayh-Dole Act of 1980 exemplifies this transformation. It aimed at accelerating the utilization of university research by enhancing patenting of research results. Later, it was used as a model in reforming IPR legislation in many European countries including Denmark, Germany and Finland. Because the societal impact of university activities has gained weight in national innovation policies, the need for more complex view on the topic is pronounced.

First, the perspective in impact assessment has been one of centralised administrative planning. At the same time, however, big differences between disciplines in terms of their typical societal influence mechanisms have been noted. What the current knowledge thus lacks is an understanding of the ways in which researchers collaborate with societal stakeholders. Second, the innovation systems approach has focused on the commercialization of research results. It is only recently, however, that the need to understand other forms of knowledge transfer was recognized. Third, the current policy runs the risk of conceptualising the third mission as a task separate from research and teaching. There is thus a need to analyse the ways in which these tasks are connected to the societal impact of university activities.

To address these gaps in knowledge, this paper investigates research activities in three areas: 1) urban studies, 2) Finno-Ugrian languages and 3) learning difficulties. By using these cases as springboards in theoretical understanding, the paper contributes to the current literature 1) by uncovering and typifying the diversity of forms of university-society interaction and 2) by investigating the ways in which epistemic, societal and educational motives are intertwined.

PARTICIPATIVE TECHNOLOGY ASSESSMENT AND POLITICAL CULTURE. AN INTERNATIONAL COMPARISON OF THE CASE OF XENOTRANSPLANTATION

Erich Griessler 1, Peter Biegelbauer 1
1Department of Sociology, INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria

Abstract: Politics is often confronted with problems that turn out to be not only knowledge intensive but also controversial in public. Well known and often quoted examples in this respect are genetically modified organisms, medical applications of biotechnology and genetics, nuclear energy or nanotechnology. Political decisions on such issues are frequently taken in a delicate and charged constellation between politicians, experts and the public. Attempts to solve the Gordian knot of knowledge intensive and controversial problems of science and technology policy with the help of partici-
patory technology assessment (PTA) in some countries reach back several decades.

Countries’ experiences vary in this respect. While some countries and international organisations completely rely on experts when looking into knowledge intensive and controversial issues of science and technology policy, others established technology assessment organisations which also included PTA in their methodological toolbox. Results of these PTA are integrated, more or less successfully, into political decision making. In a third group of countries nongovernmental actors in fact carried out PTAs, however, were unable to establish them within the political structure.

Our contribution is based on an international comparative project, which was financed by the European Commission within the 7th Framework Program. The project ...Impact of Citizen Participation on Decision Making in a Knowledge Intensive Policy Field” (CIT-PART) compares the way in which experts and citizens were involved in decision making in xenotransplantation policy in the late 1990s and early 2000s in nine European countries (Austria, Denmark, Latvia, Netherlands, Italy, The Holy See, Sweden, Switzerland, UK), the OECD, the European Commission and Canada. Xenotransplantation is the transplantation of cells, tissues and organs across species and raises an number of questions concerning risks and ethics.

We compare when and under which circumstances expert TA and PTA were carried out. We will focus on the following questions: What explains the differences in the use and impact of expert TA and PTA? To which extent can we explain this difference by the role of and the self-perception of citizens, civil servants, scientist and politicians, the concepts of representative and direct democracy and different social practices of policy making in particular countries?

"AFTER ALL, WHO DEFINES THE SKY SIZE?" - THE PRODUCTION OF SCIENTIFIC AND TECHNOLOGICAL KNOWLEDGE AMONG SCIENTISTS AND LAY PEOPLE

Teresa Duarte¹

¹ISCTE-IUL, Lisbon, Portugal

Abstract: The participation of non-scientists in the production of scientific and technological knowledge has been leading to scientific advances in different areas of science. This participation has been allowing the complementarity of the experts’ knowledge with the observation and knowledge of lay people, and the organization of spaces where the various actors argue and make recommendations (eg. Irwin, Wynne, Gonçalves, Joss, McCormick). But, regardless the specific and irreplaceable knowledge produced by the laboratories, experts and lay people work closely together, being the knowledge discussed and adapted by a diverse set of actors thus constituting a collective learning (eg. Callon, Callon & Rabeharisoa).

This paper focuses on the field of astronomy, an area where some of the key findings of unpredictable phenomena (the case of supernovae, comets and exoplanets) belong to the lay people, as often they know the night sky better than scientists. Lay people’s interest in astronomy has greatly increased in Portugal with the International Year of Astronomy in 2009 and it is an area that has watched the creation of new groups with the aim of developing ProAm projects.

Through interviews to scientists and non scientists that participate in research projects, this paper aims to identify and characterize these modes of production and legitimation of science, understand to what extent the input of lay people in the production process transforms the professional practices of scientists and describe and interpret the nature and scope of social relations.

Maria Caramez Carlotto¹

¹Departament of Sociology, UNIVERSIDADE DE SÃO PAULO/SORBONNE - PARIS IV, Paris, France

Abstract: This proposal addresses the transformation in the disciplinary regime of scientific knowledge production in Brazil after the redefinition of the national policy of science and technology in the beginning of the 2000 years. The main aim of this paper is to show how changes in the legal framework of science (particularly, the incorporation of innovation as a major goal) influenced scientific practices of the Brazilian scientific elites (that means, the researchers working in the country’s most important universities and scientific institutions). The paper will present the results of an empirical research based on:

(i) the analysis of the new Brazilian program for science, technology and innovation (2003) and of the new Brazilian innovation law (2004);

(ii) interviews with laboratory directors, members of scientific bureaucracy (directors of innovation agencies, coordinators of funding agencies, etc.) and;

(iii) most important, a survey applied to 211 scientists working with nano and biotechnology in a very important Brazilian laboratory (the National Laboratory of Sincrotron Light).

The foremost conclusion is that Brazilian scientific elites both articulate the change of the legal framework to promote the university-enterprise links and support scientific practices that preserve the relative autonomy of science.

SCIENCE AND ENVIRONMENTAL ACTIVISM IN SOCIOECOLOGICAL CONFLICTS

Mercedes Martinez-Iglesias¹,²

¹Sociology and Social Anthropology, UNIVERSITY OF VALENCE, VALENCE, Spain

Abstract: The presentation expose some results of a survey about environmental activists which have been participants in environmental conflicts included in the research project Scientific-technical information, public participation and effects of sustainability in environmental conflicts (CSO2008-00291/SOCI), included at the Spanish National R+D Programme.

The survey examines opinions of environmentally concerned citizens about the social role of science and the experts, social participation, the effects of conflicts, etc. It is based on a representative sample of people involved in Spanish environmental movements.
The project aims to produce new knowledge about social movements or collective actions that are produced from social conflicts built around environmental problems or greatly connected to them. Also, it tries to detect changes produced through the interaction between experts and activists in the pattern of social movements (effects of collective learning, building capacity for proposal, etc.) as well as in the social role of science (expanded knowledge communities, legitimacy of information sources based on traditional or experiential knowledge, and so on.). In particular, it attempts to establish to what extent the scientific arguments supporting the environmental movement have certain characteristics that very often have been attributed to them: holism, complexity, criticism of anthropocentrism, etc...

SOCIAL REPRESENTATIONS OF SCIENCE AND TECHNOLOGY, DIGITAL DIVIDE AND SOCIAL EXCLUSION IN THE AGE OF INFORMATION AND KNOWLEDGE SOCIETY: EVIDENCES FROM THE SPANISH CASE.

Cristóbal TORMES-ALBERO, José Manuel ROBLES-MORALES, Carlos FERNANDEZ-RODRIGUEZ, Ramón MAHIA-CASADO

Abstract: It is often agreed that in advanced contemporary societies education and age are considered the most relevant variables explaining the access/no access to Internet. This paper claims that along with these classic socio-demographic variables also social representations play a key role –even if a very complex and non-linear one- in the process of social exclusion brought by the digital divide. This does not mean to deny any relevance to the mentioned socio-demographic variables. Rather highlighting how ambivalent and techno-phobic social representations of science and technology are able to shape a third factor that, combined with low education level and an older age, bring about a strong bias towards the non-use of ICT and particularly Internet. Nevertheless this does not imply that every non positive social representation about science and technology ends up producing a tendency to exclusion, just like there are people under social exclusion with positive social representations regarding science and technology. In sum, the different relations between these three variables will be examined to give an account of the digital divide and thereby the social exclusion and inclusion processes in information and knowledge societies. To do so, some empirical data –both quantitative from a survey and qualitative from in-depth interviews and focus groups- from the Spanish society will be provided.

S&T DEVELOPMENT IN EUROPE AND PRODUCTIVITY IN SOCIAL SCIENCES

Helena Carvalho, Luísa Oliveira

1Department of Social Research Methods, 2Department of Sociology, Lisbon University Institute (ISCTE-IUL), Lisbon, Portugal

Abstract: In an a paper published in the journal Nature, R. May (1997) concluded that the top seven countries were the world’s seven largest economies, and USA dominated with 35% of the publications in science world followed by United Kingdom and that the production of the EU15 at the time was approaching that of the USA (32%). David King essentially reached the same conclusions in 2004 for the period from 1993 to 2002. This paper focuses on the analysis of the EU’s performance in science using the above as our starting point together with the assumption that the more scientifically developed a country is, the more productive it will be in the science area. We analyze the relationship between the development of S&T and scientific productivity in science as a whole and in Social Sciences in particular. The focus on Europe is due firstly to the fact that the strategy and goals defined for Europe (Europe 2020) are heavily dependent on R&D development if the knowledge society model is to be achieved. Secondly, on one hand the European Science space is highly segmented (Oliveira & Carvalho, 2009) and hierarchized, and on the other European science policies implemented a set of measures in the last twenty years aimed at integrating the less developed countries. In this context, we consider whether the impact of these measures has changed the stratification profile of the European science space (Cole, J. & Cole, S., 1981).

The paper is divided into two parts. The first analyzes the development of S&T in the European countries in the last 20 years and the evolution of the structure of the European Space Science (ESP). The second part analyzes the relations between the number of published articles and the hierarchical position of countries in that space.

The results are surprising in that central European countries have lost their centrality in the development of their C&T systems, and northern European countries namely Finland, Denmark and Sweden are in the top positions. Secondly, it does not mean that the number of publications in science and social sciences corresponds with this hierarchy. We admit these results may be explained by scientific and disciplinary cultures and practices on one hand and limitations of the ESI data base on the other. These new hypotheses should be tested in further research.

GOVERNING THE KNOWLEDGE OF GOVERNMENT: SECTORAL RESEARCH UNDER TRANSITION

Valtteri Johannes Vähä-Savo

1School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: Public research systems have undergone many substantial reforms in most European countries during the last few years. Along with universities, these have had a strong impact on state research institutions which conduct research to support societal decision-making and service production. These so called sectoral research institutions have been subject to significant changes in funding, governance and institutional structures. The aim has been to facilitate horizontal co-operation, to create more effective steering mechanisms and to increase productivity and innovativeness. Steering relies more and more on market-type mechanisms and new modes of governance, while the pressure to produce economically useful and marketable knowledge has increased. As research policies are reshaping the way sectoral research is conducted they also influence what kind of knowledge is produced and offered for the administration and what kinds of societal problems are raised to public awareness. Despite the significance of these developments their effects have been little studied as of yet.

This paper focuses on the reforms of sectoral research system in Finland and looks at their effects on researchers and research insti-
tutions. My paper is based on analysis of Finnish research policy documents and interviews I conducted among staff members of two Finnish sectoral research centers; The National Institute for Health and Welfare (27 interviewees) and The Finnish Environment Institute (24 interviewees). This analysis shows that the new policies and methods of steering research in Finland in fact contain several contradictory elements. Contradictions can be found both between policy objectives and steering mechanisms. This leads to a situation where these objectives and methods tend to either cancel each other out or at least weaken the research establishments’ ability to carry out their functions. Consequently, the measures taken to increase the productivity and quality of research may turn out to be counterproductive.

European countries differ in terms of how their research systems are built up and governed and have different ways of implementing these reforms on a national level. Yet, recent reforms of public research systems seem to be following the same guiding principles in most countries and they are likely to face similar problems as Finland.

**EFFECTS OF TRANSDISCIPLINARY RESEARCH – HOW TO CAPTURE SOCIETAL EFFECTS OF RESEARCH PROJECTS ON SUSTAINABLE CONSUMPTION**

Markus Winkelmann 1, Rico Defila 2, Antonietta DiGiulio 1, Ruth Kaufmann-Hayoz 2

1IKAOE, University of Berne, Berne, Switzerland

Abstract: Besides producing new knowledge social scientific research is often also expected to have effects outside the academic sphere. In contrast to the well established scientific impact measurement the investigation of societal effects is still uncommon and faces a specific set of challenges. The expectation that social sciences will produce problem solutions ensures research resources, but it may also lead to unrealistic promises. Research activities, especially transdisciplinary research, certainly do have effects. These need to be described systematically, in order to develop a realistic appreciation of the problem solving capabilities of transdisciplinary research.

Within the focal topic “From Knowledge to Action – New Paths towards Sustainable Consumption” (2008-2012) of the German BMBF (Federal Ministry of Education and Research) a special accompanying research project is being funded. One of its goals is to investigate societal effects of the ten research networks involved in the focal topic. Three basic types of research outcomes which could cause societal effects were identified, and an exemplary investigation of the effects is conducted. The aim is to arrive at a more precise description of societal effects of research and to draw conclusions with respect to realistic expectations on the problem solving capabilities of targeted research projects.

The paper presents the approach and ongoing work of the accompanying research in investigating societal effects of transdisciplinary research projects. The challenges and constraints of the approach that was chosen will be discussed.

**RATIONALES IN SHARING AND PROTECTING PERSONAL INFORMATION IN DIFFERENT TECHNOLOGICAL SYSTEMS**

Karolína Snell 1, Johannes Starkbaum 2*

1Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland, 2Department of Political Science, Life Science Governance Platform, University of Vienna, Vienna, Austria

Abstract: New technological systems are nowadays introduced in a fast pace, and people are faced with decisions of whether to participate in them or not. In technological applications – such as social media, personal health management technologies, tracking and positioning systems or biobanks – vast amounts of personal data are gathered and distributed. People have to decide whether they choose to share information or not. We will discuss what different publics think about these information flows and how they negotiate and manage their boundaries of privacy. This paper is based on 12 focus group interviews with people of different age groups in Finland and Austria.

People acknowledge that there are personal as well as social benefits in most technological applications, but simultaneously they are concerned with possible risks. One gets easily overwhelmed by the increasing complexity and inter-connectedness of technological applications as well as their expansion to almost all spheres of life. In this paper we analyse peoples’ opinions about sharing different types of data (like biological samples, health data, pictures or purchasing patterns) and what kind of conditions and reservations they identify for their use and collection. The management of personal boundaries of privacy is dependent on complex social processes of action that cannot be reduced to a simplistic cost-benefit model. People have different strategies and rationales to cope with this entanglement of data. While Web-2.0-applications enable participants to choose the information they share, top-down data collections like biobanks mostly rely on prefixed settings. However, both settings require social, political and legal regulation.

**RISING SOCIETAL EXPECTATIONS ON RESEARCH ORGANISATIONS. COMPARATIVE STUDY OF ALIGNMENT PROCESSES IN BASIC AND APPLIED RESEARCH INSTITUTES**

Axel Philipp 1

1Institute for Sociology, LEIBNIZ UNIVERSITY HANNOVER, Hannover, Germany

Abstract: Scientific knowledge is confronted with rising societal expectations. Therefore research is increasingly concerned with demonstrating its social relevance (i.e. if applying for external funding). In contrast, research also is measured by its scientific reputation. Hence, research organisations have to tackle with different demands. How are research organisations adjusting to those demands? And how do they organize multiple references to society (i.e. science, economy, politics, etc.)?

In my presentation I will compare three types of German research organisations that are equipped with different degrees of scientific autonomy and societal references: Firstly, institutes of the Max-Planck-Society, secondly, institutes of the Fraunhofer-Society and thirdly, Government research agencies. Max-Planck-Institutes are known for its great scientific autonomy, whereas the other two institutions offer scientific solutions and expertise to non-scientific agents (like business companies or government institutes). For the purpose of comparison nine scientific units concerned with material science were selected for case studies. Those rely on structural data on the organisations, on their scientific outcomes and on 20 interviews with representatives of all organisations examined.
I will demonstrate that there are diffusions on the level of societal relevance as well as increased distinctions concerning organisation’s profiles and its scientific orientation. It has consequences for the governance of science, particularly for its research criteria and mechanisms.

The results presented are part of a module within the research project: Governance of research agencies between politics, science and society (German: Governance staatlicher Forschung im Spannungsfeld von Staat, Wissenschaft und Gesellschaft) that is located at the Leibniz University of Hannover (2010-2012) and funded by the German Federal Ministry of Education and Research.

YOUNG RESEARCHERS’ INTEGRATION IN SCIENTIFIC INSTITUTIONS: SCIENTIFIC POLICY, ORGANIZATIONAL CONDITIONS AND RESEARCHERS’ ATTITUDES

Antonio Firmino Costa¹
¹CIES-IUL, INSTITUTO UNIVERSITARIO DE LISBOA (ISCTE-IUL), Lisboa, Portugal

Abstract: The current science policies in most countries have as one of its key concerns attracting young people to scientific careers and promoting the integration of new generations of researchers in scientific institutions. This paper analyses a recent initiative of science policy in Portugal aiming at integrating national and foreign young PhDs in research laboratories and research centres. In 2008 and 2009 over a thousand young post-doctoral researchers were integrated in research units from all major scientific areas. We present the first results of a questionnaire survey to these young researchers about the hosting conditions they found, the forms of integration they pursued and the expectations they have for their scientific careers.

ACADEMIC LEADERSHIP AND RESEARCH INVOLVEMENT OF EARLY CAREER SCIENTISTS

Inge van der Weijden², Rosalie Belder³
²science system assessment, RATHENAU INSTITUTE, The Hague, Netherlands

Abstract: Competent leadership is of vital importance for research groups as it affects both creativity and productivity of scientists. After selecting and hiring good scientists, the next challenge and difficult tasks for group leaders is to get and keep their researchers motivated in order to perform well. Leaders organize management activities such as reward and promotion system, internal communication structures and positive research climate which enable and stimulate performance of research groups and their members.

Today, changes in nature of research reinforced the need for competent leadership. For example the increasing complexity and interdisciplinarity of research problems calls for more and different expertise combined in one research group. Additionally, several developments in the science system have consequences for the organization of research groups. The emphasis on research excellence, the call for societal relevance of research and finally the strong competition in order to receive funding are examples. These developments pose new important questions of how to organize research.

We will study whether the young generation of academic group leaders take up these leadership challenges explicitly. We also study their research involvement; dedication to one’s work which is expressed by motivation, self-reliance, commitment to research activities and satisfaction. The study encompasses two main research questions: (1) What is the relationship between academic leadership and research involvement? and (2) What is the relation between research involvement and research performance? We will answer these questions by studying scientists, young academic group leaders, who are selected to be educated within scientific career stimulating systems. The Principal Investigator system (PI) and the Tenure Track system (TT) are two most important systems that are recently used in the Netherlands to stimulate the scientific careers of young talented researchers. At the ESA conference we will present the preliminary results of a questionnaire study among medical and health scientists.

CULTURAL AND SOCIAL NETWORK THEORY PERSPECTIVES ON YOUNG RESEARCHERS’ PROFESSIONAL SOCIALIZATION

Marija Brajdic Vukovic¹
¹Sociology of Science Research, INSTITUTE FOR SOCIAL SCIENCES, Zagreb, Croatia

Abstract: Supportive relationships in the professional socialization of young researchers can be studied as networks. However studies on the topic remain scarce and one-dimensional in their approach. The research design of this study draws from approaches that recognize science socialization culture as interplay of individual, disciplinary and institutional but also local and national cultural layers, and core social network theory approaches that regard egocentric network as a source of rewarding interactions. By combining qualitative and quantitative methodology, we focus on professionally rewarding young researchers’ egocentric networks as products of unique socialization cultures. A questionnaire about the professional egocentric network is introduced at the end of in-depth interviews (N=40) with Croatian scientific novices from natural and social sciences with parameters such as the respondent’s scientific productivity, productivity of alters - formal mentor(s) and research group - also gathered. To provide statistical generalizations, online core network questionnaire is administered to the additional sample of 140 young researchers from natural and social sciences. We analyze structure of core-networks and by analyzing the alters’ origin and history of acquaintance with ego, we place influences in the cultural spaces and try to discern more about the functioning of disciplines and institutions in which those networks are embedded. We relate findings of the core-networks structure characteristics with productivity and PhD thesis completion in order to better understand the “success” or “appropriateness” of the types of networks that support young researchers professionally. Research methodology is potentially valuable because it provides insight into whether and how the overall structure of a young researcher’s relationships matters in professional science socialization.

PRODUCING PIONEERS? A QUALITATIVE EVALUATION OF THE ERC STARTING GRANTS

Ivonne Kuesters¹
¹Fakultaet 12/ ISO, TECHNISCHE UNIVERSITAET DORTMUND, Dortmund, Germany
Abstract: The European Research Council’s ERC Starting Grants – currently on the fourth call – are designed to provide young researchers with a long-term support to allow them to establish their own research team at a scientific organisation in Europe and to conduct their research independently. This grant especially seeks to support pioneering frontier research. Despite its relative newness the grant is very prestigious, not least because of the high funding sums and of the selection process: It claims to consider solely the excellence of the researcher and of the proposed research project.

To evaluate this grant programme the MERCI (Monitoring the ERCs Implementation of Excellence) research team combines a quantitative and a qualitative approach. The qualitative part of MERCI (Prof. Dr. M. Meuser and I. Kuesters from TU Dortmund University, Germany) is based on 40 in-depth interviews with grantholders and rejected applicants of the second call in 2009.

The qualitative approach addresses questions as: In how far produces the ERCStGrant the output it aims for, i.e. pioneering frontier research? Does it provide the young researchers with a position of autonomy and independency? Does the grant affect organisational hierarchies? What is the grant used for besides conducting research? Does the selection process only react to excellence of investigator and project proposal (and to what kind of excellence?) or is it also sensitive to other factors? Does the grant encourage internationalisation and mobility?

This paper will present the findings on the following topics: characteristics (especially novelty) of the funded research projects; the grant’s impact on the reshaping of scientific organisations in different European countries (especially on hierarchy); its effects on mobility and internationalisation. For example, it can be shown that the grant rather rewards mobility at earlier stages of the scientific career than to encourage internationalisation in the present; in fact, it is often used by grantees to return to their home countries from abroad. It is also often (and in some cases: in vain) used to compensate structural shortcomings of the scientific organisations of their home countries in general and of their host institutions in particular – in benefit of the scientific research as well as in benefit of the researcher’s position and career prospects.

GENDER ISSUES IN SCIENTIFIC RESEARCH: A STUDY WITH ITALIAN UNIVERSITY STUDENTS AND YOUNG RESEARCHERS
Sonia Brondi ¹, Alberta Contarello ²

¹Department of Sociology, ²Department of Applied Psychology, UNIVERSITY OF PADOVA, Padova, Italy

Abstract: More and more often, the European Commission asserts that excellence in science would be reached solving gender issues. It would be possible allowing the best human resources - both women and men - to develop science to the highest standard. It is well known that nowadays more women then men approach the world of the scientific research, but many of them drop out through the career path (leaky pipeline). Also in Italy gender statistics are coherent with the European ones and, in most cases, even worse. A wider research plan analyzed the perceived - and/or effective - role played by different factors with respect to the issue, such as: gender stereotypes and gender-biased communication; motherhood and work/life balance; historical and socio-cultural influences inside scientific thought and practice; psychological, cognitive and biological constrains. The inter-relation between different levels - the psychological, the relational and the societal ones - was taken into account. To this end, the theory of Social Representations was chosen as theoretical framework and Flick’s contribution seemed to be the most suitable view. This perspective considers the SR as a ‘space in between’ macro-structural changes, changes in practice and everyday life activities, and changes in the individual and relationship experience. The enquiry was conducted considering three different Faculties at University of Padova (Italy), characterized by different proportions of enrolled women and men as well as linked with long term gender stereotypes. A first phase was carried out with students (N=365) through a paper&pencil instrument; a second one with young researchers (N=24) through six focus group discussions. This contribution aims to examine if and how students and young researchers perceive and live gender issues in scientific research and in their own experiences. To this end, it focuses on answers to specific questions. Results show scanty and gender-biased information on the issue: participants acknowledge that the issue of gender in scientific research exists but they perceive it weakly in their academic experience; moreover, according to expectations and to previous studies, the main factors influencing the careers are linked to a historical perspective and to the work/life balance issue. Results will be discussed also considering differences due to gender and academic field belonging.

HOW TO MOTIVATE YOUNG SCIENTISTS
Rosalie Belder ², Inge van der Weijden ²

²Science System Assessment, RATHENAUM INSTITUTE, The Hague, Netherlands

Abstract: In this paper, we focus on the important role of young scientists. They will be the new generation of researchers and group leaders, and it is therefore important to understand what motivates them. In that way, we can create the appropriate conditions to hold on to scientific talent. So far, very little research has been done on the motivation of scientists. In our study we distinguish between internal and external motivation, as well as job satisfaction and motivation. In our definition, motivation is involvement in one's own work. Motivation arises from the inside; from confidence in one's own ideas, but can also be externally stimulated. Job satisfaction is different from motivation, as it results more from the work conditions surrounding the researcher. In this paper, we will present the first results from our study, which is based on data gathered from 15 interviews with young scientists from the Dutch biomedical and health sciences – both PhD students and postdoctoral researchers. In the interviews, a number of important topics are discussed. The first topic is academic careers. Why did they choose to pursue an academic career, and how did they select the topic of research? What do they want to achieve in their career; what goals have they set for themselves? Do the young scientists receive any career guidance from their institute? Academic leadership is the second topic. How do the young scientists experience the supervision they are receiving in their academic career? Is there anyone they consider to be a mentor to them in their academic career? The third topic is job satisfaction. What are their experiences with the culture of the research group? How content are they with the working environment?

PSYCHOSOCIAL WELL-BEING AMONG PHD STUDENTS: HOW IMPORTANT IS THE MENTORING STYLE OF THE SUPERVISOR?
Hanne Derycke 1, Hans Groenvynck 1, Ronan Van Rossem 1
1Department of Sociology, GHENT UNIVERSITY, 9000, Belgium

Abstract: Obtaining a PhD is hard and stressful work. Thus far, the well-being of PhD students has obtained little attention. During the PhD track, the supervisor often plays a fundamental role in stimulating his/her students to obtain a doctorate. The relationship between a PhD student and his/her supervisor is therefore expected to have an important effect on the well-being of the student.

The present study makes use of data collected by the Survey of Junior Researchers from 1918 PhD students in the 5 Flemish universities. Three measures of psychosocial well-being were included: perceived job demands, job control and social support. The mentoring style of the supervisor was assessed by two scales, measuring how strongly PhD students perceived their supervisor to be either authoritative and directive (authoritative supervisor) or encouraging and supportive (supportive supervisor).

Using regression analysis, the main and interaction effects of these two mentoring styles were assessed on doctoral students job demands, job control and social support. The results indicate that the more doctoral students perceive their supervisor to be authoritative, the higher they perceive their own job demands and the lower they judge their job control and social support. PhD students who evaluated their supervisor as supportive had a higher feeling of job control and perceived more social support at work. Also, two interaction effects were observed: the extent to which the supervisor is perceived as highly supportive strongly differentiates the impact on job control when this style is combined with a low authoritative style. Regarding social support, the combination of a high supportive and low authoritative supervisor had a more positive impact compared to the other supervisory style combinations.

The present study demonstrates that the mentoring style of the supervisor is clearly related to PhD students’ psychosocial well-being at work. Practical implications will be discussed.

INTERNATIONAL MOBILITY AS A MECHANISM FOR TRAINING OF YOUNG SCIENTIST IN RUSSIA

Nadia Asheulova 1, Valentina Lomovitskaya 2
1Centre for Sociology of Science&Science Studies, RUSSIAN ACADEMY OF SCIENCES, IHST, St Petersburg, Russian Federation

Abstract: Training of young scientist is playing an increasingly important role in the future of Russian science. In Soviet-Russia, the emergence and reproduction of the academic staff was inextricably connected with a significant self-organizing element of the scientific community, known as a ‘school of thought’ (nauchnaya skola). The scientific elite not only matured in a particular school of thought, but this was how scientific work itself, as a scientist’s free activity, could be done. Any form of mobility and especially international mobility wasn’t necessary and quite often was even undesirable for a scientist of Soviet past.

The post-Soviet social and economic transformations have led to significant changes in Russian science. The idea of a ‘school of thought’ as a self-organizing form in the scientific community was destroyed. The collapse of the various schools of thought implied that an important tool for reproducing the scientific elite was broken. The process of liberalization is a condition for stronger mobility among Russian scientists. The ‘international mobility’ of scholars proves to be a significant new instrument for reproducing the academic staff.

The paper analyses the international mobility of Russian scientists at the different historical stages and tries to identify its effects on training of young scientists in Russia.

This research reported will also highlight the methods of international exchanges of young researchers such as scholarships, internships, and grants. These exchanges are particularly useful for young researchers carrying out experimental work elsewhere if relevant equipment (such as large research facilities) is unavailable in Russian institution.

International mobility is crucial for integrating Russian science into the global scientific community. The participation of Russian scientists in the world division of labor can help to solve difficult problems for post-Soviet science as the generations change.

The author will present results of a sociological study “Mobility as Mechanisms for Reproducing the Scientific Elite in Russia” conducted by the Center for Sociology of Science and Science Studies, Research Institute for the History of Science and Technology, St. Petersburg Branch, Russian Academy of Sciences.

SCIENTIFIC LABOUR IN TURBULENT TIMES: YOUNG RESEARCHERS’ PROFESSIONAL ASSOCIATIONS IN PORTUGAL

Luis Junqueira 1
1Institute of Social Sciences, University of Lisbon, Lisbon, Portugal

Abstract: The literature of past twenty years has identified a re- structuration of the social organization of science, both in its internal organization and its interaction with society. There are several readings of this changing organization: Mode 2 of Knowledge Production, the Corporate University or post-academic science, are some of the more influential. However, most of them identify the strengthening of the relation between the academy and industry and an increased external accountability of scientific work as the main features of the new university. This changing organisation of scientific production has significant impact on the labour conditions in the university, particularly for researchers in the early stages of their careers, by restricting access to tenured positions and strengthening the universities’ reliance on graduate students for research and teaching. As a response to the growing concern over these issues, a social/political movement is emerging among young scientists and several organizations are being created as means of collective bargaining and political representation.

This issue remains insufficiently researched, as existing works are few in number and only cover a limited set of national contexts, mostly concerning the unionization of graduate students in American universities.

The propose of this presentation is to contribute to the reflection on the impacts of the changes in science organisation over the early stages of scientific careers and their connection to this recent trend of young scientists’ mobilization by taking on the Portuguese context. The work will focus on two associations, each representing young researchers in different stages of their careers, which emerged in Portugal in the last decade. It intends to explore the changes in scientific work taking place in Portuguese science and the way they relate to the emergence of the young researchers organizations, as these associations reflect not only broad concerns
of scientific labour movements, present in the literature, but also specific issues related to the organization of the Portuguese science system and its recent development.

This paper is based on an on-going project, “SOCSCI – Scientific Societies in Contemporary Science”, sponsored by the Foundation for Science and Technology.

YOUNG SCIENCE APPRENTICES: GENDER, DISCOURSE AND INTERACTION

Carlos Catalao

1Pavillion of Knowledge Ciencia Viva, AGENCY FOR SCIENTIFIC AND TECHNOLOGICAL CULTURE, Lisboa, Portugal

Abstract: This is a case study of a Science Internships Programme, in Portugal, in which more than 8,000 girls and boys (K-10 to K-12) worked alongside scientists at their workplace within the scope of a National Science Programme – Ciencia Viva*. Combining survey with a range of interconnected qualitative methods, it was found that students experienced their engagement with the scientific community not only as an opportunity for knowledge understanding, but also as an induction into the processes of science, their organizational environment and their societal implications.

In many ways, the internships were perceived differently by boys and girls. The latter valued some aspects of their experience more than boys as part of the development of their identity as future scientists. In particular, these aspects were linked to the clarification of their careers, their professional future, and, ultimately, their feeling of themselves as scientists. The findings in this inquiry suggest that the understanding of the different ways in which boys and girls connect to science should not over-rely on essentialist explanations, such as the often assumed feminine tendency for choosing care-oriented careers. Other factors, such as peer influence, social mobility or, simply, girl-friendly learning design must also be considered as part of a complex frame of gendered social expectations and interactions.

This indicates that any strategy intended to address issues of gender in science will need to be sensitive to the differences that exist among girls and respect their subjectivities and shifting identities. The challenge will centre on the ability to develop a programme of action which pays simultaneous attention to the ‘established’ common traits of womanhood and to the differences among women, in the diversity of their individual responses to the impact of gender.

* Ciencia Viva is the Portuguese National Agency for Scientific and Technological Culture. Ciencia Viva is a private association of Portuguese scientific institutions.
RN 25 Social Movements

"THE FIELD OF NEW SOCIAL MOVEMENTS" AND "THE NEW ACTIVIST HABITUS" IN TURKEY
Derya Fırat 1, Tuba EMİROĞLU 1, Öndercan MUTİ1
1SOCIOLGY, MIMAR SINAN FINE ARTS UNIVERSITY, ISTANBUL, Turkey

Abstract: Sociologists have shown that compared to the previous generations, today's actual participation of youth in political life has decreased.24 Apoliticism observed in youth increases especially between the ages 20-30.25 The researches concerning the political participation of Turkish youth reflect a similar situation.26 The researchers point out the relation between the increasing apoliticism in youth and the crisis of the traditional political parties and the political representational system. On the other hand, apart from the classical organizations and movements, the New Social Movements start to become widespread among the youth both in Europe and in Turkey. The New Social Movements increased in number within the last twenty years differ from classical social movements both in terms of organizational forms and action repertoires. Likewise, sociologists have illustrated that the movements such as ecology, anti-war, anti-authoritarianism, anti-capitalism and new anarchist movements as well as islamophobia, xenophobia, neo-conservatism, and new ethnic and religious identity movements are advocated by the youth.

This study aims at problematizing the political participation of middle-class educated youth in big cities and analyzing the new social movements and new activism forms supported by the youth. Within this research, the works of Migration Solidarity Network which aims at building a solidarity network with the immigrants, Başyaranfest which has organized a first feminist festival in Turkey, Resistanbul which has organized demonstrations against IMF-WB, Imce which organizes social urban actions and Say Stop to Racism and Nationalism Initiative which struggles against racism are investigated by participant observation and depth interviews are done by activists of the groups.

The youth who gather beyond classical political engagements to protest a specific issue without becoming a member of an organization, can organize horizontally at international level, with the possibilities rendered by internet. "Project based engagement" put forward single issue mobilization based on limited targets.

Up to now, we have elaborated new action forms such as performative actions, action-space relationship, new militant habitus and new means of action organization, afterwards we intend to map the field of new social movements and study new activist habitus.

BETWEEN CASUAL AND WILD PUBLICS: A BAKHTINIAN STUDY OF POST-REVOLUTIONARY IRANIAN PUBLIC SPHERE
Babak Rahmi1
1Religious Studies, SCHOOL OF ORIENTAL AND AFRICAN STUDIES, Tehran, Iran, Islamic Republic Of

Abstract: An attempt is made to offer a Bakhtinian conception of public sphere with a focus on post-revolutionary Iran as a case study. Various spaces, like the parks, coffeehouses or public squares, are identified here as ensemble sites of contestation: lived interactive locations wherein changes, (de) constructions, subversions and shifting of both individual and collective identities take places. As heteroglossic spaces of communication, such public spaces not only create communicative spheres, but also produce performative sites of misrule through which the official ideology of the state is defied and alternative publics of dissent are formed. The paper elaborates on two distinct types of carnivalesque spaces: (1) “casual publics” or those sites of interaction where official cultural authority over the population (such as public squares or ceremonial spaces) and (2) “wild publics” or those shared spaces that refract ordinary social relations by openly defying official norms of interaction and behavior. The reversal strategies is described here in close connection with various state-led strategies that aim to institutionalize a cohesive and orchestrated collective identity, absent of spontaneity of public interaction and docility to state authority. The study finally considers the post-election 2009 period and attempts to offer an analysis in how “casual” and “wild” publics have contributed to the evolving social movement in changing state and society relations.

ORGANIZING AND MOBILIZING IN THE ARAB WORLD
Katia Pilati1
1Institute de sociologie, GERME, UNIVERSITÉ LIBRE DE BRUXELLES, bruxelles, Belgium

Abstract: The aim of this paper is to test social movement theories, mainly applied to the analysis of mobilization in Western countries, on some Arab countries. We will draw on theories linking organizational engagement to levels of mobilization. While resource mobilization theories (McCarthy and Zald 1986) see organizations and engagement in organizations as resources for mobilization, evidence in non-Western contexts, especially in repressive context, is more controversial. Particularly, while most types of organizations ignite mobilization, religious organizations do not (Pilati forthcoming Mobilization). In light of such findings, we take a peculiar look at levels of mobilization in 7 Arab countries (Jordan, Palestine -West Bank and Gaza-, Algeria, Morocco, Kuwait, Lebanon, Yemen) 5 of which, according to the Economist Intelligence Unit’s index of democracy, are classified as authoritarian regimes. We do so by using data collected at the individual level through the 2009 Arab Barometer survey. We aim to investigate the impact of organizational engagement and, more specifically, of engagement in religious organizations, on participation in demonstrations and protests in such contexts. Preliminary findings using such data show that levels of mobilization in the Arab countries observed are rather high in most of the countries observed compared to other non-Western countries, namely, African countries. With the exception of Jordan, around or more than 20 per cent of individuals of the countries observed are engaged in at least one protest. At the same time, findings show that individuals in the Arab countries analyzed, except Jordan, tend to have high levels of organizational engagement. Future drafts will
thus aim to test this relationship – organizational engagement and mobilization – by taking a peculiar look at the role of engagement in religious organizations.

THEORIZING MICRO-MOBILIZATION UNDER STATE REPRESSION

Emin Poljarevic

Abstract: This paper seeks to discuss Islamist micro-mobilization in Egypt since 2000. It seeks to increase our overall understanding of activism under repression by looking at low-level activists’ explanatory narratives. The activists’ discourse is analytically divided so that one can discern how emotions, identities, and beliefs are affected by repressive state policies. During the last four years, my research has developed and contrasted several different theoretical frameworks all in connection to the extensive empirical material gathered in the field. In order to contrast activists’ explanatory framework, the hosting social movement organization’s (the Muslim Brotherhood - MB) strategies are also presented as a background for discussion. The vast majority of Islamist movement organizations are non-violent, and some are prepared to work within the political structures set up by the ruling regimes (as the MB). For this reason it is necessary to revisit theories of state repression and social movements in order to increase our understanding of activism under extreme conditions. This paper therefore seeks to address questions such as: What leads some of people to engage in high-risk social activism? How do activists explain their decision to “get from the balcony down to the barricades?” How are everyday practices transformed into socio-political activism in repressive states? Lastly, the paper argues that social movement researchers have given little attention to (Islamist) social movement organizations active in repressive states. The process of (continuous) repression of social movement mobilization therefore supposedly have different implications for the activists’ lives than in the democratic societies where policing of protest events and other types of contentious displays is limited in scope, time and space.

EMOTIONS, MEDIA DISCOURSE AND THE MOBILIZATION OF CITIZENS.

Marianne Van De Steeg

Abstract: What is the mechanism that explains how political entrepreneurs created mass mobilizations by engaging European citizens against Haider’s FPÖ, against the Bolkestein directive and against Turkish membership? The paper presented at the session organised by ESA RN25 will present a research programme that sets out to unravel the mechanism with which citizens on a few, but yet a growing number of occasions have been mobilised on European issues. Moreover, the research programme is illustrated with a plausibility probe with data from a reanalysis of media discourse and mobilisation on the Haider affair, and, as a control case, EU enlargement with Central and Eastern European countries.

The lack of citizen participation is often assumed to be the main problem of democracy at the European level. The recent mass mobilisations - except for the Haider affair all directed against EU decision-making - are puzzling, as not much has changed in the circumstances that were thought to cause the apathy of citizens towards European politics. Contrary to the actor- and structure-centred accounts found in the European integration literature, this research programme focuses on the activating quality of emotionally loaded media discourse by incorporating insights from media effect theory and collective action theory. While it is known how citizens become politically engaged with national politics, the peculiarity of multilevel European decision-making, and, especially, the profoundly different political opportunity structure for mobilisation on European issues need to be taken into account.

PROTEST COVERAGE AND MEDIA DIVERSITY AT THE COP15 DEMONSTRATIONS

Thomas Olesen, Simon Teune

Abstract: Numerous studies show and problematize how violence oriented media reporting and categorization delegitimize and distort activists and activist claims. The problem with much of this literature is that it is based on a generalizing assumption. While there is no doubt that a focus on conflict, drama, and violence is a pervasive feature of all media in all countries, it is worth remembering that different media in a given country and between countries in the way they report events. The vast majority of Islamism movement organizations in the EU today are non-violent, and some are prepared to work within the political structures set up by the ruling regimes (as the MB). For this reason it is necessary to reconsider theories of state repression and social movements in order to increase our understanding of activism under extreme conditions. This paper therefore seeks to address questions such as: What leads some of people to engage in high-risk social activism? How do activists explain their decision to “get from the balcony down to the barricades?” How are everyday practices transformed into socio-political activism in repressive states? Lastly, the paper argues that social movement researchers have given little attention to (Islamist) social movement organizations active in repressive states. The process of (continuous) repression of social movement mobilization therefore supposedly have different implications for the activists’ lives than in the democratic societies where policing of protest events and other types of contentious displays is limited in scope, time and space.

PUBLIC JUSTIFICATIONS ANALYSIS: A TOOL FOR ANALYZING PUBLIC DEBATES

Tuomas Vä-Anttila, Eeva Luhtakallio

Abstract: This paper introduces Public Justifications Analysis, a new research method developed for studying public debates. The method is based on the analytical framework presented by Boltsanski and Thévenot, consisting of seven “worlds of justification” – the world of inspiration, the domestic world, the world of fame, the civic world, the market world, the industrial world, and the world of ecology. The method looks at the moral justifications of claims presented in public debates, their combinations, and ways of denouncing the justifications by other parties. The method makes it possible to incorporate qualitative classifications into qualitative
analysis, enabling the method to be used in the analysis of extensive research materials. The use of the method is illustrated through two empirical examples. The first one deals with claims and justifications in the globalization debate in Finnish news media in 1999 – 2005, particularly those presented by social movements on the one hand and economic and political elites on the other. This case demonstrates the usefulness of justifications analysis in exploring the moral dimensions of social conflicts. The second example focuses on local political conflicts in Finland and France by looking at the justifications presented by citizens and representatives of the city in the local press. This example highlights the strengths of the method as a tool for comparative analysis.

READING POSSIBILITIES OF DEMOCRATIC PARTICIPATION IN MASS MEDIA AND SOCIAL MOVEMENT PUBLIC SPHERES

Susan Pei

Abstract: Stories of political controversy, whether they be of international protests, national social spending policies or local redevelopment projects, vary vastly depending upon which public sphere one turns to for information. This is particularly evident in the records of social protest found in the public spheres of mass media and social movements. Often it is not just the framing or content of the events that are at odds. It is also the ontological understandings of public participation embedded in the public spheres themselves that differ. Further, and more insidiously, these ontological positions function to legitimate larger practices of democracy. It is this discursive organization and authorization of public engagement emerging in mass media and social movement public spheres and their material effects that I will address in this presentation.

Drawing on an analysis of an anti-gentrification campaign in an inner-city neighbourhood in Vancouver, Canada, I will explore the formation of public spheres in the local mass media and in a social housing advocacy group. By comparing representations of these media and analyzing the logics of political participation upon which they rest, I will highlight the various framings of the redevelopment project as legitimating particular actors, issues, and modes and spaces of engagement (to the exclusion of others), as well as discuss the broader implications for issues of local democracy. I will argue the mass media tended to present the redevelopment as an objective and discrete event, occurring most legitimately within sanctioned civic fora, while the social housing campaign tended to represent the issues subjectively and as part of a continuous struggle for neighbourhood-level autonomy, which was necessarily fought for in multiple public spaces. I will demonstrate that these two views are reflective of competing ontological understandings of political participation that are characteristic of mass media and social movement public spheres more generally. However, because these are unequal public spheres, I will also argue the discursive structuring of representations of social and political engagement in civic forums ultimately, and unevenly, impact broader possibilities of democratic participation.

AGRICULTURE IN THE CLIMATE CHANGE ERA: BETWEEN FOOD SECURITY AND SUSTAINABILITY

Emanuela Bozzini

Sociology and Social Research, UNIVERSITY OF TRENTO, Trento, Italy

Abstract: The paper analyses core and secondary policy beliefs as well as mobilising strategies expressed by competing discursive coalitions in the context of EU agricultural policy. Two coalitions emerge from the analysis: a productivist coalition – based on the idea of productivity and food security - and a multifunctional coalition – organised around the concept of sustainable agriculture, quality food and a critique of agro-industrial farming.

The paper argues that after significant successes of the multifunctional coalition in establishing its preferences at the beginning of 2000s, in recent times the productivist coalition is fighting back. In particular the climate change crises is interpreted as a non-cognitive event that is helping the productivist coalition to put food production and food security on the top of EU agenda, effectively questioning some multifunctional principles and assumptions. By providing a detailed analysis of policy discourses over a period of 10 years, the paper allows for a reflection on the food issues in the climate change era and provides some updated empirical evidence of ongoing discussions in the field.

CLIMATE PROTEST AND THE CLIMATE MOVEMENT: CHARTING AND EXPLAINING VARIATION IN FRAMES AMONG CLIMATE SUMMIT PROTESTORS IN THREE COUNTRIES

Magnus Wennerhag, Mattias Wahlström, Christopher Rootes

1Department of Sociology, UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden, 2Centre for the Study of Social and Political Movements, University of Kent, Kent, United Kingdom

Abstract: In December 2009, the UN Climate Change Conference was held in Copenhagen. While the official summit involved meetings and seminars with politicians, scientists and established NGOs, it also prompted extraordinary protest activities, both in Copenhagen and elsewhere in the World. In this paper we analyse surveys of three large climate demonstrations in Copenhagen, Brussels and London with a focus on how demonstrators frame the climate problem, who is responsible, and preferred solutions. The demonstrations are results of the mobilization of broad coalitions of groups, and we find significant variation in the demonstrators’ framings in terms of (1) a tension between system-critical and more individualist approaches, (2) the scale of the solutions, and (3) frame-bridging with socialist and justice frames. Variation between countries is explored, and explanations are sought in terms of differences in organizational and individual composition of the demonstrations, as well as the specific mobilizing contexts. We discuss the extent to which the characteristics of the climate demonstrations reflect the current state of the climate movement, at the grassroots level. The between-country comparison is made possible by a unified methodology for sampling participants in demonstrations and controlling for response bias.

MEAT CONSUMPTION AS LOCAL ANSWER TO GLOBAL WARMING

Adrien Quittre

1CRI DIS, UCL, Louvain-la-Neuve, Belgium, 2CADIS, EHESS, Paris, France

Abstract Book

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Feeding is a essential physiological need to human life. Meanwhile meat is a central component of Western diets whose symbolic and nutrient intake's are considerable. At the end of 1990s fears related to meat consumption appeared in forms, particularly following the crises of mad cow disease, dioxin in chicken or the beef hormone dispute. Moreover, the correlation between livestock intended for human consumption and greenhouse gas begins to prevail as indisputable among scientists and the public opinion. 

The objective here is to demonstrate on the first hand that collective mobilizations focused on decreasing meat consumption obviously looking to reduce their environmental footprint. In the meanwhile they look for maintaining a healthy diet adapted to their physiological needs. Taken individually these actors are deeply thinking about their meat consumption. They experience the cultural changes through their own bodies and responsible consumption, reflections and quality. On the other hand they protest against excessive consumption promoted by agribusiness culturally represented as the pinnacle of modernity. Their ambition goes further than food concerns. They examine symbolic practices and values related to social status, socio-economic and consumption patterns.

In Belgium this consideration is echoed in collective and individual actions. The city of Ghent in the north of Belgium is the most cited example. Thursday was suggested as veggie day by the local authorities. Elsewhere in the country similar initiatives have begun. These protests echo the dynamism of actions developed across the Atlantic and across the Channel. Like Quebec where vegetarian restaurants chains have emerged and where growing popularity of meatless Mondays have appeared.

This abstract proposes to show the forms of activism of individual and collective actors about their meat consumption on the grounds of reducing of greenhouse gas emissions. Special cases in Belgium and Canada will serve as examples to explore local initiatives and highlight links between their actions, claims and concerns with global warming. Societal, political and environmental features will surely be raised as anchor of the meat as food in Europe is deep and representative of a lifestyle.

DOES MONITORIAL CITIZEN EXIST? POLITICAL PARTICIPATION IN LITHUANIA
Jurate Imbrasaitė

Abstract: Most scholars indicated that postmodern concepts of citizenship are getting more important in contemporary Western societies. According to them, new generations of citizens are interested in politics and social life, but are less likely to participate in traditional forms of politics. The concept of the “monitorial citizen” refers to an individual, who is interested in politics, has high levels of political efficacy, participates in political acts only, when it is necessary and does not participate in traditional political organizations. The focus of this article is to investigate whether this type of citizenship actually occurs in Lithuania. Based on the survey conducted in Lithuania in 2010 and 20 in —depth interviews, the article draws conclusions that this form of citizenship occurs in Lithuania, but it does not confirm theoretical expectations. The article draws conclusions that the characteristics of identified groups (traditional, monitorial, opportunistic and bold) are mixed, because of socioeconomic and cultural conditions in Lithuania.

Keywords: postmodern citizenship, monitorial citizen.

RE-APPROACHING NIMBY: COMMON GOOD, PRIVATE INTEREST, AND PARTICIPATION WITHOUT MOVEMENTS
Veikko Eranti

Abstract: This paper takes a fresh approach to NIMBY phenomenon. Rather than looking it from the perspective of the planning authority, I analyse the arguments of one NIMBY movement from their own perspective. This provides a better standpoint to analyse their claims and their relation to local political culture. 

The empirical section of this paper focuses on one land use debate. The inhabitants of one district in Helsinki, Finland, were opposed to a planned intensification of the area. The Finnish law on planning grants individual inhabitants a possibility to provide written feedback to the city planning official.

This feedback (107 contacts) is analysed using the theory of Justification developed by Luc Boltanski and Laurent Thévenot in On Justification (2006) and the concept of different grammars of commonality by Thévenot. A brief history of the nimby concept and different waves of academic discussion concerning the phenomenon is provided.

The opposition to the intensifying project can be seen from two different views. On one hand it is a struggle over the definition of common good, on the other hand we have the debate between liberal pluralistic conception of democracy and the republican view, i.e. between the claims of interest groups and references to common good and solidarity.

Another interesting aspect of this “movement” is, that the method used to influence the planning official actually presupposes no movement at all. Individuals citizens and organizations are equally powerful, they can both send a written note to the planning official. So this case of NIMBY can be seen as a movement without movement. Another theoretically viable perspective to the participatory nature of NIMBY is provided by the concept of “counter democracy” by Pierre Rosanvallon.

As a result of this analysis, four new types of NIMBY are provided. These types aim to give us understanding on the complex relation between negative aspects and effects of NIMBY and the possibilities of local participation and deliberative democracy.

1) NIMBY as a local phenomenon with basis on the intimate relationship between inhabitants and their place of living

2) NIMBY as market-based argumentation

3) NIMMY as a problem of representation: as argumentation superficially about common good but actually benefiting a small group

4) NIMBY as argumentation based on liberal conception of politics in an otherwise republican political culture.

TECHNOLOGICAL MOVEMENTS: THE STRUGGLE FOR A WIDE ACCESS TO THE INTERNET

Abstract: Inês Pereira

Keywords: postmodern citizenship, monitorial citizen.
Abstract: Full access to the internet is increasingly considered essential for citizenship practices. The internet appears as a most important tool for practical issues, relational needs and is also a tool for social transformation as the recent events around revolutionary uses of social networks web tools has shown. So, to fight up the digital divide and to promote a wider access to the internet, empowering social actors with the tools and the knowledge for a complete, free and informed use of information technologies, appears as a most important field of social action.

This paper, based upon an on-going postdoctoral research on technological movements, addresses this question, discussing the action repertoires and the impact of social movements acting as promoters of full access to the internet. A set of associations and informal collectives that are being researched through ethnographic fieldwork will be presented, and their social impact will be discussed. The experiences presented, quite diverse, will contribute for a deeper understanding of the struggle for full digital access including (1) the spread of basic resources as computers and wireless networks; (2) the dissemination of digital literacy and the importance of training; (3) the fight for freedom of expression in the web and (4) the polemic issue of activist piracy and contents sharing.

TICK-BOX ACTIVISM? THE LIMITS OF CURRENT INDICATORS OF POLITICAL ACTIVITY IN SOCIAL SURVEY DATASETS

Alexander Hensby

1School of Social and Political Science, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: For many years, social scientists have sought to capture political participation in order to build a quantitative understanding of what makes a ‘political activist’ in contemporary society. Notwithstanding the inevitable difficulties encountered with measuring what is often seen as a subjective concept, it is argued that the longstanding indicators favoured for this task are not only inflexible but increasingly outmoded.

Drawing from UK survey data such as the Hansard Audit of Political Engagement, the British Social Attitudes Survey and the General Household Survey, it is argued that their implicit definitions of political activism carry a number of assumptions and presuppositions about modern activism, and often generate research findings that are self-fulfilling. First, such surveys conflate parliamentary-based civic engagement with social movement activism, which is made more problematic by their tendency to prioritise the range of activism above the frequency, placing undue significance to increasingly marginalised repertoires such as union strikes. Second, most surveys demonstrate an underdeveloped understanding of online activism, and fail to produce indicators that capture online behaviour in a way that can be distinguished from ‘offline’ activism. Third and finally, these surveys do not take the opportunity to explore subjective self-reflection on activist identities – how does feeling like an activist correlate with statistical measurements of activism?

This paper argues for a fundamental re-thinking of contemporary activism – and activists. Future surveys need to deconstruct activism in order to capture both its measureable and subjective properties, and employ a more flexible understanding of the different fields in which activism can be performed, reflecting in particular the rise of extra-parliamentary and online activism opportunities. Doing so will not only enable us to generate quantitative research data that can be comparatively measured across national boundaries, but offer a more realistic picture of contemporary activism today.

DE LA MOSQUÉE DE “LA ZEITOUNA” AU NOUVEAU “PARTI DES INDIGENES DE LA REPUBLIQUE”.

ETHNOGRAPHIE ET ANALYSE DES MODES D’ACTION COLLECTIVE DES NOUVEAUX ACTEURS ISLAMIQUES DU QUARTIER DE LA NOUE À BAGNOLET, DANS LA PROCHE BANLIEUE DE PARIS

Alexandre Piettre

1CSPRP, UNIVERSITE DE PARIS 7, Paris, France

Abstract: Cherchant à caractériser les différentes modalités d’articulation entre le renouveau islamique, en tant qu’il manifeste une capacité d’agir (agency), et les mobilisations collectives dans les quartiers populaires en France, j’émets l’hypothèse qu’elles peuvent être discriminées selon qu’elles relèvent d’une lutte pour la reconnaissance (Honneth) ou d’une lutte pour la visibilité (Arendt, Tassin). Alors que la première ne présuppose rien de plus que la subjectivation éthique orientée vers la question de la vérité qu’implique le renouveau islamique, seule la seconde pourrait caractériser le renouveau islamique comme mouvement social. En effet, en tant que lutte pour la visibilité dans l’espace public, le renouveau islamique pourrait être analysé comme support d’une subjectivation politique orientée vers la question de l’égalité qui entre en tension avec le mode de subjectivation éthique qu’il présuppose, dans la stricte mesure où la visibilité publique de l’islam n’y apparaît pas comme tributaire d’un procès de légitimation, mais comme constituant l’enjeu même de l’action.

Dans cette perspective, je présenterai les premiers résultats d’une recherche par observation participante sur le quartier “La Noue” de Bagnolet, au sein et autour de la mosquée appelée “la Zeitouna”, dirigée par un imam lié au mouvement islamiste tunisien Ennahda. Le contexte est celui d’une forte communauté musulmane sortie victorieuse en 2008 d’un conflit judiciaire avec la municipalité qui voulait fermer la mosquée située au sein d’une copropriété du quartier. Marquée par cette histoire, les relations semblent aujourd’hui surtout faites d’allégeance à la mairie dirigée par le PCF, notamment au travers de l’AMB, l’ « Association culturelle des Musulmans de Bagnolet » qui sollicite des subventions des pouvoirs publics. Mais aussi de conflit, avec des réseaux islamiques rassemblés dans le GAB (Groupe d’associations de Bagnolet) dont les acteurs parviennent à la fois à se faire employer dans les centres sociaux de la commune, à prendre des initiatives en y associant les acteurs publics (par exemple pour lutter contre la violence entre les bandes de Bagnolet et de Montreuil), tout en s’y opposant au travers d’une fréquentation assidue des bancs du public au conseil municipal, et d’une inscription pour les uns au Parti Socialiste qui localement s’oppose à la mairie PCF, et les autres dans le nouveau Parti des Indigènes de la République.

STUDENT PROTESTS AND SOCIAL CHANGE IN MALI

Anna Deutschmann

1UNIVERSITY OF VIENNA, Vienna, Austria

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Altbach (1998: 112) remarks that “student activists frequently serve as a social and political barometer for their societies.” Student protests and activism is a common phenomenon. So what does that say about society? And how are there possibilities to influence social and political change?

Nowadays this topic obtains a new relevance concerning the recent developments in Northern Africa. This is also reflected by the broad media presence. It seems, that students and intellectuals are an important factor for initiating political change though activism and protest against the political power structure - but a movement’s success and impact depends on different conditions, its historical, social and political context.

My research interest focus on Malian students and intellectuals and their influence on the political transformation in the 1990s, when they were an important factor for the democratic transformation of the dictatorial regime of Moussa Traoré. Remarkable and important beyond the specific context is, that in a multiethnic, resource-limited country like Mali with a low literacy rate it was successful to develop a democratic system, which seems to be relatively stable.

For my PhD theses I work with theories on social movements and conflict theories. An important question is in how far the theories – mainly developed in Western Europe and the USA – are practicable to analyze and explain the situation in Western Africa. It is important to link micro-level- with macro-level-analyses to study and explain the historical significant events as well as the present situation of Malian students and (education) policy. On the basis of two field studies in 2007 and 2010 and interviews with former and actual participants of the social movement and main student organization I plan to present some early results of my PhD research.

Key Words: social movement research, democratization, transformation, student protests, West Africa

SUPER-SOAKERS FILLED WITH URINE – INTELLIGENCE, POLICE ORGANIZATIONS, AND THE MILITARIZATION OF PROTEST POLICING
Lesley Wood

Abstract: This paper examines how scraps of intelligence about protestor violence have so often led to the overpolicing of protest. Manning (1999, 2008), della Porta and Reiter (1998), de Lint and Hall (2009) and others have shown how police behaviour is deeply influenced by both police knowledge and organization. Over the past fifteen years, police organization and knowledge has shifted, with an increasing emphasis on the importance of intelligence gathering in determining crowd control strategies. This approach of using intelligence to evaluate risk and threat, combined with a police organizational structure and culture that is hierarchical and conservative and increasingly transnationally organized - has led scraps of information about protesters and their intentions to be given undue weight and emphasis.

This use of intelligence led policing, when combined with increasingly militarized police forces, has resulted in increasingly overpoliced protest events.

The findings of this paper are based on an analysis of police testimony in court documents from mass arrests of protesters in Toronto, New York, Washington DC and Montreal between 1995 and 2005. This is combined with an analysis of catalogues of protest events from these four cities, and considered along with an examination of concurrent shifts in police organizational structure and practice.

THE WINTER OF OUR DISCONTENT: STREET PROTESTS IN LONDON 2010-2011
Christopher Rootes

1School of Social Policy, Sociology & Social Researc, UNIVERSITY OF KENT, Canterbury, United Kingdom

Abstract: The UK general election of May 2010 was preceded by good-natured and ritualistic demonstrations that were minimally policed. It was immediately followed by a period of political uncertainty marked by innovative protests demanding electoral and constitutional reform, which were tolerantly policed. This pattern continued until in November the first student demonstration against proposed increases in university fees ended in confrontation and property damage. Thus began an escalating spiral of conflict with police seeking more aggressively to contain protesters and protesters innovating to avoid containment. This culminated on 9 December when heavy policing failed to intimidate protesters and central London played host to violent confrontations of a kind not seen for two decades. Yet in the first anti-cuts protest of 2011, policing was more relaxed and permissive and the demonstration passed without incident. In this paper, the succession of protests is described and illustrated, and the tactics of police and demonstrators are described and analysed. Of particular interest are the changing tactics of a police force that had in 2009 been sharply criticised by an official inquiry into policing tactics employed at previous anti-globalisation and environmental protests. The research on which this paper is based was conducted as part of the ‘Caught in the Act: Contextualising Contention’ project, in the course of which street demonstrations have been studied in seven European countries since May 2009. The paper will refer to the data derived from surveys of participants and informal interviews with police officers, but it will principally rely upon observers’ reports and photographic evidence.

MOBILIZING HEALTH RISKS THE DEVELOPMENT OF PROTEST AGAINST MOBILE MASTS
Christian Bröer, Jan Willem Duyvendak

1Department of sociology and cultural antropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: Why do people in some neighborhoods start rallying against mobile phone mast because of health threats and not in others? The answer, we argue, lies in the political process, especially in mast siting policy. First, health risks of mobile phone technolo-
Abstract: Political movement, such as an anti-nuclear movement, can be understood as a discourse in terms of Michel Foucault’s archeology of knowledge. The rules of formation of the discourse change during the process of discourse. In a Foucauldian frame, attention will be given to points of rupture and bifurcation, to that economy of the constellation of discourses in which the discourse in question is an element, to non discursive elements and the like which might have an effect to the discourse under scrutiny.

The afore-mentioned concepts familiar from Foucault’s archaeology of knowledge will be applied in the presentation to find a crucial point of attack to a strange phenomenon: there is no significant anti-nuclear movement in Finland despite a massive on-going expansion of nuclear power. The presentation aims at exposing those features of politics and public administration that might, perhaps, help to understand why this is so.

A MOBILIZING ROLE OF DISASTERS: SOCIAL MOVEMENTS, NETWORKS AND DEMOCRACY

Oleg Yanitsky

Abstract: Nature disasters which embraced European subcontinent in the last two years had a mobilization impact on civil society’s organizations, and in particular on Russian social movements and its SMOs. Basing on the empirical research of forests and step fires as well as of the ice rains in some countries of the EU and the European part of Russia, the paper presents a detailed analysis of mobilizing effect of natural disasters on rescue operations implemented by civil activists, the framing of their activity by the SMOs’ leaders, changing disposition of forces involved in these operations, and on the emergence of new initiative groups and building new networks. The growing potential of civil society organizations to play the role of ‘programmers’ and ‘switchers’ of the rescue networks is analyzed as well. Three phases of activity of civil society actors are investigated: The preparatory phase to a disaster; their activity during it; and their role in the phase of rehabilitation of nature ecosystems and human communities. A special attention will be given to the building of ad hoc virtual communities (sites, forums) by concerned people who lived far beyond the affected areas, to mobilization of transnational networks with sister organizations, and to the mobilization activity of the movement’s leaders. The shift from nature protection movement toward the defense of basic human rights, from national to international networking, and by means of it the accumulation of social capital by individual activists and SMOs, the building of shared master frames of forthcoming climatic changes and mobilizing international support to cope with disasters and its consequences are of a no less importance. In conclusion, I’d analyze the dual social effect of a nature disaster. On the one hand, it activates national SMOs and other civil units, stimulates the process of refining their social and political technologies as well as gives the impetus to the reconstruction of public sphere. On the other hand, such disasters, engendering the state of emergency, narrows a political opportunity structure of civil actors.

CONTENTIOUS ENVIRONMENTAL POLITICS, BETWEEN INSTITUTIONALIZATION & MOBILIZATION

Helge Hiram Jensen

Abstract: The literature on watershed management is generally stuck between neoliberal and neorealist forms of I.R. theory. At one hand, the ideal theory of IWRM, advocates watershed cooperation as a medium to overcome inter-state anarchy. At the other hand, the non-ideal theory of hydrological hegemony, throws suspicion on cooperation as co-optation in asymmetric conflict. This is a classic theoretical disagreement between neoliberal and neorealist forms of state-centered I.R. studies.

In a debate stuck between those two academic ideologies, an attempt to find a way out, was done by applying an approach of “transnational contentious politics” (Conca 2005). In many of the water-related conflicts around the globe, political sovereignty is itself at stake. Additionally, environmental policy in general is known for involving the management of transnational flows. Of those reasons, researchers of watershed management should not take political sovereignty for granted, as a neutral container of contentious process. Instead, they should take into consideration what constitutes political order, the un-screwing and re-assembling of political systems. Conca (2005) proposes to use the tool box of “contentious politics”, offered by McAdam, Tarrow and Tilly (2001). However, the conceptualization offered in that book does not conceptualize of what constitutes political order, which was Conca’s question, instead McAdam, Tarrow and Tilly investigate the dynamic interaction between insiders and outsiders of states, while the state itself is static. My proposition is to make a political science informed by political anthropology, more precisely, to combine the tool box of contentious politics with the tool box of ANT. Those are compatible, as both study networked social action.
The paper uses a single-case study to research some possible mechanisms, and demonstrate a way that concepts of ANT and contentious politics may be interwoven in process tracing of river management controversies. The case is the conflict about a hydropower plant in the Alta-Kautokeino river in North Norway, from 1970 to 1983, that provoked institutionalization of environmental policies in the state, as well as representation of the indigenous minority in a trans-state region.

ECOVILLAGE MOVEMENT IN ESTONIA: GLOBAL AND LOCAL DIMENSIONS

Airi-Alina Allaste

Abstract: Contemporary New Social Movements are considered not to have purpose in a revolutionary take-over of the official power, but rather aim at drawing attention on certain problems presently ignored. The latest theoretical developments approach contemporary movements as Lifestyle Movements that “consciously and actively promote lifestyle, as a primary means to foster social change”.

This paper focuses on diffusion of global lifestyle movement, using the ecovillage movement in Estonia as an empirical case. Recent decades have witnessed an increase in the number of global movements related to environmental issues. The ecovillage movement is one of them; it differs from the rest by its specific lifestyle and ideology, with emphasis on communality, environmental awareness, and spirituality.

The aim of this paper is to explain how the global ideology is adopted in parallel to strengthening of the movement in Estonia. The ideology of the ecovillage movement as a new “language” was first adopted by the “cultural vanguard” and spread later on. Global ideology became meaningful for the local community with localised ideas together with everyday practice of specific lifestyles choices.

The empirical part of the paper is based on open-ended interviews and participant observation conducted in Estonia in 2008-2009.

ENVIRONMENTAL MOVEMENT CAMPAIGNS AS A FIELD WHERE MORAL PHILOSOPHY AND SCIENTIFIC KNOWLEDGE MEET

Bram Meuleman

Abstract: With governments and big business jumping on the green bandwagon, the environmental movement is finding itself in a position where it has to reinvent the wheel. In recent years we have seen the rise of an influential and growing minority within the movement calling for serious reforms. Crompton argues in ‘Weatherecocks and Signposts,’ a 2008 World Wildlife Fund for Nature (WWF) report, that by adopting a campaigning approach focussing on intrinsic values, the environmental movement can avoid becoming sidelined in a debate it ought to lead. Many scholars, including Geertz, Durkheim, and Hirschman, have explored how norms and values come about and are communicated throughout social groups. Yet, virtues differ from norms and values: whereas the latter two form a social contract deeply engrained in the individual, it will be argued that virtues are more progressive. Virtues are positive character traits, both integral to the individual’s identity and fully integrated with other virtues the individual may hold, and they enable the individual to strive for self-actualisation whilst simultaneously actively creating space for others to flourish as well. It has to be noted that virtues and norms are not mutually exclusive. Instead, they are complementary: norms without virtues are instrumental action, and virtues without norms are a mere thought experiment.

In this paper I will treat the environmental movement as a site, a field if you may, at which moral philosophy meets scientific knowledge. Environmental movement organisations (EMOs) are in the business of spreading a moral message, backed up by scientific evidence, through the medium of campaign initiatives. It will be argued that by exploring how an environmental movement adopts a piece of scientific knowledge and combines this with a moral message, one gains insight into how this piece of knowledge is constructed, framed, and ‘moralised’. Instead of figuring out how to stress intrinsic values in campaigns, EMOs such as WWF should focus their efforts on cultivating virtues through their campaign activities.

“CULTURAL LAG” AND “MICRO-RESISTANCE”: WHY GOVERNANCE REFORMS OF GERMAN UNIVERSITIES TAKE SUCH A LONG TIME

Uwe Schimank

Abstract: For several years now German universities have been subjected to quite substantial “new public management” (NPM) reforms. Whereas before the academic self-governance of professors, on the one hand, which highly respected each individual professor’s work autonomy, and a tight bureaucratic regulation of all matters of finances, personnel, study programs and examinations were the two dominant forces shaping the performance of universities with regard to research and teaching now stronger competitive pressures between and within universities and a more hierarchical management by university leadership have been installed. However, changes of the formal rules of the game are one thing – actual practices show that the traditional “way how these things are done” (Berger/Luckmann) persists obstinately.

Two complementary explanations of this remarkable discrepancy between rules and practices are “cultural lag” (Ogburn) and “micro-resistance” (Anderson). The former must be spelled out with respect to the relevant actors’ identities, beliefs, and motives which bring about a disregard for formal changes - as if nothing has happened. Concerning the latter, it has to be asked which identities and opportunity structures motivate and enable actors to fight back against formal changes. A clarification of both may help to anticipate things to come: whether practices gradually adapt to rules, or whether the rules become façades behind which unchanged practices proceed.

KNOWING THE EXCLUDED: PUBLIC SOCIOLOGY AND THE STEREOTYPING OF SOCIAL EXCLUSION

Sina Farzin

Abstract: With governments and big business jumping on the green bandwagon, the environmental movement is finding itself in a position where it has to reinvent the wheel. In recent years we have seen the rise of an influential and growing minority within the movement calling for serious reforms. Crompton argues in ‘Weatherecocks and Signposts,’ a 2008 World Wildlife Fund for Nature (WWF) report, that by adopting a campaigning approach focussing on intrinsic values, the environmental movement can avoid becoming sidelined in a debate it ought to lead. Many scholars, including Geertz, Durkheim, and Hirschman, have explored how norms and values come about and are communicated throughout social groups. Yet, virtues differ from norms and values: whereas the latter two form a social contract deeply engrained in the individual, it will be argued that virtues are more progressive. Virtues are positive character traits, both integral to the individual’s identity and fully integrated with other virtues the individual may hold, and they enable the individual to strive for self-actualisation whilst simultaneously actively creating space for others to flourish as well. It has to be noted that virtues and norms are not mutually exclusive. Instead, they are complementary: norms without virtues are instrumental action, and virtues without norms are a mere thought experiment.

In this paper I will treat the environmental movement as a site, a field if you may, at which moral philosophy meets scientific knowledge. Environmental movement organisations (EMOs) are in the business of spreading a moral message, backed up by scientific evidence, through the medium of campaign initiatives. It will be argued that by exploring how an environmental movement adopts a piece of scientific knowledge and combines this with a moral message, one gains insight into how this piece of knowledge is constructed, framed, and ‘moralised’. Instead of figuring out how to stress intrinsic values in campaigns, EMOs such as WWF should focus their efforts on cultivating virtues through their campaign activities.

“CULTURAL LAG” AND “MICRO-RESISTANCE”: WHY GOVERNANCE REFORMS OF GERMAN UNIVERSITIES TAKE SUCH A LONG TIME

Uwe Schimank

Abstract: For several years now German universities have been subjected to quite substantial “new public management” (NPM) reforms. Whereas before the academic self-governance of professors, on the one hand, which highly respected each individual professor’s work autonomy, and a tight bureaucratic regulation of all matters of finances, personnel, study programs and examinations were the two dominant forces shaping the performance of universities with regard to research and teaching now stronger competitive pressures between and within universities and a more hierarchical management by university leadership have been installed. However, changes of the formal rules of the game are one thing – actual practices show that the traditional “way how these things are done” (Berger/Luckmann) persists obstinately.

Concerning the latter, it has to be asked which identities and opportunity structures motivate and enable actors to fight back against formal changes. A clarification of both may help to anticipate things to come: whether practices gradually adapt to rules, or whether the rules become façades behind which unchanged practices proceed.
Abstract: The ongoing debate on new forms of social exclusion in western welfare societies connects public, political as well as sociological discourses. Especially sociologists who understand their work as a contribution to broader contexts beyond “academia” emphasize the risen number of people marginalised by society and the dangers attached to this development. But describing the dimensions of social misery in ever more drastic terms creates a two-edged form of sociological knowledge. Well meant on the one hand those texts also contribute to a long tradition of stereotyping social groups perceived as inferior. Using Andrew Abbotts concept of lyrical sociology my presentation explores, how in recent public discourses on new forms of social exclusion classical images of the poor and dirty underlasses, commonly used in literature and academic writing since decades, linger on.

LEADERSHIP AND REPRESENTATION DYNAMICS IN LOCAL CIVIC NETWORKS

Mario Diani¹

¹Department of Political & Social Sciences, ICREA-UNIVERSITAT POMPEU FABRA BARCELONA, Barcelona, Spain

Abstract: Social networks often conceal the hierarchies and the asymmetries in the patterns of relations that link formally independent actors to each other. The absence of formally defined hierarchical positions and the complexity of the interactions taking place in a network combine to provide a view of networks – in the specific case, of civil society networks – as largely acaephalous or, at best, pol cephalous. At the same time, this view of networks as horizontal and ultimately egalitarian form of social organization might be overly optimistic and ultimately misleading. In this paper, I explore to what extent the conventional image of social networks as systems of horizontal relations actually holds and provides an accurate portrait of what goes on in civic networks. In doing so I address issues of representation and leadership within complex and heterogeneous organizational fields. I ask in particular how are leadership and brokerage roles shaped within civic networks; what role do organizations that operate through social movement modes of coordination play in broader civic networks; to what extent do umbrella organizations actually coordinate local civic actors. I then move on to address the relations between civic actors and local political actors and public agencies. Does the fact of occupying specific network positions within civil society correspond to specific patterns of ties to institutions? And do civil society actors perceive different levels of political influence depending on the nature of their embeddeness in civic networks?

THE MIND OF ACTIVISTS: A COGNITIVE APPROACH TO CONTENTIOUS PARTICIPATION

Gian-Andrea Monsch ¹, Florence Passy ¹

¹Institut of Political and International Studies, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: In the social movement literature, we know fairly well who participates in protest politics (social anchorages, value structure, etc.) and how people join contention (social networks). However, the question of why individuals participate in protest politics is hardly addressed. The paper focuses on activists’ mental maps in order to understand why activists join contentious politics. Cognitions (i.e. subjectively evaluated relation to specific objects) are less stable than values and thus raise serious challenges in establishing a causal relationship between cognitions and participation. Constant resocialization of individuals could not allow scholars to assess whereas a specific cognitive map has lead individuals to join protest politics. However, scholars could assess whereas activists, once they participate in protest politics, strongly differ from inactive citizens regarding their cognitive map. The paper addresses this issue by comparing activists’ cognitive map from the rest of the population on specific cognitive dimensions. Do activists subjective world differ – and to what extend and what specific dimensions - from inactive citizens? The answer to this question constitutes the first step in evaluating the importance of cognitions in order to participate in protest politics. The paper is part of a larger project comparing activists in distinct political contentious sites in Switzerland.

ORDINARY PRACTICES, RADICAL POLITICS: INTERSECTIONS AND MOVEMENT IN THE ORGANISATION OF AUTONOMOUS SOCIAL CENTRES

Luke Samuel Yates ¹

¹Sociology, UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: Social centres emerged from European autonomist movements during the 1970s, and are alternately described as providing free education, non-corporate leisure, a counter-cultural social hub and a base for political protest. Using ethnographic data and semi-structured interviews with participants from social centres located in Barcelona, this paper investigates the social organisation of three centres as socio-cultural interfaces between ordinary daily practices and political protest. I argue that intersections among groups organising alternative education systems, leisure activities and new mobilisations create new and differentiated social groupings where social practices inflicted with distinct political-utopian framings are adopted and normalised in new and different contexts.

This movement of politically-informed practices combines with attempts to diffuse alternative political perspectives and visions through the organisation of workshops and debates and in the production and consumption of alternative media. Participants have clear ideas about the political value of their everyday actions as well as their activism, and working through these reflections helps understand the significance of ‘free spaces’, and are vital in constructing and determining newly relevant political strategies, imaginaries and futures.

ORGANIZATIONAL INNOVATION AND POLITICAL IMPACT IN THE SWEDISH MOVEMENT CONTEXT: THE CASE OF THE ANARCHIST AND AUTONOMIST MOVEMENT

Adrienne Sörbom ¹, magnus Wennerhag ²

¹Stockholm Centre for Organizational Research, Stockholm University, STOCKHOLM, ²Södertörn University, Sociology, Huddinge, Sweden

Abstract: Organizational innovation and political impact in the Swedish movement context: The case of the Anarchist and Autonomist movement.
From the 1960s until the contemporary protests of the global justice movement, one can claim that the broader leftist movement milieu of many Western countries increasingly has been inspired by the general legacy of Anarchism and the libertarian Marxism of 'autonomia', and their critique of capitalism, the state and modern social organization. As have been discussed by various scholars, parts of the libertarian and anti-hierarchical critique have also led to changes in both the public debate and society as such. For instance, new questions have entered the political agenda, political parties changed their mode of organizing, new models of work organization entered industry, cultural production, and post-material values broadly impacted society (cf. Boltanski and Chiapello 2005; Inglehart 1990; Kitschelt 1993). However, despite this impact on values, forms of critique and modes of organization, some scholars (cf. Day 2005; Graeber 2007; Epstein 2001) note that the political claims and utopias of the traditional Anarchist legacy have not attracted the same degree of attention.

Analyzing the case of the contemporary Swedish Anarchist and Autonomist movement, using interviews and survey data, this paper scrutinizes the role of this movement context in Sweden during the last 20 years, regarding its impact on politics, the general debate, and the broader leftist movement milieu of the country. Despite Sweden's traditions of consensus politics and integration of movements in the decision-making of the state, as well as the quite short history of the Anarchist/Autonomist movement in the country, it is argued that this movement context have had an impact on both intra-movement innovation and organizational values, and general debates and decision-making in society. Furthermore, it is discussed whether this 'radical flank' (eg. Haines) of the broader left milieu through this impact, and the reaction of the state and other actors, have left the original Anarchist legacy and adapted to the mode of traditional civil society politics, or rather introduced a new kind of contentiousness in Swedish politics.

ORGANIZING SPACES: MEETING ARENAS AS A SOCIAL MOVEMENT INFRASTRUCTURE BETWEEN ORGANIZATION, NETWORK, AND INSTITUTION

Christoph Haug 1, 2*

1Dept. of Sociology, 2Gothenburg Centre of Globalization and Development (GCGD), UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: This paper starts from two basic observations. (1) Despite repeated lament about the lack of knowledge about internal decision-making processes in social movements, these are still today black-box processes. (2) Despite the fact that any ethnographic field work in social movement activities involves attending numerous meetings, meetings rarely figure as a prominent category in studies of social movements.

The paper argues that both phenomena are due to a lack of a conceptual framework that is capable of grasping the peculiarities of internal social movement structures, and the sets out to provide such a framework in two steps. First, it introduces the concept of meeting arena, as the structure-side of meetings and specifies mesomobilization arenas as the place where movement level coordination takes place. These meeting arenas thus constitute an important infrastructure in mobilizing processes. Second, the paper explores how meeting arenas are a source of order in social movements and finds that their structure is threefold: meetings are consciously organized, institutionalized over time, and interconnected through personal contacts. Meeting arenas hence combine and intertwine elements of organization, institutions, and networks, forming a social movement infrastructure that cannot be adequately understood in terms of either one of these forms of order alone.

SECTION SYNDICAL APRUMA : POUR UNE ANALISE SOCIO-HISTORIQUE DES LUTTES SYNDICALES.

Caroline de Souza Cunha 1, Antônio Paulino De Souza 2

1education/master of education, IFMA/UFMA, Caxias/São Luís - MA, 2education/master of education, UFMA, São Luís - MA, Brazil

Abstract: Ce travail s’inscrit dans une recherche sur les mouvements syndicaux au Brésil et plus particulièrement sur le syndicat des professeurs de l’Université Federal du Maranhão (UFMA). On fait une analyse sur les conditions de travail des professeurs et les principales luttes qui ont été menées par le syndicat. Ces luttes démontrent très bien que cette catégorie passe par un processus de proletarisation du travail et que dans l’état actuel le syndicat a perdu non seulement son pouvoir de négociation auprès du Gouvernement, mais aussi ça capacité de mobilisation. Le grand intérêt de ce travail est de comprendre les changements sociaux qui ont eu lieu surtout avec la montée d’un gouvernement de gauche (Lu), Ce travail est une modeste contribution à l’analyse des syndicats des professeurs de l’enseignement supérieur.

AN ACTING CROWD: A CASE OF TEKEL STRIKE IN ANKARA, TURKEY

Yonca Odabas 1, Gunnur Ertong 1, Polat Alpmans 1, Yasin Durak 1

1Sociology, ANKARA UNIVERSITY, Ankara, Turkey

Abstract: In this research, the worker strike which lasted for 78 days was studied. The strike took place in the capital city of Turkey which is not a worker city. The reasons why the workers who are known as TEKEL workers are protesting is the change in their status.

In Turkey, subcontracting has become an extensively used policy especially after 1990s. The increase in privatization policies and in labor costs of public sector resulted in the employment of contract workers of subcontractor firms rather than the employment of workers with definite labor description and security.

There are four types of employment as enacted by labor laws in Turkey:

A. Public employee
B. Contract Worker
C. Temporary Worker
D. Worker

Temporary worker status enacted by Act 657, 4/C article has been filled with the previous workers of privatized institutions since 2004. Most of the governments following the 1980 military coup advocated the state’s removal from the production sphere. They endeavored to establish free market economy rules for “an increase in competition, The purpose of privatizing TEKEL enterprises and thus creating resources for the public treasury during the 60th term government gave rise to the TEKEL workers’ resistance.

TEKEL workers had already begun to unionize within TEK-GIDA İş Union since 2001, the time when the rumors of TEKEL privatization
began. Their demands, not including preventing privatizations, were securing their employee personal rights and declining 4C status. Their status to 4C is February 2010. A resistance which is unexpected appeared because of the oppress of the security forces. Because of the cold weather and the prolonging of the waiting they built tents around the street where they are protesting. These tents have become a center of interest of various groups of the society immediately. Despite hegemonic ideological influence of the government, these tents got support from almost all groups of the society particularly scientists, artists and students. In this study the support which was given by the citizens Ankara and appeared spontaneously is analyzed with Blumer’s “Model of Acting Crowd”. Social support mechanisms and how they came up were discussed by the concepts tension, exciting event, miling, circular attention, a common object of attention, common impulses of Blumer’s model.

ARE THERE ANY MEN’S MOVEMENTS IN POLAND? SOCIOLOGICAL ANALYSIS OF PHENOMENA

Katarzyna Małgorzata Wojnicka

1Department of Sociology, Jagiellonian University, Kraków, Poland

Abstract: The issue I would like to explore in my presentation concerns phenomena, which contemporary sociology calls ‘men’s social movements’, which are the type of new social movements focused on gender identity. The issue of men’s movements has been present in American and (western) European sociology for twenty years. In Poland this issue is still absent in the academy and therefore I decide to conduct my research on it. I would like to examine 3 types of men’s movement – pro-feministic movement, spiritual movements and father’s rights movement since these types are the most popular in Poland.

The aim of my presentation is the analysis of a specific character of men’s movements present on Polish social arena. I have carried out sociological interviews with Polish participants of number of organizations and associations which constitute the most important part of contemporary men’s movements. I am confronting and comparing the results of my research, and then find similarities and differences between four types of Polish men’s movements. This manner of procedure will be helpful in finding answers to my key research questions:

1. Can Polish men’s movements be considered a typical example of new social movements?

2. What kind of social actors are participants of Polish movements? What kind of goals do they have? What kind of strategies do they use?

3. How do these social phenomena affect social change in Poland?

My research is based on a variety of sources: sociological interviews with Polish participants of number of organizations and associations which constitute the most important part of contemporary men’s movements. The case studies of the following Polish associations has been provided: Mężczyźni na Rzecz Równości (Men for Equality), Centralne Stowarzyszenie Obrony Praw Ojca (Central Father and Children Rights Association), Stołeczne Stowarzyszenie Obrony Praw Ojca (Capital Father and Children Rights Association, Centrum Praw Ojca i Dziecka (Father and Children Rights Center), Fundacja Akcja (Action Association), Męski Krąg (Men’s Loop), Mężczyźni Świętego Józefa (Saint Joseph’s Men). I have gathered sufficient materials from several Polish cities: interviews, newspapers articles and also numbers of opinions from specific websites or discussion groups created by men connected with specific type of men’s movements.

"HANDS OFF OUR BODIES. THIRD WAVE FEMINISM AND SEMIOTIC GUERRIGLIA AGAINST OFFENSIVE COMMERCIALS IN EUROPE"

Laura Maria Corradì

1sociology dept, UNIVERSITY OF CALABRIA, rende, Italy

Abstract: Every patriarchal era has its own erotic ideal, in terms of body shape and attributes of femaleness. In a new world order strongly affected by the supremacy of the market - a grand ‘unique thought’ imposes itself on a multitude of ‘weak thoughts’ and approximations. An ideal of perfect body has been manufactured to fit the needs of fashion production and distribution: the global body is a mannequin, very tall and skinny, with silicon breasts and gluteus, with big eyes, long lashes, and plump lips - never aging and always sexy. A dictatorship of beauty took place - without we could realize it, an oligarchy of pharmaceutical and cosmetic industries, style experts, vogue magazines, communication specialists, well paid creatives and trend producers, transformed our way to look at our own body. Fair skin, light eyes, blond hair, thin waist, flat abdomen, long legs – the Barbie model became prevailing, and influenced girls and women. Leading figures in the show business, movie stars, television actresses, singers and even journalists – any woman professional who acts in the public sphere, in different measure feels the pressure to conform to the dominant paradigm of beauty: being in shape, waxing legs and face, dying grey hair, hiding wrinkles, are considered to be minimal necessary activities for women in the public sphere.

Ten years ago, with my gender studies students, I started to collect stereotyping and offensive commercials from magazines and newspapers - reflecting about the improper use of women’s body in the media. as a research focus for students to apply feminist semiotics. Every year hundreds of students selected images, discussed and analyzed collectively from all over the world. This long term experience gave me the impulse to formalize a research group to create an archive and start sharing the qualitative results with others, women’s groups, gender activists and the media.

In my paper I am focusing on groups of young feminists who started to fight back and to write comments or creative ‘corrections’ on the commercials posted on walls, train stations, buses, and in the roadsides billboards. By dis-ableing a dispotic signifiers, these ‘feminist semiotic guerrilla girls’ express a re-appropriation of the public space and an oppositional political agency. They often take pictures of their own intervention on the posted commercials and publish on internet - giving us the opportunity to discuss their activism.

MOBILISATION DES ÉMOTIONS AU RÉSEAU ÉDUCATION SANS FRONTIÈRES EN FRANCE: ANALYSE DES STRATÉGIES ET LOGIQUES ÉMOTIONNELLES AU SEIN D’UN MOUVEMENT « ALTRUISTE »

Katarzyna Jaszczysk-El Guerouani

1Institute of Applied Social Sciences (ISNS), Warsaw University, Warsaw, Poland, 2CESSP, University of Paris 1, Paris, France

Abstract: Dans les mouvements sociaux « altristes » (+ de solidarité ») où les militants (conscience constituents) visent la défense des
intérêts d’une population dont ils ne font pas partie et ne retirent pas de bénéfices directs de l’action, les émotions jouent un rôle particulièrement important dans le processus de mobilisation et de pérennisation de l’activité militante.

Les émotions partagées et réciproques sont au cœur de leur offre d’engagement : elles constituent, sous de formes différentes, les rétributions principales de l’activisme (en particulier dans le cas de primo-militants).

Parmi ce type de mobilisations se situe le mouvement français Réseau Sans Frontières, l’objet de ma recherche : fondé en 2004 à l’initiative de trois enseignants de la région parisienne en vue de défendre les enfants scolarisés d’immigrés en situation irrégulière, menacés d’expulsion de France, il est rapidement devenu une vaste mobilisation à l’échelle nationale (de facto, pour soutenir également leurs parents) composée d’enseignants, parents d’élèves et militants professionnels.

En m’appuyant sur mon enquête de terrain réalisée dans les années 2007-2009 au sein du RESF Paris (35 entretiens semi-directifs approfondis avec les fondateurs et militants [ou anciens militants] du RESF ; observation ethnographique ; collecte documentaire et suivi régulier des listes de discussion internes), j’étudierai le type et le rôle des émotions présentes dans le mouvement et vécues au quotidien par les militants, ainsi que le travail des émotions et le mode de gestion des processus émotionnels par les leaders lors de différentes phases de la mobilisation (de l’enrôlement des soutiens jusqu’à la stabilisation du Réseau).

J’explorera des éléments cruciaux :

• Construction symbolique de la cause des « enfants scolarisés de familles sans-papiers », victimes innocentes des lois injustes, « co-pains de classe de ton enfant » (dépolitisation) ; création de vocabulaire spécifique ;
• Conception de l’évolution des nouveaux entrants de l’émotion vers une réflexion sociopolitique ;
• Socialisation des militants au style émotionnel du groupe et consolidation de son identité ;
• Émotions-rétributions variées des activistes en fonction d’étapes de leur investissement dans le RESF (au prisme de leurs récits).

CONTESTED SPACES: PERFORMING OPPOSITION IN MOVEMENTS

Mariana Laeger1

1Cluster of Excellence “The Formation of Normative Orders”, Goethe Universität Frankfurt, Frankfurt am Main, Germany

Abstract: Despite the increasing discussions on the ‘democratic deficit’ of global institutions, the focus of the literature remains on the concerning practices of exclusion, in arguments for improving the scope of participation: from a democratic ideal of self-determination, groups affected by global governance’s policies should either have a say in its decision-making or access to mechanisms for controlling the process. Nonetheless, with international organizations increasingly opening up space for enhancing the participation of accredited civil society actors, the pressing problem of practices of assimilation or cooptation shall also come to the fore. This paper then puts in question the quality of institutional spaces that are opened to the exercise of opposition within international organizations, assessing how conducive those forums are to upholding the possibility of competition over political alternatives, that is, to empowering participants’ exercise of political judgment in a way that they can cope with the difficulties of voicing and debating ‘novelty’ in their attempt to challenge the status quo. In order to do so, it contrasts the practices of discourse civil society actors must adopt in its direct engagement with international decision-making processes – looking at the case of the International Campaign to Ban Landmines and the space the New Diplomacy Strategy creates for such engagement – with the practices of discourse promoted by civil society’s self-organized spaces for the articulation of opposition – taking the methodology of the World Social Forum as the case in study.

For raising the concern with practices of assimilation, the paper first examines the risks of global governance engendering relations of domination and the solutions the literature on the ‘democratic deficit’ argues to prevent it. Then it expands from international relations’ research on global governance in a fruitful dialogue with social movements literature, finding in the structural and cultural aspects of the interaction of social movements and political institutions important points for assessing the ideal space for the articulation of opposition. It concludes by investigating those parameters in the two cases, evaluating then the risk of opposition being co-opted in its engagement with international organizations.

EXPERIMENTS WITH DEMOCRACY WITHIN THE GLOBAL NETWORKS OF THE ALTERGLOBALIZATION MOVEMENT

Marianne Maeckelbergh1

1Cultural Anthropology and Development Sociology, LEIDEN UNIVERSITY, Leiden, Netherlands

Abstract: This paper explores the construction of alternative decision-making practices within the global networks of the alterglobalization movement (those protesting multi-lateral organizations world-wide). Through extensive ethnography of the alterglobalization movement’s own decision-making practices, I demonstrate how the alterglobalization movement challenges many of the assumptions we hold about what democracy is and what it ought to be. Specifically, I examine how movement actors transform the meanings of key democratic tenets by setting up decentralized network-based structures of decision-making that produce new meanings and practices of equality, liberty, representation, diversity and conflict within their democratic processes.

MOVEMENT BUILDING IN THE WORLD SOCIAL FORUM PROCESS: OBSERVATIONS FROM THE US SOCIAL FORUMS

Jackie Smith1

1Sociology, UNIVERSITY OF PITTSBURGH, Pittsburgh, United States

Abstract: The World Social Forum process has been called one of the most important political developments of our time. Its longevity and its success at convening many tens of thousands of activists in forums taking place at global, regional, national, and local levels attest to its importance for contemporary social movements. But as the WSF embarks on its second decade, activists are considering how the process can best contribute to the work of building durable social movements that can effectively challenge neoliberal globalization and the militarism, patriarchy, and imperialism inher-
ent to it. This paper draws from participant observation research in the United States Social Forum organizing process to uncover how organizers developed their analyses and strategies in the process of organizing the second US Social Forum in Detroit in June 2010. Drawing from meetings and discussions taking place in the aftermath of the Detroit USSF, I explore how activists learned and developed strategies to manage tensions and enable continued collaboration. I consider how the experience of organizing this large-scale event affected activists, and how they engaged in follow-up analysis and strategizing after the forum. Finally, I consider whether and how the World Social Forum process creates spaces and provides guidance for activists seeking to model new forms of action to advance alternatives to neoliberal globalization.

DECISIONS IN THE NORTH / IMPACTS IN THE SOUTH: ASSESSING THE ROLE OF FOREIGN FUNDING ON LOCAL AND NATIONAL MOVEMENTS.

Manuel Bastias Saavedra

1Latinamerika-Institut, Freie Universität Berlin, Berlin, Germany

Abstract: By retracing Chile’s recent history, this paper discusses the ambivalent role of international aid networks in the long term formation of democratic alternatives in developing countries.

The last thirty years of Chilean history have been paradoxical if one observes the evolution of civil society in relation to its political environment. Despite the hard conditions the Pinochet dictatorship imposed on political and social organizing, after ten years Chilean civil society had developed a wide array of organizations, independent media and relations, which functioned both at the national and at the local level. On the other hand, after democracy was restored, there has been a tendency toward the demobilization and fragmentation of civil society organizations. This article takes the Chilean experience as a chance to explore the interactions between international funding, national organizations in charge of distributing resources, and the local environments that benefited from this work in a varying political context. This study traces the formation of civil society organizations in an authoritarian context, describes the grassroots and organizing work they provided, and discusses the effects of democratic transition on these organizations. Empirically, this project is based on qualitative analysis of in-depth interviews and of internal organizational documents collected for the 1973-1993 period.

Raised international awareness resulting from the coup in 1973, led to the placement of important amounts of resources into civil society organizing. The organizations then developed projects that emphasized the formation of grassroots organizations and the education and training of grassroots leaders in order to assure the reproduction and autonomy of these base-level organizations. By 1986, Chilean civil society had developed an important organizational infrastructure and the organizations developed dense relations at the national and local levels. This organizational infrastructure was important for contesting authoritarian rule, as well as serving as a civic forum for the elections which ended Pinochet’s rule.

As democracy ensued in 1990, international funding has tended to decrease or has concentrated on specific issues. As a consequence, many of the civic organizations founded during the dictatorship have had to reduce their staff, their projects, assume a subordinate role to the State, or simply disappear.

MAKING MINORITY VOICES HEARD? TENSIONS BETWEEN FORMS OF PARTICIPATION IN TRANSNATIONAL ARENAS

Emmanuelle Cheyns

1Environnement et Sociétés, CIRAD, UMR MOISA, montpellier, France

Abstract: Since the beginning of the new millennium, initiatives have been developed to create “sustainable voluntary standards” for agricultural commodities (coffee, palm oil, soy, biofuels, etc.) through a series of transnational “Roundtables”. The aim of these Roundtables is to define and promote sustainable agricultural practices while evolving through “open” participation processes referred to as “multi-stakeholder” initiatives. These bring together on a worldwide scale economic operators from the agribusiness commodity chains concerned as well as “social” and “environmental” NGOs, both local and international, local communities and small-scale family farmers.

Intended to be private and voluntary in nature, these initiatives claim their legitimacy from their ability to ensure the participation of “all categories of stakeholders” in “participatory” and “inclusive” processes. However, even helped by local NGOs and organised in trade unions, local participants such as “local communities” and small family farmers feel they have difficulty in making their voices heard in the format of debate proposed.

Our contribution aims to characterise the political and material instruments suggested as the means of formulating agreement and taking a variety of voices into consideration in these arenas. Referring to the specific case of the “Roundtable on Sustainable Palm Oil” (RSPO), we will undertake a detailed analysis of the tensions relating to different forms of participation in this co-governance, especially the tensions focusing on forms of knowledge and language norms, which creates a gap between local minority voices and international stakeholders, either NGOs or industries.

We will highlight the desire of local communities and family farmers to talk about justice ‘from the heart’, where convictions are disqualified or more specifically considered as a form of ‘militancy’ or ‘idealism’ which has no place in these Roundtables. We will also underline the desire of local communities and family farmers for genuineness which assumes that everyone’s life history will be considered, where emotion and affect are sidelined as linguistic deviations and replaced by a technical language softened by a “liberal civility”. Finally, we will highlight the role of local NGOs in solving part of those tensions and facilitating the participation of minority voices, by experiencing concern with what affects them and taking care of them.

RELIGIOUS NGOS AND CIVIL SOCIETY PARTICIPATION : THE EXAMPLE OF THE RNGOS ACTIVITIES AT THE HUMAN RIGHT COUNCIL AT THE UN IN GENEVA

Sophie-Helene Trigeaud

1SECL / Religious Studies, UNIVERSITY OF KENT, Canterbury KENT, United Kingdom

Abstract: Contemporary Western societies often assume the separation between State and Religion. This is often framed in terms of national political and legal issues, however the question of the role of religions and faith-based organizations in international institu-
tions tends to be under-examined. In order to examine an aspect of this issue, this paper explores religious non-governmental organizations (RNGOs) and their activities in international institutional contexts. Based on on-going research work at University of Kent, UK, carrying out extensive fieldwork into religious and faith-based NGOs activities at the UN in Geneva and New York (with Pr. J. Carrette, Pr. H. Miall, Pr. E. Bush, Dr. V. Beittinger-Lee and Dr. S-H. Trigeaud), this analysis will uncover, through a series of case-studies, the RNGOs “processes of participation” at the UN in Geneva, and especially at the Human Rights Council. Starting from the consideration of the legally based processes of participation, it will show how RNGOs use their abilities of adaptation and innovation to improve efficiency in international contexts.

Key words : NGOs – United Nations – Religion – processes – civil society

WHERE HAVE ALL THE MOVEMENTS GONE?
COLLECTIVE ACTION FOR PEACE IN ISRAEL IN THE POST-OSLO ERA

Uri Ben-Elizer

Abstract: Peace movements exist in Israel from the early 1980s on. Some of them even regarded the 1993 Oslo Accords as partly a result of their activities. As the Al-Aqsa Intifada erupted in September 2000, their voice was hardly heard and is not heard ever since. Gradually, however, collective action against occupation, war, and humanitarian adversities emerged in Israel, characterized with some novelty that indicated a transition from a typical new social movements action to NGOs and grassroots practices (monitoring, distribution of information, humanitarian help, protection from settlers, financial support, food supply, discourse with Palestinian organizations, etc.). The manuscript’s main purpose is first to examine this transition and second to consider its impact on the chances for peace in the Middle East. Do the “NGOization” and the “Grass-rootization” of peace activities advance the chances for peace, or inversely, the new practices, which are typical to neo-liberal, late-modern and globalized Israel, serve as a fig leaf that interrupts the “big issue”?

CHANGES IN THE FEMINIST MOVEMENT IN SPAIN:
FROM NEW SOCIAL MOVEMENT TO NEW GLOBAL MOVEMENT; A VIEW OF THE FEMINIST CONTRIBUTION TO ERADICATING VIOLENCE AGAINST WOMEN

Paula Carolina Carballido

Abstract: The feminist movement has played a leading role in violence against women coming to be considered as a State problem in Spain. To explain the basic characteristics of the contribution of feminism to the definition and delimitation of the basic approaches to the way the problem is dealt with, theoretical reflections from the field of study of social movements have been collected. Basically these have included the “new social movements” approach, the “political and cultural opportunity structures” approach and, in particular, “framing theory”. Based on these guidelines, in particular the theoretical/methodological contributions of “framing theory”, a review of various documents has been made based on an eminently qualitative analysis. Special attention is paid to the Official Record of the Spanish Parliament. The main aspects of the media representation of this problem have been explained by sampling three newspapers with national circulations – El País, ABC and El Mundo.

The aim of the paper is to attempt to make a particular contribution to explaining the self-reflexive dimension work on this problem has had for feminism in terms of modernisation and for the social revitalisation of feminist ideology and objectives. On one hand, some features that already existed in its structure, its objectives and its action strategies have been accentuated, in terms of its role as prototype “new social movement”. Some new features have also been incorporated to make it appear as a “new global movement”. Some of these new and accentuated features might be highlighted, including: the greater degree of internationalisation of collective action, the more cultural nature of this social movement, and the intensification of its network organisational structure and of cooperation networks between different sectors of feminism and with other social movements. Closely linked to these last two aspects is the appropriation and use of information and communication technologies. In particular, the feminist movement has placed more emphasis on the strategic use of the conventional communications media as instruments and agents for cultural and social change, through which values and objectives of equality can be disseminated. Another interesting feature is the construction and use of the discourse of expertise on the study topics, basically through the strength acquired by “academic feminism”.

IN SEARCH OF EUROPEAN IDENTITY FOR THE YOUNG GENERATION OF UKRAINE THROUGH THE YOUTH MOVEMENT AS COLLECTIVE ACTION

Oleksandr Volodymyrovych Khyzhniak

Abstract: Ukraine as a young independent country is a CE member; it has selected the course towards European integration. Realization of that course to a considerable extent is determined by the process of creation of a new European identity form for the young generation via the youth movement collective action. The Ukrainian Orange Revolution 2004 events testify that the youth movement now has specific character, peculiar characteristics, which raise it up to the level of the subject of social changes in Ukrainian society, who is able to form European identity of the young generation.

The youth movement can be regarded as a form of self-initiated participation of young people in asserting their interests, their place and role in society through collective forms of their social activities. We think at present time the youth movement in Ukrainian society can be characterized by the features as follows: organizational pluralism; decentralization; compliance of the nature, contents, form, duration of the youth organizations activity with the social time; external support; activity virtualization; use of new information and communication technologies; new requirements for activists, leaders etc.

Priority of social problems in the youth movement of the modern Ukraine, appearance of «new social movements» in the modern social space is an answer to the new reality challenges. At the same
time a number of problem questions appear. One of them refers to conditions, under which the youth movement can become an effective collective action.

But mastering of a social technology, which would promote advancing of European integration idea as an idea corresponding to national interests of Ukraine and being able to reduce globalization risks, is not less important for the youth movement. It is also important to take into consideration the attitude of Ukrainian young people towards the idea of European integration.

For youth movement is highly important to mastering of social technology that would facilitate promotion of European integration as such, which meets national interests of Ukraine and is able to reduce the risks of globalization. As such technology, in our view, we can use social marketing: segmentation of the youth and positioning idea of European integration, which means benefits and possibilities provided by European integration and European identity.

**PROTEST IN THE EU MULTI-LEVEL SYSTEM – PARTICIPATION ‘FROM BELOW’**

Cyril Gläser

Abstract: The project studies protest in the EU multi-level system on the basis of a comprehensive empirical analysis of the characteristics and developments of protest events in the EU in the first decade of the new millennium (2000-2009). At the centre of the paper are questions of EU-references of protests: which aspects feature EU-references (e.g. addressee, protesters or topic), in how far can these protests be allocated to specific types and which types dominate. Furthermore, these types are scrutinized for specific characteristics and correlations.

Contrary to the prevalent research focus on elites and their interaction, this paper concentrates on the ‘ordinary people’ and the question if and how they react on the development of the EU and its policies. EU-protests, as a central mode of such a participation ‘from below’, are a crucial aspect of public debates on European integration and so their politicisation and democratisation.

The Political Opportunity Structure approach is employed to analyse the effects of the new multi-level (opportunity) structure created by European integration on protest events in Europe. To explain divergencies and convergencies across topics, sectors and actors the Resource Mobilisation and Internal Constraints approaches are incorporated into the theoretical framework. Different types of protest are imaginable corresponding to the development of a multi-level structure of political opportunities. They are described and classified in a typology developed on the basis of Imig/Tarrow 2001.

The core hypothesis is two-part:

(a) With the growing relevance of the EU and the transformation of the political opportunity structures towards an EU multi-level system, the share of protests relating to the EU and especially of multi-level protests do significantly rise. (b) By reason of the relative closedness of the EU system, the little developed European public sphere as well as practical difficulties, *National EU Protests* is the prevalent type. Hypotheses about correlations between types and characteristics of these protests are derived from the theoretical framework.

To test the hypotheses a comprehensive protest event analysis is carried out. It is based on a full sample of the english reports of the news agency Agence France Press during the period under study and with spatial reference to EU member states. The data set is generated combining automated (using the software TABARI) and manual coding.

**UTILISER LE DROIT CONTRE LES DISCRIMINATIONS DANS L’EMPLOI : UNE COMPARAISON ENTRE DIFFÉRENTES FORMES DE JURIDICISATION DES MOUVEMENTS SOCIAUX**

Vincent-Arnaud Chappe

Abstract: Depuis le tournant des années 2000, la lutte contre les discriminations s’est imposée en France comme un enjeu majeure dans l’arène publique. Un certain nombre d’organisations se sont ainsi emparées de cette cause en adoptant une stratégie de soutien judiciaire aux victimes. Dans cette communication, nous cherchons néanmoins à montrer que ce qui a été désigné comme une « juridicisation » de la lutte contre les discriminations a pu prendre des formes très différentes selon les types de discrimination concernés, les supports juridiques et les cultures organisationnelles des associations venant en aide aux victimes.

Pour cela, nous nous appuyons sur une enquête empirique comparant le soutien apporté par le syndicat ouvriériste CGT aux et celui apporté par l’association de jeunesse SOS Racisme aux victimes de discrimination raciale.

Si ces deux organisations ont connu une très forte juridicisation de leur répertoire d’action dans les années 1990 et 2000, l’observation concrète de ses modalités montre des différences majeures. Alors que la CGT a surtout pris en charge des cas de discrimination syndicale dans le déroulement de carrière en s’appuyant pour cela sur le droit civil de la non-discrimination, SOS Racisme a principalement traité de cas de discriminations raciales à l’embauche et ce à partir du droit pénal. Nous chercherons à montrer que cet usage de deux droits différents ne s’explique pas uniquement par la recherche du droit le plus « adapté » et le plus efficace à chacune des situations, mais prend un sens dans deux conceptions opposées de la « légalité » (Ewick & Silbey, 1998).

Alors que, à SOS Racisme, l’utilisation du droit sert d’abord à réaffirmer la conception républicaine d’indifférenciation des individus au sein de l’espace public, et s’appuie donc sur une orientation « légaliste » qui instrumentalise la victime pour en faire un levier politique, l’utilisation du droit à la CGT se situe avant tout dans une perspective agonistique de conflit de classe visant à faire « réparer » le tort subi par l’employé, et ce dans une perspective de lutte contre l’arbitraire de l’employeur. La place de la victime et la signification politique du recours au droit diffèrent donc sensiblement entre les deux organisations, en s’appuyant sur deux lectures divergentes de la société et des conceptions différentes du « juste ».

**EFFECTS OF REGIME CHANGE ON SOCIAL MOVEMENTS: POLITICS OF PROTEST IN TURKEY, 1977-1983**

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Selin Bengi Gumrukcu 1,2*  
1Izmir University of Economics, Izmir, Turkey, 2Department of Political Science, University of Zurich, Zurich, Switzerland

Abstract: Social movements are influenced by their internal organizations and dynamics. However, internal dynamics are not the only factors effecting the movements; there are also macro-level variables which influence them. The concept which has had the greatest success in defining the properties of the external environment is that of political opportunity structure (Della Porta and Diani, 2006: 16)

A long wave of collective action rose and fell in Turkey between 1968 and 1980. Protest cycle made a pick in the late 1970s and starting from 1977 the cycle increased. This cycle, besides the cultural frames, was also structured by the national political system. Turkey’s weak democracy could not benefit from these movements and the cycle ended up with a military coup d’état on September 12, 1980. The coup gave an end to the mass protests, however a little number of protests are realized by mostly left-wing groups under the rule of military junta in contrast with the general idea that the coup definitely ended up the protests. The military junta left the government to the civilians with the national elections held on 1983. The aim of this paper is to examine the relationship between the political opportunity structure and social movement in general and the effects of regime change on them in particular. For this purpose I will attempt to answer these questions: How the military coup did affect the protests? Did it cause the social movement organizations to go underground and radicalize? Did its effects differ in long-run

Empirical part of the study relies on the protests in Turkey from 1977 to 1983. Protest event analysis will be employed with a systematic coding of newspaper articles of the Turkish daily Milliyet. One day from every week in an artificial way will be selected and coded for the purpose.

SHAPING MARKETS: A COMPARATIVE PERSPECTIVE ON THE ECONOMIC CONSEQUENCES OF SOCIAL MOVEMENTS  
Philip Balsiger 1  
1IÉP, UNIVERSITÉ DE LAUSANNE, Lausanne, Switzerland

Abstract: Studies on social movement consequences usually study political, cultural, or biographical consequences; my paper suggests that movements may also change markets. I propose a comparative study of the transformations of the market for clothes under the impact of political consumerist movements in Switzerland and France. The paper takes a critical stance with regard to common studies of (mostly political) consequences of movements, which do not sufficiently account for the diversity of movement actors and thus the tensions or conflicts within the social movement sector around goals and tactics. I argue that the co-existence of such different approaches has to be accounted for when one looks at movement outcomes, and my paper shows how this changes our discussion of movement outcomes. Recent studies on movements targeting market actors have identified different ways through which movements change markets: they target market actors through campaigns, facilitate and enable individual actions of political consumerism, put in place new tools of private regulation such as labels and certifications, and create alternative niche markets such as markets for local, organic, or fair trade food.

My study on the market for clothes and its transformation to incorporate ethical issues – conditions of production, but also environmental questions such as organic cotton or recycling, addresses the articulation of such different tactics within a given market and its consequences. On this market, I observe the rise of a niche for ethical fashion around a number of new “social entrepreneurs”; the emergence of labels for fair trade and organic clothes; and the existence of anti-sweatshop campaigns fighting for global standards to improve working conditions in clothing factories. Using a variety of sources (interviews, participant observation, document analysis, archives), the paper discusses the social and political determinants for these different groups, shows the different “definitions of the situation” and frames they build on, and looks into the tensions the co-existence of these approaches produce. The comparative perspective helps explaining why the “ethical” transformation of the market for clothes differs from one country to the other, showing how national dynamics of the interplay between different social movement actors, firms, and the state led to different kinds of market change.

STAIRWAY TO THE KREMLIN: THE POLITICAL OUTCOMES OF THE RADICAL RIGHT IN RUSSIA  
Sofia Tipladou 1  
1University Institute of European Studies, UNIVERSIDAD AUTÓNOMA DE BARCELONA, Barcelona, Spain

Abstract: The current paper aims to discuss the political outcomes of the radical right in Russia over the course of the last 20 years. Within the Russian radical right movement the author distinguishes between social movement organizations (SMOs) that emerged before and after Vladimir Putin’s rise in power on the basis of the distinct political opportunity structures that the movements had to face. The National Bolshevik party, the Russian National Unity, and Russian All People’s Union will be taken as representative radical right movements of the 1990s. These ‘old’ radical right movements will be compared to their counterparts born in the 2000s: the Movement Against Illegal Immigration, the Eurasia Party, and the National Sovereignty Party of Russia. The objective of the paper is to assess the political impact of the radical right movement following a political mediation account. To this extent, the impact of the mobilization of the radical right and the resonance of its claims will be analyzed within an action-reaction model with the actions of like-minded state actors and of the government. Public opinion and the reactions of Russia’s major religious institution, the Russian Orthodox Church, will also be taken into consideration. With this proposal the author aspires to make a contribution to the scholarly debate by amplifying the discourse of movements’ outcomes on post-communist environments and undemocratic settings.

THE CONSEQUENCES OF MUSLIM PARTICIPATION WITHIN THE GLOBAL JUSTICE MOVEMENT (GJM)  
Timothy Peace 1  
1Department of Sociology, UNIVERSITÉ DU QUÉBEC À MONTRÉAL, Montréal, Canada

Abstract: This paper attempts to explain the diverse outcomes of Muslim participation within the Global Justice Movement (GJM) in France and Britain. In particular, why were religious activists in Britain able to form an electoral alliance with the radical left (Respect coalition) and why did similar attempts in France fail? This seems
particularly puzzling when we consider the political context in France which has been encouraging the number of ‘diversity candidates’ i.e. those with a migrant background. The 2008 local elections should have therefore provided an ideal opportunity to recruit ethnic minority activists to radical left party lists or at least form electoral alliances in certain areas. The outcomes of social movements are notoriously difficult to study empirically. This is, however, made feasible by using a comparative analysis which can shed more light on why outcomes were different in similar contexts. This is done in this paper with reference to four categories of political opportunity structures: formal institutional structures, national cleavage structures, party procedures and alliance structures. I therefore examine factors such as the electoral system, philosophies of integration, trust in the political left and the strength of local networks that explain why Muslim activists in Britain were able to form an electoral alliance (and experience some electoral success) and why French Muslims activists continue to be shunned by the left in France.

THE HETEROGENIETY OF MOBILIZATION AND REPRESSION IN AUTHORITARIAN REGIMES.

Hank Johnston

Abstract: This paper examines the “dark dance” of mobilization and repression in authoritarian states in a broad comparative perspective. I draw on examples of numerous authoritarian strategies, but with special analytical focus on the prevailing strategies (Koopmans and Kresi 1998) in China, Russia, and Iran. The goal is to clarify the basic concepts and identify the generalizable processes of state radicalization or deradicalization in the face of mounting protests. These are questions that are highly relevant to contemporary mobilizations in North Africa and the Middle East, and the analysis makes connections between the three focal cases and events there. Specifically, I will analyze different levels of state heterogeneity, referring to (1) diversity of elite interests within authoritarian regimes; and (2) the complexity and vertical structure of social control apparatus in modern, high-capacity authoritarian regimes, and (3) the microlevel, quotidian reality of both the political opposition and the forces of social control. Each has its own impact on the outcomes of protest mobilization at different junctures in the development of the opposition. Drawing on the three cases, I identify junctures when elite interests may diverge, thereby creating opportunities for oppositional mobilization. Another goal is to identify patterns of challenge and threat when elite interests converge, thereby leading to increasing repressive measures. The dual principles of both interest-based heterogeneity (among political elites) and vertical state heterogeneity (as measures of state capacity), however, make broad generalizations fraught with danger, as is apparent in variable outcomes of Arab democratic movements as I write. The forces of political opposition and state repression are engaged in a “dark dance” that is dynamic, recursive, and iterative. Moreover, there are great complexities at different levels of the social control apparatus of high-capacity authoritarianism which makes democratic outcomes highly contingent on elite adaptability.

HISTORY, POLITICS, AND SOCIAL MOBILIZATION. THE CONTRIBUTION OF ANTONIO GRAMSCI AND CHARLES TILLY TO THE SOCIOLOGY OF COLLECTIVE ACTION AND POLITICAL CHANGE.

Fabio De Nardis

1Dept. of Social Sciences and Communication, UNIVERSITY OF SALENTO, Lecce, Italy

Abstract: The aim of the paper is to analyze the contribution of Antonio Gramsci and Charles Tilly to the analysis of political processes, particularly in the contentious relationship between social movements (organized civil society) and established power. The attempt to compare the work of two thinkers so culturally distant may seem unorthodox, but it is not. Gramsci and Tilly are two scientists working in different historical contexts and within different cultural perspectives, nevertheless their intellectual elaboration has several meeting places that allow us to build a theoretical framework still useful to a systematic analysis of political changes. Gramsci was a Marxist intellectual and political leaders who operated in fascist Italy in a context of crisis of democratic institutions; Tilly, on the contrary, is a liberal scholar who worked in the United States in the second half of the twentieth century, but both are united by an attention to the dynamics of conflict and the belief to produce theories that are rooted in historical processes. The flexibility of the concepts developed by Antonio Gramsci, and the attention that he has addressed to the issue of ideological and cultural processes in advanced capitalist societies justifies the interest that he has raised in the intellectual and political sphere. As scholarly attention has focused largely on the political originality of its work, in our opinion the Gramscian categories may also be a useful analytical tool within a sociological framework. Gramsci, on one hand, developed a critical attitude towards evolutionistic and determinist conceptions of history (typical of the sociology of his times) focusing on the historical relevance of the collective will of popular masses in the dialectical relationship to the system of power. Tilly, on the other hand, react to the functionalistic and synchronic sociology, that is in part a product to Durkheimian structuralist approach, by focusing on the relevance of the elaboration of a historically grounded social theory. Both of them elaborate a theory to study contentious dynamics by adopting a historical comparative methodology. Our aim is to explore their conception of history and society and to connect their apparently different approaches. By this comparison we will propose an integrated theory and methodology to analyze social movements and political conflict both in the past and contemporary times.

SAUL ALINSKY ET L’ACTION COLLECTIVE. ESQUISSE D’UNE SOCIOLOGIE ET D’UNE PRATIQUE DE LA CONTESTATION AU TEMPS DE LA GRANDE DÉPRESSION.

Daniel Zamora

1Sociology, FREE UNIVERSITY OF BRUSSELS,Ixelles, Belgium

Abstract: Saul Alinsky is l’une des figures de la culture populaire radicale aux États-Unis des années trente aux années septante. Il est ainsi une référence dans la vie politique américaine, ayant eu une influence sur des figures telles qu’Hillary Clinton ou Barack Obama. Cependant, s’il est largement reconnu dans le champ du travail social et politique, il en est autrement dans le champ de la sociologie des mouvements sociaux. Il est considéré comme l’un des « pères » du « community organizing » et sa pratique militante lui permettra de développer une vision novatrice du pouvoir et de l’action collective. Celle-ci va questionner trois aspects que nous voudrions aborder. (1) Tout d’abord la notion de pouvoir dans les mouvements sociaux. Le pouvoir étant toujours du côté de ceux qui
ont « l’avantage organisationnel », le travail de l’organisateur con-
sistera donc à construire avec les dominés leurs propres ressources
organisationnelles d’expression et d’action politique. La question
du pouvoir est donc analysée du point de vue des formes organisa-
tionnelles et des ressources d’action collective. (2) Ensuite, c’est
une réflexion sur la production et la diffusion du savoir critique.
Selon Alinsky, pour les dépossédés le savoir n’est pas quelque
chose qui se donne, telle une « leçon » pour reprendre l’expression
de Rancière, mais qui se prend, qui ne peut prendre corps que par
l’action collective médiatisée par l’organisation. Le dévoilement
produit par la connaissance ne peut donc survenir de manière indi-
viduelle. Sur ce point, Alinsky est très proche des thèses de Paulo
Freire. (3) Enfin, il donne de nouvelles perspectives quant au rap-
port entre les formes d’organisations des opprimés et les institu-
tions d’État. Alinsky n’a que peu confiance dans les programmes
sociaux publics dictés depuis le sommet. L’approche que préconise
Alinsky est différente de celle des ‘liberals’ qui in fine, n’ont pas
confiance dans le « people » et défendent des réformes élitistes
excluant les opprimés de toute décision. « To give people help,
while denying them a significant part in the action, contributes
nothing to the development of the individual. In the deepest sense it
is not giving but taking — taking their dignity.» La perspective
d’Alinsky se constituant donc toujours contre le cadre institution-
nel, dans l’autonomie des opprimées, tant idéologique qu’organisatonnelle (il a de ce point de vue, des similitudes avec
les idées de Gramsci).

SOCIAL MOVEMENT AGAINST IMMIGRATION AS THE
VEHICLE AND THE AGENT OF THE RACIALIZATION
PRACTICES IN RUSSIA.
Nikolay Zakharov 1
1Sociology, Södertörn, Stockholm, Sweden

Abstract: Sense of belonging to the social movement presupposes
forging of collective identity and solidarity. At the same time the
aim of social movement is to bring about changes in the society
by affecting the attitudes and practices of the movement partici-
pants, potential supporters and those who are defined as “the oth-
er” (targets of intended change). The anti-immigration movement
is one of the most important actors in the Russian social movement
network. It has no legal status, being structurally maintained
through Internet, allowing the members of the movement to net-
work with football fans and members of skinhead movement. Un-
der the historical condition of the absence of the developed party
system in contemporary Russia, this movement considered to be
one of the main actors in democratic representation. The goal of
this paper is to isolate the key elements of the movement’s frame,
the ways in which it is applied in building the discourse and narra-
tives around “illegal immigration” and Russian citizenship. That may
help in explaining how the seemingly apolitical participants of
street riots make sense of their protests and get involved into op-
positional collective performances and develop an ethnic-based
solidarity. Also it serves the aim of uncovering the mechanisms and
agents of the ongoing process of racialization in Russia. It is shown
that the social movement against immigration may be treated both
as epiphenomena accompanying global processes unfolding by
their own thrust but also as the producer and transformer of socie-
tal patterns, discourses and political constellations which has its
own morphogenetic, structure transforming potential.

SOCIAL MOVEMENTS: RETHINKING SOCIAL
FROM THE COMMUNICATIVE DIMENSION
Lazaro Magdiel Bacallao Pino 1
1DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF ZARAGOZA, Zarago-
za, Spain

Abstract: Social movements have become increasingly significant
agents in current societies and communication is generally assumed
as an important dimension of their practices, to the point of con-
sidering the settlement of a “social agenda in communication” as
one of the social movements’ challenges (Sally Burch). Form this
context, the papers proposes a theoretical analysis of social move-
ments as a significant “sociological scenario” for a re-reading on
some of the key debates on social theories. Social movements tries
to become a particular dialectical mixture of at-the-same-time local
and global practices in a sense that implies a certain revision on the
relationships between, in one hand, individuality and sociability,
and in other, micro and macrosociological perspectives. The (desire
of) articulation of local-global, micro-macro and socio-individual
axes in social movements’ practices offers a substantial theoretical
background for the proposal of what could be called an interpara-
digm in the comprehension of social relations and links. Here the
role of communication is essential since social movements try to
develop a transversal articulation of the communicative dimension
in every practice, trying to avoid both past instrumental (technolog-
ical deterministic) and pan-communicationistic (and communica-
tion-centred) perspectives.

Communication is an appropriate dimension for the proposed re-
reading due to its inherent nature of having, simultaneously, a dual
phenomenological nature: it is structure and superstructure at the
same time (Gramsci). It supposes the assumption of a dualism per-
spective (contrary to the classical opposite and dichotomous one)
for the analysis of sociability, which finds a suitable complement in
the paradigm of mediation (M. Martín-Serrano and J. Martín-
Barbero) precisely proposed from the field of communication. It is
concluded that the emergence of a network of modalities (better
than levels) of sociability -from local-communitarian to global-
virtual one-, as part of social movements experiences, passes
through the complementation of articulation and visualization (the
two main roles linked to communicational practices), in a certain
kind of practices of articulation (articulation+action), from where
emerges a new sense of belonging that gives a particular im-
portance to the emotion, pursuing not an irrational approach of
sociability but a post-rationalistic one.

HEURISTIC VALUE OF "COMPLEX EMOTIONS" : A CASE
STUDY ABOUT THE REVITALIZATION OF SOCIAL
MOVEMENTS IN TURKEY
Deniz Günce Demirhisar 2
2Sociology, ECOLE DES HAUTES ETUDES EN SCIENCES SOCIALES,
Paris, France

Abstract: In my communication, I would like to bring some support-
ing data to the new theoretical approach of « complex moral emo-
tions » in the sociology of collective action. I will try to demonstrate
that the concept of « moral shock » derived from James Jasper’s
works and the conceptualisation of rituals by Randall Collins have
great heuristic value for the understanding of new activism practices
in Turkey. I will argue that recent transformations of social move-
CONSUMER MOVEMENT AS AN ORGANISATIONAL CHANGE AGENT - CASE STUDY OF A POLISH VIRTUAL BANK

Witold Nowak

Abstract: Consumer movements are a particular type of social movements that aim at implementing a social order change in the field of consumption and marketing. As in the case of other social movements, an essence of customer movements is an intentional collective effort of activists. A central role of consumption in contemporary Western societies causes an increasing importance of customer movements in consumer culture dynamics. The aim of this paper is to present a case study of a consumer movement that appeared in Poland in 2009 and analyse its activity in the light of social movement theories. The described consumer movement appeared during the economic crisis as a consequence of mortgages interest rate changes (related to currency exchange rates) introduced by one of Polish virtual banks. Dissatisfied clients have organized themselves through the internet bank customer service system and carried probably the most intense media campaign against a company in the modern Poland. What is distinct about that customer movement is the role of its adversary - a virtual bank, in its appearance. The bank strongly aimed at integrating its customers with various internet customer service instruments. The socio-demographic characteristics of this financial institution’s services target group were crucial for the customer movement phenomenon too. The described customer movement strongly attempted to influence the culture of organizational decision-making in the virtual bank it opposed. The main aim of the movement members was to force the adversary to include its clients claims in the decision-making process of setting mortgage interest rates, even though signed contracts unambiguously stated banks independence and discretion in this process.

THE CONFLICT OVER THE GENETICALLY MODIFIED FOOD POLICY: WHO CAN CONTEST THE RISKS?

Renata Campos Motta

Abstract: This paper is about how actors shape public discourse and policy decisions by using frame risks in the contentious politics over genetically modified (GM) food in Brazil. It is part of my PhD research, which is in progress. In presenting the first descriptive outcomes at the RN 25, I am interested in discussing the hypotheses regarding the strategic choice made by social movements to frame the GM food issue in terms of risk. Given the global dimension of the debate on GM food and the participation transnational actors of varied types such as firms and environmental movements, actors will also be categorized in types and geographical scope. Risk is defined as a discursive strategy to oppose the political decision to adopt a new technology. Using the analytical framework of contentious politics, risk will be treated as an element of a political claim, namely, a frame. Risk is thus a choice, among others, by actors as how to frame their arguments about GM food. This definition focuses on the social construction of risk as a form of communicating dissent over a political decision and avoids treating risk as a material phenomenon to be measured. In other words, for the present study it is not in dispute whether GM food are risky or safe, if it may bring future damage to health or environment; rather, the research question relates to how risk can be part of a discursive strategy to contest a political decision, what structures enable the use of such a recourse to which types of actors and what can be the effects of using this strategy on the policy field under study.

The methodology draws from political communications and social movements research. Based on the assumption of the fundamental role of mass media in the public sphere of contemporary societies, the study uses method of political claim-making identity and measure risk in the public discourse about GM food. Newspaper articles from the biggest nation-wide daily newspaper are collected per key-word search from years 2000-2008 and submitted to content analysis.

The outcomes to be presented concern the description of the discourse about GM food as it appears at the mediated public sphere: what actors take part on it, what are their policy positions and what are their frames?

THE UTOPIAS OF POLITICAL CONSUMERISM AS A SOLUTION AGAINST THE ECOLOGICAL CRISIS?

Sophie Bossy

Abstract: Political consumerism is a social movement in which a network of individual and collective actors criticize and try to differentiate themselves from traditional consumerism by politicizing
the act of buying in order to search and promote other types of consumption. Political consumers therefore view consumption as both at the heart of the ecological crisis (understood as a set of social, political and environmental crises linked together) and as one of the main potential solution to this crisis. In this study, political consumerism has been observed through the particular lenses of utopia. Utopia is understood as both a form of discourse and a set of practices. To be called utopian, a discourse has to include, first, a rejection of the existing society, and second, if not a clear conception of what another world might look like, at least the idea that another society is possible and desirable. And, to be called utopian, practices need to be an attempt to create here and now at least some of the features of this utopian discourse, in the hope of a spread in the rest of society. Focusing on the utopias of political consumerism can help the researcher understand both how activists frame their diagnostic of the ecological crisis and the solutions they offer as well as the kind of individual and collective actions they put into place to improve the current situation. In order to observe such a work, this study is based on a comparison of four cases in France and the UK: two local groups of the Slow Food organization, a group of de-growth promoters and an intentional community belonging to the ecovillage network.

The utopias of the political consumerists observed offer a discourse that is based on three dimensions: an art of slowness against the cult of speed of our society; an epicurean lifestyle against mass consumption; and political involvement against individualistic isolation. The consequences of this utopian discourse can be observed on the individual and the collective levels. Individually, they have adopted a set of utopian practices that shape their whole lives and, collectively, they believe that these particular lifestyles cannot be sufficient without collective solutions that they search within social movements and/or politics. Therefore, viewing political consumerism through utopia helps to understand the articulation between discourse and practices and between the individual and the collective levels.
GENDERED INVESTMENTS. SOCIAL INVESTMENT POLICY ON THE GROUND – A SWISS CASE STUDY

Eva Nadai1, Loredana Monte1

1School for Social Work, UNIVERSITY OF APPLIED SCIENCES NORTHWESTERN SWITZER, Olten, Switzerland

Abstract: Currently social policy in many Western welfare states is reoriented towards social investments. Within this paradigm people’s potentials and capabilities are addressed as human capital in relation to labour market participation. While long-term investments in children, care and education target the future working population, an investment perspective is also applied with welfare recipients. Activation policies and programmes are put in place in order to enhance employability and accelerate reintegration into the labour market. As feminist research points out, the social investment strategy affects the complex interplay of (re-/de-)commodification and (re-/de-)familialisation, thus has important consequences for gender relations.

While there is a considerable body of international comparative research on policy related aspects of the social investment paradigm in welfare systems, fewer studies empirically analyse the practices of social investment and activation ‘on the ground’, i.e. in welfare agencies and programmes. Yet, it is within these “street level bureaucracies” that the abstract concept takes shape. Negotiations and translations of the theoretical concept into concrete practices and its implementation on local levels lead to considerable variations – not only between welfare regimes or nation states, but also within a given welfare system, namely between agencies and programmes, and between different groups of clients.

In an ongoing ethnographic research we explore the practices of investment in social assistance services, unemployment insurance and activation programmes in Switzerland from a (intersectional) gender perspective.[1] We analyse in what ways these practices are gendered and have gendered effects. In particular, we are interested in (dis-)empowering effects of activation measures for unemployed, often low skilled and poor women. In our paper we will draw on preliminary findings from this study to address the gendering of selection processes (who gets what kind of measures) and of activation practices in welfare programs.

LONE MOTHERS’ PARTICIPATION IN ACTIVE LABOR MARKET PROGRAMS IN GERMANY

Cordula Zabel2

2FB C2, INSTITUTE FOR EMPLOYMENT RESEARCH, Nuremberg, Germany

Abstract: This paper examines lone mothers’ participation in labor market programs such as job subsidies, workfare, and training programs in Germany using large-scale administrative data. In this way, it may be possible to gain a clearer picture of the role ascribed to lone mothers in the German welfare state context. Across the last decade, policy reforms including the reform of the unemployment and welfare benefit system, as well as developments in childcare provision and parental leave regulations show signs of reorientation from a male breadwinner towards an adult worker model of the family. Expectations that unemployed parents responsible for caring for young children should be ready for employment or labor market program participation have grown stronger. Since discretion for program assignments is left to individual case managers in employment offices, requirements faced by lone mothers are difficult to predict on the basis of formal policy regulations alone. Therefore, lone mothers’ participation in labor market programs is studied empirically here. Entries into labor market programs are analyzed using event-history analysis.

Findings are that in both eastern and western Germany, lone mothers’ participation rates in workfare programs and class-room training programs closely approach or even surpass those of single childless women by the time the youngest child is 3 – 5 years old. For job subsidies, on the other hand, lone mothers’ participation rates reach those of childless single women only when the youngest child is 6 - 9 years old, and for in-firm training programs, not until the youngest child is 15 - 17 years old. However, job subsidies and in-firm training programs have in previous research been found to clearly increase subsequent chances of being regularly employed, while effects of workfare programs and class-room training programs were smaller. In eastern Germany, partnered mothers’ participation rates are very similar to those of lone mothers. In western Germany, on the other hand, partnered mothers’ participation rates are much lower than for lone mothers. This could be indicative of an influence of traditional views on the division of labor in the household in western Germany. In the analyses, special attention is also paid to the influence of the local childcare infrastructure as well as partner characteristics.

CITIZENSHIP AND GENDER REGIMES IN UNEMPLOYMENT INSURANCE: AN EUROPEAN COMPARISON

Jean-Pierre Tabin1,2*, Raluca Enescu1

1Haute école de travail social et de la santé, 2Université de Lausanne, Lausanne, Switzerland

Abstract: This paper aims at discussing how norms about citizenship and gender are produced and reproduced by social policy. Using the theoretical frame of citizenship and gender « regimes » (Jenson, 2001; Martin, 1996; Taylor-Gooby, 1996), we will demonstrate that legal definitions of insured populations and of benefits granted by unemployment insurances in 11 european countries[1] are socially constructed by representations of citizenship and gender relationships. For this demonstration, we will use data collected from the Mutual Information System on Social Protection (MISSOC) and from the Social Security Worldwide (SWW), completed by information from national sources and from key correspondents.

Our results indicate on the one hand that social citizenship, which in our research[2] refers not only to the way in which categories of citizens are included in the unemployment insurance, but also to its access conditions (e.g. qualifying period of contribution) and to the granted benefits (e.g. rates, length...), varies hugely among the countries we examined. This variation cannot be explained by Esping-Anderson’s typology (1990). One the other hand, our data

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
show that the countries under review do not take into account the peculiarities of women’s employment for determining the right to unemployment benefits. Here, the differences between countries are not significant: all countries under review reproduce the traditional gendered hierarchy in society.

In order to understand these differences and resemblances, our discussion is based on the European Social Survey in 2008 (Welfare attitudes in a changing Europe) and on the International Survey Programme in 2002 (Family and changing gender roles). We will also suggest ways for future sociological research to sharpen up the comparison criteria drawn up in this study.

[1] Countries under review: Germany, Denmark, France, Greece, Ireland, Italy, Poland, Romania, United Kingdom, Sweden, Switzerland.

[2] Research financed by the Réseau d’études appliquées en politiques sociales, familiales et de la santé (University of Applied Sciences Western Switzerland).

WORK AFTER RETIREMENT: TOWARDS A NEW UNDERSTANDING OF THE DISTRIBUTION OF SOCIAL TEMPORALITIES ON THE LIFE CIRCLE, A COMPARISON FRANCE AND QUÉBEC

Melissa Petit

Abstract: Despite the social situation which relegated French seniors outside of the company since January 1st 2009 a financial law of social security has made it easier to combine employment and retirement, when retirees can use this legal opportunity. From 1945 to 1982, this possibility was encouraged, by reducing social security contributions for the employer with employees beyond the 65-year. From 1982, public policies legislated on this issue and we witnessed a restrictive approach which divides social temporalities. From 1993 to 2003, public policies lighten the tax related to the total which makes far less restrictive, however, the dis-incentive nature remains present as the total pension and wage accumulated can not exceed the amount of the last salary obtain of retirement. Liberalization of the accumulated wages in 2009 is nevertheless a phenomenon on the margins of the culture of work and retirement in France.

However, this situation has become a reality in Quebec since the early 2000s. While the early retirement measures put into effect, following the recession of the early 80s, had an effect on the number of active seniors. By cons, since 2000 we are seeing a return on the labor market for seniors Quebecois. This results since 2008 by public policies incentives to promote the work after retirement and flexibility at retirement. A summary of various studies in Quebec over the last five years has estimated that between 25% and 40% of retirees reported working order (for tax).

Therefore, do public policies of combining work-retirement segment social temporalities or do they allow a complex and chosen social temporalities? After initially defining the concept of combining employment and retirement, we try to understand how associated systems of social protection and public policies influence or not this practice and therefore compartmentalize or not social temporalities.

We assume that the French public policies exacerbate the fragmentation of the life course in three stages where the individual would go from work to retirement, while Quebec would be in a culture of de-specialization in activities where the combination would allow a social wellbeing and an entry into society. As a conclusion, public policies influence the possibility to combine work and retirement.

LABOUR MARKET REFORM IN GERMANY AND THE LOW-WAGE ISSUE: WHO IS AFFECTED BY AN INCREASING RISK?

Marco Giesselmann

Abstract: Since the early 1990s, Germany has implemented social and labour market policies directly or indirectly aimed at the expansion of the low-wage sector. Accordingly, many studies reveal a serious increase in the low-wage rate. At the same time, empirical evidence shows that a dispersion of the wage distribution did not occur proportionally across different socio-demographic and labour market characteristics: Low-wages have especially increased among groups that already had a high risk before decisive reforms were implemented. This concerns for example the low-qualified, immigrants, East Germans and young workers.

This study seeks to reveal an additional relevant dimension of increasing wage-inequality, which is the biographical position in the labour market. It is argued that increasing low-wage risks have spread especially among persons in transitory labour market - positions. This can be explained by the basic constitution of the German labour market and the important role, that unions play in allocating rents and closed positions. These institutions protect established employees to a large extend from the effects of reforms and consequently from a decrease of their labour market position.

However, persons in transitory positions are not explicitly addressed by unions’ acting. Consequently the effects of deregulation and commodification affect these groups stronger than the insiders of the labour market. Accordingly, empirical analyses on the basis of the Socio-Economic Panel (SOEP) show that low-wage work has spread especially among entrants and re-entrants to the labour market between 1993 and 2008.

In the light of the results, the study finally seeks to discuss weather a new type of dualism has established on the German labour market. While the former two-tier benefit system supported disparities among the unemployed (outside the labour market), the departure from bismarckian welfare ideals graded these differences. At the same, the new configuration (in conjunction with the high level of employment protection) emphasises the dualism between core and periphery within the labour market.

A STATE AS AN AGENT OF A WELFARE POLICY: A COMPARISON OF OPINIONS OF RUSSIANS AND EUROPEANS

Olga Gryaznova, Denis Podvoysky

Abstract: A State as an Agent of a Welfare Policy: A comparison of opinions of Russians and Europeans

All European states face the challenge of effective social policy. Attempts to solve the problem are also made by sociologists. There
are developed analytical tools allowing to systematize existing concepts of social policy, to reveal agents of social policy practice and their interactions, to describe characteristics of welfare institution and its functions. While empirical studies are focused on more particular issues.

Our research is devoted to studying of attitudes towards welfare provision in Russia and other European countries and of the factors having an impact on it. In particular, ideas about a role of a state in a question of maintenance of social guarantees and distribution of material benefits in Russia and other European countries are in the center of our attention. Empirical base of the made analysis is the fourth wave of the European Social Survey conducted in 2008 in 29 European countries.

The data show up that not only socially-demographic factors (gender, age, educational level, professional status), but also a complex of basic life values (which vary in different countries) have an effect on a position of individuals concerning a role of a state in welfare provision and maintenance of social guarantees. General regularities common to the all observed countries can be designated: welfare state is mostly supported by women, elderly population, those who have a low educational and professional level, representatives of vulnerable social groups, and employees of government-financed organizations. However the level of a welfare state support varies in the different countries significantly. Articulated welfare demand is lower among representatives of the “old capitalist” countries with an old tradition of liberal individualism, and higher – among representatives of the post socialist and Mediterranean countries.

Here we can fix an impact of both institutional and cultural variations. Among cultural factors we focus on basic life values: achievement and independence are of a great importance for the representatives of the first group of countries, and security, tradition and conformity for the second ones.

ROLE OF STATE AND OPTIMAL WAY OF RUSSIA’S DEVELOPMENT IN PERCEPTION OF POPULATION

Svetlana Mareeva

1Dept. of socio-economic research, Institute of Sociology RAS, Moscow, Russian Federation

Abstract: Based on the results of pan-Russian surveys (2005-2010), Russians’ inquiry on a certain type of social and economic development of the country and their expectations of social and economic policy carried out by the state are analyzed.

It is shown that in perceptions of population, future of Russia is connected with its natural resources, cultural and tourist potential of the country. Most possible role of Russia in international system of division of labor is the role of “energy superpower”. The way of development connected with innovations, science, education, seems much less possible to population.

Most Russians agree that property for natural resources that ensure Russia’s future should belong to state – as well as the opportunity to control Russia’s economy as a whole. Even concept of private property through Russians’ eyes allows governmental interference in the rights of proprietor. This request weakened during the last 10 years, but not significantly. In social sphere role of the state (as population see it) should be visible and important as well. State should provide a certain minimum for everyone, while everything above that minimum should be achieved by people themselves. This model in perceptions of Russians is stable.

First and the most important steps for modernization that state should undertake are the following: start to fight corruption and provide equality before the law for everyone. These are the most acute problems that need to be solved. Request for social fairness is connected with general situation. Request for efficient innovative economics is spoken out by only ¼ of population; these are Russians who can efficiently work in it.

Comparison with requests for governmental role in other countries (based on World Values Survey data) shows that such a request for governmental leading role in economic and social sphere differentiates Russia greatly from USA and West European countries, providing different prerequisites for the modernization process. However, request from population in Russia is not homogeneous. There are groups in Russian society which are characterized by very different understanding of Russia’s future, modernization and governmental role. Age and professional status, as well as rural/urban type of settlement, are among the main differentiating factors.

WELLBEING AND WELFARE: A PSYCHOSOCIAL ANALYSIS OF BEING WELL AND DOING WELL ENOUGH

David Taylor

1Faculty of Health and Social Science, UNIVERSITY OF BRIGHTON, Brighton, United Kingdom

Abstract: Wellbeing is increasingly supplanting welfare as a central political goal for social and public policy. In academic Social Policy some writers have suggested that a focus on wellbeing allows us to consider a ‘fully-rounded humanity’ whereas welfare focuses on economic utility. This article avoids this polarisation and proposes a generative and relational view of wellbeing and welfare as mutually constitutive. It adopts a trans-disciplinary critical psychosocial perspective to reveal highly normative views of wellbeing and agency employed in these political and academic discourses. It proposes a view of agency for wellbeing which is contextual, includes non-rational action, and is oriented to being well-enough with others. Instead of a concern with outcome measures such as happiness it proposes a view of wellbeing as a process which varies according to context. Drawing on the notion of ‘thick’ and ‘thin’ needs, the specific content of wellbeing is seen as generated through ‘close’ and ‘distant’ relationships. This approach challenges contemporary policy responses to wellbeing which are individualised and marketed and suggests that a question for Sociology and Social Policy is, which relationships and contexts are generative of individual wellbeing and welfare?

EXPERT DISCOURSES, SOCIAL NORMS AND MEANINGS OF INSTITUTIONS: CHILDCARE POLICIES IN FRANCE AND THE CZECH REPUBLIC

Radka Dudova

1Gender and Sociology, INSTITUTE OF SOCIOLOGY, CZECH ACADEMY OF SCIENCES, Prague, Czech Republic

Abstract: The paper is a comparative analysis of the policies, discourses, and practices of care for children under the age of three in France and the Czech Republic. The focus is on the question why in those two countries, where the basic design of care leave policies and childcare institutions and women’s employment rate are surprisingly similar, the employment rate of mothers with young children and the usage of childcare leave and childcare facilities for the
youngest is so very different. I use the discursive institutionalist approach in order to explain the different historical development of social policies targeted at parents of young children, and especially the different social norms and public discourses that developed around these policies. I illustrate how these norms determine the meanings that are attributed to these policies and thus influence the practices of parents (for instance the use of child-care institutions).

In fact, especially the substance and the presentation of expert knowledge in public discourse has had a fundamental impact on the formation, on the public understanding and also on the use of policies and institutions. In both countries under study, expert discourse has determined the ideas and views that the policies and institutions rested on, and thus also shaped the behaviour of people who used them and who reproduced those views and ideas through their actions. However, this expert knowledge has had a rather arbitrary nature – in two different national contexts the contents of this knowledge differ dramatically.

CHILD PROTECTION SYSTEMS IN SWEDEN, ENGLAND AND PORTUGAL. COMMON CHALLENGES, DIFFERENT PATHS

Sandra Mestre Cunha

1Sociology -School of Sociology and Public Policies, CIES - ISCTE/IUL, Lisbon, Portugal

Abstract: All child welfare services balance the need of protecting children and the need of helping parents and preserve families. Thus, all systems have the capacity to remove children from their parent’s home. Yet, systems of child protection are rooted in particular institutional and cultural contexts as in specific visions of children and family and therefore, striking differences can be found in practices and procedures among diverse child protection systems.

Broadly speaking, child welfare and protection systems can be characterized by two major ideal-types models: the child protection orientation mainly in practice in America, United Kingdom or Canada and the family service orientation characteristic of Northern European countries.

The first perspective pays special attention to the need of protecting children from harm, whereby specific legislation concerning Child Protection is not unusual. The basis of state intervention is legalistic and child services are usually separated from family services. Efforts are concentrated in reparation of damage, procedures are standardized and limited by rigid time-lines. State-parental relationship tends to be adversarial and most of out-of-home placements are mandatory.

The second system is mostly characterized by a strong emphasis on public services for family support. Services intervention operates through supportive or therapeutic responses to meet the needs of children and families, child services are embedded within the broad child welfare or public health services and a great emphasis is placed in prevention and support at earlier stages. State-parents relationships are based on partnership and thus out-of-home placements are mainly voluntary. Usually, countries with a family service orientation don’t have specific legislation on child protection as policies and measures towards children are included in broader family policies.

Taking, as starting point of discussion, Neil Gilbert’s models of Child Protection Systems, this paper presents the main findings of a comparative study on Child Protection Policy and Practice between Sweden, England and Portugal. It highlights the main differences in legislation and services organization but also in field practice and procedures.

THE MISMATCH BETWEEN WELFARE PROVISION AND THE NEEDS OF THE ADOLESCENTS LIVING IN POVERTY

Marta Petelewicz

1Department of general sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: National (Warzywoda-Kruszyńska, Wóycicka) and comparative (UNICEF, EC) reports indicates that Poland face severe problem of child poverty. Children are the most vulnerable group in the Polish society in terms of poverty. Even though the general conditions of the polish society have vastly changed for the last years, the relationship between age and poverty is constant. The question arises are the welfare institutions able to tackle or at least mitigate the problem. Especially that the target unit of the social policy and social work in case of Poland is a family. The main goal of the text is to consider social policy and actions undertaken by the welfare institutions connected with the underprivileged adolescents, in the context of the specific needs of this group. The diagnosis of the situation of children is based on the empirical data, that were gathered among 12-13 year olds living in the poverty pockets in Lodz in Poland. Self-completed questionnaires were conducted in the elementary schools placed in the most deprived parts of city. In the schools, where the field study was conducted there is an overrepresentation of children coming from families supported by the welfare. The analysis combining the

CAUGHT BETWEEN JOB AND ELDER CARE: FINDINGS FROM AN INTERNATIONAL LITERATURE REVIEW IN THE CONTEXT OF SOCIAL POLICY IN GERMANY

Monika Reichert 1, Annette Franke

1Social Gerontology and life course research, TU DORTMUND UNIVERSITY, Dortmund, 2GOETHE UNIVERSITY FRANKFURT, Frankfurt, Germany

Abstract: An increasing number of international researches address the importance of the reconciliation of elder care obligations and employment. However, research towards the reconciliation of work and care has emphasised more the carers’ perspective and paid less attention to the employers’ view. Therefore, more knowledge is needed about both sides of reconciliation. Furthermore, there is still a lack of knowledge on conflicts, strategies and effective instruments to enable the combination of work and care in the light of different care regimes.

The aim of the Carers@work project (funded by the Volkswagen Foundation) with partners from Germany, Italy, Poland, and the UK is to show that such reconciliation is possible under appropriate support measures at both enterprise and policy level.

This paper aims to comprise the results from the international literature review and compare them with the empirical findings from the research project “Carers@Work” in the four partner countries. Special emphasis is put on problems, strategies and most effective
measures inherent to both work and care for older individuals. In addition, the presentation highlights the importance of instruments and measures in this four care regimes.

The empirical findings from the “Carers@Work” project reconfirm many features from the international literature review but complement these findings with new aspects for the scientific community, employers and social policy. For example, it can be shown that country-specific socio-political and cultural framework conditions play an important role regarding strategies employees and employers use to reconcile work and care.

EUROPEAN WELFARE STATES AND QUALITY OF LIFE IN SUNSET YEARS: THE DIFFERENT ROLES OF INTERGENERATIONAL EXCHANGES FOR OLDER PEOPLE

Franz Stephan Neuberger, Klaus Haberkern

1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: The idea of the welfare state as main provider of help and care for the old and needy is one of the most important achievements in the history of European social policy. The welfare state was meant to be a warrantor for the well-being of its inhabitants, improving their quality of life through support and also to unburden the traditional provider of support, the family. In Europe, different welfare state regimes found different balances between these two pillars of social solidarity. Therefore, the role and importance of the family as provider of help and care is shaped by the welfare regime. Diversity in the balance between the family and the state is likely to result in different roles of family and state for the quality of life. What is the role of intergenerational solidarity for quality of life? Is family support more important in the so-called familialistic welfare states, whereas in generous welfare states, quality of life is more dependent on social services? Do welfare state regimes influence the individual’s assessment of family life?

The paper discusses the role of intergenerational relations for self-reported quality of life in different European welfare states against the background of changing family structures and the recent economic crisis. Tight budgets increasingly force policy makers to shift responsibility back to families and individuals, whereas unstable family structures may be unable to bear the responsibility. First, we describe the prevalence of intergenerational solidarity, measured by support, e.g. financial and time transfers between elderly people and their children. Second, we discuss the impact of these exchanges on self-reported quality of life in European welfare states. The analyses are based on the Survey of Health, Ageing and Retirement in Europe (SHARE) with respondents aged 50 and older from 14 European countries, including Poland and the Czech Republic.

CARE AS SOCIAL RESPONSIBILITY: UNFORESEEN CONSEQUENCES IN THE APPLICATION OF THE SPANISH LAW OF DEPENDENCE

M. Victoria Gómez, Patricia Barbadillo

1Political Science and Sociology, UNIVERSIDAD CARLOS III, Madrid, Spain

Abstract: Within the context of the Welfare state transformations and the debate on different models of social care, a profound change in social relations has taken place in Spain whereby care (for children, the elderly or sick people) is not considered a private issue anymore but has become subject to law initiatives and the design of public policies. From this point of view, care emerges as part of the social reality, but also as a social practice, and frequently linked, at the same time, to what has been called ethic of responsibility, all of them intersecting with the claim for gender equality.

This contribution examines recent changes in law and the development of new public policies in Spain over the last years. More specifically, we focus on the unforeseen effects of the implementation of the Dependence Law (2006), under the light of sociological classical theory and sociology of law. Taking into account that one of the main aims of this law was to provide a new right of citizenship for dependent people, we analyse empirical data related to its implementation in the Spanish regions, concluding that far from the initial purpose, it may be contributing to perpetuating the role of women as care-givers.

NEED ASSESSMENT IN SWEDISH ELDERLY CARE: ARE UNDERSTANDINGS OF ETHNIC ‘OTHERS’ RELEVANT?

Sandra Torres, Emilia Forssell, Anna Olaison

1Dept. of Sociology, UPPSALA UNIVERSITY, Uppsala, 2Dept. of Social Work, Ersta Sköndal University College, Stockholm, 3NISAL, Linkoping University, Linkoping, Sweden

Abstract: Swedish elderly care is nowadays characterized by a high degree of ethnic diversity among both elderly care recipients and elderly care providers. Few studies on the way in which this diversity has influenced this welfare sector have, however, been conducted. There is also a lack of studies on how institutional categorization in need assessment may influence understandings of ethnic ‘Othersness’ may influence institutional categorization in general and the kind of categorization that takes place within elderly care specifically. This presentation is based on an ongoing project on needs assessment within the context of Swedish elderly care that aims to shed light on the understandings of ethnic ‘Otherness’ that need assessors depart from and the manner in which these may influence the institutional meetings that take place between them and older people with migrant backgrounds when the latter seek elderly care services and undergo the need assessment process. The presentation will be based on a pilot study we have conducted in order to design the focus groups interviews that will constitute the project’s empirical point of departure. The findings from this pilot study suggest namely that understandings of ethnic ‘Otherness’ do affect the need assessment process and that alternative elderly care services are being designed as a result of it which differentiate between older people with migrant backgrounds and those who belong to the ethnic majority population. As such, a differentiation is being made between migrant elders and Swedish elders in a manner that resembles the ‘us’ and ‘them’ dynamics that characterize power un-awared ethnic relations. The presentation will address how the understandings in question are constructed and present some of the cases documented so far; cases that show that social policy for older people in Sweden is being challenged by the elderly care sector’s lack of awareness about the implications of understandings of ethnic ‘Otherness’ for social care inequalities in old age. As such, the presentation will contribute to the debate on institutional categorization and the manner in which welfare services are affected when their categorization practices lack an awareness of the implications that ethnic ‘Otherness’ have for power differentials in institutional settings.
MULTILEVEL ORGANIZATIONS OF THIRD SECTOR AND SOCIAL CAPITAL: INDICATIONS FROM A QUANTITATIVE RESEARCH IN ITALY

Lucia Boccacin¹

¹Department of Sociology, CATHOLIC UNIVERSITY OF SACRED HEART, Milan, Italy

Abstract: The paper aims to analyse the social production of relational goods resulting from the networking process of associations of third sector.

Third sector plays a specific role in the process of promoting a pluralistic welfare society, thanks to new forms of social networks among public, private, third sector and informal subjects.

The entrance of new players in the welfare systems generates innovative synergies in the answer of the more complex social needs and widens the services recipients’ right of choice.

In order to observe and understand such a ever-changing sector and its contribution in terms of services and practices, we need interpretative categories able to explain the morphogenesis of the phenomenon. Two of these are social capital and social partnerships.

They offered a scientific background for a quantitative research carried out in 2009 in Italy, on 110 nationally-based associations of social promotion and multilevel organizations belonging to the third sector.

The final results of this inquiry highlight particularly the capacity to create social capital, the differences between bonding and bridging social capital and the role and meaning of both within the associative sphere and in the production of activities and services.

The presence of social capital stimulates an intensification of the social relationships and leads to weave community links. The third sector subjects can play different roles in the creation of such a resource.

Moreover, another important point under analysis is the interrelation among different forms of social capital and the specific ability of the third sector organizations to establish formal relationships with other different actors, through the form of social partnerships.

Empirical data show a significant correlation between the existence of social capital and the emergence of social partnerships. This is evident from the spread of specific relational goods resulting from the multilevel associative relations.

In short, social contexts can take advantage of this connection, as relational goods of reciprocity and cooperation, as well as of services and practices provided, keep on growing internally.

Lesley Hustinx ¹, Jozefien Godemont ²*, Joris De Corte ³, Bram Verschuere ⁴

¹Center for Social Theory (CST), Ghent University, Ghent, ²CST/Centre for Sociological Research (CESO), Ghent University/Catholic University Leuven, Ghent/Leuven, ³Business Administration and Public Administration, University College Ghent, Ghent, Belgium

Abstract: While mixed public-private provisions of welfare have always been a typical characteristic of continental welfare states, recent international scholarship has been pointing to a historically new process of institutional hybridization (Billis, 2010; Bode, 2006; Brandsen et al., 2005). However, ‘hybridity’ to a large extent remains a fuzzy concept, and it lacks a comprehensive theory and indicator model (Glänzel & Schmitz, 2010). It follows that little empirical research has been conducted on the dimensions of hybridity and how it manifests itself in concrete organizational settings, such as nonprofit organizations (NPO’s). In this paper, we aim to contribute to the theoretical and empirical knowledge on this diagnosis of ‘hybridization’. Drawing on data from a large-N survey of 256 NPO’s in four welfare domains (ethnic-cultural minorities, poverty reduction, elderly care and special youth care) in Flanders (Belgium) we construct 1) a new analytical framework identifying forms and dimensions of hybridity; and 2) a typology of NPO’s based on the extent and nature of hybridity. That way, we aim to test two competing hypotheses: the thesis of a ‘bifurcation’ between a ‘grassroots’ and ‘corporatist’ organizational field (Milligan & Fye, 2005) vs. the the continuum or pluralification, observing a more complex and ‘disorganized’ process of hybridization (Billis, 2010; Bode, 2006).

THE SIMULTANEOUS RISE OF PUBLIC RELIGION AND PRIVATE WELFARE: A COINCIDENCE?

Ipek Gocmen ¹

¹MAX PLANCK INSTITUTE FOR THE STUDY OF SOCIETIES, Cologne, Germany

Abstract: This paper sets out from the observation that the last decades have witnessed an increasing presence of religion in the public sphere and of voluntary associations in the realm of welfare in various European countries. Faith-based/religiously-motivated welfare associations are an outcome of this double rise. This historical-institutionalist study explores the mechanisms behind the increasing presence of these associations in the realm of welfare provision. The five European cases selected (Britain, France, Germany, Sweden and Turkey) represent different and historically specific relationships between the state and society and the state and religion.
The paper explains the increasing emphasis on RMAs in various welfare states as a “political revitalization of religion” in order to solve contemporary problems of societies such as increasing poverty and social exclusion. The paper claims that the increasing visibility of these associations in the European welfare arena can best be explained as a reaction to the contemporary dynamics and tensions in European societies. Yet, how these contemporary dynamics and tensions influence single welfare states are highly dependent on various trajectories of institutional change in them. Therefore, the expanding role of RMAs in the social policy realms of various welfare states is explained by two mechanisms: (1) shifts in state-society relationships/transformations of welfare state structures; and (2) shifts in state-religion relationships/rearrangement of institutional structures between the state and various religious communities.

FROM SAFEGUARDING ONE’S STATUS TO ONLY SECURING ONE’S LIVELIHOOD – THE CHANGE OF SOCIAL WELFARE PROVISIONS IN GERMANY

Karin Scherschel1, Melanie Booth1
1Institute of Sociology, FRIEDRICH SCHILLER UNIVERSITY, Jena, Germany

Abstract: In the years 2003-2005 Germany has introduced a change of labour market policies as a response to an extensive and increasing base of unemployment. These reforms, which are often referred to as ‘Hartz reforms’, can be seen as a turnaround in welfare policies. They constituted a crucial and in comparison to other European countries abrupt paradigm change, from a welfare-oriented to a workfare-oriented labour market regime. Since their implementation, Germany has been regarded as a model for activating labour market policies throughout Europe.

The contribution will focus on these reforms and examines their institutional implementation as well as the individual consequences of the new ‘activating’ approach to unemployment. We put a special emphasis on the influence that the reforms have on the individual work orientations of jobseekers and their strategies for dealing with their position in the labour market. Hence, unlike the majority of research, evaluating the efficiency of such new employment policies, we approach the topic from the perspective of the job seekers. Based on regional case studies of the institutional implementation developed from interviews with experts of regional labour market policies, we conducted a qualitative longitudinal survey of the group targeted by the most recent labour market reforms. Our theoretical framework is based on the research on precariousness and social exclusion (Bourdieu, Castel).

The remodel of the German welfare state, which at its core contains the new labour market policies, is highly contested. This also becomes apparent in our case studies. Although most experts adopt the official doctrine of the new reforms, nevertheless we can observe various conflicts between different hierarchical levels within the labour market institutions. Furthermore, we can show that the new social policy doesn’t reflect the different types of unemployed people. Instead its standardized procedures have numerous unintended effects such as stigmatization and social exclusion. For some people it is not only a matter of financial losses. Rather, the institutional change of social provision goes along with of a loss of social recognition for one’s achievements throughout their employment history.

MAKING SOCIAL POLICY BY NGOS IN POLAND. THE CHANGES IN PERFORMANCE OF POLISH NGOS IN PERSPECTIVE OF UNCERTAIN TIMES.

Agnieszka Otępła-Szkłarczyk1
1Jagiellonian University, Krakow, Poland

Abstract: One may observe the growing position of NGOs in Poland. They have more financial, human and material resources. Some new legal arrangements like “The Act about Public Benefit and Volunteer” reflect their growing role. Local governments are obliged to cooperate with nongovernmental organizations. In 2008 about 60% of NGOs declared cooperation with local governments. Year by year the budget allocation for social services provided by NGO increases.

In Poland third sector is strongly miscellaneous. Many organizations function without diversified resources (e.g. stable employee). For that reason nongovernmental organizations are not as meaningful as they could be. However, some of stronger organizations aim to gain an impact on social policy. They want to present their point of view in the public debate. They organize social campaigns, for example against governmental plans of reforming the pension system, and had a say in media. Some of this campaigns have a real influence on social policy. As an example in 2003 The Board of The Public Benefit had forced an attractive condition of businesses tax liabilities that may be donated to NGOs.

Many recent analysis show that the economic downturn has negatively affected NGO’s provision of social services in Europe and generally condition of third sector (Forbig 2009; Hanfstaengl 2010 ). However the economic crisis in Poland was not so burdensome for everyday citizens life as in the rest of Europe. Poland had another problems and challenges. How NGOs have changed over the last 5 years? Has the economic crisis influenced their performance? Since many anxious news come from the global market(e.g. the dramatic increase of the food prices), one can ask about the role of the third sector in this uneasy times. This presentation will supply an answer on these questions, based on selected case studies of Polish NGOs, which wanted to have an influence on social policy in the areas of health care and human services. The research is being undertaken from March to July this year. The main research methods are individual in-depth interview. Analyzing the activity of NGOs in respect of their effectiveness, their aims, strategy and plans for the future, can give a new look on the role of third sector for social policy in Poland.

THE SOCIAL EMBEDEDNESS OF WELFARE SANCTIONS AGAINST YOUNG PEOPLE IN GERMANY

Franz Zahradnik1, Franziska Schreyer1, Susanne Götz1
1Education and Employment over the Life Course, INSTITUTE FOR EMPLOYMENT RESEARCH, Nuremberg, Germany

Abstract: Since the German welfare reforms in 2005 sanctions became a core element of the activation paradigm. If recipients in Germany don’t fulfill their duties – such as e.g. participation in activation measures – this results in a temporary reduction of benefits below the socio-economic subsistence level. Benefit recipients younger than 25 years are defined as a special target group regarding the participation in activation measures. Moreover, they are also subject to stricter sanctioning rules. Benefits are reduced by 100% for three months after the first neglect of duty. In case of
repeated failure the payment for housing and heating is cancelled in addition. For people older than 24 years, however, benefits are reduced stepwise. In the course of our research project we interviewed 26 case workers in jobcenters because they have to enforce the activation policies and strict sanctioning rules against the young welfare recipients. Furthermore we interviewed 15 young people with at least one 100% sanction within the last two years. All the interviews had a narrative orientation. Finally we analyzed the counseling records that have been compiled about the young people. Previous research shows that case workers have wide discretion over the allocation of sanctions despite precise regulations. Their decisions can affect the life chances of the recipients comprehensively. The rules became voluminous and contain contradictory aspects. In addition the high personnel turnover and only short periods of preparation for the job as case worker can result in selective enforcement and incorrect decisions. The direct interactions between case workers and clients are also shaped by differences in cultural capital and bureaucratic knowledge. Undereducated and disadvantaged young people fall behind in negotiating on good reasons for their deviant behavior. Moreover, counseling records bear the danger of labeling the sanctioned in a negative way especially when case workers change. Our presentation will focus on the perspectives of the young sanctioned regarding the embeddedness of sanctions in the social relations to their case workers. How do they experience the ambivalent situation of supervision (help and control)? How do they value the sanctions in this context and what are the consequences for the further working relationship? What role do (reciprocal) sympathy and empathy play?

WELFARE STATE AND MIDDLE CLASSES IN INTERNATIONAL COMPARISON: IS THE MIDDLE CLASS IN DANGER?

Ursula Dallinger

1Sociology, Department IV, UNIVERSITY OF TRIER, Trier, Germany

Abstract: This article analyses the role of public income redistribution on the relative income position of the middle class in international comparison. To capture this impact of the welfare state it distinguishes between market income and disposable income, reflecting also income redistribution. At both levels different dynamics take place and it is shown whether social policies change the stratification markets generate. Moreover, the broad category of a middle class is differentiated into three groups. Analyses based on data from the Luxembourg Income Study between 1985 and 2005 show that income redistribution by the social state mainly improves the position of the lowest income group, while the highest income group experiences losses. The income position of the middle classes shows little change by income redistribution. This pro-poor orientation is especially strong in continental countries. Scandinavian and Anglo-Saxon countries rather improve the relative income position of the middle classes. Changes over time show, that the impact of public redistribution on income-distribution increased without compensating the strong losses at the level of market income in the bottom quintile. But the middle lost relatively little over time. However, the distance between middle classes and the top which gained most regarding market incomes is growing. This may fosters the impression of the societal middle not to participate in the income development any more.

SOCIAL CAPITAL AND WELL-BEING: PORTUGAL IN THE EUROPEAN CONTEXT

Eduardo Rodrigues

1CENTRE FOR RESEARCH AND STUDIES IN SOCIOLOGY, Lisbon, Portugal

Abstract: In this paper the connections existing between levels and types of social capital and well-being are explored, with special attention given to the place of Portugal among the European Union members. Quantitative data will be presented from two sources: the European Quality of Life Surveys (EQLS) currently available (2003 and 2007 rounds) and the European Social Surveys (2006 and 2008 rounds).

We start by asking if distinct patterns of social relations and sociability exist in the EU and in what sense are those countries converging or diverging when it comes to relational resources and networks. Also, we try to find if the patterns observed are related to differing welfare regimes and make some considerations about the strengths and limitations of this kind of macro-analysis.

The position of Portugal in the European context is singled out: different types of sociability are considered and special attention given to the persisting role of the family in filling out gaps in relational capital from other spheres. Portugal stands therefore in contrast with other European countries not only when it comes to the kind of prevalent social resources but also when we talk about well-being and the links that exist between them. Other European contrasts but also some similarities are underlined.

Well-being indicators are then used in connection with other notions such as interpersonal trust and life satisfaction. To help explain the patterns found in Europe, we look at the characteristics of welfare regimes but also at other kinds of variables such as those related to the life cycle (age, conjugality and family situation, for example) and income.

This kind of empirical analysis is necessary if we want to highlight the theoretical importance of social capital in the understanding of well-being and welfare: the differential possession of social resources has effects not only in life satisfaction, perceptions of the future and social cohesion, but also on the levels of trust in others and in political institutions.

Talking about social relations in this manner is synonymous of talking about decisive social differences and inequalities. Further integrated analyses of relational capital and well-being will therefore be needed to understand the current turbulent times of Europe.

MECHANISM FOR EXCLUSION? SOCIAL WELFARE ADJUSTMENTS IN POST CELTIC TIGER IRELAND

Elaine Moriarty

1TRINITY COLLEGE, Dublin, Ireland

Abstract: Ireland is in the throes of the worst recession since the foundation of the state. Inevitably, in times of an economic downturn and a sharp increase in unemployment, the issue of social welfare benefits has acquired a greater importance. This is particularly the case in a labour market like Ireland’s, where during the Celtic Tiger boom, 14 per cent of the workforce were made up of non-Irish nationals. As a rising number of migrant workers have sought social protections, questions are being asked about the welfare
rights of migrants. Some public representatives have gone as far as denying the legitimacy of European migrant welfare rights altogether.

This paper seeks to explore the implications of increased intra-European mobility for a welfare based understanding of citizenship. It raises the issue of the portability of social rights, highlighting the emerging tensions between EU directives guaranteeing equal protections between member state nationals and national welfare implementation systems which have engaged in selective ‘restriction’ policies.

Using data from a three year study of Polish migrants in the Irish labour market (2007-2010), as well as key informant interviews with NGOs and relevant stakeholders, we show that at the time of eight New Member State countries joining the European Union, Ireland sought to qualify EU social rights through the time limited removal of welfare entitlements. This was achieved through the imposition of a two year ‘Habitual Residency Condition’ before claimants could access a range of social protections. Since the onset of the recession, we demonstrate how such adjustments have further deepened. Thus we show how the ‘crisis’ has helped to facilitate the further rolling back of social rights. These social policy adjustments attempt to reassert the notion that people live in one place. However, the reality of EU mobility undermines this. Ultimately, we consider how the implementation of particular aspects of social citizenship can in fact become a mechanism for exclusion.

PENSIONS IN TURMOIL: RECENT TRENDS AND CHALLENGES IN GREECE.

Athanasia Spyridoula Kapakidou

Abstract: The global financial crisis has brought on the spotlight pensions as an emerging issue all over the world. In this international context the pension challenge is crucial nowadays.

This article aims to focus on the Greek case study. According to recent surveys the pension “problem” in Greece is in many respects similar to that observed in other countries. However, in Greece, the current turmoil has inevitably increased uncertainties. Future pension levels are subject to a number of risks and have become a cause of concern for future sustainability and adequacy of the Greek pension provision. Many scholars have pointed out that serious financial problems are expected after 2015, and this is mainly due to adverse demographic trends. Given that, it has become increasingly essential to analyze the latest developments in the pension field under the current economic climate in order to ensure that the Greek pension system will be financially sustainable and provide adequate retirement income.

Specifically, the current article seeks to highlight the development of occupational pension funds, the current situation and the need for re-examination of the new institution in Greece. The development and strengthening of the institution of occupational pension funds can contribute significantly to address the pension problem, if we want to promote safety, viability and effectiveness in social protection and ensure an acceptable standard of living for the elderly.

THE STATUS OF DRUG-ADDICTS IN THE ANTIDRUG POLITICS

Elena Stepanova

1Baltic State Technical University VOENMEH, Saint-Petersburg, Russian Federation

Abstract: During last decades most of countries faced the problem of uncontrollable widespread of drug-addiction in the society and accordingly should solve a number of different problems.

Different countries come to different socio-political decision-solving: some countries consider that it is possible to achieve the total abstinence in their countries and pursue the policy of criminalization of drugs and drug-users; other countries have come to a view that drug-addiction is inevitable and it is necessary to learn to co-exist with it and to focus on the idea of harm reduction.

There is a high correlation between drug-addiction and HIV/AIDS spreading which essentially varies in different countries.

The aim of this project is to analyse anti-drug policies in several countries and to reveal and to understand the status of drug-users in these policies and to specify what rights and resources the drug-users have for solving their medical and social problems. The comparison of different countries allows to understand the variety and efficiency of various anti-drug policies and to realise more deeply the situation in Russia.

According to our point of view three essentially different spheres should be presented as independent components in the anti-drug policy of a country: (a) the struggle against drug-business, (b) the protection of the society and the population against drugs and (c) the support of people suffering due to drugs. We suppose that these three components have different status and significance in the anti-drugs policies of different countries.

The methodology includes macro and micro-analysis. The macro-analysis is based on studying of the concepts, programs, statistical and other documents, publications and presentations of experts.

The micro-analysis is based on studying the materials of a survey among drug-users and their relatives about resources, availability and efficiency of treatment programs, about possibilities of social problems solving, about observance of their civil rights, etc.

THE UNEMPLOYMENT TRAP BEFORE AND AFTER THE GERMAN “HARTZ IV” REFORM

Sonja Fehr

1Joblessness and Social Inclusion, INSTITUTE FOR EMPLOYMENT RESEARCH (IAB), Nuremberg, Germany

Abstract: The aim of my study is to compare the dynamics of social assistance spells in Germany before and after the labour market reforms in 2005. In Germany, like in other European welfare states, there was a shift from traditional approaches to social assistance to more ‘active’ labour market policies. Hence the relationship be-
between work and unemployment, poverty and the welfare state was redefined by the implementation of a new social benefit regime. The aim of the so-called ‘Hartz Reforms’ is to strengthen the incentive structure at the interface between social assistance and the labour market and to shorten individual unemployment spells. According to poverty trap theorem of economics, the individual reservation wage increases by generous social benefits and the incentive to take a job is reduced. Hence it is assumed that unemployed remain in social assistance receipt but miss the opportunities that can result in an integration in the labor market.

The poverty trap theorem was tested empirically by several German studies analyzing the dynamics and labour market mobility of benefit recipients in the 1990s. The results emphasise that poverty and social benefits are often a temporary phase in people’s life. Even in precarious situations most social benefit recipients can cope with their precarious living conditions and find a way no longer to rely on social benefits. After the German welfare reform, further empirical research is needed to analyse the consequence in benefits dynamics.

Therefore my analysis deals with the question of the existence of an ‘unemployment trap’ at the intersection between social assistance and the labor market between 2001 and 2004 as well as between 2005 and 2008. The study is based on the German Socio-Economic Panel (GSOEP). Multivariate analysis by piecewise constant exponential model are estimated. The study comes to a first result that the problem of persistent individual unemployment hardly existed before 2005. The second finding is that unemployment spells have not been shortened by the ‘Hartz IV Reform’. On the contrary unemployment benefit recipients spend some more time in unemployment after than they did before ‘Hartz IV’. Possible explanations are discussed.

INCOME SUPPORT (RMI) AND THE FIGHT AGAINST POVERTY IN SPAIN
Joan Cortinas-Muñoz1
1CSU-CRESPPA, Paris, France

Abstract: This paper studies the genesis and the implementation of income support (RMI) in Spain as a measure against poverty. Based on archives and interviews, the research first focuses on the years 1975-1990, during which reformers define poverty as a social problem. The arrangement of their various interests, related to their trajectories and social locations, lead them to set up income support as a solution to this problem. The problem of poverty emerges and takes shape as officials with connections to Catholic networks need to reposition themselves in their social and occupational lives within the new institutional context of parliamentary democracy from the end of the 1970s. The genesis of income support as a solution is related to two aspects of these agents’ situations: some of them belonged to the parties in power throughout the 1980s on the one hand; they accepted the constraints of the political and administrative apparatus to which they belonged on the other hand. The paper subsequently uses an ethnographic study based on observations and interviews to analyse the practical implementation of income support through the way social workers understand and enforce the policy, and especially the way they decide to allocate or not the benefit. The analysis of these processes shows how the implementation of income support is related to social workers’ occupational logics. It also depends on the bureaucratic constraints related to these social services and on the practical and bureaucratic constraints related to income support itself.

“THE LOOPING EFFECT” AS A DYNAMIC OF THE IMPLEMENTATION OF YOUTH UNEMPLOYMENT POLICY IN SWITZERLAND: AN INSIGHT OF THE CATEGORIZATION OF POPULATION IN SOCIAL INTERACTIONS.
Eva Nada1
1Faculty social sciences and politics, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: In this paper, I ask specifically to which extent the notion of “looping effect” (Hacking, 1995) can explain the ways in which unemployed young people are framed and categorized in Switzerland. I address this central issue using qualitative data collected from an ethnography study in a public organisation for professional reintegration of young people within its two first years of existence.

The study of the social interactions between the institutional level actors’ and the street level bureaucracy actors’ shows how the initial categorization of young people is questioned and reinforced. More specifically, conflicts occurring around the framing of unqualified young people within these social interactions, show how thesese conflicts redraw the functioning of the public organisation and its tools. This, in turn, affects the “original” framing of unqualified young people. This is what Hacking calls the “looping effect”. Based on these results, I suggest that the “looping effect” participate in the legitimization of the public organisation and the policy towards youth unemployment in Switzerland.

More widely, this contribution aims to show that interactionist approaches can shed some light on the framing of populations in action and not as a top down process. In this perspective, studying policy implementation might be considered as a circular process rather than as a linear one. Finally, studying the framing of the population in social interactions can give insights of the shaping of human possibility (“nominalism in action”) as well as how real people get sorted in new and specific ways as events are enacted (“realism in action”) (Hacking 2001: 280).

INCOME INEQUALITY AND ITS CONSEQUENCES FOR SUBJECTIVE WELL-BEING – A STUDY OF ITS EMPIRICAL INCONCLUSIVENESS
Simone M. Schneider1
1Berlin Graduate School of Social Sciences, Humboldt-Universität zu Berlin, Berlin, Germany

Abstract: Rising economic inequalities challenge European welfare states, in that its consequences for the individual well-being are still indistinct. This paper asks whether the inconclusiveness in empirical findings on the relationship between income inequality and subjective well-being (SWB) is caused by empirical inconsistencies: the selection of indicators (inequality indices), the unit of analysis (nation states vs. federal districts) and its political embeddedness (liberal vs. post-communist regimes); and/or whether inequality only affects the SWB of specific sub-groups, i.e., structurally disadvantaged (e.g. lower income groups, unemployed), or those who are concerned about society (universalistic vs. hedonistic values). Using data of the 3rd wave of the European Social Survey (ESS), 23 Euro-
Abstract

The proposed paper will aim at presenting axiological and institutional factors shaping legitimized patterns of early adulthood and life opportunities for young adults in Poland. It will also focus on reconstructing the selected elements of life-course regime emerging after 1989, especially in relation to the question of upward social mobility.

The paper will be structured around various types of data. The reconstruction of patterns of early adulthood typical for different social classes will be based on available statistical and demographic data, as well as on own research conducted among young adults. In order to reveal the legitimate models of the life stage in question, strategic documents other elements of public discourse, such as selected media debates, will be put into analysis.

TRANSLATING GLOBAL HEALTH POLICY AGENDAS: COMPARING PRIMARY CARE REFORMS IN ENGLAND, GERMANY AND RUSSIA

Viola Burau 1, Ellen Kuhlmann 2, Pavel Romanov 3, Elena Iarskaia-Smirnova 3

1Political Science, University of Aarhus, Aarhus, Denmark, 2University of Bath, Bath, United Kingdom, 3Moscow School of Social and Economic Sciences, Moscow, Russian Federation

Abstract: As a visionary model of reform, primary care was first introduced by WHO in 1978 and again highlighted by 2008 World Health Report. Importantly, this model of reform travels easily across different countries, as primary care also enjoys high currency in relation to the modernisation agendas in both established healthcare states and healthcare states in transition in industrialized countries. Not surprisingly, primary care reforms have common features in otherwise highly different institutional settings: implementation is driven by similar goals to respond more effectively to healthcare needs and organisational models set focus on collaborative care.

At the same time, primary care reform strongly challenges existing organisational arrangements in healthcare and combined with the limited jurisdiction at international levels such as the EU, reforms are to a considerable extent influenced by national health care states. More specifically, reforms are blurring the boundaries between governance tools related to professional self regulation, like clinical guidelines, and those related to new managerial regimes, like standardisation of care and target setting. This makes the medical profession and public regulatory bodies important switchboards for translating the global health policy agenda.

Against this background, the aim of the paper is to analyse how primary care as a global model for reform is translated into national health reforms and to identify which (country-)specific factors are at play. To this end, the paper compares primary care policies in England, Germany and Russia. The first two countries represent well-established healthcare states. In contrast, in Russia the healthcare state is in transition and still in search for a model. The analysis consists of country case studies of specific reforms: a range of reforms in 2005 in England, which set out to encourage primary care organisations to work more collaboratively; Disease Management Programmes for chronically ill people in Germany, which were first introduced in 2002; and major reforms initiated in 2005 in Russia, where primary care policies are closely related to the general restructuring of the healthcare system.

GLOBAL ECONOMIC CRISIS IN LATVIA; SOCIAL POLICY AND INDIVIDUALS’ RESPONSES

Signe Dobelniece 1, Tana Lace 2

1Department of Sociology, Latvia University of Agriculture, Jelgava, 2Faculty of Communication, Riga Stradins University, Riga, Latvia

Abstract: The global economic and financial crisis has resulted in some devastating socio-economic and socio-political consequences in almost all countries of EU, and Latvia because of external and internal reasons is one of the hardest hit countries of the region.
The paper discusses the manifestation of crisis, the government’s response to it, and individuals’ coping strategies on the basis of statistical analysis and in-depth interviews.

Economic recession is characterized by GDP reduction, unemployment growth, increase in rates of poverty (needy persons), and household debt.

In response to the crisis, Latvia has been forced to borrow a significant amount of money (about 1/3 of its 2008 GDP) from international lenders – IMF, European Community and World Bank. The government has taken severe steps towards the budget consolidation – drastic cuts of wages in public sector, cuts of pensions (were abolished by Constitutional Court), reduction of social insurance benefits, and increase of taxes. These measures had impact on different categories of people, but mostly hit those with low or medium income, most vulnerable groups of population. As a result, the need for social assistance increased. Several new activities to strengthen social security net for the poorest were introduced.

Among others, one of the results of government’s austerity measures is - rising distrust of the population in the system of social security, especially – social insurance. In such situation inhabitants choose different individual survival strategies.

Government decisions which concern social insurance principles have reduced the motivation of people to pay taxes and as reaction to it - the grey economy has grown dramatically.

Even notwithstanding the economic decline in practically all member states, the number of inhabitants leaving the country in search of employment abroad continues to grow and this is another strategy that was chosen by different households as reaction to severe crisis.

All of the government’s taken measures significantly affect not only the current situation, but also have a long-term effect. Time and resources will be needed to restore the confidence and trust of the society in government decisions and the system of social welfare in general.

VARIETIES OF WELFARE STATES IN THE THIRD WORLD
Cenk Aygül 1, Sonay Bayramoglu 2
1International Relations, Atılım University, 2Gazi University, Ankara, Turkey

Abstract: Varieties of welfare states have been discussed after the seminal work of Esping-Andersen. Esping-Andersen’s classification of liberal, corporatist and social-democratic welfare regimes have been challenged or qualified by many writers. For example, a southern European version is suggested; different countries that allegedly have the liberal type such as the US and Canada, are argued not to be subsumed under the same rubric; the low expenditure levels in the US compared to the others are said to exclude corporate welfare expenditures so emphasized in the US middle class culture. Yet, Esping-Andersen’s classification, as well as various revisits, focuses only on the advanced capitalist countries. Nowadays, welfare state literature seems to focus more on the affects of globalization. Nevertheless, there are important contributions such as that of Gough and Rudra that take the developments in the Third World countries into account. Since capitalist development in these countries become increasingly more visible, it is necessary to investigate the formation of welfare regimes there. In this paper, we will discuss these relatively new works and try to analyze the Brazilian, Korean and Turkish welfare regimes.

PARADOXICAL MISMATCH OF RATIONALITIES : FOCUS ON THE RELATIONS OF SEVERAL BENEFICIARIES WITH THE SOCIAL ASSISTANCE IN A COMPARISON BETWEEN FRANCE AND GERMANY
Yoann Boget 1
1CMH/ERIS, ECOLE DES HAUTES ETUDES EN SCIENCES SOCIALES, Paris, France

Abstract: The “bismarckian” systems of social protection have been described as particularly hard to reform (Esping-Andersen: 2006). It’s true that the unemployment assurance haven’t been removed or radically restructured but merely amended (Barbier and Knuth, 2011). However, the French and German systems of social protection against unemployment have deeply changed. Firstly their transformations have been brought about by the severe turbulences of the labour market. Secondly they are the result of important reforms of social assistance. These transformations led to a dual welfare state (Bleses, Seeleib-Kaiser: 2004, Palier, Martin: 2008).

In the first part I will briefly describe the evolutions of social assistance in both countries considering its increasing role in the social protection. In particular, I will focus on the two latest broad reforms introducing the “Hartz IV” in Germany and the “RSA” in France. They will be presented focusing on the rationality of this new dispositifs (Foucault: 1975). I will argue that the French and German minimum-income benefits (MIBs) aim for the same value-oriented rationality found on the will to assure the predominance of the market as the privileged instrument of regulation of poverty and precariousness. They are however distinguished from each other by the instrumental rationality. Indeed, the French MIB lays great stress on financial incentive while the German model insists on disciplinary means.

In the second part I will emphasize the relation which the beneficiaries keep up with the social state concentrating on the paradoxical mismatch between rationality of the social policies and those of their recipients. On the one hand, with few exceptions, the beneficiaries agree with the goals of the policies to return to the labour market. On the other hand several of them consider the instruments of the policies hinder their ability to improve their situation regarding employment and/or destabilize their living conditions. An analysis of cases extracted from semi-structured interviews with recipients in France and Germany, will be used to illustrate why both dispositifs are seen negatively by part of the beneficiaries.

In conclusion, this comparative demonstration allows to consider the reasons of the mismatch between the rationality of state and those of beneficiaries and to discuss why two different types of governmentalities (Foucault: 2004) fail to bring people back to the labour market.

CLIENTELISM IN THE POLISH HOUSING COOPERATIVES
Arkadiusz - Peisert 1
1Sociology Philosophy and Journalism Institute, Gdansk Univeristy, Gdansk, Poland
Abstract: My intention is to present the phenomenon of clientelism in the Polish housing cooperatives. Most of them have been founded in the communist period. The clientelism was present inside them at least from seventies. Initially, Cooperativism in the Nineteenth Century was a democratic, social movement, defending week economical position of the poor. The post-communist Polish housing cooperatives are something completely different – cooperative estates are rather more similar to the Russian ‘kholhoz’ than to classical cooperative.

The crucial characteristic of that housing cooperatives are: huge dimensions, strong managerial elites and low members-inhabitants’ activity. Most of members lives in cooperative estates larger than 15.000-20 000 inhabitants. Strong managerial elites have built their position in the communist period, when the housing cooperatives were centralized and actually governed by the communist state. The centralization have been removed twenty years ago, but managers in many cases was able to maintain its domination in cooperatives. The boards – an executive power in each cooperative, still dominate over the general assemblies. It is possible because of the patronage mechanism. Finally, I consider the clientelism as a barrier for reinventing citizenship and as a negative factor of the social welfare.

I would like to share the outputs of my research conducted in Polish housing cooperatives in 2006-2008. It was partly described in my book edited in polish Spoludzielnie mieszkaniowe – miedzy wspolnota obywatelska a alienacja. It was on the perspective of Robert Putnam’s Making democracy work (clientelism in the southern Italy). However, I would like to present some new conclusions. Robert Merton also describes clientelism, using a term ‘bosses’ in his article Manifest of the latent functions. It seems, that such latent phenomena are crucial for sociologist, especially in turbulent times.

WILL AS COMMUNICATION MEDIA: FUNCTIONAL ANALYSIS OF THE ACTIVATING SOCIAL POLICY IN GERMANY
Tomoko Watarai1

1Institute for Sociology, LUDWIG-MAXIMILIANS-UNIVERSITY MUNICH, Munich, Germany

Abstract: The ongoing transformation of social policies is given many labels: “from welfare to workfare”, “social policy for the market”, “the productivistic revision of welfare states”, “welfare in competition”, “from the active to the activating welfare state”. While lively discussions revolve around such labels in political economic fields, there are very few sociological attempts investigating how such transformation affects our communication in practice and what dynamics are emerging in relation between individuals and society.

This paper focuses on increasing “actor-oriented” sensibility in social policy and analyzes how individual engagement becomes relevant in new welfare strategies and in what way it is thematized in three types of social systems respectively: “functional (especially political) system”, “organization” and “interaction”.

Referring to Niklas Luhmann’s system theory, I conduct a functional analysis of discourses in and about migrant policy in Munich, which is strongly linked to the general transformation of national welfare policy. As source material I make use of a range of administrative documents. 47 interviews are also mentioned which were carried out from 2007 to 2010 with migrants as well as with public servants and social workers engaged in migrants’ incorporation in Munich.

This analysis reveals that there is a significant discrepancy between semantics in the functional systems and organizations on the one hand and that in the interactional practice of social work on the other hand. The former recognizes clients’ will as such only insofar as it follows the offered workfare services obediently and cooperates willingly in order for successful social work. Taking the voices of migrants into account, however, they often mention their will in another way: the will to escape from control imposed from authorities and to keep on their autonomous decision – even refusing national integration provision. Such “will” of clients would be mostly dismissed or labeled as “laziness” or “idleness” in the political and organizational programs.

At the end of this paper I argue that this divergence between welfare programs and welfare practice constitutes the very dynamics of contemporary socio-political enterprises and illustrate how mutual changing between different communication levels can be brought about.

POLICY FORMULATION AS CONSTRUCTION OF MEANING: A CONSTRUCTIVIST FRAMEWORK TO SOCIAL POLICIES ANALYSIS
Chiara Mombelli1

1ISS, Lapssad, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: This paper presents a constructivist framework to the study of the formulation of social policies. Particular attention will be paid to the process of constructing this analytical tool, by discussing the interest of using both the inductive and the deductive approach to build bridges between theory and empirical data.

Our specific topic is the formulation of new practices of interprofessional collaboration which aim is to enhance the return-to-work process of people with cancer. These practices have been negotiated in a mixed task force composed by healthcare workers, social workers, invalidity insurance agents and employers. Our empirical data on this negotiation process are grounded in a deep ethnographic investigation in the quality of participant-observer.

The basis of our theoretical framework is issued from the french school of the cognitive approach of policy analysis. Within this approach, the formulation of social policies is a process of construction of meaning revealing the power relations among agents with different Worldviews. In this respect, the interpretive pluralism as well as the legitimization strategies of the agents involved in the policy formulation are two major analytical categories.

In our views, this general theory needs to be completed with sociological mechanisms allowing us to precise what is at stake in social relations between welfare recipients and professionals and also between various professionals and various fields of social welfare. These three interrelated mechanisms also need to be taken into account when analysing policy-making process: 1) the social categorization, e.g. the link between health and work through the different meanings associated with the concept of employability; 2) the social construction of expertise, e.g. the legitimate knowledge and skills to facilitate returning to work; 3) the fragmentation and specialization of society, e.g. the content of professional identities and the boundaries between professional roles and fields of intervention.
We will close our contribution by presenting a grid of analysis integrating coherently all these theoretical elements.

THE MAKING OF CITIZEN THE USER

Liv Johanne Syltevik¹, Kjetil Lindberg¹
¹Department of Sociology, UNIVERSITY OF BERGEN, Bergen, Norway

Abstract: The making of citizen the user in Norwegian welfare policy

Since the 1990s a growing number of scholars have stressed the role of ideas in welfare politics and policy. Language is representations of reality as well as shaping the same reality, and the concepts and ideas used to classify and categorize are important expressions of relations of power. At present ‘user’ is the most used term for those in contact with and/or receiving help from the welfare-bureaucracy in Norway. The term has emerged the last decades, and this paper discusses the ideas and discourses connected to the ‘user’ by politicians and top-bureaucrats at the start of the 21st century. The empirical analysis is based on political documents and parliamentary debates about the major political reform in the Norwegian welfare state this century, the Nav reform. The Nav reform is mainly a merger between the former employment service and the national social insurance services, and the coordination of these in a partnership with the municipalities Social assistance offices at the local level. This merger in itself demanded a joint term, and as such the ‘user’ could be viewed as a product of this reform. In the analysis we draw mainly on a discourse analytical perspective where the debates and documents are viewed as discursive practices and where we identify competing discourses regarding the ‘user’. We argue that there are two main discourses about “users” represented; an empowerment discourse and an activation discourse. On the one hand ‘users’ are viewed as in command of their own destiny, and on the other hands as citizens who ought to become more active and less passive. Subordinated discourses are a rights discourse (emphasizing the obligations of the state towards its citizens) and an administrative discourse. We compare the present ideas about the ‘user’ in the Norwegian welfare state, with the client, consumer and citizen discourse in Great Britain, and end by suggesting that the ‘user’ concept’s vagueness is one of its attractions in the Norwegian context.

THE CONCEPT OF “DISABILITY” – HOW WELL DOES IT TRANSLATE? DISCUSSING THE CATEGORY “DISABLED PEOPLE” IN EUROPEAN SOCIAL POLICY CROSS-NATIONAL STUDIES.

Ingrid Fylling¹, Johans Sandvin¹, Jan-Inge Hanssen¹
¹Faculty of social science, UNIVERSITY OF NORDLAND, Bodo, Norway

Abstract: Cross-national social policy research has become an increasingly important field of inquiry and analysis. The issue of cross-societal equivalence of concepts is a crucial factor in cross-national research. And, like Patricia Kennett (2001), we argue that in order to be able to compare phenomena within social policy across national systems, we need to be confident that the components and their properties being compared in fact do indicate something equivalent. In this paper we will discuss the challenges which appear when concepts are difficult to translate between national contexts.

A concept often used in comparative social policy, which causes some concern in this respect, is “disability”. Cross-national politics is faced with two major challenges in regard to disability politics. One is the concept itself, how to define “disability” in a way that is consistent and possible to translate between countries. The other challenge is the fact that the prevalence of self-reported disability varies between European countries to a degree that leaves us with the question on whether statistics in fact measures the same phenomena in different countries. Regardless of the data source, survey-based measurement of disability shows similar patterns of variation between countries, with the Nordic countries on top with a percentage between 30 and 38, and the Mediterranean countries at the bottom with percentages below 10.

Using data from EQLS 2007/08 (European Quality of Life Survey, Eurofound Dublin), which includes data from 31 European countries, we explore in this paper a set of possible explanations for the large variations in proportion reporting having a disability or a chronic illness in different European countries. Explanations will be related to the concept of welfare systems (Baldock et al 1999), which include a range of institutions determining the welfare of citizens, such as family, community networks, market, and the benefits and services provided by the state. The paper argues that the variation in self reported disability and chronic illness between countries is, at least partly, linked to variations in welfare systems.

NEW ISSUES EMERGING FROM RECENT ECONOMIC CRISIS IN SOUTHERN EUROPEAN SOCIETIES

Eleni Nina - Pazarzi1, Michael Pazarzi2
1Business Administration, UNIVERSITY OF PIRAEUS, Piraeus, Greece
2department of maritime studies, University of Piraeus, Piraeus, Greece

Abstract: Southern European societies are encountering problems as an impact of the recent economic crisis. My presentation will deal with the new issues emerging with the crisis in European societies, such as changes in the division of labor, with special emphasis on gender, unemployment, social protection etc.

The origins of these issues will be discussed as well as the future developments, due to economic crisis, in our societies. I will raise some questions on the policies and reforms taken by the governments in order to couple with the emerging problems. In this context, comparisons among countries are necessary to be discussed as well as the inadequacies of the European Union to help the member states to face the effects of the economic crises.

PERIPHERAL AGAIN? THE GREEK CHALLENGE TO EUROPEAN INTEGRATION STUDIES

Klaus Mueller1
1Political Science & Contemporary History, AGH-UNIVERSITY OF SCIENCE & TECHNOLOGY, Krakow, Poland

Abstract: The global financial crisis has damaged some core concepts which constituted the political as well as the dominant social science discourse(s) on European integration. In contrast to regional integration agreements in other parts of the world, the EU was until recently described as a ‘convergence club’. A common market, funds and structural policies would reduce regional disparities. The normative influence of the EU on the political elites of Southern Europe should consolidate the ‘transitions to democracy’, while membership in the European Monetary Union was perceived as ‘anchoring’ reform policies and increasing political credibility. However, since the crisis of 2010 we know that the conditionality of the EU can be harsher than that of the IMF, that divergence is possible and that the much cited ‘Europeanisation’ may be shallower than earlier thought.

To understand in which sense the Greek crisis is a crisis of European integration in general, it is necessary to expose how union-wide policy programmes and national polities interact. On the one hand, Greece’s clientelistic system exemplifies how little the formal institutional practices of the EU penetrate the informal state traditions, power constellations and political cultures of the member states. On the other hand, the terminological switch from ‘cohesion countries’ to ‘peripheral countries’ indicates how much the normative foundation of the EU has changed: The causes of the crisis are externalised to its weakest members, discounting the idea of an ‘ever closer union among the peoples’.

PUBLIC DEBT DYNAMICS AND THE UNDERGROUND ECONOMY: AN EMPIRICAL INVESTIGATION

Konstantinos Eleftheriou1, Stamatina Hadjidema1
1Department of Economics, UNIVERSITY OF PIRAEUS, Piraeus, Greece

Abstract: The aftermath of the 2008 financial crisis has left many countries with large and partly further growing fiscal deficits; a situation which has exacerbated the fiscal burden in terms of public debt. During such periods, the level of the underground economic activity and its interrelation with taxes and public revenues are very crucial for achieving fiscal stabilization. This paper attempts to shed some further light to the relation between the public debt and the informal economy and in doing so, it provides useful insights to policy makers and analysts.

SOUTHERN EUROPEAN COUNTRIES UNDER PRESSURE: ENLIGHTENING CREDIT RATING AGENCIES’ ROLE

Sofia Terlica1, Bernardo Coelho1
1CIES-IUL, LISBON UNIVERSITY INSTITUTE, Lisbon, Portugal

Abstract: After the emergence of the financial crisis in 2007, in 2010 we were confronted with the turmoil in southern European countries’ sovereign debt markets. We are in front of an hidden finance led society, moreover we’ve been caught by obscure institutions and secret dynamics shaping our social world. One of the must obscure institutions of the financial markets are the credit rating agencies.

Markets in general and particularly financial markets have been traditionally a specific domain of economics. Based on a theoretical and methodological perspective bridging the gap between sociology and economics we frame financial markets as socio-historical processes. From this stance, we perceive financial markets as social institutions that cannot be separated from power relations, silently setting conditions for individuals’ daily lives.

This paper enlightens credit rating agencies’ role in three consequential dimensions. First, we assess their normative power in financial markets, structuring countries’ rating. Second, credit rating agencies do not limit their action in downgrade/upgrade decisions. There is a wide range of other announcements that affect daily life in financial markets. Contributing to this disclosure we match the analysis of credit rating agencies announcements on sovereign debt in the main Portuguese economic newspaper and their immediate and objective effect in the level of interest rates. Third, in an increasingly financialized world the normative power of the rating agencies and their financial consequences produce a complex set of inequalities, both at macro scale (between countries), and micro scale (inside each country). For this we analyse economic indicators revealing the impacts of the sovereign crisis affecting southern European countries in what regards unemployment, credit restrictions and consumer confidence.
A CROSS-NATIONAL COMPARATIVE ANALYSIS ON CIVIC ATTITUDES IN CHANGING WELFARE SYSTEM

Mara Maretti\textsuperscript{1}, Simone Di Zio\textsuperscript{2}, Lara Fontanella\textsuperscript{3}, Annalina Sarra\textsuperscript{2,}\textsuperscript{2*}

\textsuperscript{1}Social Science, UNIVERSITY OF CHIETI-PESCARA, Chieti, \textsuperscript{2}DMQTE, UNIVERSITY OF CHIETI-PESCARA, Pescara, Italy

Abstract: Welfare policies can be seen as one of the most important ways in which a society organises to meet common vulnerability and need for protection.

Nowadays Governments need to face the rising in citizen demand for safety, strongly linked to current financial crisis, but, contempo- rarily, they are forced to cope with the necessity of cost containment which should lead to an overall reorganization of the welfare system.

In this framework, in order to investigate the relationships between national characteristics (e.g. socio-economic condition and social policy choices) and citizen attitudes towards welfare state and individual civicity, we consider a cross-national comparative analysis among EU Member States.

This cross-national comparative analysis allows the identification of clusters and leads to a classification of EU Member States in relation to the ability to manage the crisis perception.

From a methodological point of view, a Multilevel Analysis approach is adopted by considering citizens nested within States; both individual features and national variables are taken into account to explain citizen attitudes. Since response variables are individual attitudes, measured through Likert scales, we are properly referring to Multilevel Item Response Theory models (ML-IRT, Fox 2010). IRT models are routinely employed in behavioural and social research where latent variables play an important role in the statistical modelling of response data. The main idea of ML-IRT is to integrate an item response model for measuring a latent variable with the hierarchical structure exhibited from data.

The citizen data for the analysis are from Round 4 (release 4) of the European Social Survey (ESS), the national data are available from Eurostat.

COMMON POLICIES TO TREAT THE IMPACT OF ECONOMIC CRISIS IN SOUTHEASTERN EUROPE COUNTRIES

Theodore Tsekeris\textsuperscript{3}, Charalampos Tsekeris\textsuperscript{2}

\textsuperscript{3}Centre of Planning and Economic Research, \textsuperscript{2}Department of Psychology, PANTEION UNIVERSITY OF SOCIAL AND POLITICAL SCIENCE, Athens, Greece

Abstract: The countries of Southeast Europe (SEE) are considered to be quite vulnerable and have experienced important side-effects from the recent economic crisis. In contrast with Greece, which has been mostly influenced by its large debt and deficit, the other SEE countries have predominantly been affected by their heavy reliance on trade with the EU and (especially, foreign direct) investment. However, such SEE countries as Romania, Bulgaria and Croatia have experienced less economic decline than their neighbors in Central Europe. Romania and Serbia already seem to be recovering their investments from abroad, in contrast with other SEE countries, such as Bosnia and Herzegovina. The strengthening of intra-regional trade, through the improvement or development of new transport, energy and communication projects and policies and multi-lateral trade agreements, will render SEE countries less vulnerable to the EU’s recession and will help to accelerate growth rate. These infrastructure investment policies should be coupled with other strategic plans, including common reduction of tax rates, fiscal stimulus and spending to enlarge the market in the region.

ECONOMIC CRISIS, EMPLOYMENT, AND INCOME DISTRIBUTION: THE CASE OF GREECE

Anna Merika\textsuperscript{1}, Anna Triantafyllou\textsuperscript{2,}\textsuperscript{2*}

\textsuperscript{1}Economics, Deree College, \textsuperscript{2}Economics, Deree, Athens, Greece

Abstract: Economic crises tend to be associated with sizable changes in macroeconomic variables, notably employment and income. In periods of crisis, working hours and real wages tend to fall as aggregate demand subsides. Thus, employment and earnings are reduced both in the formal and the informal sectors. Moreover, government responses to economic crises are likely to include tightening of fiscal policy, often as part of IMF conditionality, leading to cuts in social programs and/or spending on education, health care, and social security. As a result, economic crises are also likely to be associated with significant deterioration in income inequality. Reductions in transfer payments to households and firms, coupled by cuts in wages and salaries in the public sector, contribute to growing income inequalities in crisis-struck economies. Income inequality is highly selective, hitting more than proportionately middle income quintiles compared to low income quintiles, where households may resort more readily to informal sector activities, and certain sectors of economic activity more than others. In the case of Greece, the impact of the economic crisis has mostly affected formal employment in the private sector, particularly in the construction and manufacturing sectors. Measuring the impact of the economic crisis upon employment and income distribution is important not only for designing policy responses, but also to mitigate the impact of future economic shocks. In this paper, we use a microsimulation approach that superimposes macroeconomic projections on behavioural models built on pre-crisis household data. Our model is based on those developed by Habib et al. (2010) and Bourguignon et al. (2008), linking the simulations to macroeconomic projections to extrapolate future household income level impacts. Finally, we compare scenarios with and without crisis for the same year, as well as between pre-crisis and post-crisis years.

MODELS OF TERTIARISATION AND TERRITORIAL DIFFERENCES IN ITALY

Francesco Lagana\textsuperscript{1}, Alberto Violante\textsuperscript{2}

\textsuperscript{1}University of Lausanne, Lausanne, Switzerland, \textsuperscript{2}University of Rome, Rome, Italy

Abstract: The debate on models of transitions from industrial to post-industrial society generated a large corpus of literature on the upgrading/downgrading of labor market structure in different types of societies.

According to the neo-industrialist approach, growth processes led by the producer service sector have a positive impact on the increase of high skilled occupations. A second approach considers the growth of tertiary sector as the effect of unbalanced growth, absorbing unproductive occupational surplus, which has to be redistributed by national welfare systems.
While tertiarisation processes have always been analyzed at a national level, the regional level is important because local territories are often identified as the places where innovation is produced, thanks to the contribution of local context.

This article aims at analyzing the effect of different models of tertiarisation on the Italian employment structure at regional level.

Italy is an interesting case because in no other Southern European country the regional divide is so strongly marked.

We hypothesize a dual model of post-industrial growth where the Northern post-industrial development is driven by high skilled producer services and the Southern tertiarisation model is centered on the public service sector.

To identify models of post-industrial growth, we apply the Principal Component Analysis (PCA) on Census and Labor Force survey data.

We considered the first two components of PCA, synthesizing about 55% of total variance. We identified two models of post-industrial development: the first, dominant in the Southern Italy, is characterized by high unemployment rates and high incidence of the public service sector and the second one, dominant in Northern Italy, which is centered on producer services.

However, the strong association between low skilled non-manual occupations and the presence of producer services prevailing in Northern model, does not confirm our hypothesis on the upgrading of occupational structure in this model of post-industrial growth.

QUAND LES SOCIOLIGUES PARLENT DANS LES MÉDIA: DE QUOI PARLENT-ILS ?

Ana Romão 1, Luís Baptista 2

1social sciences, Académie Militaire, 2social sciences, Faculté de Sciences Sociales et Humaines – Université Nouvelle de Lisbonne (FCSH-UNL), Lisbonne, Portugal

Abstract: Le centre d’activité de la sociologie publique est le dialogue entre les sociologues et ses publics (Buraway, 2007:36), les médias sont, de ce fait, que mieux ressemble à l’Agora où ce dialogue peut se faire. Les journalistes font eux mêmes partie du public de la sociologie, tout en étant aussi des intermédiaires entre sociologues et une multiplicité d’autres publics (Buraway, 2007 : 57). Cette communication propose une analyse de la visibilité des sociologues et de la sociologie dans les média portugais. Il s’agit d’une démarche exploratoire qui essaye de comprendre à quel propos et dans quelles conditions les apports des sociologues sont-ils présents dans l’agenda médiatique. Par exemple, sont-ils convoqués à fin de prendre la parole en tant qu’experts pour exprimer leur regard sur des problématiques concernant les « turbulences » des temps actuels, notamment la crise économique, le chômage, les inégalités sociales, les mouvements de contestation, etc. ? Ou sont-ils plutôt appelés dans les médias à cause d’autres critères, notamment, suite à des événements qui suscitent l’attention médiatique, soit parce qu’ils sont disruptifs, soit simplement parce qu’ils suscitent de la curiosité ? Puisque qu’il on reconnait aux différents média différents pouvoir d’agenda setting (Saperas, 1993 : 76,77) il sera aussi question de classer dans quels genres de média se matérialise la parole des sociologues. La sélection des textes objet d’analyse sera faite avec les fonctions de recherche du Google News. S’agissant de répertorier la participation des sociologues dans les débats publiques au travers des média, et spécialement de cerner les discours sur les « turbulences », l’observation se situe entre août 2008 et janvier 2011.Bien que cette communication se propose des objectifs modestes de caractère exploratoire, les liasons de la sociologie au champ médiatique soulèvent quelques questions critiques qu’il faut considérer, notamment en ce qui concerne «certains risques d’instrumentalisation ou de réduction de la parole scientifique» (Lemieux, Muchelli et Neveu, 210).

A STORMY TRANSITION OF THE MEDITERRANEAN SOCIETIES: RECALLING AND REDISCOVERING MEDITERRANEAN-NESS

Laura Bergnach 1

1Department of Human Sciences, UNIVERSITY OF UDINE, Udine, Italy

Abstract: This research is concerned with understanding the Euro-Mediterranean socio-cultural transition process. Re-analysing the parameters so as to pro-duce a way of remembering “you are Medi-ter-ranean”, in this work we explore the sources of existing comm-onalities, homogeneity and heterogeneity – of way of thinking, of attitudes – in Euro-Mediterranean societies. Aiming at re-constructing the ideas and details of the establishment of the Euro-Mediterranean institutional cultural dialogue, the analysis attempt-ed to extrapolate the sensitive areas of ambitious cooperation pro-ject, inquiring into the past of the Barcelona process. Is it possible to share cultural links and a possible common future project? The analysis uses data outputs of a pilot study on cultural operators, who were “inter actors” in the process relating to cultural heritage preservation, restoration and management, with the intent of ana-lysing the Mediterranean identification. Exploring perception of the reality of the basin and feeling of belonging to the Mediterranean, in order to recognize the extent to which society has been involved in the promotion of socio-cultural dialogue, the findings show that distinctive ways of life of human beings and of national realities seem be expressed in terms of collective belongings being national, without any risk of losing own collective loyalties in a frame of co-operation, manifesting in-directly the possible coexistence of na-tional belon)g)ings together’ with’ a Mediter)ranean beling)enance. La’) selec)tion of the data) set)ting process, re)vealing) the) par)ticipation of the) Medi)ter-ranean socie)ty, will) feel) the) sense) of) dialogue) between) people) who) are) different but equal: the) results) indicate) the) unifying) elements) of) the) Mediterranean) perceived) positive-ly) in) itself) (the) civilising) process) and) in) its) consequ)ences (progress) and) security).

IS BAD COMMUNICATION IN THE MEDITERRANEAN AREA ONE OF THE REASONS FOR TURBOLENT SOCIAL RELATIONS?

Giovanni Bechelloni 1

1DISPO, UNIVERSITY OF FLORENCE, Roma, Italy

Abstract: Focusing on recent events concerning North Africa we cannot avoid to be aware of the high degree of public ignorance about “the things of the Mediterranean World”. Public commu-nication circulating across Southern European Countries – which are the most important partners of North African Countries – is really poor and misleading. We are dealing with a serious problem of bad communication.
TUNISIE, LA RÉVOLUTION DE JASMIN: ELEMENTS DE SOCIOLOGIE DE L'EMERGENCE D'UN MOUVEMENT SOCIETAL

Daniel Bertaux

Sociology, CNRS/ Université de Strasbourg, STRASBOURG, France

Abstract: Il vient de se passer en Tunisie une séquence d’événements d’une signification considérable pour tous les pays de la région méditerranéenne, et même au-delà. En quatre semaines seulement on a assisté, stupéfait, à la chute d’une dictature policière brutale sous les assauts répétés d’un « mouvement social » spontané d’ampleur nationale qui - caractéristique remarquable - n’existait pas l’instant d’avant; comme s’il surgissait tel un ḍjinn qu’une action très locale aurait enfin libéré de son interminable emprisonnement. On a écrit que « personne » n’avait vu venir ce mouvement : ni les institutionsdont c’était la mission (services secrets etc.); ni les chercheurs spécialisés. L’hypothèse qui sera développée ici est que si « personne » n’a vu venir ce mouvement, c’est parce qu’effectivement il n’y avait rien à voir. Certes l’idée d’un mouvement qui l’instant d’avant, n’existait pas, puis l’instant d’après commence à se déployer, s’étendre et se fortifier de façon irrésistible, est insupportable à l’esprit scientifique. E pur se muove...! D’où la question: comment penser sociologiquement ce phénomène exceptionnel, transformateur de sociétés, les révolutions à l’état naissant ? On proposera ici quelques éléments d’analyse sociologique de ce passage soudain de la « série » au « groupe en fusion » (Sartre) : basculement soudain des canaux de communication; passage d’une soumission « rationnelle » au rejet «irrationnel » sinon de la peur du moins de la prudence, et de l’expression hésitante de sentiments et émotions individuelles à la prise de conscience – formidable accélérateur – qu’elles sont partagées... Comment décrire le passage d’une société de l’état d’ordre sérail (imposé d’en haut par un pouvoir fort, seule force organisée existante) à l’état de mouvement « effervescent » : comme si la « matière sociale » passait soudain de l’état solide, cristallisé, à l’état liquide ? Quel que soit son cours ultérieur, la révolution « de jasmin » tunisienne mérite une grande attention. Elle a déjà conduit d’autres peuples à se soulever ; jusqu’où ira son influence ? Traversera-t-elle la Méditerranée pour atteindre la rive Nord, où des sociétés « démocratiques » sont soumises au despotisme soft de « marchés » tout-puissants ?

HIGHER EDUCATION AND SOCIAL INEQUALITIES: THE ‘KNOWLEDGE SOCIETY’ AND NEW ELITES

Manuel Carlos Silva

Research Centre for the Social Sciences, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: In this text the author, noting the current and uncritical discourse in teaching and research programs around excellence, discusses this thesis and its objectives. Further, he questions the idea of ‘pure’ academics or scientists above the ‘material things’, disconnected from the world of life and the social interests.

Considering the evolution of Higher Education, the author, in the wake of other critical sociologists (Mills, Bourdieu, BERTaux, MORrow and Torres), claimed as a fruitful working hypothesis that the models and the dynamics of education are intertwined with the stages of unequal development of capitalism.

Interwoven with old and new forms of class inequalities, the education system, namely the Higher Education, must be related with the theme of the elites, whose theorists such as Pareto take an insurmountable gap between elites and masses as a kind of circular, fatal, return. This separation between elites and masses presupposes a overdetermination of political and organizational factors, seeing the political as separate from the economical and underlying interests of the dominant classes.

In this paper, the author, questioning the old and generalized argument of meritocracy, sustain that the reforms of higher education around the Bologna Process, implemented as a national and european imperative, aim the reproduction of economically dominant classes in the alleged ‘knowledge society’. The political, scientists and cultural elites are legitimated through mechanisms technocratic mechanisms of hierarchisation and competitiveness of universities and research centers, new control of outputs (rating agencies, harmonization of degrees and accreditation systems), system deregulation and restrictions on funding in public higher education.

Besides the harmonization guidelines and under the pretext of change of student-centered teaching methods, there is a tacit juggernaut in the current Bologna Process, which is a higher education at two or more times, speeds and levels: teaching superior to the masses translated in obtaining degrees in three years, devaluing them, and a postgraduate master’s degrees and doctorates and especially post-doctorates to certain elites. Those access to the top places, while yet to co-opt and incorporate some members coming from the poorest classes in economic resources, but exceptionally successful in their academic, professional or business activity.

LE MAGHREB DANS LA CONSTRUCTION D’UN MARCHÉ INTERNATIONAL DE L’ENSEIGNEMENT SUPERIEUR PRIVÉ

Sylvie Mazzella

Laboratoire mediterraneen de sociologie, CNRS, marseille, France

Abstract: Le Maghreb dans la construction d’un marché international de l’enseignement supérieur privé

Depuis le début des années 2000, on assiste en Tunisie mais aussi au Maroc et au Maghreb (Syrie, Liban, Egypte, Jordanie) au développement des établissements privés d’enseignement supérieur. À la différence d’instituts privés plus anciens qui proposent des formations professionnelles courtes pour non bacheliers, ou des
The length of the courses, the major university drop-out rates, the risk of education to be devalued, characterize the current university systems in Italy like in France (Pitza 2002). The function of promoting research in public policies is however different in the two countries. In France, the public policies offer the small and medium enterprises a supply of skilled labor and facilitate the job placement of young graduates. In Italy, theses policies have instead a different function more aimed at the technological innovation of the equipment of the firms than at the recruitment of skilled human capital.

These reflections on the role of public policies in university innovation as indicated in the European law do not appear only as an exercise of multi-levels governance; this analysis can draw the different policy makers’ attention and can give the different academicians ideas or show practices through which they can participate in the construction of a competitive university knowledge.

UNIVERSITY EVALUATION AND INSTITUTIONAL CHANGES IN EUROPE

Andrea Vargiu

1 Dipartimento di Economia, Istituzioni e Società, UNIVERSITÀ DEGLI STUDI DI SASSARI, Sassari, Italy

Abstract: The paper deals with the theme of university evaluation in the light of institutional changes that European academies are presently facing. Some key factors of those changes as well as critical elements concerning them that are to be found in literature are discussed. In the paper, a distinction is made between macro, meso and micro levels at which changes are taking place. As to the macro level, the role of the European research and higher education policies is taken into account with a particular emphasis on the Open Method of Coordination. At the meso level, the main directives of National policies carried out in the different European member States are presented and discussed particularly by referring to accountability and autonomy. Whereas what is here defined micro level is dealt with by briefly discussing the links between the diffusion of new public management, university governance and evaluation. Following such premises, some proposals are made as to the ambitions and modes of university evaluation that do not appear sufficiently developed.

THE BINARY HIGHER EDUCATION SYSTEM AND THE BOLOGNA PROCESS IN PORTUGAL

Cláudia Valadas Urbano

1 Sociology, CESNOVA-FCSH/UNL, Lisbon, Portugal

Abstract: The social, economic, political and educational transformations in Portugal over the last three decades are undeniable. The political regime has changed, the society has changed, the currency has changed, and the nation’s path has changed. Regarding school, Portugal is no longer a country of illiterates, and the access to education is now massive. The universities nowadays have the competition from the polytechnics (non-university institutions), and higher education system has been restructured into a binary model. Higher education changed from elitist to the masses, and polytechnic education has strengthened its position.

Which are the changes that the Bologna process produced in higher education in Portugal? How are combined the inside experiences with the regulations imposed from the outside? Our goal with this
communication is to discuss the (new) reality of higher education in Portugal. These guidelines are part of a PhD research in Sociology about the polytechnic subsystem in Portugal, whose theoretical framework is based on the concept of identity as a social construction.

“CAPORALI” FROM ROMANIA AND FROM BURKINA FASO IN SOUTHERN ITALY’S AGRICULTURE

Domenico Perrotta

1UNIVERSITY OF BERGAMO, Bergamo, Italy

Abstract: The paper will describe foreign “caporali”’s activities in southern Italy’s agriculture. The “caporalato” is an illegal system of labour management, which delegates the tasks of hiring and supervising labours to informal brokers. The figure of caporale has been present since many decades in southern Italy’s agriculture. In the past twenty years, the number of immigrants employed agriculture has risen; at the same time, foreign caporali have become more important for farmers. They operate in “turbulent” agricultural sectors characterized by deep mistrust and difficult communications between the different actors (farmers and labourers, farmers and public employment office, landowners and canneries, etc.). The caporali connect two social groups: local farmers and foreign day-labourers; they recruit teams of labourers (often their relatives and friends), carry them to the fields in the requested time, and supervise their work (usually, in harvest of products, for example tomatoes). They provide their labourers with board and lodging, usually in abandoned houses in the countries; they bargain for wages and working conditions, and stop part of labourers’ pay. These brokers’ power come from the trust and respect they build in both the groups; however, their power is always negotiated and at risk. The paper will describe comparatively the activities of caporali from Romania and caporali from Burkina Faso. Data have been obtained from a study on the work of immigrants in agriculture, realized in Puglia and Basilicata, and based on in-depth interviews (with day labourers, caporali, farmers, etc.) and ethnographic observations.

MIGRATIONS AND INTERCULTURAL INTEGRATION: THE RESULTS OF AN EMPIRICAL RESEARCH CARRIED OUT AMONG PREADOLESCENTS IN THE ABRUZZO REGION (ITALY)

Rina Manuela Contini

1department of social sciences, UNIVERSITY OF CHIETI-PESCARA, Chieti, Italy

Abstract: In the study integration processes of the “new generations” of immigrant origin and the possibilities of intercultural integration in Southern European Societies, that are undergoing deep transformation because of the growth of their multiethnic and multicultural character, are analysed. Particularly, integration processes are investigated taking into consideration the ways of selective acculturation (Portes, Rumbaut, 2001; Portes, 2004; Ruben, Rumbaut, 2004), that is to say in reference to a recent explicative model. Such a question is dealt with considering an empirical research carried out - on a sample of 1314 Italian and foreign preadolescents - in Abruzzo, a region in central Italy, that is to say in a context that in the last decade has had a growth of foreign presence, and also a transformation in the migration flux from temporary immigrations to a populating immigration. Through the presentation of the results of the empiric research, we suggest to:

• Cast a look on preadolescents’ identification formation processes with larger groups (formation of multiple belonging) (De Wenden, 2008; Commission of European Communities, 2008);
• Investigate the construction of intercultural relations, that imply on one hand the ability to under stand and respect cultural diversity, and on the other the research of social cohesion, in a new vision of citizenship suitable to current pluralism in which particular focus is set on building the convergence towards common values (Kymlicka, 1995; Dubet, Martuccelli, 1996; Council of Europe, 2008);
• Understand how these young immigrants articulate the complex relation between their family and cultural origins, the perception of diversity with which they are identified, the larger social context with which they enter in relation (Portes, Hao, 2002; Portes, Rumbaut, 2005; Nesse Network 2008; Ambrosini, 2008);

Observe how particular cultural and social practises - as language or religion, listening to music or following the country of origin’s traditions - are taken into possession and repurposed, become a binding social and distinctive element, favours aggregation and distancing (Hakuta, 1986; Portes, Zhou, 1993; Hirschman, 2004; Chen, 2006; Levitt, 2007).

THE INSERTION OF IMMIGRANT WOMEN IN LOCAL CARE JOB MARKET: AN EXAMPLE OF PARALLEL WELFARE

Mariantonietta Cocco

1Dipartimento di Economia, Istituzioni e Società, UNIVERSITÀ DEGLI STUDI DI SASSARI, Sassari, Italy

Abstract: One of the most significant tendencies of contemporary migrations is the progressive increase of women’s presence, testified by the augmenting number of so called breadwinner that are mainly involved in domestic help and care functions. It is a process which will produce a drain of resources from poorer countries towards the families residing in richest countries and which contributes to the growing phenomenon of international care chains.

Basing on such premises, the paper will discuss the care work of immigrant women in a specific area – Sardinia, in Italy – with an emphasis on possible comparative elements with other situations. The analysis will focus on the diffusion and consistency of the phenomenon as well as on the impact that it may have on institutional contexts, especially in the welfare sector, by pointing out the possible perspectives of sending and hosting countries. In fact, most of the studies that have been done on the subject mainly concentrate on the characteristics and conditions of care work of immigrant women in hosting countries. A great deal of work still needs to be done as far as the impact that care work migration flows have upon sending countries. The welfare systems that are present in the two poles of the migration process can be seen as an integrated social space, within which they come to react to similar dynamics, thus becoming more and more connected and interdependent. Care work migrations are at the same time the manifestation and active part of such an interdependency: they are resources that tend to satisfy social needs that national welfare states are not able to in-
MINORITY MIGRATION, LOCAL LABOUR MARKET AND SOCIAL CHANGE
Giorgio Carlo Cappello

Abstract: The paper introduces a survey among “standard” and “no standard” approach. Survey exploring changing in the economic structure in any communities of Sicily. In this area involved cities where we can find rural market for vegetables business: means € 300 mln pro year and 14.000 workers. Since 1995 there are continuous replacements of immigrants of the North-Africa and East Europe. Communities prominent in this area are Tunisians and Albanians: +26% and +19% (Istat, 2010).

The survey underlines discovered in the agricultural sector and the commercial services involved by Tunisian employers (first one) and Albanian (second). In addition, local people don't want develop low profile jobs anymore, because they wish prestige jobs (lawyer, engineering, public employment, businessman etc.). Therefore, they left low jobs skills profile: agriculturists, laborers, help-family, babysitter, waiters, cleaner, storekeeper. The rate of presence of minorities is 15% on a local rate of 100.000 inhabitants, and increases every year + 4-5%. Everything is showed by Dual Labour Market theory (Zanfrini, 2004; Sassen, 1995; Castels, 1989).

Once more, survey discovered a changing in the relationships of the workforce (workers in agricultural sector, tourist and hotel services) and immigrants leaders are acquired ability to “impose” workers quotas the local businessman in “greenhouse processing market”. Also, we recorded new first agricultural businessman from Tunisia (+12), and new Albanian owners of hotels and restaurants now (+27). So, big immigrants communities network also show “hard economic power”. They demand “new immigrants” like workforce to involve in their tourist services and agricultural market.

Methodology: The surveyin progress since 2010; proportional and snow-balls samples are operated; NVIVO 6is operated in textural-analysis; SPSS is operating in matrix-analysis; GIS for the spatial-analysis is operated for secondary data and digital maps.

Results: Survey shows “locals area” are changing across a new “local labour market”, and in same time increases presences of different ethnic minorities communities. Also, community immigrants is going on a new urban morphology by new ethnic shop; requesting new house (immigrants-distrcits); more immigrants going in “new second generation”; building new 4 Mosques (today are 10). Finally, in this local community are starting a new scenario now, and new identity are in progress.

CHALLENGES AND PROBLEMS FACING SINGLE PARENT FAMILIES: A COMPARATIVE REVIEW
Laura Alipranti

Abstract: Since the 1960s, there has been a wide array of changes in the patterns of family formation, child bearing and family disso-

lution. These changes include a decrease in the number of marriages, an increase in the age at marriage and at childbirth as well as an increase in the number of divorces. Over this period, other changes concern a decrease in the average family size and a significant increase in the number of extra-marital births. Moreover, alternative family schemes prevail such as consensual unions, one-person households, lone parenthood, reconstituted families, same-sex couples etc. Although marital life has become more fragile. Women constitute the overwhelming majority of lone parents (91% is the European average). As expected, lone parenthood is female: Ireland has the highest rate of 99%, followed by Germany with 96% and Austria with 95%. In Greece the same figure is 91%. Most mothers are in the age group of 30-39 years. Nevertheless in UK, Ireland and Malta, single mothers are younger. It appears that social structures and norms didn't restrict pluralism in family life choices. Households with single mothers are particularly vulnerable to issues of social care and social services because they are facing strong pressure at two levels: a) family responsibilities and b) working life. The lack of systematic comparative longitudinal researches does not allow us to have a clear picture of their problems in European level. Lone mothers are an interesting “border case” as they focus some of the most difficult issues and dilemmas faced by European Welfare States. We will try to indicate their problems and the policy responses.

DOWN TO EARTH. NEO-LIBERALISM AND SOCIAL TIME IN CONTEMPORARY RUSSIA.
Svetlana Stephenson, Elena Danilova

Abstract: The paper discusses the case study of the transformation of the VDNKh – the “Exhibition of the Achievements of the National Economy”, since the start of neo-liberal reforms in Russia. Originally built in 1934-1939, the exhibition was intended to symbolise the promise of the new socialist regime. After the collapse of the Soviet Union, VDNKh, with the rest of the country, experienced a rapid market transformation. The Soviet exhibits were disposed of, and the pavilions were colonised by small businesses and traders. While the Soviet pavilions are on their last legs, one highly popular new exhibition is thriving. This is the museum of gifts to Leonid Yakovchik, the presenter of a highly popular TV programme, “The Field of Fortune”. This is a place of pagan worship, a shrine to the new god of money – and money that is not earned, but magically delivered by this deity, inhabiting the new Olympian heights of television. At the same time the once proud ‘Space’ pavilion has been turned into a market for gardening appliances and seeds. The agricultural cycle has replaced the modernist project. Mankind’s dream of transcendence has been overtaken by the eternal drudgery of petty accumulation, consumption and waste. The paper argues that while the linear time has been privatised by the elite, who are busy constructing themselves as the new aristocracy, accumulating resources, inventing family “tradition” and preparing their children to be the future masters of the country, the lives of the masses are de-temporalised. They are now supposed to live in circular time, where there is little change and progress. The idea of ‘stability’ has substituted the idea of progress. The paper analyses discourses on political process and social problems to show how private concerns have displaced the visions of a better collective future.
THE CRITICAL TRANSITION: EMPLOYMENT, EDUCATION AND CITIZENSHIP, A PICTURE OF PORTUGUESE YOUTH IN TURBULENT TIMES

Inês Vieira, António Cardoso

Abstract: In a particularly critical time of modernity, characterized by chaotic transitions and turbulent social and economic processes, a reflection upon youth and its potential active participation in society is needed. Southern European societies face numerous complex situations in what regards to employment, education and civic participation. In the Portuguese context, the late youth is now facing difficult challenges, namely due to a large amount of people with high qualifications and low employment rates. So therefore, is it possible that the individual courses of the youth, as for the Portuguese example, might mean a pathway guided by the educational and democratic projects of modernity? In this context, which types of youth can we identify within this singular Southern European society?

Parting from empirical data on employment (employment, unemployment, labour types and situations), education (educational levels and projects) and citizenship (interest, democracy evaluation and active civic participation), considering regional and gender variation of the Portuguese youth, in this presentation we shall try to clarify – whenever possible – the causes and dynamics that are leading to the present “entangled generation” (geração à rasca). In order to do so, we will update and analyze the data collected through the questionnaire that is submitted at the National Defence Day events, developed around the entire country, with a sample that covers the great majority of 18-year-old Portuguese boys (since 2004) and girls (since 2009).

VIOLANCE IN CLOSE RELATIONSHIPS AND RELATIONSHIPS BETWEEN PEERS AND THE PASSIVE SPECTATOR

 IGNazia Bartholini

Abstract: Globalization has dispersed along several different lines of action the historical concepts of war and enemy. Yet globalization has also changed the way in which victims are figuratively and symbolically produced. Violence today are dramatically changed, especially in intimate and peer relationship.

Violence is traditionally a mode of action, refers, in the public sphere, to the dyad Friend/Foe. It’s just dyad inimicus / hostis to have been turned upside-down as unexpected effect of a global culture that is also marked by an increase in violence in the private sphere. The more the hosts (political enemy) refers to a symbolic enemy, the inimicus (the personnel enemy) delays the proximity of the ‘other person who is a dangerous polarity within relationship. This polarity threatens the same boundaries of individuality of everyone that is defined through the marks of sex, gender, age, status and role. Violence is wrongly described as an effect rather than as an action, but at the same time, becomes the frame in which individuals redefine their identity profile.

The relationship with the private enemy - husband, partner, classmate - regress into a barbarism aim at restoring the contour of identity of those who, through violence on the other, requires a recognition of its role in a violence performance. Violence doesn’t become a category of the relationship but the same matter of relationship, in which to do and to suffer the violence are two sides of one relation. Paradoxically, however, the violent action cannot be fully realized without the non violent acceptance of those who suffer the violence of other. Starting from these premises, we will try to analyze the possibilities through which we translate the subordination and liabilities of those who suffer violence in an authentic non-violent action. In the reports of the private sphere, the violent act provides a real audience (family members, classmates) or symbolic (eg. public opinion) that, until now, has been regarded as a “passive spectator”.

What is urgently needed to do now, is a radical reflection on violence as grounding mode of relationship between partners and the relationship between peers, with the contribution of “passive spectator”.

Starting from these premises, we can analyze some cases of violence in western Sicily, in order to define some features that identify the specific violence relationship.

JEUNES ET CHÔMAGE: REGARDS CROISÉS DES DEUX RIVES DE LA MÉDITERRANÉE

Yolande Benarrosh, Zineb Rachedi

Abstract: Après une large enquête auprès de chômeurs français de toutes conditions pour dégager les places et traces laissées par le travail et dessiner « en creux » les significations et fonctions du travail, notre regard s’est porté dans deux enquêtes récentes, sur des jeunes demandeurs d’emploi français issus de l’immigration maghrébine, et des jeunes marocains venus à Tanger à la recherche d’un emploi. L’idée est de faire de l’objet travail, un analyzée des attentes plus larges de la part des jeunes, voire un « observatoire » des changements sociaux que connaissent les pays du Maghreb, ainsi que de la situation des jeunes dans ce qu’il est communément admis d’appeler les « quartiers », notamment à travers une comparaison des attentes entre hommes et femmes et une distinction entre différentes générations au sein de la catégorie « jeune ».

Ce regard croisé se focalisera notamment, comme le suggèrent nos résultats, sur le rôle de l’environnement familial et spatial, et des transmissions dont il est porteur dans les projections relatives à l’idée de travailler.

Dans un cas comme un autre, les déceptions sont à la hauteur des investissements consentis par les familles et des rêves que les études ont pu nourrir pour améliorer la condition d’origine. Quitter famille et village suppose un coût important pour les jeunes venus à Tanger à la recherche d’un emploi. Cette ville en pleine mutation fait l’objet de toutes les attentes, le plus souvent déçues et l’installation dans la vie adulte est repoussée comme l’indique la moyenne d’âge élevée des jeunes vivant encore au domicile familial ou restant dépendant de leur famille.

Pour les jeunes d’origine maghrébine, la misère vécue par les parents était légitimée par le contexte migratoire. Or, aujourd’hui elle...
Abstract: In this paper, I propose to describe and analyse Portuguese alter-globalisation social movements' praxes, that is their works of theorisation and their material actions. If social movements' actors are moved both by individual and collective interests, the study of social movements cannot be limited to the study of their instrumental rationality as this mainly appears in the mainstream American sociology on social movements, namely the resource mobilisation theories and the related political process model. Inspired by diverse philosophical, political and scientific theories, social movements' actors also produce theories about the world and are great doers of knowledge, including scientific knowledge. Borrowing Raymond Boudon's sociological language, they generate descriptive ideas (what is and is not: representations of their immediate and more distant environment, positive collective beliefs) and prescriptive ideas (what must be and not be, and what counts and does not count: evaluations, normative and axiological collective beliefs). Thus, they carry out an important cognitive activity that both precedes and orients concrete actions but also that is built from the latter.

Their cognitive praxis converts them into public spheres, areas of public life open to the (in)formation, communication and debates on public issues. To speak with Jürgen Habermas, they construct "communicative reason" as when activists denounce "instrumental rationality" under its economicist and neoliberal variant or when they call into question globalisation in its current and hegemonic form. They are places for "ideal speech situation", that is, for rational discussion and critics, notably via assemblies, print and virtual media.

Thus, these are the aspects, which explain to a large extent the existence of social movements, I am going to develop in the present paper from the observation of Portuguese alter-globalisation social movements.

«INTERCULTURELLEMENT JEUNE DANS LES SOCIÉTÉS DU SUD DE L’EUROPE»

Albino Pereira Guimarães Da Cunha

Abstract: It is known that European Mediterranean societies leisure activities in coast lines play an important role in its economies. That is why this paper presents the beach of Carcavelos, the biggest beach in the municipality of Cascais and important in the Lisbon metropolis, as the research object. The paper aims to comprehend and explain some phenomena related its everyday life, particularly strategies of public authorities but also of the establishments owners in the surroundings.

During the bathing seasons it’s acceptable that commercial activities are boosted by tourists and also other visitors, mainly in coffees with their terraces filled with people urged to satisfy their times of leisure, breaking with routines. Surely these are not sustainable strategies in an economical point of view. To answer this fragility some entrepreneurs have adapted their business in order to be rentable during the whole year. They do so creating synergies that allows them to use their private spaces and the public space, fulfilling their own economical needs. For instance coffees, although opened the entire year, have associated themselves with another services ready to be consumed, especially the practice of surf – that isn’t allowed during the bathing season.

The role of the state is especially important in the maintenance of the attractiveness of the public space, concerned with the good image of the territory, role that is most of the times driven by the local public authorities. Decision and policy makers work this territory in order to be used and appropriated not only by the inhabitants of Cascais, but also other social actors, like tourists and visitors.

The accesses to the beach and to the surrounding businesses are more than fair. The beach can be reached by train and bus, since both station and bus stops are nearby. Also by car the accesses are more than fair, reachable via highway 5 and Marginal Av., where parking spots fulfill the needs including at the bathing seasons.

Researching these strategies is highly important because of its success, and because they can be extrapolated to other territories with similar specs. In a world yet living consequences of the global economical crisis, and taking in account the economic influences that seafronts have in Mediterranean Societies, small steps like these can be taken to help reversing the situation.

MIGRANTS AT A GLOBAL BALL. THE MIGRANT PLAYERS ON THE 2010 FIFA WORLD CUP SOUTH AFRICA

Carlos Nolasco

Abstract: Among many other metamorphoses, football, without ceasing to be a game, has become an activity where the results achieved are much more than simply a victory or a defeat. In a context of intense competition, emphasized by globalization processes, the football industry seeks to maximize performances through an incessant search for high quality skilled players in order to attract more fans, the media attention and sponsors. Buying virtuous players, capable of assuring victories, have become an essential imperative of competitiveness. In a market logic, the most popular players, those with more skills or the more talented, become a scarce asset. They are intensely sought out by teams, which results in an intense migration flow of footballers. World Football Cups, the most celebrated and mediatic competitions at the global scale, are attended by the best players in the world. Hence, they constitute exceptional moments to observe the international migrations processes of football players. In the last World Cup, in South Africa, 736 of the present players were representing 32 national teams. From the total footballers, 60% were playing outside their country. Moreover, many national teams were constituted by naturalized players.

The present communication aims to analyze the international migrations of footballers by observing the migratory path of the players at the World Football Cup South Africa 2010, identifying flows, trends and paradoxes of these contemporary migrations. The Portuguese national team on the competition, composed by several emigrant players and naturalized foreign players, clearly illustrates such circumstances. This is why it will be subject of particular attention on the work to be presented.

SPORT AND NATIONALISM: A MULTILEVEL STUDY

Ørnulf Seippel

Abstract: Although the discourse on nationalism is extensive, there are few studies looking empirically and systematically at the more mundane aspects of nationalism from the point of view of individuals and their national context. This article studies how nationalism reflecting pride in sport varies between 25 nations, and how various levels of sport nationalism depend on individual characteristics, national characteristics and the two together (random effects and interactions). The results show how sport nationalism varies between nations with Western Europe having the lowest levels and some less developed nations and Eastern Europe with the higher levels. More democratic, prosperous and culturally globalized nations are the least sport nationalistic nations. At the individual level age (although with a substantial random effect), religion, income, sport participation and attendance of sport events promote sport nationalism whereas education has a negative effect. Looking particularly at the effect of economic and cultural factors, we find that the individual effect of education depends on the national level of cultural globalization – the more globalized the stronger the negative effect of education – and the individual effect of income depends on GNP: the effect of income is smaller (and even negative) the more prosperous the nation.

SPORT, THE NATION AND ITS INTERNATIONAL CONTEXT.

Dieter Dieter Reicher

Abstract: Modern nationalism in sport differs from other, mostly older forms of nationalism in many ways. Despite the xenophobic and chauvinistic agitations of some groups of sport spectators like Hooligans, nationalism in sport has an open and widely international orientation. This is especially true for nationalism in sport that is transmitted via the media system. This kind of nationalisms does not emphasize the homeland, mythology, an autochthonous national culture, or resentments as its core doctrines. In contrast, nationalism in sport seeks for acceptance and admiration in the context of an international audience and an international community. Thus, not uniqueness but acceptability and not the emphasis on a nationalistic but conformity towards worldwide standards are the central elements of this new nationalism. The thesis of this paper, therefore, is that modern media-sport shapes not only national realities and ideals but standardized internationally. Ironically, the globalization of sport does not deemphasize the concept of the nation and of national rivalry. It, however, changes the content of nationalisms. The paper is based of content analysis of newspapers, internet-fora and TV-broadcasts.

THE RITUALS OF NATIONAL FOOTBALL TOURNAMENTS AND THEIR EFFECTS ON SOCIAL INCLUSION

Sven Ismer 1, Christian von Scheve 1, Manuela Beyer 1

1Cluster ‘Languages of Emotion’, FU BERLIN, Berlin, Germany

Abstract: There’s a pervasive link between soccer and stereotypical thinking about national identities. Recently, this became evident again during the FIFA World Cup 2010 in South Africa, for instance when the South African newspaper Sowetan suggested German player Bastian Schweinsteiger had the “fearsome aura of Adolf Hitler”. In scientific discourse, a lively debate circles around the question whether football has the tendency to increase nationalism and nationalistic attitudes or whether it rather bolsters behavioral attitudes like cooperation, tolerance, and inclusion.

Research about the effects of football World Cup tournaments on attitudes towards minorities in Germany has led to contradictory conclusions. Kersting, for example, examined representative survey data from a pre/post-World Cup 2006 and concluded that xenophobia in Germany had indeed decreased. Heitmeyer and colleagues, on the other hand, showed that the 2006 World Cup had led to a rise of nationalism and to a strengthened correlation between nationalism and xenophobia. We have used the broader “group focused enmity”-scale (GFE is a scale to measure different types of prejudice, assuming that they are based on a common core
of group focused enmity and a generalized ideology of inequality, see Heitmeyer (2002) in a 2010 pre-post World Cup online survey and the results show an increase in GFE. This rise, however, is partly driven by a slight increase in xenophobia, but mostly by an increase in negative attitudes towards disabled persons and homosexuals.

Within the presentation, the 2006 findings will be discussed and related to the results of our survey.

**FERTILE LAND OR MINED FIELD? PEACE-BUILDING AND ETHNIC TENSIONS IN POST-WAR BOSNIAN FOOTBALL.**

Davide Sterchele

Sociology, UNIVERSITY OF PADOVA, Padova, Italy

Abstract: Toward the end of the 1980s, Yugoslavian football had undergone a progressive politicization. The emerging nationalist élites utilised it both as an arena of dissent in an anti-communist key, and as a basis for personal enrichment, construction of power at the local level, and political self-legitimation in the eyes of their own national group.

With the outbreak of the war in Bosnia-Herzegovina, each national group – Bosnian-Muslims (Bosnjaks), Bosnian-Serbs and Bosnian-Croats – set up its own football federation and began to organise its own competitions separately. After the war, the condition of Bosnian football was disastrous: division into three distinct and separate mono-ethnic federations, extremely low quality, lack of financial and structural resources, power in the hands of incompetent speculators coming from outside the world of football itself.

Nevertheless, following strong pressures and conditionalities from FIFA, UEFA, and the IOC, the football establishments of the three national groups finally accepted to merge into a unified Bosnian Football Federation (N/FSBH) in 2002, and agreed to organise the Premier League, the first united Bosnian post-war championship.

Drawing on ethnographic studies conducted in Bosnia-Herzegovina since 2003, I will examine the consequences of such a revamped inter-ethnic competition both in terms of re-integration of the Bosnian population, on the one hand, and possible exacerbation of ethnic tensions, on the other.

As a first relevant consequence, the re-unification of the Bosnian football’s landscape contributes to unveil how ethnicity is instrumentally used by the post-war élites to exploit the common good for their private enrichment.

**FOOTBALL PLAYERS OF TURKISH ORIGIN IN TURBULENT SOCIAL SPACES: SPORTSMEN MOBILITY BETWEEN MONO-ETHNIC AND MULTICULTURAL TEAMS**

Oktay Aktan

Sociology, TECHNICAL UNIVERSITY OF DORTMUND, Dortmund, Germany

Abstract: This paper aims to discuss the social impacts of migrant player movements i.e. transfers in the football environment in Berlin. In this qualitative PhD research, the young players of Turkish origin are taken as the participant group and the twenty-eight existing Turkish football clubs in Berlin are selected as a representation of migrant organisations. Considering only the names of these football clubs, it can be observed that almost each name has ethnic, religious and political connotations and that many clubs have the names of cities in Turkey. At the beginning of the research, it had been supposed that, judging from the names of the football clubs, some homogeneous social groupings according to religious or ethnic background and political orientation respectively, could be discerned among the different clubs.

The collected empirical data show however that the Turkish players move permanently between mono-ethnic and multicultural teams. Focus group interviews were conducted with the players in which their collective experiences in diverse social environments in Berlin were discussed. The notion of social belongingness to a youth group at an individual level and the role of the Turkish football clubs in the social inclusion of the migrant youth constitute the main interest areas that I intend to discuss in my paper. The impacts of the cultural and religious differences among the mono-ethnic and multicultural groups and the possible impacts of the inherited social origin on the collective identity of the youth will be discussed profoundly. Finally, the meaning of milieu in the context of sport for the migrant youth will be reconstructed.

**SPORTS PARTICIPATION IN TWO REGIMES: EFFECTS OF CAPITALS IN SOCIALIST AND CAPITALIST CZECH REPUBLIC**

Ondřej Špaček

Faculty of Humanities, Faculty of Social Sciences, CHARLES UNIVERSITY IN PRAGUE, Prague, Czech Republic

Abstract: The range of empirical surveys inspired by the work of Bourdieu (1978; 1984) proves connection between sports participation and cultural and economic capitals (Scheerder et al. 2002; Skille 2005; Stempel 2005; Wilson 2002 ). However, Bourdieu’s theory developed in the condition of relatively stable economic, political and social conditions shall be revisited when applied to the situation of the post-socialist country and the previous socialist regime. To empirically inform the previous development of Bourdieu’s theory, this contribution will discuss to what extent was the former role of political capital in socialist society (Bourdieu 1998) replaced by the role of economic capital in the conditions of capitalism. Two cross-sectional datasets of Czech population (TSS 1984 and ISSP 2007) are analyzed to understand the interconnectedness between the regime of the society and the field of recreational sport. The analysis will focus on the reconfiguration of this field which occurred during the post-socialist transformation. The study will discuss the role of cultural, political and economic capitals in connection to sports participation and a special focus will be given to practice of specific sport disciplines.

**THE COLLEGE AGE FEMALE POPULATION: STILL AN ENIGMA, STILL MISUNDERSTOOD**

Judith McDonnell, Wendy Baker

Sociology, BRYANT UNIVERSITY, Smithfield, RI, practitioner, University of Rhode Island, Kingston, RI, United States

Abstract: Messner (2007, p. 31) discusses “female athletes as contested ideological terrain.” This view may be more true today as the globe comes to terms with financial and social turmoil. In the US, this has been exacerbated by an almost ruthless attack on women.
One manifestation of this is in sport. The college age female participating in perhaps the most embodied of all phenomenon, sport, is misunderstood culturally, especially in terms of gender, identity and sexuality, especially during these difficult times. What is less well known is that she is misunderstood physically, which can have significant implications medically.

This paper explores the connection between the larger cultural forces of embodiment, body cultures, the female athlete as contested terrain and the potential real, tangible medical consequences to the ever-growing college age female athlete population. We focus specifically on the current medical condition of post-breast cancer upper extremity lymphedema. The standardized method of measuring lymphedema for all women is inadequate for generalizing across all female patients (Mayrovits et al, 2007). The current measurement guidelines are especially problematic for young women within the age group of 18-24 who participate in either a sport or regular exercise. Although this age group is at a low risk of breast cancer, the medical community has yet to recognize the significant effects of participation in sport and regular exercise on the physiological changes in the female body. A recent study on the consistency of bilateral arm circumference measurements in women over eighteen found the only subpopulation with significant differences in what would be classified as “medically” normal values were within the 18-24 age group participating in sports and regular exercise (Baker et al., 2010). We argue that such disregard for this age athlete is connected to the larger issues of the female athlete as “contested ideological terrain.”

FIELDS OF ALTERNATIVE SPORTS LEISURE ACTIVITIES IN SWITZERLAND : COMPARATIVE ANALYSIS OF THE "SLOW UP MOVEMENT" AND THE CAPOEIRA “MOVIMENTO NOVO”

Monica Aceti 1,2*

1Laboratoire de socioanthropologie LaSA 3181, Université de Franche-Comté, Besançon, France, 2Unité Sciences du Mouvement et du Sport, Université de Fribourg, Fribourg, Switzerland

Abstract: To travel increasingly long distances and more and more quickly with “one’s own muscular force” appealed to men since the invention of the dandy-horse. Tour de France, Giro and other challenges fascinated them, giving rise to myths which answered the dreams of the modern individual. However, taking into consideration the flaws of the neoliberal growth system (sub-primes crisis, environmental, nutritional and north / south imbalances) and in the sports field the ambiguous dealing of anti-doping measures, in this third millennium we can read transformations in the models of thought of individuals through the emergence of new modalities of sports practices such as the slowUp movement in Switzerland? The analysis of the increasing popularity of these days (1 in 2000 to 18 in 2011 with 500 000 people envisaged), of the motivations of these “wheels and casters” fans and of the principles and values (no chronometer, no award ceremony) which make it a “recipe for success, impervious to crisis, hip and at the same time long-lasting” was compared to an emerging way of playing capoeira.

In the last few years, some followers of this playful dance-fight of Afro-Brazilian origin has developed “capoeira rounds” which favors the friendly exchanges in opposition to the competitiveness and hierarchy which characterize the contemporary capoeira “groups”. The analysis of similarities and divergences of both sports cultural movements directed a reflection on the relation to free access, to conviviality as well as individual freedom shared in a gathering of individuals. The eclecticism of these participants on the level of sexes, ages, social classes, origins as well as in the capoeira “styles” or mobility “techniques” disturbs the sports ideal of performance and homogeneity. The understanding of the slowUp fields was fathomed with participating observations, interviews and exchanges on Facebook, while the material relating to capoeira results from a Ph.D thesis on the growth of capoeira in Europe.

SMALL FOOTBALL PITCHES AS A ’’THIRD PLACES’’

Aleksandra Goldys 1, Maria Rogaczewska 1

1Institute of Sociology, Warsaw University, Warsaw, Poland

Abstract: The physical and social landscape of Poland has changed radically since fall of the Communist system. People live in more comfortable houses, they have much more facilities, access to ICT, they are clients of modern public institutions. Nevertheless, the post-communist legacy is still manifested in the scarcity of friendly, non-commercial public space. The open, accessible public space is still not perceived as a fundamental condition for democracy. It is not treated as common good, but rather as a “free space” to be easily colonized by commerce, marketing, private housing or other manifold private interests.

Sport facilities and sport infrastructure are also perceived mostly as an area of private interests. Multiple local sport centers have been privatized and many social groups (e.g. aged people, disabled people, young poor families with children) have been excluded from these places. In such context of escalating privatization, the governmental programs of revitalization of public spaces can make a huge change.

Therefore we have decided to make a case-study of such governmental program of building small, public football pitches in every polish community. This program called ORLIK (“A Small Eagle”) is based on the partnership of central and local authority (they pay in half). Studying this program, we have discovered the huge social change that happened as a “side-effect” to building a completely free-access, public sport spaces in so many localities. Local people started to come up with new practices, new networks of cooperation appeared to take care of these common facilities. People started to think about their own local space as their own common good and as a chance for change. A small football pitch appeared to be a “third place” in which different groups can meet to cheer for their teams, to have shared experience of success and victory. Thus, the deficits of post-communist public space have been somehow diminished. Our research in more than 20 localities has thus shown how local sport infrastructure can foster public life and embody democratic practices in a society that was under the threat of total privatization. We have revealed social dimension of sport “in action”: we have observe how sport strengthens bonds, helps in social inclusion and forces to act more efficient.

VOLUNTEERING IN SPORT: AN EMPIRICAL COMPARATIVE IN EUROPE

Ramon Llopis-Goig 1

1Department of Sociology, UNIVERSITY OF VALENCIA, Valencia, Spain
**THE BOARD DIARY AS AN INSTRUMENT TO CAPTURE THE LIVED EXPERIENCE AT PRACTICUM: A STUDY CASE OF A PRE-SERVICE PE TEACHER**

Ana Luisa Pereira, Patricia Gomes, Cátia Ferreira, Gonçalo Silvaíra, Paula Batista

**Abstract:** Becoming a teacher involves the (trans)formation of the teacher identity. Assuming the professional training as a milestone in the construction of Professional Identity (PI), it's fundamental to follow the accomplishment of the practicum. The aim of this study was to capture the lived experiences of a Physical Education (PE) pre-service teacher using the board diary. Additionally, we tried to understand what kind of experiences were reported and their impact on the (re)construction of PI. Indeed, this kind of instrument allows gathering the inner discourses and better understanding the meaning of the practicum's daily practices. This is a study case with a PE pre-service teacher (female, 23 years old) from Faculty of Sport, University of Porto, academic year 2010/2011. It's also a primarily study in order to test and to validate the board diary as a data collection instrument for the research in the development of PI. Data presented here is drawn from the 1st semester of a one year practicum and focuses on the lived experiences and critical reflection upon daily practices of that pre-service teacher. The research primarily findings revealed that this instrument has great potential to capture thoughts, feelings and learning experiences. Data was submitted to thematic analysis using the Nvivo9 software. Data revealed that the most common type of registration are: i) all the issues related to classes, namely, the interactions with the pupils, contents and outcomes; ii) the participation within the school community, i.e., teacher’s meetings, sports clubs, and extracurriculum activities; iii) the self-involvement and efforts to improve her/his performance as a teacher; iv) feelings, emotions, anguish, expectations and challenges along the process of being a pre-service teacher. Concerning the impact of the lived experiences on the (re)construction of the PI data shows that practicum it’s a very dynamic process which involves a constant self-reflection about the daily activities and a continuous self-questioning about what is to be a teacher. These are thoughts very well expressed in the board diary, and confirm that it’s not only a significant instrument of data collection but also a personnel tool to the pre-service teacher as future PE teacher.

**KEY WORDS:** PERSONAL TRAINER, COMPETENCE, KNOWLEDGE

**THE PERSONAL TRAINER COMPETENCE PROFILE**

Lígia Guilherme, Paula Batista, Ana Luisa Pereira

**Abstract:** Bearing in mind the importance that the Personal Trainer represents in the context of gymnasiaums, the central purpose of this study was to analyse the professional competence profile required for this profession. Six Personal Trainers and six clients from three gyms in Oporto and Vila Nova de Gaia participated in this study. To gather data was used a semi-structured interview composed by the following themes: a) intervention areas; b) continuous learning; c) competence representation; d) professional action in PT’s and clients; a) reasons to hire a PT; b) ideal characteristics of a PT. Procedures of content analyse were used to analyse the data with the help of the qualitative analysis software, NVivo7. The main conclusions about the Personal Trainer are: a) The commercial, motivational, and coaching are the concern areas; b) Ongoing Training is the most important source for acquiring knowledge in the construction of his/her professional competence; c) The Representation of Competency was extremely important, suggesting personal and professional aspects; d) In professional action the capacity of intervention is mentioned as a mean to create changes in the work places. With clients it was observed that: a) The main reason for hire a PT was the need for personalised monitoring in the pursuit of specific objectives, b) Personality features, friendliness and imagination as well as job-related aspects were the more valued.

**KEY WORDS:** PERSONAL TRAINER, COMPETENCE, KNOWLEDGE

**THE STRUCTURAL DEVELOPMENT OF SPORT CLUBS – A MULTI-LEVEL APPROACH**

Jens Flatau

**Abstract:** The development of structural properties of sport clubs (i.e., number of members, number and target groups of club goods) has been subject of controversial debates in the organizational sociology of sport. Some emphasize the need for sport clubs to react to environmental development, such as the demographic change, by becoming “learning organizations” (Breuer & Haase 2007, 120). Others describe sport clubs as structurally highly stable organizations (Emrich et al. 2001). The second point of view corresponds with the general assumption of the population ecology approach that selection favours structurally inert organizations and that adaptation to environment rather occurs on the population level. Hypotheses derived from both approaches are tested.
Can Successful Elite Athletes Constitute a Myth of Probation for the Secularized Subject?

Frank Schröder

Universität Bamberg, Frankfurt, Germany

Abstract: In this contribution the question whether successful elite athletes can deliver a myth of probation for the secularized subject – according to Oevermann’s (1995) structural model of religiousness – is discussed.

For the secularized subject, a myth of probation cannot refer to an afterlife as it is possible for the religious one, but it has to have a secular character. The secularized elite sportsman’s myth of probation can consist of an orientation to an ethics of achievement (cf. McClelland 1961). Currently and previously successful elite athletes live according to this ethics – as the prophets in the Old Testament lived after the religious ethics. These athletes can be seen as approved (for the present) because of their radical orientation to this ethics of achievement. The community – as it is defined by Tönnies (1912) – which is necessary for generating a suggestive evidence of probation then for the secularized subject consists of other elite sportsmen and -women who are also living according to this myth of probation.

The Reach and Limitations of the Main Theoretical Perspectives to the Comprehension of the Ultra Groups in the City of Oporto

Daniel Alves Seabra

Fernando Pessoa University, Porto, Portugal

Abstract: Relying on the comparative study of four Ultra groups which led to the PhD thesis entitled Cláques Portuenses. Um estudo de grupos organizados de adeptos em contexto urbano (The Oporto Ultra groups. A study of organised groups of supporters in an urban context), the proposed communication intends to present data that demonstrate the importance, but also the limitations, of the four main theoretical perspectives tending to the comprehension of these groups. This ought to consider not only violence but also their various dimensions, their heterogeneity and the different behaviours of their members.

A classicist theoretical perspective regards the participation in these groups, and especially violence, as a means of ritual vindication of their members, who belong mostly to the working class. But how to understand the involvement in violence of elements of the upper class and the non-violent behaviour of other members who...
belong to the working class? The generational perspective interprets these groups as a compensatory juvenile subculture while adulthood is not attained. And yet how to explain the permanence in the group of members who have already reached that condition? On the other hand, a third perspective seeks to understand the Ultra groups as a social reproduction of configurations of sub urbaniy. There is still to consider the socio-environmental perspective, which explains the behaviour of such groups as a consequence of the physical, social and emotional context of the football game. But how to perceive different behaviours of members of the Ultra groups in the same context? How can one also explain the same kind of involvement in the group of members from such diverse urban configurations?

Following the theoretical eclecticism supported by Armstrong, the concept of social experience, as proposed by Dubet, will be defended as being adequate to the conjugation of the referred theoretical perspectives and to the comprehension of the Ultra groups of Oporto.

INTERACTION RITUAL CHAINS AND PEACE-BUILDING IN POST-WAR GRASSROOTS FOOTBALL: THE CASE OF BOSNIA AND HERZEGOVINA

Davide Sterchele

Abstract: In post-war Bosnia and Herzegovina, ethnicity is used by the local élites – Bosnjak (Muslim), Serb and Croat – as a criteria of recognition that legitimizes particularistic allocations and parasitic use of social power. On such a context, the grassroots youth football programme Open Fun Football Schools (OFFS) has proved to be highly successful in encouraging the reintegration of divided communities, thus contributing to unveil such a politically instrumental use of ethnicity.

Drawing on ethnographic data interpreted through interaction ritual theory, the social mechanisms which enable the programme’s achievements will be analysed. OFFS shows how ritual dynamics can be used to increase the relevance of alternative criteria of recognition, promote symbols and feelings of trans-ethnic belonging, and empower those people who support them.

The sport events organized by OFFS are collective rituals, where participants gather together to celebrate objects of common interest – such as the playful dimension of football, the respect for diversity, the quest for meritocracy, the commitment to children’s welfare – which became symbols of the group thanks to the attention and the emotional energy directed towards them by the group members. By celebrating this common way of seeing and experiencing football, sport, and (more generally) social relations, the group celebrates itself as a moral community and keeps itself united.

As the success of OFFS strongly depends (although not exclusively, of course) on the good functioning of the ritual mechanisms, it relies therefore on the organizers’ capacity to mobilize and manage them. In this respect, the key point is the education provided to the coaches through the seminars, which have a double relevance for the ritual performance. Indeed, each seminar is both a ritual event itself, contributing to strengthen the group, and a locus where ritual competences are learned (i.e. experienced and embodied).

ROLE OF SPORT IN POLITICAL STABILIZATION

Larisa Vdovichenko

Abstract: The main goal of my research is studying correlation between sport and political situation in the country and international relations. This subject was evaluated on theoretical & empirical backgrounds. My paper describes & analyses how the preparation for the Winter Olympic Games of 2014 in Sochi influences political situation in Caucasus & Russia. It’s a case study with using data from different surveys.

The theme of my paper is designed to reflect the new role of sport in contemporary policy. It is actually not only for Russia where many sport events will be held in the nearest future: the XXII Winter Olympic Games of 2014 in Sochi, the 2018 FIFA World Cup & others. Stabilizing role of sport & big sport events could be seen in many countries. As sociologist I am interested to research some aspects of this correlation. On the one hand sport is one of the most effective & important social lift to politics. Many ex-sportsmen & sportswomen get hold of high positions in politics. On the other hand sport may impose a new model of life & political design. Sport creates new social, economic & cultural infrastructure, decreasing gap in quality of life & sport infrastructure in different countries. Some international sport organizations try to minimize this gap. For example the Financial Assistance Program of FIFA helps to develop football infrastructure in different countries, to organize youth tournaments, to develop women’s football. Women’s games are developing all throughout the world. Sport is a global phenomenon which gives people (especially young) hope to extend the horizons of their life & carrier. It’s a real way to connect with people from other communities across the country & abroad. But sport could be used by some politicians for the purpose of reinsuring their power & inflaming the grains of nationalism. Such attempts could negatively influence political stability and situation in the country and the region of future sport events. My paper describes & analyses the preparation for the Winter Olympic Games of 2014 in Sochi in interrelations with political situation in Caucasus & Russia.

SOCIAL MOVEMENTS, DEVELOPMENT POLITICS AND SPORT: CONSIDERING OPPORTUNITIES IN ‘SPORT FOR DEVELOPMENT AND PEACE’

Simon Darnell

Abstract: Recent years have seen increased scholarly attention paid to the ‘Sport for Development and Peace’ (SDP) movement and to understanding the disparate organizations and stakeholders that attempt to support sustainable development under the SDP banner. In particular, recent scholarly activity has attempted to make sense of SDP through classificatory (Levermore, 2008) and policy analyses (Hayhurst, 2009) as well as through analysis of SDP’s transnational dimensions (Giulianotti, 2011).

Giulianotti’s recent analysis drew on wide-ranging fieldwork with SDP project officials to call attention to, among other issues, the possibility for increased connections and partnerships between SDP organizations and new social movements and/or organizations.
relatively radical in their development politics within the global civil society. Giulianiotti’s conclusions are significant as they come at the same time that sociologists of sport have drawn particular attention to radical social movements of alter-globalization that coalesce around sport (Harvey et al, 2009), and sport based social activism facilitated by the communicative opportunities of online technology (Wilson, 2007; Wilson and Hayhurst, 2009).

In this paper, I consider these previous studies as the basis for a theoretically informed framework for better understanding the compatibility between SDP and social movements, and the opportunities this presents for researchers as well as activists. Drawing on critical development studies (such as Kapoor’s radical education approach) and critical pedagogy (De Lissovoy’s praxis of terran as a basis for international solidarity), I explore the theoretical and research possibilities that emerge through the synergies between SDP and radical social movements, as well as the organizational and political challenges such partnerships likely present. In particular, I suggest that social movements’ commitment to historical structures, relations of power and oppression, and local change through global solidarity, all hold purchase for making sense of the possibilities and limitations of sport-based, transnational activism within ‘turbulent times.’

‘WALLS MINUS THE SHOOTING’: SPORT, PUBLIC ART AND CONFLICT TRANSFORMATION IN NORTHERN IRELAND

Alan Baimer, Peter Shirlow

School of Sport, Exercise and Health Sciences, LOUGHBOROUGH UNIVERSITY, Loughborough, School of Law, Queen’s University Belfast, United Kingdom

Abstract: It has been increasingly recognised the much of the ‘heavy lifting’ which has contributed to the peace process in Northern Ireland has been undertaken by former paramilitaries and their closest associates. As Shirlow and McEvoy (2008:152) suggest, ‘it is precisely because of their violent past as having fought “on behalf of” those communities that they have the credibility to engage in such real reconciliation work in the working-class areas in which it is most needed’. Relatively little attention has been paid, however, to some of the more subtle and often symbolic ways in which former combatants and their communities have altered the built environment of Northern Ireland’s cities and towns as part of the ongoing work of conflict transformation. This paper focuses on the evolving use of murals in loyalist areas of Belfast through the substitution of violent images with representations of sport. By way of a commentary on some of the more striking examples, the authors reflect on this linkage of sport and public art. They debate whether such a development should be construed simply as an example of the continuation of war by other means – war minus the shooting, to borrow Orwell’s (1945/1970) celebrated description of international sport – or if, by modifying the material culture of the urban landscape, local communities are making an important contribution to maintaining what remains a relatively fragile peace.

ACTOR-NETWORK THEORY AS A NEW PARADIGM IN SOCIOLOGY OF SPORT?

Elodie Paget, Yohann Rech, Jean-Pierre Mounet

1UFR APS, UNIVERSITY OF RENNES 2, Rennes, 2UFR APS, UNIVERSITY OF GRENOBLE 1, Grenoble, France

Abstract: This paper addresses the theoretical renewal in sociology of sport. It focuses on actor-network theory (ANT), which provides a heuristic perspective for understanding the transformations of modern sport. ANT is an expending paradigm in sociology, but has not yet been much mobilized to analyse the sport phenomena. The aim of this communication is to show how the actor-network can provide a relevant conceptual framework to the field of sociology of sport.

ANT has the ambition to explain how technical or scientific innovations are possible (or fail) by the aggregation of actors and non human entities, and whose the cohesion can produce a “socio-technical” network (Callon, 1986 ; Latour, 1989). This sociological approach conceives the society as an on-going process and helps understand how “collective” can be formed, reassembling heterogeneous entities. Several elements in this theory appear to be particularly challenging for the study of sport. First of all, considering the social as a laboratory, this approach helps to analyse the sport in a dynamic perspective, examining its evolution and its changes more than its stability. Then, the principle of symmetry helps to discuss the technologization of sport (doping, video refereeing, innovative equipment, etc.) and thus the introduction of non-human entities in human affairs, sometimes causing considerable (scientific, technical, institutional, etc.) controversies. Finally, given actor-network, the social world is “flat”, i.e. there is no distinction between micro and macro. But globalisation of sport is part of this flat world, where the various levels of analysis are confusing as the same time as a multi-level governance of sport is established. In this communication, we also want to show that ANT is primarily a method of inquiry that places the researcher at the heart of sport controversies.

AUTHENTICITY OF THE TOP-LEVEL SPORTS FIELD

Annost Svoboda

1Sociology, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: The paper deals with the contemporary, top-level, mass-mediated sport. It is based on the social field theory of Pierre Bourdieu. The primary aim is to present a set of concepts defining the relative autonomy of the sports field. According to P. Bourdieu the autonomy is one of significant features of this field which constructs and maintains it. The relativity of the autonomy is understandable through an analysis of relationships with other fields whose powerful actors struggle to establish themselves as dominant players of the sports field. Four sub-fields constitute the sports field. These are: economics, physical activities, political-normative and mass media and popular culture.

The autonomy of the sports field is based on various components – unique qualities that constitute symbolic boundaries of the field. Pierre Bourdieu refers to these qualities and calls them a political
philosophy of sport. It consists of, for example, ideas of amateurism or fair-play. The unique role is played by the concept of authenticity which comprises the former characteristics of the political philosophy of sport. The authenticity of sports becomes an object of struggles between actors of different external fields and also of sport sub-fields. The reason of struggles for the possibility to define the authenticity is its uniqueness. The authenticity defines sports as a unique field with a symbolic overlap to the idealized past with less strict rules, classical values and heroes. In context of the paper the top-level sport and its representatives are ideal bearers of authentic values due to the massive media coverage of this field.

The paper is based on the theory of Pierre Bourdieu but it tries to point out its several inconsistencies as well. For example P. Bourdieu’s usage of the concept of autonomy isn’t consistent and clearly stated. He also underestimates or doesn’t always express an importance of complex network between sports, athletes’ bodies and external (medical or technological) interventions to the bodies which is one of the up-to-date topics of contemporary top-level sports. This area can possibly constitute another sub-field of sport.

THE CONSEQUENCES OF REFLEXIVITY: THE CASE OF CONTEMPORARY SPORT

Dino Numerato

Abstract: Contemporary sport has recently been engaged in a number of reflexive projects, which have been focused on the development in sport or the development through sport. Sociability, community, rituals, authenticity, spontaneity and fair play; all these topics have emerged on the reflexivity agenda promoted by numerous bottom-up and top-down initiatives, involving actors from public, private and NGO sectors. In their efforts to transform the nature of contemporary sport, not only sport actors have struggled to (re)invent or (re)articulate the “traditional” values of modern sport, but they have also used sport as a tool for attaining wider social objectives, defined in terms of social inclusion, social capital, social cohesion or social development. These reflexive practices are understood within the context of late modernity developments, post-crisis responsibilisation, critique of neo-liberalism, Europeanisation of public policy in sport or, simply, as a reaction to inner malaise of contemporary sport represented by corruption, doping or violence.

By discussing these recent developments through the lens of the concept of reflexivity, several implications for contemporary social theory are provided. First, this contribution questions the utility of abstract disconnection between tradition and reflexivity (Beck, 1994; Giddens 1994). Second, this paper discusses the relevance of the links between meta-reflexivity and third sector (Archer 2007, Donati 2010). Third, by elaborating upon the recently defined notion of anti-reflexivity (McCright & Dunlap 2010), a notion of systemic anti-reflexivity is introduced. Finally, it is argued that the dialectic nature between reflexivity and social relations (transformed as a consequence of reflexivity) must be understood in order to understand the real impact of reflexivity on social relations.

MOTIVATIONS FOR AND AGAINST PROFESSIONAL SPORTING CAREERS

Jens Flatau

1Sportwissenschaftliches Institut, UNIVERSITÄT DES SAARLANDES, Saarbrücken, Germany

Abstract: Research Problem

Professional sporting careers are temporary and end inevitably at an age between 30 and 40 years. For some elite sportsmen in popular kinds of sport, this is no problem since they are able to earn enough money in that comparatively short period of time that they can retire and still live a life in wealth. However, this does not go for most of the professional athletes in not highly commercialized kinds of sport. For them, the decision for a professional sporting career is risky and can become a “biographical trap” (Bette & Schimank 2006, 117ff.). They have invested several years of training on that one hand. On the other hand, their sport is not going to provide them with substantial income during their whole life span, what makes the decision very critical.

The described problem leads to the following research questions regarding young athletes at the step to a professional sporting career:

- Which kinds of “biographical models” are created by the athletes?
- What motivates athletes to decide for a professional sporting career?
- Can differential decisions/biographical models be linked to particular athletes’ properties?

Method: Ten unstructured interviews with female basketball players from the first German league and former junior players who denied a contract offer were conducted and analyzed using Objective Hermeneutics (Oevermann 2002).

Results: On a continuum between risk-aversion and risk-tendency, three distinct types of deciding, characterized by their extent of discounting the future, are identified. The types correspond with distinct social backgrounds (e.g., the parents’ educational and occupational status).

QUEST FOR EXCITEMENT REVISITED: FROM MARTIAL ARTS TO FREE FIGHTS

Valerio Zanardi

1teoria sociologica/ceccups, UNIVERSITY OF BARCELONA, barcelona, Spain

Abstract: The proliferation of the practice of Martial arts in western countries has known different stages. Nevertheless, they have been the mirror of generational ghosts and dreams, as well as their development was intrinsically bound to the evolution of society and to the media coverage. One of the main aspects of martial arts is related to the millenary wisdom they embody. Such a wisdom has always been supposed to be opposite and superior to western rationality. Such a keynote, that has been linking throughout decades Bruce Lee fans to Olympic competitors, neighborhood practitioners to new age devotees, was broken with the introduction in middle nineties, when media coverage of inter style fights without rules (or
very very few rules) allowed the proliferation of a new kind of apparently violent practice. In few years, free fight competitions become a huge social phenomenon, going with different fighting leagues, as well as many management agencies, thematic media programs, numerous fighters, and definitely, huge audiences.

The initial stigma of being a sort of deviant practice disappeared, leaving space to a new fighter star system, fed by multinational sponsorships. In this paper, gathering evidences from interviews, ethnographic approach, quantitative data, and a semiotic approach, I will endeavour to discuss some implication related to the reproduction of violence and the production of apathy in everyday life.

SPATIAL DIMENSION OF RISK AT MAJOR EVENTS: THE CASE STUDY OF GENEVA DURING EURO 2008

Pascal Viot

1ÉPFL, ÉCOLE POLYTECHNIQUE FÉDÉRALE DE LAUSANNE, Lausanne, Switzerland

Abstract: This abstract corresponds to a thesis project that targets questions of laying out, of welcoming, of security and crowd management asked by the organisation of major contemporary events, based on two case studies, a music festival (Paléo Festival Nyon - Switzerland) and a sports event (Euro 2008 in the host-city of Geneva - Switzerland). In the Framework of this research, we will interest ourselves at the manner an event incurs a temporary rearrangement of the space in a physical dimension (deployment of security barriers, road closures, arrangement of special transport measures, etc.), and at the specific social and policing management (deployment of a reinforced surveillance, police presence, welcoming and security policies). This project aims to understand the manner in which the actors of a major event are brought to integrate the risks and security questions in the organisation of the event. Among the numerous questions that we ask ourselves, some particularly concerns the management of the event’s participants (fans and supporters, visitors with or without tickets, neighbours, etc.), the temporary urban installations specifically installed for the event (redefining traffic plans, pedestrian walkways) and the management of designated meeting points. It is thus a question for us to analyse the security Handling of an event in all its aspects, not only in the festival sight or stadium but also in the movements of participants or their gathering in public areas. In terms of objectives, this research aims to shed light on the general security and welcoming measures for major contemporary events but also in fine to think on the application of planning and urbanism measures (ephemeral or more long-lasting) integrating strong security preocupations.

SUPPORT AND DIE: THE TREATMENT OF SPORTS VIOLENCE BY WRITTEN PRESS. ELEMENTS OF TEXTUAL STATISTIC.

Nicolas Delorme1, Yohann Rech1

1UNIVERSITY OF GRENOBLE, Grenoble, France

Abstract: The different forms of violence in sport are regularly treated as 'news in brief' by written press. This study examines a case of extreme sports violence (causing the death of a fan): the soccer game between Paris Saint-Germain (France) and Hapoel Tel Aviv (Israel) (November 23, 2006). This event took place when the security policy in force had drastically increased control procedures to maintain the order in and outside stadiums. Therefore, one may question the journalistic treatment of the transition between the imposed security order and the social disorder generated by this event. The present sociological analysis is not intended to reflect the journalistic work. Instead, it focuses on the construction of the journalistic discourse at different levels. Indeed, this soccer game produced a controversy fuelled by different spheres. A galaxy of actors took a stand on the subject: the directly affected fans, but also the high political and sports authorities.

From a corpus of newspaper articles (n = 172), the aim of our study is to decipher the argumentative forms of all actors who are involved in a controversy rooted around the themes of violence, security and racism. With the help of Alceste ® software, the statistical textual analysis allows to bring out ‘lexical worlds’ which are specific to different categories of actors (e.g., fan, politician) or media (e.g., general press, sports press).

From our sample, we identify four ‘lexical worlds’. We notice that these ‘lexical worlds’ do not have the same weight. There are two main dimensions (i.e., supporterism and judicial) and two more secondary dimensions (i.e., politico-institutional and factual). Then, using a hierarchical ascending classification, it is possible to analyse more accurately each ‘lexical world’, notably by describing the semantic universe which characterises each dimension.

FOOTBALL AND RELIGION: A MATTER OF LIFE AND DEATH

Roger Penn

1SOCIOLOGY, LANCASTER UNIVERSITY, CARNFORTH, United Kingdom

Abstract: Professional football began in Britain historically and was strongly rooted in nineteenth century Christianity. Many clubs were formed by churches in the new urban, industrial centres and the ethos of the game was strongly affected by the muscular Christianity developed within the English Public School system. In recent years football has often been characterised as either a ‘new’ religion or as a secular alternative to traditional organized religion. The proposed paper will explore the increasing tendency for major rites of passage in post-industrial societies to take place in football stadia. These include marriages, funerals, baptisms and even barmitzvahs.

The main empirical focus of the paper will be upon English Premier League clubs including Manchester United, Liverpool, Tottenham Hotspur, Manchester City, West Bromwich Albion and West Ham United. These stadia can be seen as ‘Cathedrals of Sport’ and have iconic status within their local communities.

The paper will also incorporate examples from Western Europe [Schalke and Hertha Berlin] and South America [Boca Juniors and River Plate from Buenos Aires]. The evidence will be both visual [photographs and videos] and narrative [interviews with participants].

The paper will explore the significance of these developments and offer a new interpretation of the contemporary relationship between religion and football which emphasises post-modern syncretism.
RESURGENCE OF SPORT AND RELIGION LINKS IN BRITAIN; MORE THAN MUSCULAR CHRISTIANITY

Mike Collins

UNIVERSITY OF GLOUCESTERSHIRE, GLOUCESTERSHIRE, United Kingdom

Abstract: Public schools were crucial in codifying and spreading several of what are now global sports in the UK, with a message of manly moral development, then across Europe and through the agency of Empire and Commonwealth, around the world (Mangan, 2018; Watson, Weir & Friend, 2005). But churches were providers in their own right, having clubs and facilities for a range of indoor and outdoor sports. Indeed a third of Britain’s premier league soccer clubs owe their origins to Catholic, Anglican, Methodist and other churches (Lupsen, 2005), and rode on the huge growth of sport in Britain from 1880 to World War 1 (McLeod, 2006). As the forces of secularisation built through the 20th century, and particularly the 1960s (Brown, 2010), regular attendances declined, churches aged, sports clubs closed and members transferred to secular clubs, and facilities were closed or sold. Now, however, there are signs of a resurgence of interest, partly as a means of proselytising young people (through organisations like Youth for Christ, and in universities through Christians in Sport), and professional sports are appointing chaplains to clubs, notably in soccer, rugby union and league, cricket, horse racing. It may surprise many to discover that there are moves in other religions to developing sports links, notably by mosques and Muslim centres, for both men and women, boys and girls (Daar, 2008). These need researchers’ attention (Collins and Parker, 2011). Through its new Centre the University of Gloucestershire is responding to these moves in providing courses for sports ministers and chaplains, but in a different context and with different intent than the rabid and often simplistic evangelicalism seen in the USA (Hoffman, 2010), which the paper will spell out. It is to do with the development of religious/spiritual/faithful capital in societies locally (Finke, 2005; Furbery et al, 2006; Baker and Miles-Watson, 2010). The paper ends by speculating on whether Prime Minister David Cameron’s idea of the Big Society will help or hinder such movements.

TOTEMISM REVIVAL IN FOOTBALL: THE CASE OF ULTRAS MOVEMENT

Adrien Battini

1INSTITUT D’ÉTUDES POLITIQUES D’AIX-EN-PROVENCE, AIX-EN-PROVENCE, France

Abstract: We propose to deal with the links between sport and religion through the study of supporterist phenomenon in football. The ultras movement, one of the four forms of radical supporterism spread in the world, born in Italy, presents indeed some characteristics which directly concern the sociology of religion. The aim of our communication is to explore and to demonstrate the possible contributions of the durkheimian theory to the case of ultras movement which revives some intuitions of the French sociologist.

We intend to question the relevance of the concept of totemism when it is applied to groups of supporters. Even if they can’t be qualified as proper clans (in an ethnological perspective) they are still groups whose names, collective and individual emblems are specific representations of a mobilisation of identities (bound to territories issues) which remind totemism as described by Durkheim. This gathering of several identities (directly and indirectly linked to the football team) and of external references brought by the group’s members is one of the aspects of the particular ultras religiosity.

Mobilising durkheimian theory implies also a reflexion on the sacred/profane dichotomy. We will first analyse the geographical representation of such a separation, which can be described as a centripetal movement (City-stadium-end-position of the group in the end). Then we will focus on the sacred objects, in their collective (group’s banner) and individual (group’s clothing) form. We will show for instance how the banner becomes a symbolic indication of the group’s birth, strength and death. Lastly we will interrogate the ultras career under a new perspective: an initiatic career whose steps can be seen as formal and informal rituals, toward the sacred sphere of the group.

ADS AND SPORTS: MALE STEREOTYPICAL SCENES

Stéphane Heas 1, 2, 3*, Dominique bodin 3, Iuc Robènè 4, Jens Blumrodt 5

1Université de Rennes, 2STAPS, Université de Rennes, 3 Université de Rennes, 4STAPS, Université de Rennes, 5STAPS, ESC, Rennes, France

Abstract: The advertisements of sports are far from being able to reflect the changing realities of sports or physical activities in a country such as France. The purpose is to test the proposition that the gender relationships portrayed in specific sport advertisements perpetuate traditional and sexist stereotypes, are far from egalitarian shared social representations, and far from egalitarian social and professional activities.

There were 700 advertisements of sports in several French magazines analyzed during a twenty-two-year period (1986-2008) constituting the support of content analysis, using specific spreadsheet software (Sphinx®). Specifically, four men’s readerships magazines and four women’s magazines are strongly represented here because of their large national diffusion. There are 25 encodings used to analyze this corpus, and they distinguish the people displayed, setting of Advertisements (nature, area’s sport, and undetermined places), situations of equality or domination between male/female and vice versa, domination between male/male, domination between female/female, and the colours used, the appearance of physical movement, skin colour, the presence of hair and hairs, etc.

In sports advertisements and which use sports, males are over-represented: 57.4% are present, versus 18.5% females present. Women in sports are generally in situations of inequality or subordination: face to face, males dominating the females (11.9% of all ads, 28.5% of face to face ads). Men in sports seem to be more dynamic individuals: males move more often than their female counterparts (50.1% versus 36% respectively). Especially, a man’s physical movements are more frequent when several men are represented in the magazine ads. Females are represented with fewer activities, often seen as spectators of male sporting events, and even nowadays are over-sexualised. On average, the advertisements of sports maintain an andrological point of view.

[1] Research conducted with the support of ANR-08-VULN-001-PRAS-GEVU, universities of Lyon, Rennes, FRANCE.

LEISURE CULTURE IN NEW MEDIA: A STUDY OF BICYCLE RIDERS IN TAIWAN
THE ROLE OF THE MEDIA IN THE ETHICAL REGULATION OF SPORT. A CASE STUDY IN PORTUGAL

Salomé Marivoet

Abstract: In exploring sports ethics as a sociological phenomenon, we aimed to understand the role of media in the process of ethical regulation. Apart from other authors, theoretical approaches of Foucault, Bourdieu and Giddens were mobilized to theorize the issues under discussion. The universe of study was the Portuguese society during the Democratic state of the 20th century (last quarter). The news from media collected in our research mobilized methods of analysis qualitative and quantitative.

The media, far from being the mere vehicle of information and communication, has taken an active role in the surveillance and supervision of sport. Not only has it provided a platform for managers and other sports agents to publicize their suspicions and make allegations or insinuations, but has also frequently taken the initiative in launching journalistic investigations aimed at denouncing irregular situations. The evidence suggests that this manifests not only a tendency for increased reflexivity on the part of individuals as regards matters in the public domain, which leads to a greater receptivity and involvement in ethical regulation, but also increased interdependence, differentiation and radicalization of vested interests; and with these the need to be in a 'state of alert' in order to safeguard the interests of the parties involved.

Throughout the period under analysis, the panoptic action of surveillance and supervision exerted by the media and followed in a participative fashion by the football supporters was strengthened, in particularly during the 1990s. However, the succession of facts that have become public has certainly increased the levels of conflict and intensified feelings of distrust, in particular in the professional football field. As far as we can conclude from the information under analysis, the public clamour for justice, incited by the media, has exerted a pressure on the regulatory bodies, leading to greater participation in ethical regulation and making it subject to negotiation. Thus it has become more flexible, and adaptable to the different interests that are at stake, as we considered in our initial theoretical proposition.

'BURKINI DISCOURSE' AND THE PRACTICE OF SWIMMING FOR MIGRANT WOMEN IN SWITZERLAND

Sandra Günter 1, Karin Elisabeth Tschirren 1

1 Institut für Sportwissenschaft, UNIVERSITÄT BERN, Bern, Switzerland

Abstract: The so-called burkini (also known as a "scharia swimsuit") is currently being negotiated on various levels of discourse. It is a contested symbol of the visibility of Islam and of oppression, and also considered a sign of the integration of Muslim women into a western-dominated body culture such as swimming. Analysis of the ‘burkini discourse’ identifies the shifts in normative boundaries of behaviour towards the gendered, ethnicised and religiously constructed body. As a result, new boundaries in the normative patterns of social order become visible, along with a tangle of discursive strands on gender equality, the veil, burka and burkini.

It is controversial to determine the burkini as an expression of either dissolving or stabilising normative body and gender orders. The results of the discourse analysis clearly show continuity of the
attribution and reproduction of stereotypes, which, through the practice of labelling, draw attention to the other and foreign, particularly to foreign physical difference.

The first part of the paper presents the results of research into macro-sociological discourse analysis of the ‘burkini discourse’ in Swiss newspapers and presents a synoptic interpretation for discussion. The second part of the paper focuses on a praxeological perspective and analyses the role of performative physical practices that occur during the crossing of borders of established space, body and gender orders. Through this, the interpretations, based on an endogenous level of the field characterized by swimming lessons for migrant women in a city of the Swiss-German speaking part of Switzerland, are examined. Through fieldwork in combination with interview studies, processes of discourse production and discourse adoption are deduced on the basis of an internal perspective. Different possibilities and techniques of situational adaption and modification and an inner dissociation of cultural norms and hybrid identities become visible. Initial research results indicate a dynamic process of socio-cultural adaption, connection and redraft, simultaneously within the asynchronic ambivalence by migrant women, based on a conflict about symbolic capital. As a result, binary difference patterns are being transgressed and stereotypes avoided.

MUSLIM FEMALES FOOTBALLERS: A BRITISH EXPERIENCE

Aisha Ahmad

Abstract: This paper focuses on the relationship between sport and Islam for Muslim women in the UK, drawing on the findings from a doctorate study on the British Muslim women’s football team who competed in the Women’s Islamic Games, 2005.

New understanding of Islamic texts placed the British Muslim women’s football team in a powerful position within Muslim communities, in challenging dominant male interpretations of religious text and pushing the boundaries to compete in sport. The British Muslim women’s football team found an avenue in which they could continue to be ‘visibly Muslim’ and participate in sport. The study supports the idea that religion is used to justify people’s actions (Ferrante, 2002); but also demonstrates how this small group of Muslim women used Islam as a tool for their liberation, a base that permits their participation in sport, thus reflecting an Islamic feminist ideology (Bahlul, 2000; Moghadam, 1994).

The team challenged dominant western stereotypes of the typical heavily veiled and oppressed Muslim woman and challenged cultural stereotypes in competing in a ‘masculine’ sport. They challenged misconceptions and pushed boundaries in their choice to compete in the Women’s Islamic Games. Findings revealed subtle forms of power inequalities that have previously been left unquestioned by those that suffer from them. It illustrates how Muslim women have constructed their perceptions from their experiences of sport and position in society as a whole, showing how they can experience relative power, feeling both powerful and powerless simultaneously. This study presents a new insight into the subtle inequalities and discrimination that Muslim women face from ‘within’ their groups as well as from the ‘outside’. It continues to contribute to new and different forms of power relations within sport feminist literature, where through ‘acceptance’ of this discrimination Muslim women themselves, may be perpetuating the discrimination they face.

SPIRITUALITY, BODY AND MARTIAL ARTS. A GLANCE INTO THE PROCESS OF EVERYDAY LIFE

Alessandro Porrovecchio

Abstract: This phenomenon is a symptom of a profound change which characterizes the crisis of the Western paradigm of modernity. This paradigm questions the relationship between nature and culture, the role of reason and the centrality of the rationalist positivist paradigm.

3. A significant case is the one of Far East and South-East Asian martial arts, such as different styles of Kung fu, of Pençaç silat, of Kalaripayattu and Krabi krabong. The highly ritualized practice of this kind of sports becomes a part of the player’s daily life. The attitude affects his way to dress, to arrange the furniture of his house, his relationship with food, his body care but it also affects ethics and morality at the base of the player’s biography;

4. In order to analyze the Orientalization process of everyday life, I have chosen to focus on the role of the body in the Far East and South-East Asian martial arts. In this context, I performed an ethnographic research (participant observation, collection and analysis of different material). Plus, I analyzed the interactions within some virtual communities about martial arts’ world and I performed in-depth interviews with some Masters, instructors and players;

5. Through this research, I reconstructed both the dynamic process of self-body image construction of the martial arts player, and the size, the characteristics and the role of spirituality in the collective imagination’s Orientalization process.

SPORT WITHIN MUSLIM ORGANIZATIONS IN NORWAY

Kristin Walseth

Abstract: During recent years, there has been a growing focus within sport research on ethnic minorities and their involvement in sports. Studies show that Muslim youth are less involved in competitive sport than other groups. Despite this, studies from UK show that Muslim organizations offering sport activities to their members are a common phenomenon. The goal of this study has been to map the existence of such offers in Norway and to study the reason for this activity. The question asked is: “Do Muslim organizations in Norway offer sport as an activity within their organizations. And if so, why and how?”.

The paper is based on data from fieldwork and interviews with representatives of six different Muslim organizations in Oslo. Those
interviewed are either religious leaders, spokesmen, or leaders of youth committees within six different Mosques in Oslo. The study shows that sport activities organized by Muslim organizations in Norway do exist. However, the representatives attitudes towards sport clubs based on religious belonging are mixed. The Islamic discourses on health and gender segregation and the majority discourse on integration and sport do frame the sport practice offered by the Muslim organizations.
THEORIZING THE AGE OF DISPLACEMENT

Dennis Smith

Abstract: THEORIZING THE AGE OF DISPLACEMENT: For a quarter of a century the ruling ideology stemming from Washington has declared that this is an age of aspiration and hope in which market forces provide the vehicle for satisfying the wants of humankind. However, with the rebalancing of the transatlantic relationship between North America and Europe, the emergence of China, the upturning of autocratic regimes in North Africa, continuing migration traffic, the ballooning growth of mega-cities and, not least, the intensification of the contest for scarce energy resources, it is becoming clear that displacement and humiliation are becoming a common human experience. This paper extends and develops the analysis presented in the author’s paper ‘Social fluidity and social displacement’ in Sociological Review (November 2010) and his book Globalization. The Hidden Agenda (Polity 2006).

IS MASS SOCIETY A THREAT TO REPRESENTATIVE DEMOCRACY IN ADVANCED LIBERALISM

Pekka Sulkunen

Abstract: Since Montesquieu, representative democracy has been based on the idea that interest groups form parliaments through competitive elections, and majority coalitions legislate in favour of their supporters. Declining electoral participation, rise of non-interest based right-wing parties, contingent coalitions, personalized electoral success and scandal-driven media presentation of politics indicate a fundamental crisis in representative democracy. Mass society theories that flourished after the Second World War, still current in political diagnostics of advanced liberalism, predicted a decline of representative democracy on the basis of homogenisation of mass consumption societies. Alluding to pre-war experiences, the mass society threat was seen to involve totalitarian rule combined with highly organized bureaucracy serving the interests of elites, especially the military industrial complex. This paper examines the underlying presuppositions of mass society theory, and argues that the homogeneity argument is insufficient to fit the realities of advanced liberal societies. Following David Riesman, it is emphasized that the other-directed character grows from unstable interest group identities, but its most important determinant is not sameness but agency and therefore difference. To have agency is to orient oneself to others as a self, as unique, separate and autonomous subject. This is vindicated by trends in public administration since the 1980s, which stress citizens’ self-control, autonomy and partnership with the public sector rather than conformity and authoritarianism. Instead of interest conflicts, political disputes arise around contradictions between difference and autonomy in societies where agency is a fundamental principle of justification. Universal autonomy requires homogeneity but agency stresses difference and uniqueness.

NOTHING BUT COPING: A POST-HEROIC CONCEPTION OF ACTION IN TURBULENT TIMES

Uwe Schimank

Abstract: Hans Joas some time ago proposed, from a neopragmatist perspective, that the theory of social action should abandon with its teleological understanding of action. While this may go too far as a general re-direction of action theory it might fit very well to the type of action which is typical or even prevalent in times when multiple instabilities of all kinds of social structures confront actors with an extraordinarily high level of complexity. In such turbulent times actors have no chance to shape their circumstances in any ambitious manner but can do no more than try to cope with them as best as possible. This means, above all, that it is futile to conceive ex-ante goals of action and then try to pursue them by properly selected means. In this sense, a non-teleological conception of action as sketched by Joas is required for a proper understanding of what actors do in such situations.

Their coping consists, first of all, of waiting until an opportunity arises when doing something could make a difference at all to what happens. Waiting is often no passive state but can consist of rather stressful efforts to “keep things going”: to prevent a catastrophic escalation of events. Second, when, often all of a sudden, an opportunity to intervene into social dynamics comes the actor cannot start a lengthy reflection of alternative goals and means but has to make quick decisions. Here several types of “improvisation” can be distinguished. To specify coping practices observations and reflections especially from Eric Leifer, Francois Jullien, and Friedhelm Guttandin can be combined.

In this way, a theoretical instrument to understand how actors in contemporary turbulent times can manage their individual biographies, organizational change, or large-scale political transformations is elaborated by a conjunction of neopragmatist ideas from social theory and findings from empirical research about decision-making.

DEFINING IDENTITIES IN THE XXI CENTURY

Massimiliano Ruzzeddù

Abstract: In these “turbulent times” social actors, especially those belonging to new generations, have to cope with ever growing difficulty to assess strong and effective identities, no matter if collective or individual. Thus, my paper will aim to seize the potentialities and the criticalities, that contemporary social theory shows in highlighting the modalities, the causes and the possible remedies of this cognitive weakness.

This implies treating the object “identity” within different theoretical frameworks; namely, cybernetic and systemic notions, can be the base to draw a theoretical model that takes ultimately into account the frequent changes occurring in the social actor’s environment; this will also imply considering the necessary cognitive effort, that the single subjects are called to accomplish, in order to
Abstract: Tying in with my contribution to the ESA Social Theory Conference in Prague, my contribution’s focus is going to be the theoretical debate about “Post-Secular Society” (Jürgen Habermas) - particularly in the context of the recent social and political movements within North African and Arabian countries. These movements are deeply secularized and, as Olivier Roy states, can be considered “...Post-Islamist Revolutions”. In a historically reconstructive analysis (which – besides – owes much to Jean Piaget’s Genetic Epistemology), I will demonstrate not only that they represent processes of ongoing secularization, but that “...radical Islam” itself has as also been a “...children’s disease” of post-colonial societies, and paradoxically at the same time a main factor in the secularization process. Secularization: mainly regarded a process of differentiation and thus a profound change in the comprehension of “world” and societies.

THE DIALECTIC OF SOCIAL LIQUIDITY AND ECONOMIC FIXITY: A CRITIQUE OF BAUMAN’S ‘LIQUID MODERNITY’

Dean Curran

Sociology, QUEEN’S UNIVERSITY, Kingston, Canada

Abstract: Bauman’s metaphor of ‘liquidity’ identifies a key characteristic of this phase of modernity in which social forms, relationships, and identities have become extremely impermanent. However, by prefixing the term ‘liquid’ to describe this period of modernity en bloc, Bauman’s formulation renders opaque the nature of this process of incessant social discontinuity. This liquidity of society is not a self-contained process, as ‘liquid modernity’ implies; rather it is the counterpart to the increasing fixity and rigidity of the basic economic rules of society, which is clearly displayed in Hayek’s account of the ideal neo-liberal state that imposes fixed, universal economic laws, which he contrasts with the state that engages in discretionary, particular economic ‘planning’ depending on the situation and social values involved. This neo-liberal withdrawal of the state from social action that mediates the ‘market system’ renders inflexible the basic economic rules, which, as Schumpeter’s theory of entrepreneurship illustrates, leads to an overall dynamic of economic life which necessitates constant change in each individual’s economic and social practices, and hence, ubiquitous social ‘liquidity’. Consequently, rather than reifying social liquidity, a dialectical account of the economic and the cultural is necessary to illuminate the intensified fixity and liquidity in our contemporary condition.

BELONGING NOWHERE IN A POST-MODERN WORLD

Shalva Weil

Hebrew University, Jerusalem, Israel

Abstract: Zygmunt Bauman’s work covers a range of issues, including liquid modernity, managerialism, memorialisation and globalization. However, each of these topics returns to the same theme: Bauman’s unique brand of sociology reflects the genre I call “belonging nowhere”. He describes and analyses young people in fleeting relationships living in digital time, glued to Facebook in search for thousands of “friends”. The lecture to be presented at the conference will expand upon this theme and present in detail Bauman’s attitude to allegiance, identity and modernity.

RECENT CHALLENGES IN THE ISLAMIC WORLD: TOWARD A POST-SECULAR OR RATHER A POST-ISLAMIST ERA OF SOCIETIES?

Gerda Bohmann

Socio-Economy, VIENNA UNIVERSITY OF ECONOMICS, Vienna, Austria

Abstract: This paper will address the problem of the public relevance/irrelevance of sociology in a time of crisis through historical recontextualization of the debates within American sociology in the 1930s when the assumptions related to the expected development of American society had been overturned by the “Great Depression”, which dramatically changed not only American society, but also the pragmatic context of sociological research. At the same time, the organizational and institutional structure of the discipline has been undermined: for the first time in its short history sociology
stopped expanding, and more importantly, experienced a “regression”. On the one hand, due to the economic crisis it was forced to cope with reductions in the academic world, overall changes in the financing and organization of science, and career uncertainty, and on the other hand it was facing the more and more apparent “irrelevance” of sociological knowledge to the public, a growing preference for rival disciplines, and marginalization within governmental institutions. To put it in exaggerated terms, given the avowed objectives of sociological expert “analysis”, the “Great Depression” might have seemed like a dream come true. The crisis and the disruption of society would surely create a demand for the sociological perspective, which seemed to have matured and was ready to analyze publicly relevant problems. American society became a “social laboratory”, and sociologists felt able to deploy their scientific tools to help uncover the real causes of the crisis. This happy scenario, however, was never enacted. In fact, sociologists had to watch the key positions in the Roosevelt administration and in its plan for reform and renewal being occupied by economists, political scientists and legal experts. It will be argued that the sociological perspective was not primarily ineffective in public debates because it was insufficiently scientific, but mainly because it was too self-obsessed and so disengaged with general issues that it was not able to frame its knowledge in the terms of the wider “public debate”. The resulting efforts at self-promotion of American sociologists will be examined, together with the attempts to determine sociology’s relation to the crisis and disruption of society. The historical analysis should enable to pose a question of public, academic and practical implications of sociological research.

WHO NEEDS SOCIAL THEORY NOWADAYS?
Grażyna Woroniecka

Abstract: Many questions about a role of sociological theory arise in last few decades. In current theoretical landscape, efforts to promote any form of sociological theory are not popular; we rather say about social theory. The first is in evolution: there are some remarks of RAT, theoretical sketches in convence of double hermeneutics, emancipative ideas by Habermas or objective schemes by Bourdieu, and many other approaches. In the latter, sociology meets cultural anthropology, philosophy of politics nd political ideologies; these meetings lead to ideas of needlessness of sociology at all (Baudrillard), its new political role, ideological and political feinist or postcolonial theories.

When politics leaves individual Lebenswelt and a sphere of social and gives space to sub-politics, when concepts of processes and ‘flows’ compete in social imagination, when cultural globalization digitalizes ‘society of majority’ and creates broad margins of multidimensional exclusions, social theory is asking about its place in this world-in-move. In my paper, I will argue that such a place exists and has an important role. I will also consider the role of academic and non-academic intellectuals in their active work of translating (Baurman) multiconceptual world into a language of ethic human coexistence in turbulent times.

LUHMANN’S ECOLOGICAL COMMUNICATION AND THE ENVIRONMENTAL CRISIS
Ferdinando Spina, Mariano Longo

Abstract: If one had to describe contemporary sociology as opposed to the classical social thought, one could underline the fact that present-day sociology is unable to give a plausible representation of late modernity.

Whereas the founding fathers proposed a theoretical description of modern society in the shift from 19th to 20th century, contemporary sociology (with some exceptions, Parsons, Luhmann, Habermas) did not even attempt at that task. What we propose is a theoretical description of an encompassing phenomenon, the ecological crisis, analysing it from the stand point of a general sociological theory.

The theme of ecological crisis is one of the most relevant in the political agenda nowadays. It is a cause and, at the same time, an effect of our turbulent times. It has both a local and national relevance, as well as a global one. Yet, the great amount of public discussions about pollution and correlated risks has hardly produced political effective decisions. The difficulties of international summits to find plausible solutions the greenhouse-effect are explicative of such impasse. So, one of the main problems of contemporary society seems unable to produce political strategies on the global scale.

A possible explanation of such paradoxical situation may be given by the way Niklas Luhmann has discussed the question of ecological crisis within his theoretical background. What Luhmann suggests is that much of the public discourse about ecology is rhetorical, in so far as it furnishes the political system with a theme which may have a strong public impact, regardless of the fact that it may produce effective policies. If we assume the system theory approach as a theoretical guiding-light, we notice that ecological problems may be solved only in so far as each social system (law, polity and economy in particular) assumes ecological questions as themes of their self-referential communication. By adopting Luhmann’s standpoint, sociological analysis of ecological problems may gain in realism, in so far as it may observe the actual way in which social systems thematise, within their own operations, the theme of the environment as relevant.

TOWARDS A GLOBAL ECOSYSTEM OF NEW SOCIAL WORLD-OBJECTS
Pablo Navarro

Abstract: The purpose of this paper is first to discuss the concept of “New Social World-Object” and second to argue that such objects are composing a sort of global ecosystem which is boosting the current globalization process. World-objects are realities that define their dynamics as a worldwide unitary system (cf. M. Serres). These objects are becoming a cause and, at the same time, an effect of the process of globalization. Social World-Objects are those social in nature, namely, those formed as a consequence of interactions between human individuals and groups. An example of such objects is the Internet considered as a space of glocal social interaction, but also the new global cultural objects, the new dimensions of the global marketplace, the new global spaces of communication and identity construction, etc. It can be argued that the combined development of those objects is becoming the main driver of the globalization process.
World-objects are environments where new forms of human subjectivity, and new social subjects materialize and spread. For this reason, they are becoming the objective basis for a new global soc-

CONTRIBUTIONS TO SOCIAL THEORY IN TURBULENT TIMES: THE INCLUD-ED PROJECT AND THE DIALOGIC APPROACH IN SOCIAL SCIENCE.

Esther Oliver¹, Ramon Flecha¹, Adriana Aubert¹

¹SOCIOLOGICAL THEORY, UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: On November 2009, preliminary results of the INCLUD-ED project were presented at the European Parliament by some researchers and different social agents: a Colombian mother of a primary school student and a Roma member of the Evangelist Church. The audience (MEPs and members of the scientific community) listened how this research is approaching the analysis of society in current times through a constant dialogue with people belonging to vulnerable groups. A very relevant social and political impact was obtained from that event, as a strategy for the inclusion of Roma people in Europe has been approved at the European Parliament including the INCLUD-ED results.

INCLUD-ED is an Integrated project (the research instruments with the largest funding and highest scientific status of the Research Framework Programs of the EC) which develops empirical and theoretical research through promoting dialogue between two major trends in social theory: subjects and social systems. This dialogue is guaranteed through the inclusion of the voices of the social agents (subjects) in a scientific discussion with researchers and policy-makers (social systems). This dialogic approach is highly appreciated by Michael Burawoy’s public sociology as it challenges the Weberian principle of distinguishing between the politic and the scientific, to go further into a new link between the scientific and the public oriented to contribute to transforming societies. This paper will present how this dialogic approach in Sociology is enabling to start from people’s reality and voices for the study of social transformations.

A MODEL OF CO-OPERATION WITH A LOCAL GOVERNMENT APPLICATION

Juha Klemelä¹

¹Sociology, UNIVERSITY OF TURKU, Turku, Finland

Abstract: In the study a sociological model of co-operation is presented. In this model the principal elements of co-operation are 1. task, 2. actoriness, 3. interaction, and 4. motivation. (Like in a crime-novel, more or less respectively: deed, means, opportunity, and motive.) The element of motivation can be analytically divided into two components: quest for power and quest for status.

The theory of co-operation depicted may be used normatively. A state of good co-operation is one, where there is a complementary and supportive relationship between the interacting parties. Complementarity means, that the actors are of use for each other, and supportiveness means, that they honour each other. (Again, somewhat respectively: the parties have power and status vis-à-vis each other.)

As an example, the relationship between local government elected representatives and office-holders is studied, and the inter-category conflictual properties analyzed. Municipal committee decision-making cases will be used as empirical data. The data is currently being collected and the presentation will report some preliminary findings.

SOCIOMETRY OF TRANSLATION: FROM SOCIAL MOVEMENTS TO THEORIES OF DEMOCRATIC DELIBERATION

Nicole Doerr¹

¹University of California Irvine, FREIE UNIVERSITÄT BERLIN, Alsfeld, Germany

Abstract: In theories on democratic deliberation and linguistic heterogeneity, the potential of translation remains largely undertheorized. Disagreement over two principal positions, political theorists have proposed both policies aimed at ensuring language diversity and the establishment of a ‘lingua franca’ as solutions to the language question. My sociological approach will explore of the model of translation as a third perspective showing ways to democratize deliberative politics used by global activist groups and local citizen forums. Based on seven years’ of ethnographic research, my paper explores translation as a practice to enhance the inclusivity and equality of deliberative democracy in multilingual social movements and local civic forums.

Practitioners of deliberative politics in the current global justice movement introduced translation in order to work together more democratically in linguistically and socially heterogeneous groups. Treating their own diversity as a basis for radical democracy based on translation, they were able to make decisions more equally and include socially disadvantaged groups. My study presents evidence on the impact of translation in the European Social Forum (ESF). Activists who created the ESF take decisions on behalf of joint campaigns, on the EU constitution, and on specific EU policies in European meetings. Comparing activists’ practices of translation in these European meetings with meetings without translation at the national level in Germany, Italy and the UK, I came to a counter-intuitive result: it was the European meetings that had a higher degree of inclusive, transparent and egalitarian decision-making and not, as would have been expected, national level meetings. I show that it is a very distinct practice of translation that underpins this surprising finding. As practiced in the Social Forums, translation not only bridges linguistic differences; it also crosses non-linguistic barriers such as those based on gender and class.

IS THERE A NORMATIVE STANDARD FOR SECULARISM IN EUROPE?

Haldun Gulalp¹

¹YILDIZ TECHNICAL UNIVERSITY, Istanbul, Turkey

Abstract: Social theory considers secularism as a universal corollary of modernization and the guarantor of the freedom of religion. In fact, a variety of institutional arrangements that regulate state-religion relations may be found, even within Europe alone. But all European states are also bound by the same Convention on Human Rights, which protects, among other things, the freedom of religion, and their affairs are regulated by the same European Court of Human Rights (ECtHR). Does the ECtHR jurisprudence generate a norm-
Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times

mative standard for secularism and for the protection of the freedom of religion and conscience under Article 9 of the Convention?

I addressed this question in an EU-funded, multinational project completed in 2009, and argued (in European Public Law, 16/3, 2010) that “Historically ingrained cultural assumptions about not only the division between Christianity and Islam but also between Western and Eastern Christianity appear to have played a part in the reasoning of the judges of the ECtHR.”

But, three unprecedented ECtHR rulings in 2010 have complicated this picture. Turkey, a record breaking violator of a variety of Convention articles, had never before been found in violation of Article 9, but was condemned twice in 2010. Likewise, the controversial ruling in Lautsi v. Italy for the first time found a Western European nation in violation of Article 9.

My proposed paper aims to update my research and examine the sources of this new trend in the Court’s judgments.

«VIRTUAL STRATA» AS AGENTS OF SOCIAL INSTABILITY

Vladimir Igorevich Ignatyev

1Department of Sociology, NOVOSIBIRSK STATE TECHNICAL UNIVERSITY, Novosibirsk, Russian Federation

Abstract: Virtual strata (VS) arise in astable social conditions and generate instability. The reason of their occurrence - deprivation and exclusion that is accompanied by identity disappearance. Following VS can be marked out. (1) Network financial actors are deprived relative to the national financial systems. They are provokers of instability of national financial systems. (2) “Glam-capitalists” unite round values of symbolical hyperconsumption, provoking the national markets and the states to satisfy the requirements which have not been provided with growth of national wealth. (3) After the traditional local identity was lost («nation-state crisis») global political elite has found the new identity in creation of the mechanism of global regulation, provoking political instability at local level.

(4) New underclass - stable and numerous community of migrants in the countries of Europe and the USA. The attempt of the European democracies to integrate immigrants into the Western society has ended with failure. These strata do not aspire to social integration. They reproduce the social capital and submit to its logic: expansion of other kinds of the capital in host countries. They are interested in maintenance of instability for their domination increase.

Thus, the distance in social space, on the one hand - from the position of subjects of communications - is infinitely reduced, meanwhile borders of social space, with another hand - from the point of view of information saturaibility - infinitely increase. The similar situation naturally leads to steady growth of rates of social interactions that as a result developed into possibility and necessity to establish "online" connections.

Such "online" interactions, quite naturally, has opportunistic and changeable character, but illusion of a constancy of "online" communications system thus remains. Finally it leads to instability of social structure as a whole. First of all, in public administration sphere ("the electronic government"), business (the virtual organizations and the enterprises), network communications (social networks and social movements), interpersonal relations (individual communications).

SOCIAL THEORIES, LOCAL MEANINGS AND THE CONCEPT OF DENATIONALIZATION

Csaba Szaló

1Sociology, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: Denationalization is a category of analysis used in the discourse of new political economy to reveal that decisive processes of recent global transformations in reality arise inside the nation-state. These processes routinely continue to be experienced and represented in the language of nationalism, for this reason they carry on beyond recognition. In other words, the concept of denationalization goes against the assumptions of methodological nationalism, nevertheless it emerges out of a claim that categories of the current critique of methodological nationalism (globalization, transnationalism, post-nationalism, critical cosmopolitanism) are inadequate. These categories of critique are declared to be insufficient because they became trapped in a search for a cultural dynamics and social formations that go beyond the container character of the nation-state. Two of the most important objects of denationalization are considered (borders and citizenship), and a cultural pragmatic reading of the narrative of denationalization is proposed.

A THEORY OF ASYMMETRY COMMUNICATION AND PLURALISM IN EU:UNITY AND DIVERSITY MODES IN TURBULENT TIMES

Christos Tsironis

1Theology, sector Ethics and Sociology, ARISTOTLE UNIVERSITY OF THESSALONIKI, Thessaloniki, Greece

Abstract: The European history has flourished through continuous contests, hopes, despair, steps of cultural development, interstate alliances and confrontations. This dipolar perception is a typical characteristic of the “EU concept”: unity - diversity, global - local, tradition – modernization. During the last decades a set of social, political and economic changes have been introduced in the societies of EU state-members. At the same time internal and external migration flows have been developed, while cultural and religious diversity along with extended mobility in business, education and leisure came to a peak. Within this scope intercultural communications has been placed in the centre of political interest. The economic mis-functional results (such as debt crisis and decline of welfare structures) generate a twofold challenge: On one hand it becomes more and more clear that European societies could face successful

INSTABILITY PRODUCING BY MEANS OF "ONLINE" INTERACTION IN A MODERN SOCIETY

Sergey Alexandrovich Kuzin

1Department of Sociology, NOVOSIBIRSK STATE TECHNICAL UNIVERSITY, Novosibirsk, Russian Federation

Abstract: The vast majority of people on our planet is involved in communication process in its various forms. Due to the modern digital technologies, the increase in communicating speed is supplemented with unimaginably huge volumes of the transferred information. As a result the volume of the information every second circulating in social space has increased.
ly the global challenges by coordinated actions on a European scale. Consequently, emphasis is placed on the need for linking the local and European perspective in the political development of the EU. On the other hand in periods of crisis or insecurity people obviously turn to the visible horizon of the local reality and not to abstract political concepts. The purpose of this paper is to analyze the interrelation between the parts of the triptych Politics-policies-Polis under the present (turbulent) situation in EU as well as to investigate the deeper political dimensions of communication, be it communication between EU citizens, between EU organizations, or between organizations and citizens. Moreover, it analyses the political content of intercultural communication in structural perspective. In this frame any effort made to determine categories such as familiar or strange, ally or competitor, partner or “third country” is in reality a political procedure and therefore communication affords a firm political background. Thus, it does not suffice to analyze the integration of intercultural communication in the EU political goals only in terms of history; an integrative social theory focuses on questions such as: for what reason, to what extent and with which aims the discussion on intercultural communication was developed at political level as well as with which other political goals it is associated with.

COSMOPOLITANISM AND HOSPITALITY

Gallina Tasheva

Institute of Sociology, University of Jena, 07743 Jena, Germany

Abstract: Following the debates between the proponents of cosmopolitanism, with their idea of world society, universal norms and hybridity of cultural identities, and the communitarians, who argue that the true agents are not equal individuals but collective identities living and acting in particular cultural life worlds, it seems that there are no possible bridges between these two contradictory concepts of social and political order. Based on the Heideggerian idea of “being with” (Mitsein) as coexistence, but also as mutual asymmetric relation of responsibility, and on the idea of “unconditional hospitality” (Derrida, Levinas), this paper tries to recommend a concept which may allow the bonding between political cosmopolitanism and cultural particularism.

THEORETICAL DURKHEIMIAN REFERENCES FOR COSMOPOLITAN STUDIES

Gilles VERPRAET

Sophiapole, Université Paris ouest, NAnterre, France

Abstract: The sociological theories of cultural exchanges inside cosmopolitanism visions are distributed on different socio cognitive explanations as cognitive cooperation and responsibility (Piaget), as interaction and prejudice (Doise), as cultural “matrix” of civil society (Alexander), as cultural and civilisational encounters (Arnavon)

We will examine these different contributions in their synchronic dimensions (cosmopolitan exchange) and their diachronic dimensions. So come the questions on the continuity and the evolution inside the durkheimian paradigm. We notice the change between a cognition national centred (national frames) towards a demultiplication of cognitive process as multi directionals (networks, mobility, exchange).

How to reframe the debate between national habitus and cultural pragmatism? They find different solutions in different social spaces (network, national society, bildung process. Another branch of Durkheimian heritage can be questioned, who focus on the classification system inside social exchange (Mauss, Latour, Descola).

FOR THE NEW TYPE OF SOCIOLOGICAL IMAGINATION - NON-LINEAR HUMANISTIC ONE

Sergey Alexandrovich Kravchenko

sociology, MOSCOW STATE INSTITUTE OF INTERNATIONAL RELATION, Moscow, Russian Federation

Abstract: I. Prigogine has worked out the theory “The Arrow of the time”, according to which all the matter (this concerns as material as social worlds) is being developed increasingly quicker and quicker. The dynamic becomes more and more complicated, including points of bifurcation and the development in the direction from complexity to hypercomplexity – to the socium in which people are loosing their ability to control their own processes.

The non-linear social and cultural dynamics has influenced the essence of the sociological imagination that has its roots in the works of C.W. Mills. Recently P. Szotmca, U. Beck, S. Fuller, G. Delanty have made the attempts to update the sociological imagination. But today in my opinion even the newer theoretical approaches to the sociological imagination should be elaborated. We need a new type - that is non-linear humanistic sociological imagination. Its main features are: it should recognize the validity of different types of sociological thinking and theorizing taking into consideration that sociologists work in different temporal worlds; focus on what I have called the riskological turn - pay special attention to risk traps, manufactured uncertainties, ambivalent consequences of the appearance of posthuman realities; deal with discontinuities and paradoxes of modern socium, different types of rationality as well as irrationality, with globality, locality and globality; take into account the increasing influence of the cultural coding, performative statements, processes of spectacularization thus leading to performative power; regard human’s health as the main value, taking into consideration the complex health of the body, mind and sole.

BEYOND 'THE INDIVIDUAL': RELATIONAL AND HISTORICAL ONTOLOGIES OF INDIVIDUALITY

Kaisa Ketokivi, Mianna Meskus

Department of Social Research, Sociology, UNIVERSITY OF HELSINKI, University of Helsinki, Department of Social Research, Sociology, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Beyond ‘the Individual’: Relational and Historical Ontologies of Individuality

The notion of ‘individual’ as the counterpart to ‘the social’ is at the core of sociological thinking and analysis. It has multiple implications and modalities directing us to think people, actions and practices through qualities of being ‘conscious, independent, autonomous, free and responsible’ (Mauss 1938). Like Elias (1978), we believe the concept of individual confuses an idea to flesh-and-blood people who live socially interwoven lives. While ‘the individual’ is often presupposed as an entity, its critics claim it to be an idea with no substance. Instead of either presupposing or fully rejecting ‘individuality’, we go beyond ‘the individual’ and empirically
analyse the variegated and fluid ontologies of individuality from relational and historical viewpoints. Relational analysis of selves’ personal narratives and configurations of significant ties shows how individualities are interdependent on the bonding effects with others. Historical analysis of the institutionalization of choice and autonomy in medical practice demonstrates the historical contingency of individuality. Both analyses suggest ontologies of individuality that do not emerge from bounded individuals, but from relational and historical processes of the social world. We are left with the dilemma of how to deal with the ontological contingency of individuality.

SOCIOCOLOGICAL THEORIES OF REGION

Zbigniew Rykiel 1

1Institute of Sociology, RZESZÓW UNIVERSITY, Rzeszów, Poland

Abstract: Of the sociological pre-theory of region an early stage of formalisation, and even verbalisation, is characteristic. It is generally assumed that region is a correlate of regional society, i.e. a territorial group in ideological rather than ecological sense. As a cultural phenomena, region and regional identity are thus to be analysed as a degree of the participation in the regional culture rather than a membership in a regional collectivity. The modernisation theory of nation and that of private welfare would thus be useful to discuss. In this context, the concept of ‘entrance’ of individual social classes and local communities to the region is worth to discuss. More generally, two major question should be asked, i.e. (1) whether society is a structure, organisation or system, and (2) whether society exits or becomes. Particularly, a misidentification of social regions with political units, or an automatism of a creation of a region by a political nomination, should be replaced by an analysis of the region-creating processes. In analysis of regional identity, sentimental and behavioural regions should be distinguished.

WORLD OUTLOOK CRISIS AS THE MAINREASON OF TURBULENT TIME

Victor Ivanovich Franchuk 1

1RUSSIAN STATE SOCIAL UNIVERSITY, Moscow, Russian Federation

Abstract: In opinion of leading Russian sociologists (G.Osipov, V.Zhukov, etc.), a principal cause of turbulent time is not economic or financial, and the world outlook crisis having moral, intellectual character, generating degradation of culture, deficiency of spiritual, devaluation of family values, destruction of an educational system and a science.

The world is broken off on parts where each part wants to become the independent democratic state. In the global development the mankind has gone to impasse. People are not ready to live in a global society. The mankind stands on the verge of self-destruction. To correct a situation, it is necessary to correct the person, to create the person with new « human qualities » (A.Pechchei) and new outlook. Theoretically, for the decision of this problem there are biological (genetic) and social alternatives. However more humane one is the social alternative. For its realization new institutes of education and formation, new theories of the social relations, the new models of social development changing a paradigm of development of a world civilization are required, as theoretical doctrines (communistic, liberal, social democratic, etc.) have not justified themselves as have more ideological, than scientific character.

In the multipolar world in which we live, it is necessary to base on the concepts connecting, instead of separating, the social world. The analysis of set of known doctrines of social development (K.Marx, N.Luman, T.Parsons, A.Etzioni, etc.) prompts, that the most adequate one is the paradigm based on renovated ideas of positivism of A.Comte and base values of P.Sorokin. So, according to A.Comte and P.Sorokin social relations in the world can be more integrated and tolerant at observance of two conditions. First, at presence of universal system of base values and norms (P.Sorokin), and, second, at presence of the planetary social mechanism (A.Comte) reproducing base values and solving social problems, arising before mankind. Oterwise turbulent time will last for uncertainty period.

FROM THE TOOL OF REPRESENTATION TO THE VEHICLE OF MODIFYING SOCIAL RELATIONS. IMAGES IN INTERVENTION

Maciej Frackowiak 1

1Institute of Sociology, ADAM MICKIEWICZ UNIVERSITY, Poznan, Poland

Abstract: The aim of the proposed paper is to reconstruct the area of the modern applied visual research. The first part is devoted to the discussion of the social and theoretical changes which led to a significant redefinition of forms in which video and visualization techniques appear today in the social sciences that employ them in non-academic purposes. These activities are based to greater extent than ever on the cooperation with the individuals who are suppose to benefit from the interventions, the dissemination of technology of manufacturing and distributing the images, and accompanied by the significant change in the concept of the technical picture within the social sciences. Author identifies and follows five model strategies of visual intervention in the second part of the paper where he analyzes the use of images for the purposes of advocacy, cultural brokering, community art, teaching the visual competence and assuring the values and security of individuals.

PHENOMENON OF THE REFLEXIVITY IN THE EXPLANATIONS OF SOCIAL CHANGE

Olga Nowaczyk 1, Agata Krasowska-Marut 1

1INSTITUTE OF SOCIOLOGY,UNIVERSITY OF WROCŁAW, Wroclaw, Poland

Abstract: This paper addresses one of the problems of the contemporary theories of social change, namely a tendency to place an extended process of reflexivity in the heart of a modern identity. Considering this tendency a symptomatic feature of the ‘neo-modern’ accounts of thinking, the paper sets out by reviewing the critical readings of A. Giddens and U. Beck and their accounts of the relationship between reflexivity and culture. In light of the existing criticisms of the reflexive modernization thesis, the ways in which culture might still play an important role in shaping reflexivity and explaining social change are discussed. In the body of the article we reconstruct some of the hidden meanings behind the category of reflexivity. For example, in the theories of (reflexive) modernization, reflexivity is a normative goal that must be achieved by individuals. Thus, reflexivity is a systemic requirement, a form of social pressure which determines the ways in which individuals should live. It points to both paradoxical and normative nature of reflexivi-
ty in the theories of modernization. We argue that this normative approach reflects the ways in which the very concepts of reflexivity and culture and their relationships are defined by the theorists of modernity, including. This is a significant problem, because culture is still relatively popular category which is used to explain social change. In a situation, in which structuralist concepts, such as social class, cease to be considered core mechanisms accounting for social change, the alternative explanations of societal transformation emerge that stress the relevance of culture (social status, contemporary social movements).

REFLEXIVITY AND THE FUNCTION OF EMPIRICAL RESEARCH AND EXPLANATION WITHIN CONTEMPORARY SOCIAL THEORY

Allan James Sutherland¹

¹Nursing, KYUSHU UNIVERSITY OF NURSING AND SOCIAL WELFARE, Tamana, Japan

Abstract: Reflexivity has featured strongly in contemporary social theory, particularly in response to perceived social turbulence and explanatory difficulties. Reflexivity is variously theorised and conceptualised, falling into two primary versions. On the one hand, reflexivity is determined an essential technique for uncovering the unseen, unknown constraints, and distortions in the foundations and premises of theories and categories (Adorno, Archer, Beck, Bourdieu, Giddens, Goffman, Habermas, Lash and Parsons). This reflexivity challenges second-order statements intentionally to check and strengthen, not undermine, sociological knowledge (Bourdieu 2004:4). On the other hand, reflexivity is conceptualised as a requirement for competent social action (Parsons, Archer), or as impelled on individuals by encompassing reflexive modernity (Beck, Bauman, Giddens). Theorists oscillate between these versions, echoing what Holmwood and Stewart (1991) term the horizontal and vertical fallacies with conflicting orders of explanation proposed by theorists for the same social practices; the explanations of social scientist and the understandings of engaged social groups. The deployment of reflexivity by contemporary social theorists who pursue primary empirical research in developing theoretical statements, concepts and explanations (e.g., Archer, Bourdieu), are compared with the application of reflexivity by theorists who predominantly internally critique the premises, coherence, and outcomes of theoretical statements and concepts, sometimes drawing on secondary sources. to advance theory, concepts and propose explanations (e.g., Beck, Giddens, Lash). The paper considers whether reflexivity results in productive reformulation of theory and concepts yielding explanatory expansion to accounts of empirical results, or unproductively leads to unreformed theories and concepts being proposed as accurate statements of contradictory social formations and practices. Determining blindness within theory and concepts is a first step to their refined reconstitution, rather than concluding entailed epistemic deficiencies disclose contradictory social practices. Mutuality implies incorrect theory and concepts systematize imprecise data; subsequently corrigibility is mutual requiring rigorous reflexivity directed at theory and data to creatively resolve explanatory incoherence and realign theory, concepts and empirical data.

SOCIOLOGY OF VULNERABILITY AND CRITICAL STANCE

Barbara Anna Misztal⁰

⁰Department of Sociology, UNIVERSITY OF LEICESTER, Leicester, United Kingdom

Abstract: The main of the paper is to emphasis that sociology has a very important role to play in developing a comprehensive understanding and awareness of vulnerability as the recognition of vulnerability has implications for social justice and can be conducive to developing a sense of responsibility and resistance against the existing social order. Sociology, by establishing a powerful understanding of vulnerability and by informing public debate about the social character of human vulnerability, can offer an illuminating account of the nature of society therefore it can motivate and justify critical stands. In spite of the fact that not all sociological accounts assign a positive role to the notion of vulnerability, the paper argues that sociology has a critical role to play in advancing our understanding of causes and consequences of vulnerability and in developing as well as evaluating strategies for responding to vulnerability. It proposes aggregative conception of vulnerability that enables to show the importance of vulnerability for justifying stand for change and for grasping the nature of the relationships between the main societal realms. As the contemporary trends, including the process of globalization, are forcing us to re-conceive the relationship between society and market, socety and the state vulnerabiliy, seen as being reducible neither to economic deprivation nor to social isolation or cultural disrespect, is a very useful notion to discuss these relations interaction under conditions of social change.

CONCEPTUALIZING THE RIGHTS OF A VULNERABLE HUMANITY IN THE AGE GLOBAL CLIMATE CHANGE

Tracey Skillington⁰

⁰School of Sociology & Philosophy, UNIVERSITY COLLEGE CORK, Cork, Ireland

Abstract: Abstract for consideration under Theme 13: In this age of climate change risk, can we still base models of distributive justice on the territorial state’s rights to self-determination and exclusive authority over the allocation of scarce resources like water, oil or arable land? As climate variability fundamentally alters the geographic distribution, frequency and intensity of weather–related destruction and heightens the prevalence of drought (Sub-Saharan Africa), flooding (Indian sub-continent, China and the Andes in South America) and pollution worldwide, the demand for water in particular rises sharply. Shortages amongst ‘water deficient’ states like Tunisia, Algeria, Egypt or Morocco and related food-price inflation are predicted to trigger new conflict scenarios in the future. Given that climate changes are internationally sustained, what is owed to the peoples of ecological challenged states currently facing large-scale humanitarian disaster? Is the state the primary duty-bearer in this regard or does international law also necessitate the wider community to protect the rights of inhabitants of ecologically vulnerable regions and fulfill certain obligations? If so, how should a principle of cosmopolitan duty, beyond normative criteria outlined in the International Covenant on Economic, Social and Cultural Rights or the United Nations Framework Convention on Climate Change, for instance, be actualized and how can notions of ‘vulnerability’ be re-conceptualized beyond the boundaries of the nation state in a manner that is more attuned to the interdependencies of a global humanity?
SOCIOLOGY IN ACTION: NOT TEXTS BUT THEIR SEMIOTIC EFFECTS

Antti Gronow

Department of Social Research, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: In recent decades, the social sciences have been under the influence of social constructionist ideas about meaning and culture. The basic argument of constructionism states that cultural meanings are constructed at the level of language and therefore texts are the proper level of empirical analysis. At first glance, this emphasis laid on meanings is at odds with realist theories of action. However, there is an insurmountable contradiction only if constructionists maintain that culture is exclusively a phenomenon of language and texts. Texts, and also other cultural artifacts, certainly can construct social meanings for us – they enable shared responses – but whether they do so is a matter for empirical research. The object of such research should be the semiotic effects of texts; that is, their possible effects on action rather than texts as such. I argue that Ian Hacking’s ideas on so-called interactive kinds are helpful in formulating a view of culture, which takes into account both the mediating role of cultural meanings and their effect on concrete reality. Such a realist research agenda should be carried out especially in relation to historical data.

WHAT, IF ANYTHING, ARE CULTURAL STRUCTURES?

Marek Skovajsa

Faculty of Humanities, CHARLES UNIVERSITY PRAGUE, Prague, Czech Republic

Abstract: Cultural sociology, in particular the strand represented by Jeffrey Alexander, has been increasingly recast as the study of cultural structures. Culture is said to enjoy autonomy from material structure and to be organized following its own intrinsic principles. This paper attempts a critical investigation of the notion of “cultural structures” with the aim of finding an unambiguous and analytically fruitful definition of this concept. Recent work on the structural character of culture is reviewed, in particular the contributions by Alexander, but also the work of Giddens and Sewell. Culture as structure is compared and contrasted to the view of culture as system (Parsons, Geertz, Archer). Since the notion of cultural structure points unmistakably to its inspirational sources in structuralism, the classical conceptualization of structure in the works of Lévi-Strauss and Piaget and their relationship to newer developments is also discussed.

The two, mutually interrelated, main theoretical questions addressed in this paper are: what is the ontological status of cultural structures and what are the principles guiding the organization of cultural structures? A realist understanding of culture (Archer) is contrasted with the notion that culture consists of virtual generative rules that have no actual existence in the social world (structuralism) and a third view that culture exists as meaningful schema embodied in real actors (Bourdieu). In this connection, Giddens’ concept of virtual rules that exist only as instantiated in practice and Sewell’s notion of the duality of structure are reexamined. I propose to distinguish between culture as an aspect of the practical context of action and cultural structure as an external model for analyzing action. Then, I ask whether the principles based on which cultural structures are internally organized and that endow the latter with autonomy can be found in the domain of logics and semiotics. The limited relevance of the logical properties of cultural contents for the structural organization of culture is explored mainly with critical reference to Archer’s work. Next, it is shown why semiotic systems (conceived along the lines proposed by, among others, Eco) can be seen as providing internal organizing principles for cultural structures. Following these steps, an attempt is made to rearticulate the notion of cultural structures in a novel way.

FORMATIVE BECOMINGS: HOW TO ACCOUNT FOR THE BIRTH OF ORDER?

Olli Pyyhtinen

Department of Social Research / Sociology, UNIVERSITY OF TURKU, Turku, Finland

Abstract: The various philosophies of becoming (e.g. Bergson, Deleuze) seem to resonate well in our present condition, which is generally considered to be marked by mobilities, flows, fluctuations and contingency. Substantial and mechanistic notions have given way to concepts more processual in emphasis. For example, ‘life’ has become the general conceptual frame within which a whole variety of phenomena, from labour and capitalism (Hardt and Negri, 2000; Lazzarato, 1996) to information (Lash, 2005), film (Muljarkey, 2007), computer viruses (Parikka, 2007) and even matter (Deleuze & Guattari, 1987; Bennett, 2010) are perceived, be it by modelling them on the idea of living process or by regarding them as specific ‘forms of life’. Nevertheless, given the contingency and flux that assumedly mark the present social relations, what is the real cause of wonder and in need of explanation is not change, but stability and order. How do things actually endure? How is it that fleeting and precarious links are made stable and lasting? How do forms emerge from the formless, order from disorder? Drawing on the insights of Georg Simmel, Gabriel Tarde, Michel Serres and Bruno Latour, the paper develops and elaborates a conceptual apparatus with the help of which to tackle the problem of stabilization orformativity. To put it shortly (and vaguely), from Simmel, it takes up the notion of formed becoming and the identification of different phases in the objectification of forms; from Tarde, the idea of repetition as the first form of order; from Serres, the idea of the circulation of the quasi-object as the basis of the collective as well as his way of thinking structure as ‘an ordered multiplicity of ordered multiplicities’; and, lastly, from Latour, the insight that every order is a product of the coming together of heterogeneous elements.

FACTISHISM OF COMMODITIES: BETWEEN MARX AND LATOUR

Cagatay Topal

DEPARTMENT OF SOCIOLOGY, MIDDLE EAST TECHNICAL UNIVERSITY, ANKARA, Turkey

Abstract: According to Marx, commodity is the name of the product/thing within the capitalist mode of production. Commodity fetishism is a social relation that prioritizes the relations between things over the relations between human beings. Marx shows that this social relation is an exploitative and non-human one. According to Latour, a fetish is conceptualized as something that is nothing in itself. We project our labor onto it. We fill it with our meanings. In contrast to the fetish, we have the fact, an absolute certainty, to get rid of the fetish. Latour introduces the factish to overcome the
tension between them, indicating that the fact and the fetish have a common ground of fabrication.

This paper discusses whether the factish – and so factishism – may introduce a new way of arguing and acting on what we regard fact, what we regard fetish, and what we would regard factish with respect to their subtle, hidden, ignored, and repressed dimensions. From a factishiist perspective, the fact necessarily includes the fetish; and the fetish necessarily includes the fact. Consequently, human realism is inseparable from human fetishism; so is commodity fetishism from commodity realism. Factishism may encourage us to reread what we have already read and to rewrite what we and others (especially Marx and Latour) have already written. But to begin with; Does Marx simply project onto a meaningless object his own beliefs and desires and is commodity fetishism the wrong target for Marx?

BOURDIEUSIAN REFLECTIONS ON LANGUAGE: UNAVOIDABLE CONDITIONS OF THE REAL SPEECH SITUATION

Simon Susen

Abstract: The main purpose of this paper is to shed light on Pierre Bourdieu’s conception of language. On various occasions, Bourdieu distances himself from what he considers to be ‘transcendental’, ‘idealistic’, and ‘scholastic’ accounts of language. In opposition to Habermas’s communication-theoretic approach, for example, Bourdieu claims that language almost never functions as a mere instrument of communication. On the contrary, given that the production of communicative relations is inconceivable without the reproduction of power relations, the meaning-ladenness of linguistic reality cannot be dissociated from the interest-ladenness of society. In other words, our communicative orientation towards mutual comprehension is impregnated with our purposive immersion in social competition. If linguistic power is a matter of social power, then every linguistically raised ‘validity claim’ can be regarded as a relationally determined ‘legitimacy claim’. Examining both the philosophical and the sociological implications of this perspective, this paper makes a case for the view that we need to identify the unavoidable conditions of the real speech situation, rather than the avoidable conditions of the ideal speech situation, in order to understand that the legitimacy of linguistic validity is always contingent upon the validity of social legitimacy.

STRUGGLE AND SOLIDARITY: REPUBLICAN ELEMENTS IN PIERRE BOURDIEU’S POLITICAL SOCIOLOGY

Chad Alan Goldberg

Abstract: Jeffrey C. Alexander argues that Pierre Bourdieu’s sociological work lacks three elements that are essential for an adequate theory of democratic politics: a conception of civil society or the public sphere, moral universalism, and solidarity. This paper qualifies Alexander’s critical assessment. By drawing attention to the republican (and especially Machiavellian) aspects of Bourdieu’s thinking—in particular, his concept of field autonomy, his view of interests and universalism, and his understanding of how solidarity is generated—it attempts to show that these elements are not absent in Bourdieu’s work. On the basis of this reassessment, the paper concludes that Alexander and Bourdieu are not as opposed in their thinking about democratic politics as it might first appear.

SUICIDE FROM THE PERSPECTIVE OF LUHMANN

Tanya Jukkala

Abstract: More than 100 years after it was first published, Emile Durkheim’s pioneering work Suicide still seems to dominate the theoretical and methodological approaches to suicide within the field of sociology. A rich body of empirical research on suicide has been produced within this tradition, this has, however, not lead to any comprehensive understanding of suicide. The present paper is an effort to bring some new thinking into the sociological theorizing of suicide by addressing some critical aspects of Durkheim’s theory and exploring the possibility of applying Niklas Luhmann’s systems theory to suicide. Compared to Durkheim’s typology of different types of suicide Luhmann’s theory seems to open for a more complex approach to suicide, where suicide can be seen as a selection, or, in Luhmann’s terms, a way of reducing the complexity of the environment. In relation to this, change in the environment triggers the system (an individual or collective of individuals) to make selections in order to reduce complexity. The structures of available systems in the system’s environment effect the system’s own structures and the way it organizes reality and makes selections. Through a self-referential process and its particular way of organizing reality, the system interprets and responds to external effects, and makes selections, including that of suicide or not. Luhmann’s theory provides potential solutions for problematic aspects of Durkheim’s theory such as the negligence of culture, problems of causality, and the divide between individual and societal reasons for suicide. Luhmann’s focus on communication provides a radically different perspective in relation to Durkheim’s concepts of integration and regulation - the need for integration is a need for communication and communication brings about regulation in terms of complexity reduction. The system’s inclusion in other systems (i.e. access to communication) is thus an important aspect for understanding suicide in relation to particular systems. Moreover, the effect of societal factors and societal change on suicide mortality must be understood in relation to system specific ways of organizing reality.

THE HISTORICAL BASIS OF MAX WEBER’S POLITICAL VIEW IN THE TIME OF WAR

Daniel Vasconcelos Campos

Abstract: Since his childhood, as his father joined the city council of Berlin, Max Weber came into contact with an intense political environment and soon became interested in political questions. However, he would express a clearer position on this subject only in the last years of his life. This fact is certainly related to the development of sharp political events. From 1914 to 1919, period that coincides with Weber’s main contributions about politics, Germany was involved in the First World War, in a failed attempt of revolution and, finally, in disputes on the new constitution. Despite the stimulation given by this exceptionally unstable situation, Weber’s
political view kept principles that began to be developed before the war through his sociological approach on history. Our main purpose here is to understand how Weber applied his historical vision of modernity to examine the political problems of such troublesome time. Particularly, this presentation aims to elucidate how his reflections about modernity, in which state actions are considered in terms of violence and unconsecrated values, demand new answers to millenary problems, that is: 1) a distinctive search for meaning and 2) a new ethical solution to the practical irrationality of reality.

**RELIGION AND AFFECTIVITY – TWO RESPONSES TO THE PROBLEM OF ORDER**

Tina Arppe

1Department of Social Sciences, UNIVERSITY OF HELSINKI, University of Helsinki, Finland

Abstract: The paper compares two 19th century French social theorists, Auguste Comte and Emile Durkheim, who both sought the answer to the problem of social order (an acute problem in France during the 19th century) in the domain of affectivity, and more particularly, in the realm of religion. Both see the primary source of disorder in human passions, as did Hobbes and the whole subsequent social contract tradition. However, instead of seeking the solution in the juridical sphere, like the social contract theorists, Comte and Durkheim try to canalize the harmful passions through normative means. Furthermore, for both the primary domain for the regulation of the affective energy is the religious, though they disagree on the question concerning the viability of the religious solution in modern society (Comte aims at founding a "positivist" religion, acting as the affective supplement for the ideological re-production of his new, scientifically organized society, whereas Durkheim sees the religious regulation of affectivity more as a solution typical to primitive societies). However, in both theories order seems to presuppose a transcendental instance, be it Humanity (Comte) or Collective Consciousness (Durkheim) – formally in the same position as the sovereign (the "transcendental Third") in Hobbes' theory.

**THE PURSUIT OF ONTOLOGY AS A CONSTANT SOURCE OF CONFUSION**

Leonidas Tsilipakos

1Sociology, UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: Questions of ontology have proliferated in social thought during the past decades, particularly due to the work of John Searle, Bruno Latour and Theodore Schatzki, among others. In this paper I argue that the pursuit of ontology inevitably leads to confusion because it is by definition unable to pay sufficient attention to the subtleties concerning the use of words, in order to ensure that what is seeks to establish makes sense. Although this type of objection has been systematically explored by philosophers such as Wittgenstein, Austin and Ryle, regrettably, it is still widely neglected by most social theorists. ‘Ontological expressions’ such as ‘real’, ‘exist’, ‘entity’ and ‘reality’ are only partly overlapping and individually discontinuous in their ‘grammar’. The implication of this is that we cannot indiscriminately subject all sociologically relevant expressions (e.g. ‘social structures’, ‘collectivities’ etc.) to the question ‘what entity does it refer to?’, nor can we ask, of what these expressions are about, the question ‘is it real?’ as if that were one determinate question. The incoherence of these questioning procedures which are built into the ontological project entails that the latter functions as a constant source of confusion. I illustrate the above with some examples from the sociological and social-theoretical literature.

**SOCIAL SCIENTIFIC THEORIZATION AS ENTRAPPED IN VARIOUS EPISTEMIC CIRCULARITIES: THE VICIOUS, THE VULNERABLE AND THE VIRTUOUS.**

Christoforos Bouzanis

1Sociology, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: This paper aims to argue that epistemological discussions about epistemic circularity are intrinsically related with the ontology/epistemology debate in social theory. Epistemic Circularity has been defined (Alston 1986) as when the reliability of one source of beliefs is implicitly based on the belief of its being reliable. However, this result, it is said, (Alston 2005, Bergman 2004) should not be considered as an unfortunate one. For here, we do not face a logical circularity where the source of belief is directly used in the premises of the inference of the reliability of this source. After all, epistemic circularity is not a vicious one since there is no problem, for a source which has been taken to be reliable, to produce beliefs about its own reliability.

Psillos (1999) adds that to rely on a successful method of inference should not worry us about the circularity produced in our effort to justify its use – as far as it remains successful. Yet this paper supports that ontological arguments are cognitively prior to methodological ones. And as a result, by placing epistemic questioning within a social ontology, the resulting epistemic circularity is the one between the knowing subject and her object of objectification that is, society.

**CRITICAL THEORY AS CRITICAL STANCE: THE LATE WRITINGS AND ACADEMIC PRACTICE OF MAX HORKHEIMER**

Stefan Klein

1Sociology, UNIVERSITY OF SAO PAULO (USP), Sao Paulo, 2IG, Formosa, Brazil

Abstract: The hereby proposed presentation aims at discussing the late writings of Max Horkheimer that have been relatively left aside vis-à-vis those of Theodor W. Adorno. In this sense I shall focus especially on the kind of social theory perceived by Horkheimer as critical upon the return to Europe after World War II, when he not only regained his professorial chair but was twice elected the Dean ("Rektor") of the Johann Wolfgang Goethe Universität Frankfurt am Main. Initially I will argue that there has been a greater continuity than rupture concerning his initial works from the 1930s: he was and still remained worried about the type of association that should be advocated between a philosophical viewpoint and the use of empirical social research. Albeit the often debated and widespread issue that a breach had been introduced after the "Dialektik der Aufklärung" I shall assert - based on speeches, meeting minutes and material from his personal archive - that his foremost emphasis was on bringing together (critical) theory and research as an enduring formative stance that rested attached to a modified concept of "Bildung", therefore stimulating a questioning human being and
investigative approach prepared to deal with the antagonistic aspects of society.

**LINKING FROMM AND BENHABIB: INTERACTIVE UNIVERSALISM AND WISDOM**

Ricca Edmondson

School of Political Science and Sociology, NATIONAL UNIVERSITY OF IRELAND GALWAY, Galway, Ireland

Abstract: This paper returns to a classic of critical theory, Erich Fromm’s *The Sane Society* (1955), and to the eight ‘basic needs’ he attributes to human beings in *Escape from Freedom* (1941). It suggests that aspects of Fromm’s work may be in a position to resist reproaches made by Seyla Benhabib against theorists such as Marcuse or Arndt for failing to ground their social criticism adequately. She asks in ‘The Critique of Instrumental Reason’ (1995) whether the Critical Theorist is self-righteously speaking ‘in the name of a future Utopian vision to which he alone has access’ or playing ‘the role of memory and conscience in a culture that has eliminated its own past?’ Benhabib turns instead to the idea of communication with ‘the concrete other’, in which ‘individuals learn to see the world from the perspectives of others,’ grasping their dignity and difference in self-transforming processes (1986: 341). This paper argues that her position has compatibilities both with some of Fromm’s work and with some versions of the traditional concept of ‘wisdom’, interpreted in the context of a humanistic theory of communication stemming from Ancient Greece.

**CRITICAL THEORY AND POWER: FROM MARX TO BIOPOLITICS**

Emiliano Bevilacqua

UNIVERSITY OF SALENTO, Lecce, Italy

Abstract: The paper will critically discuss irrational foundations of power in contemporary society through a comparison between a classical thinker as Karl Marx and the most recent biopolitical reflection on sovereignty.

Marx thinks that the liberal politics announces the existence of an abstract world in which the individuals are equal in front of the State’s Law: modern State seems a Christian heaven on the earth. This vision contradicts the reality of an unfair and unequal society and represents a fantastic ideology fed by the alienation: unhappy people believe in the liberal politics for the same reasons that push them to believe in the religion.

The paper will discuss this dimension of the marxian thought comparing it with the biopolitical interpretations of the power, particularly of the sovereignty. Michel Foucault has shown as the governmental power characteristic of political liberalism found itself on irrational foundations and Giorgio Agamben has recalled our attention to the Christian political theology, able to elaborate tools of the power’s glorification useful also in the modernity. The paper will discuss some questions opened by the debate on the irrational nature of power.

**SALVAGING THE POLITICAL SUBJECT: SOCIAL THEORY AFTER MARXISM AND POST-MODERNISM**

Filc Dani, Uri Ram

Politics and Government, BEN GURION; Sociology and Anthropology, Ben Gurion, Beer Sheva, Israel

Abstract: It is difficult to think of social theory without the concept of the political subject. Yet it is difficult to imagine such a subject after post-structuralism (and post-modernism). The latter heralded the end of (emancipatory) history and the death of the (social) subject. In this paper we examine the political subject that emerges from the encounter between Marxism and Post-Modernism. We propose a classification of four major responses of Marxists to the PM challenge; and argue that each of these responses designates its own concept of the political subject. We will conclude by an assessment of the concept of a political subject in the present age.

The different responses of Marxists to the Post-Modern challenge result from the intersection of two questions: whether Marxists reject or accept PM; and whether they do so totally or partially. Marxists who totally reject PM produce Anti-Post-Modern Marxism. Marxists who partially reject PM, produce Marxist Post-Modernism; Marxists who partly accept PM, produce what we call Synthetic Marxist-Post-Modernism; and Marxists who totally accept PM, produce Post-Marxism. Building on the critical analysis of these different types of articulations, we will conclude with a reexamination of the concept of the political subject in the contemporary era.

**POLITICS BETWEEN JUSTIFICATION AND DEFIANCE**

Paul Blokker

Sociology, UNIVERSITY OF TRENTO, Trento, Italy

Abstract: The paper discusses the status and role of politics - in its various facets - in the pragmatic sociology of critique. The paper focuses on a number of different dimensions of politics - politics-as-justification, politics-as-distribution, politics-as-constitution, and politics-as-defiance – that can said to be of importance for a pragmatic sociology of critique, but that have not all been taken up equally in this approach. In this, the paper situates pragmatic sociology in a tradition of thought that views politics as emerging in the settlement of disputes over differences without resorting to violence. However, I argue that pragmatic sociology tends to ignore questions of the constitution of politics, and suggest that one way of bringing the foundational aspect upfront is by conceptualizing and studying defiance, including forms of explicit (dissent) and implicit critique (resistance) of the existing order.

**SOCIOLGY OF CRITIQUE - A SOCIOLOGY OF KNOWLEDGE**

Claudia Globisch

Department of Sociology, UNIVERSITY OF INNSBRUCK, Innsbruck, Austria

Abstract: Since its founding there’s an ongoing debate within sociology about the question if it has the competence and legitimacy to criticize society and on which base sociological theory can act as critical science. While the position of a “Sociology of Critique” from the perspective of a reconstructive sociology of knowledge, where I locate “Sociology of Critique”, avoids using normative criteria of the good life and a priori structures and principles, Critical theory as well as the paradigm of “Critical Sociology” still stick to these
grounds. "Sociology of Critique" therefore doesn't try to answer normative questions in general and to judge society, but asks under which specific conditions and sociocultural circumstances what specific kind of critique can evolve. The "critical moment" of a "Sociology of Critique" is the reconstruction of the structural forms and their persistence from the perspective of empirical subjects. Therefore, a "Sociology of Critique" is not just an observing and descriptive form of critique of society, but analyzes society's historical constitution and the implementation of worldviews through the actions of empirical subjects. The paper will discuss this paradigm and analyze empirically different contemporary critiques of society from the perspective of a "Sociology of Critique".

SOCIOLOGY AND CRITIQUE: OPPORTUNITIES AND PITFALLS IN THE CONTEXT OF THE NETWORK CAPITALISM

Vando Borghi\textsuperscript{1}
\textsuperscript{1}\textsuperscript{1}Sociology, UNIVERSITY OF BOLOGNA, Bologna, Italy

Abstract: The socioeconomic model of the network society is introduced and discussed, as the way the contemporary capitalism imposes its own mode of domination. The network model seems to provide the most effective vocabulary for understanding crucial social processes of the contemporary social life, organizations, corporations and, more in general.

Given that context, possible strategies of a public, critical sociological thought are explored. Two possible roots can be newly combined in order to look for new possible strategies. On the one side, postcolonial and subaltern studies are and have been helping social theory in its reflexive efforts for a better understanding of modernity as a terrain of struggles and conflicts (about the legitimate meaning of ‘being modern’) and of the way the capitalist logics of development is crucial for that terrain. On the other side, the inquiries about the “new spirit of capitalism”, the paradoxical developments of capitalism and the (very heterogeneous, often weak and not easily replicable elsewhere) experiences of “counter-movement” against an expanding marketisation (Polanyi’s concept is in itself a terrain of debate about the topics discussed all along the paper) should be studied as agency (“capacity to aspire”) of differently situated individuals and collectivities.

The decolonization of Western and European sociological thought (overcoming the traditional monological intellectual architecture of the “Northern” or “metropolitan social theory”) and the inquiries about innovations in the collective actions concerning different experiences of social injustices (experienced by citizens, peasants, workers) can offer a fruitful opportunity for rethinking the relationship between sociology and critique. At the same time dangers of overlapping or confusing “sociological imagination” and “political imagination” should be recognized and avoided.

‘EXTERNAL AND INTERNAL RESISTANCE: A MEDIATORY CONCEPTUALISATION OF THE INTER-ACTIONAL AND INTRA-ACTIONAL FEATURES OF RESISTANCE’

Athansia Chalari\textsuperscript{1}
\textsuperscript{1}\textsuperscript{1}\textsuperscript{1}\textsuperscript{1}\textsuperscript{1}\textsuperscript{1}SOCIOLOGY, SCHOOL OF SOCIAL SCIENCE, UNIVERSITY OF MANCHESTER, UK, MANCHESTER, United Kingdom

Abstract: Resistance has been perceived by relevant literature in terms of inter-action and opposition. This paper argues that the sociological conceptualisation of resistance should be broader, entailing two definitions: (1) external resistance, which is associated with the elements of external opposition and inter-action; and (2) internal resistance, which is associated with internal opposition and intra-action. Internal resistance is examined in terms of: a) internal opposition to oneself by focusing on the case of internalised resistance; and b) internal opposition to external stimuli. In both cases internal resistance is perceived as a form of intra-actional opposition, which is subjectively defined and experienced. This paper proposes a mediatory approach concerning the connection between the inter- and intra-actional features of resistance. It employs aspects of current social theoretical discussion concerning the relationship between structure and agency and, in particular, between internal and external conversation.

CIVIL SOCIETY IN TURBULENT TIMES: RUSSIAN CASE

Svetlana Kirdina\textsuperscript{1}
\textsuperscript{1}Institute of Economics, Russian Academy of Sciences, Moscow, Russian Federation

Abstract: In contrast to the universal character of civil society discourse, there is still a lack of contextually defined concepts in its critique. A critical interpretation of civil society discourse needs careful contextual considerations of its theory building in contingent policy regimes defined by political, geographic, generational and other factors. The well-known concept of “civil society” and its historical metamorphoses are discussed in this paper. It is shown that “civil society” remains an ideologue rather than a rigorous scientific term. This is confirmed by the analysis of contemporary indices of civil society such as the Civil Society Index (CSI), the Global Civil Society Index (GCSI) and the Civil Society Support Initiative (CSSI). The objective is thus to examine a version of civil society discourse contextualized in the Russian transitional society. We argue that for Russia a more accurate term is “civil activity” or “active citizen participation” and not “civil society”. The main institutional forms of “active citizen participation” in contemporary Russia are analyzed from the standpoint of the institutional matrices theory with relevant empirical data.

PUBLIC SPHERE AS A META-SPACE OF PERSONAL NETWORKS: CULTURAL IMPLICATIONS

Gabriel Barhaim\textsuperscript{1}
\textsuperscript{1}NETANYA ACADEMIC COLLEGE, Netanya, Israel

Abstract: The contemporary public sphere I argue, reflects new and unprecedented social relations that are founded on new forms of social solidarity, one of which is the personal network. Hence, the substantiation of public exchanges and contents are to a great extent defined by the character of such networks and bear their stamp.

As for the nature of networks’ cultural commentaries it is mainly concerned with screening, testing, application, encoding and in general practice of cultural discourses. By virtue of their constitution such networks not only lack collective consciousness but are also incapable of developing social action. This is also true of more homogeneous or specialized networks that draw many of their “members” from a larger group of people who share a common
social characteristic, such as singles, or even, those who share a common dominant activity, such as, for example, computer scientists.

The nature of networks, in their entirety, requires in its turn a meta-network space that transcends their singularity, fragmentation, heteromorphism, and even their incidentality. Without such a common meta-space that inspires and guides, it would not be possible to make sense of these dispersed networks. The public sphere provides networks with a common cultural vocabulary and a general system of meaning. The argument presented here contends that there is a reciprocal relationship between the public sphere, as a meta-space and personal networks, which coalesces in coherent everyday working patterns.

MARKETS, HIERARCHIES AND SUBVERSIVE LEGALITIES: THINKING POSTCOLONIAL LIBERTY AND CITIZENSHIP IN 19TH CENTURY AMERICAN POLITICS AND LAW

Mary Vogel

1Law, KING’S COLLEGE OF UNIVERSITY OF LONDON, London, United Kingdom

Abstract: It has become commonplace to associate democracy with a “rule of law.” Yet the specific role that law plays in democratic state formation remains relatively understudied. In this paper I build on earlier work of mine that explores the development of a conception of political authority in postcolonial America during the early to mid-19th century. Here I explore how several areas of law simultaneously participated in the articulation of a vision of liberty and of the political subject for a new post-Revolutionary world of self-rule.

The significance of this legal activity lay in the fact that the United States, lacking any common ethnicity or culture, would turn to the mythic identity of liberty as the basis for its sense of nationhood and the political membership of its citizens. Yet, the conception of liberty that emerged was a paradoxical and dualistic one – at once, free and, at the same time, not free. It was a sense of freedom conceived, not in a radically democratic society, but rather in a sober, well-regulated one of the early American republic.

It is the dimensions and generating conditions of this sense of freedom as a basis for citizenship that this work considers. It also considers how the common law, which initially served as a mobilizing force for the Revolution, comes to be challenged by the early 19th century as a colonial residue. Opposition crests as the common law comes to be used by postcolonial American Whig elites in an effort to reconsolidate their waning power as the franchise is extended and popular politics stirs during the Age of Jackson. Thus, the common law comes to play a role in the reproduction of the inequality that the Revolution it helped to mobilize was fought to transform.

SOME REMARKS ON THE CONTRIBUTION OF ACTUAL PHILOSOPHICAL APPROACHES FOR SOCIAL THEORY

Michael Jonas

1Sociology, INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria

Abstract: In recent years philosophical approaches of societal processes gained in importance. Combining different theoretical discourses of diverse disciplines like philosophy, sociology and geography for instance Manuel deLanda’s assemblage theory, Annemarie Mol’s praxeography or Ted Schatzki’s social site approach offer new perspectives on social activities and relations in the actual ongoing process of global transformation. The aims of my contribution are to discuss central aspects of the named approaches and to stress the advantages sociological approaches are able to gain in treating these invitations from philosophy seriously.

MEDIA SYSTEM AS A SYSTEM. MEDIA SYSTEMS THEORY FROM THE VIEWPOINT OF LUHMANN’S SOCIAL SYSTEM THEORY.

Marina Urbanikova

1Faculty of Social Studies, Masaryk University Brno, Brno, Czech Republic

Abstract: The term media system belongs, also due to the popularity of Hallin and Mancini’s book Comparing Media Systems: Three Models of Media and Politics (2004), to the most widely discussed terms of contemporary media studies. Till now, the research of media systems concentrated on assembling a wide spectrum of indicators, leaving the key term, media system, without closer inspection. Since the definition and theoretical grounding of the key term is missing, there is no basis for derivation of the indicators, what shifts the models into proofless assumptions.

This paper attempts to enrich the research on media systems with the perspective of Niklas Luhmann’s social systems theory. From this viewpoint, media system can be seen as an autopoietic (self-reproducing) system existing in the environment of social system, fulfilling the task of self-observation of society and production of social memory. Media system interacts with other subsystems by means of structural couplings specifically created for these interactions.

Luhmann’s social systems theory remedies what we identified as the main defect of up-to-now studies of media systems: theoretical grounding. Besides this, application of this theory surpasses the rather narrow field of media studies and enables us to analyse media system in a broader social context.

WAITING TO HAPPEN: THE ACCIDENT IN SOCIAL THEORY

Steve Matthewman

1SOCIIOLOGY, UNIVERSITY OF AUCKLAND, Auckland, New Zealand

Abstract: While the unintended consequences of human action have exercised the sociological imagination since the discipline’s inception and social thinkers have argued that the truth only reveals itself in moments of rupture, sociology is yet to develop a systematic study of the accident. Despite widespread agreement that we live in turbulent times marked by risk and crisis, we await what Paul Virilio (2007) called a fully-blown “accidentology”. What would such a theory give us? This paper attempts an answer by focusing on the topic of the technological accident, which is to say the dominant form of accident in modernity. However we also examine the “happy accidents” of scientific discovery and so-called accidents of nature. The argument is made that “accidentology” would expose the substance of technology, the symptom of society, and the riskiness inherent in the complex socio-technical systems that shape our lives. Since accidents can obfuscate as well as reveal we also consider what the accident conceals. It will be claimed that...
interpreting some events as accidents, of discovery and of nature, may obscure the conditions of knowledge creation and the structural violence of our political arrangements.

THE RELEVANCE OF PRESTIGE IN ORGANISING SOCIAL RELATIONS

Vasiliki Kantzara

Sociology, PANTEION UNIVERSITY OF SOCIAL AND POLITICAL SCIENCES, Athens, Greece

Abstract: Prestige is considered a symbolic and scarce good in society. In social sciences it is furthermore defined as a symbolic value that is attributed to individuals, groups, and other collective entities on basis of achievement or on basis of ascription. Prestige is a constitutive element of social relations, constituting in its turn a form of social hierarchy that is connected with other prevalent forms of stratifying categories, such as class, status, gender, and ethnicity, to name but a few.

In sociology, prestige has been studied in relation to occupations and professions attempting to depict a social image of social stratification. Approaches stemming from the qualitative paradigm have attempted to explore the symbolic aspect of prestige and its controlling effect on individuals and society. In anthropology it has been studied as a source of honour and esteem accruing to individuals according to certain social criteria.

The research I carried out concerned the study of gaining prestige in the teaching profession, in which one finds oneself among equals, with respect to education and income. The questions that arise and I shall discuss in the paper I propose are, How is prestige gained? And how does prestige organise social relations?

The study just mentioned and the study of the bibliography show that prestige as a phenomenon points to an evaluation system, which is important, for it contributes to organising and regulating social relations; it constitutes a kind of ‘symbolic credit system’ that has an effect as it organises both equal and unequal social relations.

TOLERANCE AS SOCIAL RELATIONSHIPS IN UNSTABLE TIMES

Oleksandr Volodymyrovych Khyzhniak

Department of Sociology, V. N. KARAZIN KHARKIV NATIONAL UNIVERSITY, Kharkiv, Ukraine

Abstract: A sociological study of the place and role of tolerance in the system of social relations, mechanisms for optimizing the social interactions in the context of tolerance allows us to outline the direction of movement of humanity from a culture of violence to a culture of peace through the expansion of tolerant social practices. Currently, not only practical importance of tolerance as a criterion of “civilization” of any society, but also its multidimensionality is being realized. Multidimensionality of tolerance is due to several issues: first, this phenomenon differently understood and interpreted in different cultures, secondly, in different historical periods in the life of mankind was the need for tolerance of different and manifested in different ways, uneven covering certain social segments and thirdly, the different layers (groups) of society demonstrate different forms, styles, types of tolerance and behavior. Generally tolerance of different cultures in different social environments and situations is being fixed.

In unstable times calls for tolerance of institutional support from both the state and civil society are needed. Social institutions according to their role in the formation and regeneration of tolerant social practices the author arbitrarily are divided into three groups: the first group consists of institutions which “produce” tolerance as cultural norms and values (institutes of science, law, politics, religion, ideology, etc.); the second group includes institutions that can transmit the vision of a tolerant world, form tolerant competence (of the family, education, mass-media); the third group includes institutions that perform the function of social control over compliance in a particular society the principles of tolerance (law institute, institute of state, public opinion). Tolerance provides boundless ways of communication, the creation of tolerant social networks on individual and institutional levels. Optimization of social interactions in the context of tolerance requires technologizing sociological knowledge about this phenomenon. Especially it applies for increasing the role of tolerance in promoting human rights in the context of growing social inequality.

“SOCIAL THEORY AND VIOLENCE. THE CASE OF NAZISM”

Ramon Vargas Maseda

SOCIOLOGY, UNIVERSITY OF MEXICO-UNAM, Madrid, Spain

Abstract: Social theory has faced a number of critiques for being incapable of explaining many different aspects of modern social life.

Hans Joas has established the relationship between the assumption that modern societies would be peaceful, and the subsequent lack of theoretical tools to understand the current growth of violence in a global scale. He has also explicated why the idea that modern societies would eradicate violence and be peaceful in accordance to reason, progress, and democracy, led to many of the most prominent social theorists to disregard violence as an integral part of society.

I consider fruitful to incorporate the case of Nazism as an eloquent referent that has revealed the theoretical weaknesses of social theory. I claim with many others that we still don’t have an adequate sociological response to Auschwitz. On the one hand, the principle of a peaceful modern society led to the interpretation of Auschwitz as something unique. On the other hand, in spite of the interpretation advocated by Arendt and Bauman that states the relationship between Nazism and modernity, there has not been an interpretation that somehow attends both, modernity and uniqueness.

THE AMBIVALENT SIGNIFICANCE OF FREEDOM IN SOCIOLOGICAL THEORY

Mikael Carlehedén, Margareta Bertilsson

Department of sociology, COPENHAGEN UNIVERSITY, Copenhagen K, Denmark

Abstract: The concept of freedom has an ambivalent role in sociological theory. On the one hand, sociology as a discipline is predominantly understood as a scientific reflection on modernity which, in turn, is closely linked to the imaginary signification of freedom. On
the other hand, sociology has always been a skeptical follower of Enlightenment philosophy and classical contract theory. Classical sociology situated freedom in the relation between individualism and social order. Later focus became redirected onto social order and to the problems of its generative conditions. Yet, freedom (in one sense or the other) remained an implicit point of departure. In this paper we attempt to work out the often hidden role of different conceptions of freedom in some influential sociological theories. Our point of departure lies in the transformation of sociological theory reflecting on modern societies. Such a point of departure (significantly inspired by the works of Peter Wagner, Nikolas Rose and Luc Boltanski & Eve Chiapello) rests on the assumption that both sociological theory and modern societies have gone through two general historical epochs and seems now (since the last quarter of the 20th century) enter a third one. The aim of our paper is to clarify how the concept of freedom in its relation to the social is transformed in sociological theory over time.

RETHINKING THE LEGAL SUBJECT: HISTORY, TRANSFORMATION AND CRITIQUE

Thomas Goldup

1Law, King’s College London, London, United Kingdom

Abstract: Previous attempts to locate the historical origins of the universal and abstract legal subject have been misguided producing flawed attempts to resolve the crisis which afflicts the contemporary liberal legal subject. Not only are they questionable as a matter of historical enquiry, but they undermine our ability to think beyond this legal subject in an age which demands it. Today turbulent forces lead us to question the universalistic assumptions about the person underpinning legal institutions. I argue that rethinking the limits and possibilities of today’s legal subject requires greater awareness of the historical contingencies and uncertainties which shaped it.

I begin with a critique of previous accounts of the origins of the universal and abstract legal subject. Focussing on Norrie, Lacey and Ramsey, I suggest important limitations to the efforts of each to identify the origins of the abstract and universal legal subject. In each the formative influences from economy, politics and, especially, ideas which shape these institutions escape historical analysis. Instead an ahistorical logic is implied that downplays the tensions and contradictions inherent in those formative dynamics. In this way, a vital dimension of that subject’s historical foundations is missed. We are left with an ideological critique of particular institutions and ‘its’ legal subject.

These problems lead each to identify the origins the abstract and universal legal subject in the 19th and 20th centuries. I argue earlier origins which suggest new lines of critical analysis for the legal subject and our capacity to treat diverse ‘others’ before the law today. I uncover a paradoxical pattern in the spread of the formative influences that shaped this subject which should inform critical thinking about the legal subject more generally. Whilst diffusion of universal and abstract thought about the world and persons within it was, on the one hand, a reaction to historical events which accommodated it, the reception of such ideas by political and legal institutions paradoxically demanded the inheritance of particular historical contingencies challenging that claim. Critical thinking about the legal subject demands that we acknowledge the inheritance of these historical artefacts inherent to the ideas and forces that shaped it: the historical contextuality of ideas and attitudes themselves provide the only grounds for critique.

THE PARADIGM DELAY IN THE CRISIS OF TECHNO-NIHILIST CAPITALISM

Onofrio Romano

1 Dipartimento di Scienze Storiche e Sociali, Università degli Studi di Bari "A. Moro", Bari, Italy

Abstract: The relationship between a crisis and thinking strategies in the context of western modernity is generally marked by a peculiar movement: the harmful effects of an absolutization of market rule is counterbalanced by ideologies that emphasize the benefits of political redistribution (and viceversa). For example, the Great Depression of 1929 was the output of the market golden age started in the second half of the nineteenth century and at the same time it legitimated the long-run cycle of the State-centred regimes, with their multiple political declinations (fascism, communism, social-democracy). Even the birth of sociology is connected with the anomic effects of the spread of the market exchange. Normally, thinking strategies precede the crisis of regulation systems and prepare their change, offering new perspectives. So the crisis of the redistribution cycle at the end of the seventies and its substitution with neo-liberalist recipes (i.e., techno-nihilist capitalism) has been prepared by the imagination of post-structuralism and the paradigm of complexity. The current crisis opens a specific and unprecedented scenario: it evidently requires a new shift towards the State but the trauma for the harmful consequences of political sovereignty on society and economy is still strong, so a paradigm that legitimates this shift is not yet available.

SOCIOLOGY AND THE MAKING OF ITS CLASSICS

Frank Welz

1 Sociology, INNSBRUCK UNIVERSITY, Innsbruck, Austria

Abstract: In turbulent times sociology will not stand still. As the breakthrough to the industrial world gave birth to classical sociology, the current changes will shape the subject - but in which direction? Will the current state of sociology’s fragmentation and specialization be overcome by new ‘classics’ that will again raise the ‘big questions’, keep sociology’s disparate subfields together and renew its public role in society?

For considering the prospects for that, I will first analyse the making of the classics. How does the scientific community produce its canon? I will distinguish three ways of promoting and finally constituting the ‘classical’ heritage of the discipline: On the one hand, there is the ‘identity engineer’ who conservatively serves the discipline to stabilize its identity by reconnecting us to our predecessors (stabilization). On the other hand, there is the ‘collector of ideas’ who is dredging up concepts and authors and through doing that tries to critically undermine sociology’s contemporary predominant paradigms (variation). However, a reflexive sociology in the 21st century will require a more selective approach toward its heritage (selection). I will argue that in theory a historical epistemology of disciplinary paradigms will be needed, if sociology and its core paradigms like to regain its lost attractiveness in explaining the lives and worries in turbulent times.
RN 30 Youth and Generation

‘WHEN OPPORTUNITY KNOCKS’: CHOICES, CONSTRAINTS AND HOUSING TRANSITIONS IN TURBULENT TIMES

Steven Roberts

School of Education, UNIVERSITY OF SOUTHAMPTON, Southampton, United Kingdom

Abstract: Despite there being no particular sequence or ranking order in the various interrelated transitions to adulthood status, leaving the family home (even if not permanently) presents young people with significant adult responsibilities – usually (though not always) having to manage one’s own finances, consumption decisions and domestic labour independent of parental influence (Mulder, 2009). Yet curiously, and despite the interlinked and interdependent nature of the various stages in the transition to adulthood, domestic and housing transitions remain relatively under-researched in comparison to experiences of and journeys through education and employment. Indeed, the paucity of research in this area has led Heath (2009: 214-215) to suggest that ‘one could argue that… any new contributions are to be welcomed’.

Using data from interviews with ‘ordinary’ and ‘unproblematic’ young men in the South-East of England, this paper critiques and refines Ford et al’s (2002) influential typology of housing pathways and shows how opportunity needs to be considered alongside agency and structural constraints in order to fully understand young people’s housing aspirations, even in the context of a (post) recessional climate. The limited research interest which is afforded to young people such as those in this study ensures that the experiences and aspirations outlined here will add to and complement existing literature focussing on the housing careers of graduates and young professionals (e.g. Heath and Cleaver, 2003), students (e.g. Thomsen, 2007; Macintyre, 2003), those leaving home especially early (e.g. Jones, 2004; Aquilino, 1991), and those entering the housing market after leaving care (e.g. Biehal and Wade, 1999; Wade and Dixon, 2006).

LIFE COURSE TRANSITIONS IN TWO GENERATIONS: THE CASE OF PALOP MIGRANTS AND THEIR YOUNG DESCENDANTS

Tatiana Matos de Jesus Ferreira

ISCETE - Lisbon University Institute, Institute of Social Sciences - University of Lisbon, Lisbon, Portugal

Abstract: This paper is part of an ongoing PhD project, named “Gender and generations: processes of transition to adult life of young descendants from Portuguese speaking African countries”, which will adopt a comparative methodology between young descendants from PALOP and their parents in what concerns representations and life trajectories. Based on a literature review from sociology of youth, migration, gender and generation studies and the preliminary results of the exploratory field work, this paper seeks to identify and explain the main generational differences in life courses comparing the process of entrance to adulthood in two generations. The main purpose is to identify the main differences in terms of timing, duration, and order of life’s major events, like finishing education, entering the labor market, leaving home, conjugality and parenthood. The analyses of the exploratory interviews will also be important for the understanding of the negotiations processes and different representations of adult status within the family.

TRANSITION OF ABANDONED YOUTH FROM „THE GREEN-HOUSE” TO „COLD WATER” LIVING CONDITIONS

Ilze Trapenciere

Sociology, INST. PHILOSOPHY & SOCIOLOGY, UNIVERSITY OF LATVIA, Riga, Latvia

Abstract: The objective of the paper is to discuss the transition of abandoned young people after reaching the full age. According to legislation these young people have to leave the residential care when turning 18. When leaving residential care young person has to start independent life in a very short time without previous experience and knowledge about the real life outside residential care.

In Latvia there is little research on abandoned children and youth, and research on youth leaving residential care. The paper discusses the transition process and how it is expressed for young people leaving residential care.

The paper is based on interviews with care leavers on the following aspects of their lives: settling at own accommodation and problems related with housing conditions, finding job and problems related with job searching experience, their knowledge and experience on organizing their everyday life, earning and spending money and the role of social services during the very fast transition from ...green-house” conditions at the residential care. Paper also provides an analyses on necessity of ...transitional phase” for youth before the real transition starts and gives insight on the ...transitional policy” for abandoned children in other ex-socialist countries - Bulgaria and Romania.

YOUTH POLICY IN RUSSIA: PLURALISM OR UNIFICATION?

Valentina N. Yarskaya, Elena R. Larskaia-Smirnova

Department of Social Anthropology and Social Work, Saratov State Technical University, Saratov, Department of General Sociology, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The aim of this paper is to analyze major obstacles and sociocultural barriers on the way towards modernization of the national youth policy in Russia and its contradictory discourses. The strategies of Russia youth policy have significant gaps, determined by the fragmented and stereotyped knowledge about the youngsters as well as interaction between youth and the state. Youth policy is now reduced to the thematic plans of activities directed to young people as objects of action. It is not enough to think of youth as an object of state policy. To understand youth as a subject of social change it is important to integrate micro- and macro approach to take into account the issues of individualization and risk, prevention and inclusion. Youth subcultures in today’s Russian offi-
cultural discourse are presented as a source of danger with associated moral panic while they provide young people with an alternative of adult dominant culture, help manifest identity. Semantic of social risks is evolving within cultural-historical contexts, and in today's Russia it is associated with danger to life or well-being, and even falls under the Penal Code of Russia. Social exclusion is promoted through deprivation of many young people of the accessible facilities, services and respect. At the same time, subcultures are dynamic phenomena and they indicate the existing or emerging moods, problems and crises. The members of different subcultures receive a certain status within the local cultures, building a cultural self-identity. It is a message to us about their unique system of values and norms, behavior practices, consumption identities and lifestyles. Code switching of youth policy is required on the way from the ideology of exclusion towards the principle of inclusion of groups that differ not only by lifestyle, but also by social status, education, health. The authors discuss issues of deprivation in childhood and youth as well as social stigma that is attached to the members of some youth groups and subcultures due to the dominant normativist and punitive discourses of socialization, inter-generational relationships and your state policy. A necessity of social integration and interpretative approach to socially diverse youth cohort is considered. Social inclusion is shown as a serious and complex task that imply consistent and co-ordinated actions of all policy agents.

CHANGES IN YOUTH TRANSITIONS TO PARENTHOOD – CHALLENGES TO YOUTH AND FAMILY POLICIES

Siyka Kostadinova Kovacheva1

1 applied sociology, PLOVDIV UNIVERSITY, Plovdiv, Bulgaria

Abstract: This paper addresses the challenges to youth and family policies that arise from changing youth transitions to parenthood in the turbulent first decade of the 21st century. The ambition is to examine the overlapping effects of structure and culture in framing and constraining young people’s choices to become parents or not and to situate the study in concrete national, organizational and household contexts.

The paper analyses the process of family formation as intermingled with the transition from education to employment and from precarious to more stable jobs, from the parental home to independent housing, as well as with processes of identity construction and wider social integration. Modern trajectories are more fluid and force young adults to make choices at many critical points at time. Based on combination of qualitative and quantitative data from several comparative research projects such as Transitions, Quality of Life and Up2Youth, the paper offers reflection upon the experiences, meanings and consequences of individual strategies for combining work and family under the conditions of different country and company policies and practices. It ends with a discussion of current policy dilemmas of how to support young working parents while leaving room for experimenting, and moving beyond individualistic, gender and culture blind assumptions, and short-term competition gains to longer-term considerations of broader societal and economic issues.

NEGOTIATING RELIGIOUS AND NATIONAL IDENTITIES: THREE STRATEGIES EMERGING FROM THE EXPERIENCES OF YOUNG BRITISH MUSLIMS

Michela Franceschelli1

1 Centre for Research on the Child and Family, University of East Anglia, Norwhich, United Kingdom

Abstract: Contemporary European societies are becoming increasingly diverse as a result of greater international mobility. However, the current socio-economic circumstances with increasing competition, job insecurity and decreasing welfare protection have exacerbated the conditions for the integration of immigrants and led to concerns about security and cohesion. Governments are now facing the difficult challenge of creating a sense of national belonging, while maintaining a plurality of social identities. Together with these economic and political ‘turbulences’, the growing religious and cultural diversity has created new contexts that have affected family life and relationships.

The paper draws from a PhD ‘Young British Muslims and their parents: negotiating religious and national identity’ that aims to explore how young British Muslims from South Asian backgrounds negotiate their religious and national identity in the context of family life, particular Muslim parental culture. The influence of parents, through the intergenerational transmission of values, on their children identity is also examined.
The study adopted a 'qualitative driven mixed method approach', which started with a survey conducted with 560 young people, aged 14-19, from different ethnic and religious backgrounds in secondary schools in London (Newham) and Oldham in the North of England. This was followed by 52 semi-structured interviews with a sub sample of young British Muslims from South Asian background and both their parents. Visual methods were used in combination with the interviews with young people who, prior to the interview, were asked to take pictures of 'anything that they felt was relevant to describe their identity'.

The paper specifically presents qualitative results about the strategies adopted by young people to negotiate religious and national identities. Three main typologies were identified to capture young people's accounts of their identities negotiation and are: contesting tradition and parental culture; conforming to parent's will and traditions and combining identities.

Finally, the research provides insights into different parenting values and thus could contribute to the development of support for parents and young people which is grounded in the understanding of diverse family lifestyles.

THE ROLE OF THE FAMILY AND INTERGENERATIONAL RELATIONS IN SHAPING YOUNG PEOPLE’S VIEWS ON THE PAST

Karolina Keler1, Katarzyna Stec1

1Jagiellonian University, Kraków, Poland

Abstract: Within the academic and non-academic discourse about the transformation of the contemporary meaning of the history and the memory of the past a general question is formulated: whether and how important they are to the contemporary young man. Conservative cultural critics and other social scientists (Bell 1998, Lasch 1990, Framptom 1988) claim that in unsettled times young man has lost his/her sense of the history and the social relations in families are weakened. Thus, the continuity of the intergenerational transmission is interrupted. The aim of the paper is to explore the role of the family in creating the memory of the past and keeping the continuity of the memory. This issue is explored in the specific context of the visit of young people to the memorial sites of the former death and concentration camps. This visit supposes to enhance their historical awareness and educates them about the meaning of the past and memory. The argumentation is based on the outcomes of the survey study (before and immediately after the visit), which was carried out in 2009-2010 among young visitors (14+, N=2355) to the memorial sites (Auschwitz-Birkenau, Majdanek, Treblinka in Poland) and follow up qualitative study with survey respondents. Moreover, it seems that the guides and teachers opinions and observations are significant to discuss the issue of the role of the intergenerational relations in shaping the young people's sensitivity of the memory of the past. Thus, the focus group interviews with guides and personal interviews with teachers were made to grasp their perspective as well.

Ladislav Machacek1

1Institu of Social and Political Sciences, UNIVERSITY OF SS CYRIL AND METHODIUS, Trnava, Slovakia

Abstract: Slovak Republic achieved the lowest voters turnout in the European Parliament elections both in 2004 (16.9%) and in 2009 (19.6 %). Slight increase in the turnout that was recorded in 2009 by 2.7 % to 19.6% was with the first-time voters aged 20-23. The evaluation of the voters mobilization has been done by experts who claimed that the only difference between the pre-election campaigns in 2004 and 2009 were mobilization projects focused on students. These projects were financially supported by the European Parliament and the European Commission. One of them was the project SEP of the Department of Political Science, University of SS. Cyril and Methodius in Trnava. During 5 months this project developed activities focused on broadening the students knowledge about the European Union and the European Parliament. The results of the sociological analysis of turnout in the European Parliament elections cast doubt on the statement that the turnout of older citizens was higher than that of young people. Individual segments of young people in Slovakia had completely different voting behaviour. Especially university students identify their future with work in the EU. Therefore the university students turnout was very high (52%), in fact it was the highest in EU in all structured groups in the 2009 European Parliament.

EXPLORING THE DIFFERENT WORLDS OF POLITICAL PARTICIPATION AMONG YOUNG ADULTS IN SWITZERLAND. POLITICAL YOUTH CULTURE IN A DIRECT DEMOCRACY.

Martina Rothenbühler1, Kathrin Kissau1

1FORS, Université de Lausanne, Lausanne, Switzerland

Abstract: In view of diminishing turnout of young adults in many democracies one possible solution of the feared depolitization voiced frequently has been the introduction of more direct democratic processes to reinvigorate the citizen – political elite relationship. We scrutinize theses considerations by focusing on the only direct democratic country in Europe - Switzerland - and analyzing political participation patterns of young adults aged 18 to 25.

Using data recently collected as part of the author’s ongoing research project CH@YOUPART we map the political activities of young citizens in Switzerland. The data allows for an in-depth analysis of various forms of conventional political participation as well as newer political activities, such as blogging, using social media or engaging in events such as flashmobs. We compare these patterns with youth participation in Europe by drawing from data gathered with an identical questionnaire during the European research project EUYOUPART, which was conducted in 2004 in Germany, Austria, France, Britain, Slovakia, Finland, Italy and Estonia.

The analysis reveals that young Swiss display the same level of interest in politics as their European counterparts. However, they seem to engage in a wider range of political activities. We are able to show that apart from a small percentage of apolitical youth, politics and young adults do not represent two incompatible worlds. Rather we find evidence for the existence of a large political universe that consists of seven different patterns of political engagement. Education, gender and migration background are good predictors of belonging to one of these political spheres as well as of related opinions regarding political institutions and their effectiveness. Furthermore we detect an overall trend of young adults engaging in events such as flashmobs.
towards short, issue-specific political engagement instead of long-
time commitment. This tendency relates to the subject-oriented
nature of popular votes and their corresponding political activities.
The central characteristics of the Swiss political system thus seem
to accommodate young people’s preferences for these specific
types of engagement and therefore spur their participation offline
and online.

**FORMAL POLITICAL ENGAGEMENT OF YOUNG PEOPLE IN THE UK SINCE 1991**

Gary Pollock¹, Robert Grimm²

¹Sociology, MANCHESTER METROPOLITAN UNIVERSITY, Manchester, United Kingdom

Abstract: Despite recent activity in the UK where young people have been at the forefront of demonstrations against government policies on Higher Education, the growing disengagement of young people from electoral politics has come to be regarded as both a fact and as an irreversible phenomenon. The argument goes that young people are increasingly turning to alternative forms of expressing their political views, especially through new technologies. The decline in participation of young people is, however, poorly documented and is in need of an analysis which takes into account changes in individual attitudes given that it is widely accepted that political attitudes change over the life-course. This paper explores youth political participation in the UK using data from longitudinal data using the British Household Panel Study and its successor Understanding Society. It is less concerned with the party political dimension of their participation, rather it is focused upon the intensity of engagement and to the ways that it has changed over the past two decades. The analysis is both cross sectional and longitudinal: changes in individual attitudes are therefore set within the context of aggregate levels of engagement.

**COHORT DIFFERENCES IN CLASS ATTAINMENT IN SWITZERLAND**

Julien Chevillard³

³Political and Social Sciences, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Several studies have shown the impact of historical changes and, hence, of birth cohorts on life chances (Elder, 1974). This impact has been well demonstrated for France (Chauvel, 1998) and Germany (Blossfeld, 1986).

From this point of view, the case of Switzerland has remained for a long time understudied, with the exception of a descriptive study (Joye & Bergman, 2004). Our current study precisely aims to fill this lack. For this purpose, we used biographical data from a retrospective longitudinal survey of the Swiss Household Panel (n=3103). These longitudinal data allow for an accurate assessment of work trajectories and class attainment across generations in the life course, for the 1940-2002 period. We used Survival analysis and Discrete-Time Models and choose as event the access to upper and middle class.

Contrary to our initial assumptions, Switzerland is not characterized by very significant differences of class attainment between cohorts. Hence, young Swiss cohorts are not facing significant penalties in the labour market, oppositely to others young cohorts in some others European countries (like France and Southern European countries). Our others findings show that most of the access to upper and middle class happens in the beginning of work trajectories: after ten years of employment, access to upper and middle class becomes very scarce. Our analysis also demonstrates that, all other things being equal, unsurprisingly access to upper and middle class is strongly dependant of level of education, gender and class origin; furthermore these explanatory factors of access to upper and middle class have not changed in a systematically significant way in Switzerland during the last sixty years.

**RETHINKING INDEPENDENCE: PORTUGUESE YOUTH AND INTER-GENERATIONAL RELATIONSHIPS DURING THE ECONOMIC CRISIS**

David Cairns¹

¹CENTRE FOR RESEARCH AND STUDIES IN SOCIOLOGY, ISTCE-IUL, LISBOA, Portugal

Abstract: In Portugal, as in many other European countries, the practice of prolonged home-staying is extremely widespread among youth, with the length of time spent living in the parental home often stretching well into adulthood, and encompassing the years spent at university. This paper examines the housing situations of a sample undergraduates in Lisbon, Portugal (n=200), with the original empirical research taking place against the backdrop of the ongoing economic crisis. With Portugal being one of the countries in Europe most profoundly affected by the crisis, the question is asked if this is having a significant impact upon housing situation and other aspects of the transition to adulthood. The results obtained show that not only do the majority of those surveyed reside within the parental home (85%) but also that they intend to further extend this period of inter-generational cohabitation as a consequence of the economic crisis (66%). While financial justifications for this decision predominate, it is also evident that the high level and broad range of support which these young people receive from their parents plays an important role in defining their housing orientations. Further responses reveal a cultural dimension to Portuguese home-staying in respect to conceptualisations of independence: in the majority of cases, independence is related to the freedom from domestic responsibilities and financial constraints, as well as the provision of time and space in which to personally develop, as opposed to taking on such burdens. Staying with parents thus becomes not only financially and emotionally appealing, but the period of residence in the parental home can be imagined as a positive resource in the transition to adulthood.

**THE EFFECTS OF THE ‘CREDIT CRUNCH’ ON 16-YEAR OLDS IN NORTHERN IRELAND**

Dirk Schubotz¹

¹ARK, QUEEN’S UNIVERSITY BELFAST, Belfast, United Kingdom

Abstract: This paper addresses the effects of the current economic crisis – or ‘credit crunch’ on 16-year olds in Northern Ireland. I will present findings from the 2009 and 2010 Young Life and Times (YLT) surveys in which random samples of 16-year olds in Northern Ireland were asked about the extent to which the ‘credit crunch’ has affected them.

YLT is an annual study of 16-year olds undertaken in Northern Ireland since 2003 by ARK, a joint initiative by Queen’s University and...
the University of Ulster. The sample is drawn from the Child Benefit Register. Child Benefit is (still) a non-means tested benefit which is universally paid to people who bring up children in the UK and is paid for each child.

857 and 786 respondents participated in the YLT surveys in 2009 and 2010 respectively. Using descriptive as well as regression models, I will show what young people were most likely to be affected by the economic crisis (e.g. family financial background, rurality, living with both parents or not, ethnicity, educational background etc.). I will then discuss some of the potential consequences for the life courses of these young people as well as implications for 16-year olds’ mental health.

In 2009, YLT also asked how the ‘credit crunch’ affected young people on a day-to-day basis, and I will discuss the findings of this open question.

**BINGE DRINKING, ETHNICITY, GENDER AND ASIAN AMERICAN YOUTH**

Geoffrey Hunt

1INSTITUTE FOR SCIENTIFIC ANALYSIS, alameda, United States

Abstract: Asian Americans represent one of the fastest growing ethnic groups in the U.S. Nevertheless, in spite of the growing significance of Asian Americans within the U.S., the depth and breadth of scholarship on alcohol use among Asian American youth is far less than that of white and African American (and to a lesser extent, Latino) youth. The result is that we know relatively little about Asian American alcohol use. One of the primary reasons for this neglect has been the belief that alcohol use among Asian Americans is not a problem. Increasingly, however, this assumption is viewed as erroneous. In fact the small amount of research that exists suggests that Asian American youth that drink are often involved in heavy drinking and may even consume more alcohol during binge drinking sessions than other ethnic groups.

Given this relative absence of available research, this paper examines issues of alcohol consumption among young Asian American, both male and female, who attend dance clubs in the San Francisco Bay Area. Using data from in-depth interviews with 275 young people, we will explore young Asian American club attendees’ drinking practices and patterns and their discussions of ethnic identity, group drinking, binge drinking, experiences of drunkenness, and violence. We examine two aspects in detail. First, the extent to which Asian American young women are involved in fighting while drinking and second the distinctions made by our respondents in discussing different types of drunkenness brought on by different types of alcohol.

**COMPARING YOUTH DRINKING ACROSS EUROPE AND THE UNITED STATES**

George W. Dowdall

1Sociology, SAINT JOSEPH’S UNIVERSITY, Philadelphia, United States

Abstract: This paper examines several related issues. First, do young people in Europe and America differ in their use of alcohol? Considerable evidence suggests that youth alcohol use is associated with a range of behavioral, criminal justice, and health consequences. Data on 35 European nations from the 2007 European School Survey Project on Alcohol and Other Drugs (ESPAD) are compared with the 2007 Monitoring the Future (MTF) data for the United States. In addition, data across the American states on youth alcohol use is presented from the 2006-2007 National Survey on Drug Use and Health. Variation in past 30 day measures of the prevalence of drinking, heavy drinking, and intoxication across the European and American states pose a second question: What are the most significant factors that account for variation in these measures? A final section of this presentation discusses the sociological and public policy implications of these results.

‘LIKE MOTHER, LIKE DAUGHTER, LIKE FATHER, LIKE SON?’ A CRITICAL EXPLORATION OF ‘INTERGENERATIONAL CULTURES OF WORKLESSNESS’

Tracy Shildrick

1sociology, TEESIDE UNIVERSITY, Middlesbrough, United Kingdom

Abstract: This paper draws on research funded by the Joseph Rowntree Foundation (JRF). The project put influential but controversial theories about ‘intergenerational cultures of worklessness’ (IGCW) to the test. Ideas about IGCW are extraordinarily popular idea in contemporary British politics and social policy circles – and in the minds of the general public. Yet there is surprisingly little empirical evidence in support of them. This JRF study aimed to critically investigate the existence of IGCW empirically, close up and in detail. Research was carried out in deprived areas of Teesside and Glasgow. The project employed life history interviews with three generations of families who had experienced prolonged worklessness in each generation. Interviews were held with grand-parents, parents (in middle age) and young adults from these families.

With the aid of case study data, the paper will seek to illustrate some of the main, emergent findings of the study. Locating families with permanent, near permanent or even very prolonged periods of worklessness in each generation proved enormously difficult. The paper reflects on the interplay of individual and family biographies in the contexts of changing labour market opportunities in each locality over time, demonstrating the significance of opportunity structures in shaping life chances. The paper reflects on how shared and cumulative disadvantages and experiences beyond the labour market – and beyond the normal ‘barriers’ said to limit employability – (e.g. to do with violence, abuse, problematic drug use, offending, victimisation) can shape patterns of labour market engagement in complex ways and with complicated effects across generations.

‘INTERGENERATIONAL CULTURES OF WORKLESSNESS: POPULAR MYTH OR MISERABLE REALITY?’

Robert Macdonald

1Social Futures Institute, TEESIDE UNIVERSITY, Middlesbrough, United Kingdom

Abstract: This paper reports on the theoretical background to a Joseph Rowntree Foundation research project which has critically investigated the idea that high rates of worklessness amongst young people in the UK can be explained by ‘intergenerational cultures of worklessness’ (IGCW). The concept of IGCW is used with confidence and authority by politicians, social commentators and social welfare professionals, yet appears just as at home in popular UK television programmes such as ‘Shameless’ and ‘Little Britain’. Typically, the meaning and fact of IGCW is presented as simple and
self-evident; the concept is rarely subjected to critical interrogation. Yet closer reflection reveals the lack of clarity and ambiguity of the idea – it is used by different people to mean different things – and empirical research evidence in clear support is surprisingly elusive given the widespread use of the idea in political and policy circles.

IGCW proposes that over time anti-employment attitudes and cultures of dependency on unemployment and incapacity benefits have developed in locales of persistent worklessness. Critically, it argues that these cultural outlooks and practices are passed through generations and into whole communities. Young people are said to be pivotal in receiving (and passing to their own children) a cultural disposition towards worklessness. The Social Exclusion Task Force suggest that, for young people, ‘the intergenerational experience of worklessness and traditional views of women’s role... could be influential social frameworks’ (2008) leading to low aspirations, pursuit of ‘the mothering option’ for some young women (Craine, 1997) and a lack of legitimate, longer term employment plans for both young women and young men. These sorts of findings are far from conclusive and MacDonald and Marsh (2005:123) found overwhelming commitment to the ‘social and moral value of working for a living’ amongst economically marginal young adults. This paper critically examines the contemporary relevance and shape of political, policy and academic discourses about inter-generational cultures of worklessness in the UK, particularly their implications for young adults in contexts of high and rising unemployment.

“YOUNG UNEMPLOYED AND UNQUALIFIED PEOPLE AT WORK”: AN ANALYSIS OF THE CONDITIONS OF PROFESSIONAL INTEGRATION FOR YOUNG UNEMPLOYED AND UNQUALIFIED PEOPLE IN SWITZERLAND.

Eva Nada

1Faculty social sciences and politics, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Ideas that young people relations to work have changed over the last decades is very widespread. It is argued that they are less disposed to make invest themselves into work and learning. This problem is even more accurate when facing deviant youth. In this contribution, I ask specifically to which extent institutional settings participate to produce this issue by analyzing the content of levels and directions of effort young people must make to have a chance to integrate labour market and the effect produced on their conditions of professional integration.

To investigate this issue, I used evaluation reports of young people knowledge and psychological aptitudes as well as social interaction between guidance counsellor and young people, which have been collected during an ethnographic study in a public organisation of vocational guidance working with young unemployed and unqualified people.

One important result is that direction and level of efforts that young people have to make are more oriented towards gaining autonomy and motivation than towards the improvement of their knowledge. In the lights of the data collected, the shortcomings of young people are considered as barriers for chances of improving knowledge. Guidance counsellors advice young people to reorient their professional project toward a job less demanding in effort. However, depending on the understanding of the direction and level of efforts young people have to give, some of them get a chance to see their conditions of professional integration open up and to receive help to achieve it. I will then discuss under which conditions young people understand the expectations of the organisation in the aim to underline the normative models on which the possibilities of integration for young unemployed people are constructed. This study shows that quality and performance of young people is depending on the way organisational setting framed them and how young people understand what is expected by theses organisation.

COMMON PROBLEM - VARIOUS CONSEQUENCES. SOCIAL EXCLUSION OF THE YOUNG LONG-TERM UNEMPLOYED FROM KIELCE (POLAND)

Piotr Binder

1Institute of Philosophy and Sociology, POLISH ACADEMY OF SCIENCES, Warsaw, Poland

Abstract: Scholarly work has provided significant evidence to confirm (a) a highly negative influence of the experience of long-term unemployment on further careers of the young people, and even more importantly (b) the risks related to their progressive exclusion from various areas of the society. The aim of the proposed paper is to discuss the outcomes of a careful analysis of the in-depth interviews with young people and young adults (aged 18-35) from mid-size town/regional center in southern Poland (Kielce) designed and conducted within the framework of Grounded Theory Methodology.

The general idea is to discuss how making “maturity of judgment” a central phenomenon and a starting point of the analysis might help us to interpret and understand a variety of possible consequences (including elements of social exclusion) of the situation of the long-term unemployment experienced by people at the early stages of their adult lives.

Concentrating on the category of “maturity” allows us not only to see the intriguing similarities in attitudes towards the problem of unemployment between those who differ significantly between each other (in terms of age and level of achieved education), but also – in the course of analysis – to construct four theoretical types of the unemployed (or situations of unemployment) named: “threatened by social exclusion”, “highly motivated”, “teenagers 20s” and “young adults”.

The empirical basis for this analysis comprises of materials collected within the qualitative part of YOUNEX "Youth, Unemployment and Social Exclusion in Europe" (WP4) 2009-2011 (Seventh Framework Programme No. 216122).

REPRESENTATIONS OF SELF AND SOCIETY AND FUTURE ORIENTATIONS OF YOUTH IN PRECARIOUS LIFE CONDITIONS

Marliese Weissmann

1UNIVERSITY OF LEIPZIG, Leipzig, Germany

Abstract: With growing social uncertainty, the extension of precarious jobs and high youth unemployment rates, the question as to how youth integrate themselves and develop future plans has received critical importance. Especially young people with a low educational level and disadvantaged family backgrounds face the chal-
lenges of integrating at two levels of formation and employment or respectively of gaining a societal position which provides social recognition.

Processes of individualisation have led to a higher individual responsibility for one’s own biography and life conditions. Since the political turn towards activation policy the main socio-political aim of the German unemployment administration has been the strengthening of individual responsibility. Individuals below the age of 25 benefit in particular from so-called “enabling” welfare measures, providing e.g. resources to finish school. At the same time, the duty to integrate through work and activity has been significantly enhanced. A violation of these obligations can quickly result in strong sanctions, even to the point of a complete cut of unemployment benefits. Furthermore, parents are legally bound to vouch for their children, which entails that unemployed youth up to 25 years may strongly depend on their parents’ help and resources.

The proposed paper focuses on German unemployed youth who failed in their school or formation career and who are currently in labour market measures. Recent research detects significant difficulties of these young people to localize themselves in society. However, they are still a part of society and so take part in it.

By adopting an actor instead of a victim centred approach, I explore their ways and attempts to participate in society in relation to their image of society along qualitative data. Where do they see their place in society in the present and the future and in which interpretations of society is it embedded? In what way serve labour market measures as resources for them? The analysis draws on biographical-narrative interviews and group discussions which are undertaken within the framework of the research project “Worldviews in Precarious Conditions of Life” at the University of Leipzig.

ORIENTATIONS OF SENIOR STUDENTS TOWARDS AUXILIARY EDUCATION AND PART-TIME JOB

Irina I. Kharchenko¹

Abstract: Paper is based on the data of two comparable sociological surveys at educational institutions of higher, secondary special and vocational (primary) levels in Novosibirsk region of the Russian Federation in the course of which senior students were interrogated by questionnaire – in 2001 N=2450, in 2007-2008 N=3600 (including 1945 people at universities). It was revealed that senior students have high demand for additional competence (especially in IT) and complementary education in professional sphere. Auxiliary professional education is considered by the majority of future young specialists as an important factor of professional qualification growth and successful career. Among the students of universities and colleges within the observed period the share of those intended to continue education in the next 2-3 years after completion of current step has grown.

Another distinctive feature of contemporary students is their inclination in part-time employment. Among the respondents each second universities’ student and each third colleges’ and professional schools’ student had part-time job or earn additionally at the moment of interrogation. The main motives of employment were getting money and acquisition of work experience.

PRECARIOUS TRANSITIONS OF YOUNG PEOPLE IN PORTUGAL

Nuno de Almeida Alves¹, Renato Miguel do Carmo¹, Frederico Cantante¹, Inês Baptista¹

¹CIES, INSTITUTO UNIVERSITÁRIO DE LISBOA, Lisboa, Portugal

Abstract: European youth is currently facing an increasingly difficult transition process to adulthood. The economic crisis that most of Europe faces these days has been a major contribution to the shrinkage of job opportunities for young people, at least the kind of jobs that everybody seeks and only some find: skilled, secure and well-paid. For many, the future seems like a harsh journey through unemployment, interrupted by periods of low-pay part-times or unskilled full-time jobs, intertwined with unpaid internships and training experiences. This can be considered a rather bleak future for the most qualified generation ever, after the massification of secondary and tertiary education.

Portugal presents a somewhat different picture. Education attainment is rather low in the 18-34 age cohort, by European standards, and the economy is substantially more fragile, unable to provide the volume of job-offers needed, either qualified, secure and well-paid or not. How is the Portuguese youth coping with these hard living conditions and future prospects? How does the volume of resources possessed (educational, professional and social capital) operates as a leverage to overcome this situation? Which strategies, if at all, are envisaged and deployed by young people? What is the role of family support?

This paper will try to answer all these questions drawing on a recently finished research project concerning young people integrated in low-qualified and low-paid jobs in Portugal, based on eighty in-depth interviews carried out in four different locations of the country and stratified by sex, age, educational and occupation criteria.

YOUNG ADULTS BETWEEN INDIVIDUAL RISK, CONSERVATIVE NORMS AND CHAOTIC POLICY. ON SHAPING LIFE-COURSE REGIME IN POLAND

Magdalena Rek-Wozniak¹

¹Institute of Sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: During last decades, social structures in Central and Eastern European countries, have been reshaped, both in consequence of systemic transformation and global processes. The criteria, under which individuals are ranked on the social ladder, and those, under which the segments are located in the social space, have been changing. These phenomena are accompanied by decomposition and re-composition of social status. Tendencies towards class closure which can be observed in today’s Poland, reveal the diversity of life courses, resulting from mutual influence of the stratification process, institutional measures aimed at overcoming structural factors limiting life opportunities of individuals and the shift of value-laden fundamentals of social policies.

Normative modeling, understood as socially constructed concepts of “normal” life-course is one of important elements of welfare culture. It defines “success” and “failure”, as well as desired patterns of educational, occupational and family career, their relative importance and sequence. It also defines the division of responsibility for supporting individual life courses.
However, the distribution of biographical risks among different socio-economic groups, remains unequal. As many empirical analyses show, early adulthood can be seen as critical phase in this respect, as it covers transition from education to the labour market and from parental household to independent one/family of procreation.

The proposed paper will aim at presenting axiological and institutional factors shaping legitimized patterns of early adulthood and life opportunities for young adults in Poland. It will also focus on reconstructing the selected elements of life-course regime emerging after 1989, especially in relation to the question of upward social mobility.

The paper will be structured around various types of data. The reconstruction of patterns of early adulthood typical for different social classes will be based on available statistical and demographic data, as well as on own research conducted among young adults. In order to reveal the legitimate models of the life stage in question, strategic documents other elements of public discourse, such as selected media debates, will be put into analysis.

ROLE OF FAMILY IN THE SHAPING OF FEASIBLE FUTURES OF YOUNG PEOPLE ON THE MARGINS
Sanna Aaltonen

1YOUTH RESEARCH NETWORK, Helsinki, Finland

Abstract: This paper will elaborate the notion presented by Isabelle Bertaux-Wiae (1993/2005) that imagining of ‘possible futures’ takes place within the context of family relations. The paper will draw on qualitative biographically focused interviews with a specific group of 15-17-year-old young women and men and with their parents. Many of the informants had a somewhat turbulent history of school disengagement, delinquent behaviour or use of intoxicants. At the time of the interviews they were participating in targeted services offering support to complete comprehensive school and to prevent marginalization. Further, they all were ninth graders and therefore about to make the transition to post-compulsory education. Being in the ninth and last grade of compulsory school and having a somewhat troubled school history can be understood as a critical institutional moment in which people are expected to reflect on their life both retrospectively and prospectively, deal with the weight of the past and calculate the feasibility of different choices concerning the future. What then is the role of family in shaping the aspirations of young women and men on the margins of educational institutions? The paper will focus, with special reference to gender and ethnicity, what are the hopes, resources and options of the young people and their parents concerning the educational transitions of young people.

YOUNG GIRLS WITH IMMIGRANT BACKGROUNDS: IDENTITY AND CULTURE IN A MULTICULTURAL SUBURB
Gaia Farina

1sociology, UNIVERSITÀ DEGLI STUDI DI PADOVA, Padova, Italy
2dipartimento discipline della comunicazione, Università di Bologna, Bologna, Italy

Abstract: My research focuses on young girls with immigrant backgrounds. The aim is to understand the ways they deal with cultural differences in daily lives and if and how the experiences of living in a multicultural context affect and shape their cultural repertoires and identities. In Italy the number of the so-called “second generation migrants” has considerably increased in the last ten years in conjunction with a period of economic crisis that caused an increase of insecurity and fear of difference. However, the multicultural composition of the Italian towns promotes the daily encounter between young people with different cultural roots, the sharing of meeting places and life experiences. In the context of a growing symbiosis between autochthonous youth and young people from migrant backgrounds, the first assumption of my research is the need to consider the youngsters with migrant roots not only as immigrants but as young people, in the daily interactions with same age autochthonous. In particular my attention is focused on young girls and gender issues. Indeed “immigrants’ daughters” are not very present in the literature comparing to several studies conducted on “immigrants’ sons. My main case study is on young people living in a fringe neighborhood of a Northern Italian city, Bologna. It is a popular area out of the city center, where live in council houses Italian and immigrants from different countries. I used qualitative and ethnographic research methods: participant observation, interviews and participatory visual methods in order to involve young girls (photo elicitation) and to investigate their use of public spaces (walkabouts). Finally I analyzed how young girls, involved in my research, use new on line media and their self-representation on Facebook. The issue is reflect on to what extent young people shape and hybridizes their own cultures and identities throughout their daily practices. Last goal of my research is to cover the 3 following issues about young women studied: their form of social involvement, their social relations and friendships; their aspirations for the area of self-realization, their expectations and intentions for the future; their reference model of woman. I will present the first results of my fieldwork and I will focus on the advantage of using mixed methods in research projects that focus on young’s cultural worlds.

YOUTH OR SOCIETY IN DIFFICULTY: TOWARD A NEW DEFINITION OF YOUTH POLICIES?
Patricia Loncle

1sciences humaines et sociales, ECOLE DES HAUTES ETUDES EN SANTE PUBLIQUE, Rennes, France

Abstract: Firstly, macro societal and European difficulties: an important rate of unemployment but also of precarious forms of employment; major problems of employment market access; a growing social precariousness. Secondly, French specific social difficulties: a social mistrust toward young people as a whole; growing forms of repressions of youth behaviours; healthism of social youth problems. Thirdly, multidimensional weakness of youth policies: a familialisation of youth problems; a certain and historical frailty of the national State in the field of youth policies; the central role of local authorities in this field and the pertaining territorial inequalities.

In this context, one could raise the question of the capacity of French institutions and society to support young generations in their social and political integration trajectories. To analyse this dimension, as national policies are very loose and fragmented, we will focus on local policies that take care of vulnerable youth in the sectors of health and social affairs.
Our material is the result of a project that is in process: in this project, we study three French départements (meso level territories between Cities and Regions) and compare their ways of dealing with their population of vulnerable youth. For the conference, we will refer to interviews led with locally elected persons, with decision makers of different local levels and local state bodies (around 90 interviews have been led in 2009-2010).

In the presentation we will concentrate our attention on four dimensions: 1. the presentation of socio-economic situations of young people in the three départements; 2. the new formulations and implementation of youth policies that take place in these territories and the perceptions of young people that come along; 3. the territorial specificities of these youth policies and the territorial inequalities that come consequently in each département. 4. the capacities of these policies to cope with young people’s multidimensional difficulties (in particular under the point of view of cooperation, networks, transversality and coherence of public action).

"I HAVE NEVER SEEN MY VILLAGE, BUT ONE DAY I WILL RETURN THERE." ADOLESCENCE AND INTERGENERATIONAL TRANSMISSION IN A PALESTINIAN REFUGEE CAMP.

Christoph Heiner Schwarz1

1GOETHE-UNIVERSITÄT FRANKFURT AM MAIN, Frankfurt a.M., Germany

Abstract: Palestinian society is one of the "youngest" societies worldwide, with over 65% of the population under the age of 25. These youths grow up under conditions of extreme political instability and permanent (civil) war. In the Westbank, it is especially the refugee camps, whose inhabitants comprise around one third of the Palestinian population, that have seen some of the roughest confrontations in the ongoing conflict with Israel.

When nowadays adolescents in these camps call themselves refugees and state, for example, that they have never seen their villages, and that one day they will return there, they identify with a political and militant struggle based on a narrative of “return” that has been transmitted from one generation to the other since 1948. In peace negotiations, the refugee question has been one of the most difficult issues: the claim of “return” of originally around 711 000 refugees which nowadays comprise over 4 million people has been determinantly rejected by Israel, arguing that thereby Jewish Israelis would become a minority.

My Ph.D. project explores the structure and dynamics of adolescence and intergenerational transmission in a Palestinian refugee camp. Doing group interviews with boys and girls between 15 and 18 years I pursued the question to what extent and under which conditions youths in this context are provided with a "potential space" (King 2002) to develop their life plans. Moreover, I focused on how adolescence is related to processes of intergenerational transmission of the refugee narrative and the political identifications implied therein.

GENERATIONS IN MOBILITY: A CASE STUDY OF HOW LIFE-COURSE DECISIONS IMPACT UPON THE EXPERIENCES OF FEMALE TEMPORARY MIGRANTS FROM WESTERN UKRAINE AND MOLDOVA.

Kathryn Vincent

1Sociology, University of Aberdeen, Aberdeen, United Kingdom

Abstract: A majority of the literature on temporary migration from the Former Soviet Union tends to present age as a simple variable attributed either to an individual’s life course position (either productive or reproductive) or physical ability; there are far too many assumptions of youth flexibility being solely due to their lack of children, job, or increased physical health. Instead, the paper proposes that the expectations of individuals within each of the generations need to be examined in contrast to their roles. Youth may not be more mobile solely due to their physical capacity, but also due to a newly discovered European identity, which includes an expectation of freedom from borders. Women without children may be more mobile due to their freedom from responsibilities, but is the increased opportunity for mobility, in turn, challenging their reproductive choices?

This paper is an evaluation of the experiences of six groups of women, specifically how their fertility choices were impacted by generational factors, and how these choices in-turn influenced their decisions to migrate temporarily. Each case study consists of women from one of three generations, in two regions (L’viv region of Ukraine, Chisinau in Moldova). The paper proposes that younger generations of women in this region are encouraged to pursue the post-materialist values presented as a birthright of European youth, while constrained by the social expectations of motherhood, and economic realities of life in the Former Soviet Union. As such, the younger generation follow patterns of elongated childhood and adolescence, while the older generations are constrained by family choices made before the economic transition.

MIDDLE CLASS YOUTH OF BIG-CITY AREAS IN TURKEY AND ALTERNATIVE LIFE STYLES

Derya Firat1, Hande TOPALOĞLU1, Öndercan MUTİ1

1SOCIOLOGY, MIMAR SINAN FINE ARTS UNIVERSITY, ISTANBUL, Turkey

Abstract: It is a fact that in modern societies the life period called “youth” has extended. As is the case in most world cities, young people in big cities in Turkey postpone also entering mature life, leave their families and build their own lives considerably later, belatedly delve into a working life that would provide them a stable status, and marry at a later age. Furthermore, the increase in unemployment is also affecting the youth. Although educated young people have elevated labor force participation rates, they are facing unemployment issues. The rise of “qualified people” unable to balance the rise of employment, is bringing forth the impairment of diplomas, forcing young people to continue in education period for a longer time to obtain a higher academic level and on the other hand, conducing to a disappointment as they couldn't reach committed positions. Nowadays not engaging oneself with ultimate decisions concerning future, taking roots into temporariness have come to define educated, middle class and urban youth in particular. In other words, "establishment" has been transformed to an "establishment on the temporality" for this population.

The extension of the passage to the mature life has created the opportunity for the youth to criticize and to reinterpret the values of mature society. It has been observed that youth’s subcultures have evolved into a "new life style".
Based on the results of our research (implemented with 180 interviewees), in this paper we will focus on issues influencing the emergence of this new life style such as prolongation of education process, postponing of marriage, passage to working life, separation from the family house, and military service and analyze “cultural and everyday practices constructing the ‘subcultural style’”, “the new conception of family, friendship, sexual relations”, and “new forms of political activism”.

AMBIVALENT EFFECTS OF YOUTH SCENES IN THE MULTICULTURAL SOCIETY OF LUXEMBOURG

Jean Claude Zeimet

Abstract: Youth scenes and open youth works structures constitute important fora for Luxembourghish youngsters to create new trans- and international forms of identity in times when traditional na- tional identities are challenged by a rapidly growing internationali- sation of Luxembourg. The daily street life in Luxembourg reflects the active and colourful panoply and life of different youth scenes. Youth scenes are increasingly seen as attractive alternatives to tra- ditional formal youth associations, which are still in vogue for most Luxembourghish youngsters. Foreign adolescents rarely profit from these structures.

Despite their growing attractiveness, youth scenes have never been the topic and subject of research within the Luxembourg Youth Studies. Youngsters in Luxembourg experience heterogeneity in everyday-life due to the country’s cultural, linguistic and ethnic diversity. This is exemplarily expressed by the country’s official and daily exercised multilingualism, the high rate of immigrants and cross-border commuters. Half of the population have a migration background and over 40% of the workforce commutes from the neighbouring countries on a daily basis.

Relating to youth Luxembourg shows ethnic and cultural segmenta- tion tendencies particularly in education and leisure activities, e.g. due to linguistic knowledge and social backgrounds. The paper points out the ambivalent effects of youth scenes. In ‘turbulent times’ they serve as an alternative path of social and cultural inte- gration and as expression of further segmentation. Based on the data and the first results from an ongoing field study of Youth scenes in Luxembourg there is evidence that the multilingual and multinational framework has a major impact on the development of youth scenes and influence the differences in acculturating styles. National, social and regional backgrounds seem to stand in a dialectic relation to ongoing segmentation tendencies. Youth scenes nevertheless show simultaneously trends to bridge or over- come e.g. social and linguistic barriers.

Keywords: Youth scenes, multicultural society, integration, segmenta- tion, acculturation, Luxembourg

MEANING OF VIOLENCE IN DIFFERENT SUBCULTURES

Airi-Alina Allaste, Kadri-Ann Salla

Abstract: Youth subcultures are often considered deviant and asso- ciated with violent behaviour. The latter is especially the case in Eastern Europe, where the society is not used to pluralities of life- styles and differences are often demonised. While in the Western today world different youth lifestyles tend to be seen as consumer networks with varying style preferences, in Estonia they are more often associated with rebellion, acts of vandalism, violent rituals, etc. by the wider public.

This paper investigates the meaning and role of violence in differ- ent subcultures in Estonia. For the purposes of this analysis, vio- lence was approached in a very broad sense (everything that could be interpreted as violence) and theoretical distinction was made between expressive and instrumental violence. The empirical part of the paper is based on open-ended interviews and results of par- ticipant observation of 4 subcultures (hip-hop, metal, bikers, and specialized schools) conducted in 2008.

Results of the analysis demonstrate that besides expressive and instrumental violence, it is possible to distinguish simulated vio- lence, which characterises most of the behaviour in spectacular subcultures. The crucial discrepancy between perceived and actual violence has its roots in the difference between the contemporary subcultures in Estonia and their cultural origins. The paper analyses how has the meaning of violence changed in international subcul- tures in the process of cultural diffusion and glocalisation.

SOCIAL NETWORKING YOUTH: SOCIAL INEQUALITY CONTINUED?

Natalia Waechter

Abstract: In the past years, social networking sites (SNS) such as Facebook and MySpace have become very popular communication online tools all over the world, especially among adolescents and emerging adults. Recent research indicates that social networking sites are an important part of young people’s lives, however, there are still many open questions regarding the diverse activities of youth on such sites. In a study with young SNS users in Austria, we investigated the amount of use, why they use social networking sites, what they do on these sites, who they meet and who they are connected with, how their online and offline worlds overlap, what they like and what they dislike or fear (“cyber mobbing”). Further- more, we were interested if and how their educational background impacts their use of SNS. Theoretically, we refer to the discussion in youth cultural theory how social class impacts youth cultural partic- ipation.

For data collection we used an online questionnaire, focus groups (with existing circles of friends) and qualitative interviews with SNS users aged 12 to 19. Cooperating with the umbrella institution of youth work in Vienna we achieved to collect a sample that, regard- ing educational level and migration background, corresponds close- ly to the whole young population of Vienna.

We found out that having at least one profile on a social networking site is important for all young people in order to become a teenager and for their full integration into their teen clique. There is an important overlap of online and offline social networks of youth. Typically, the teenagers use different social networks for two dif- ferent purposes: either for being connected with their offline friends or for flirting and dating. Every social networking site platform has a certain image, and the educational background seems to influence the young people’s preferences. We conclude that a) social networking sites are important for the young people’s identi-
ty development and b) social inequalities continue on social networking sites.

YOUTH POLITICAL PARTICIPATION: THE IMPACT OF BECOMING AN ADULT
Jasmine Choko Lorenzini
Political Science, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: In this paper we propose to analyze youth political participation in a life-cycle perspective, studying youth as a transition to adulthood and taking into account the impact of five steps of this transition on political participation. The political forms of participation we study are related to political activities that do not demand long-lasting engagement and that can be one-shot activities; both criteria correspond to forms of engagement and participation valued by youth. Hence we included in our analysis: signing a petition; wearing a badge; boycotting or boycotting; taking part in protest.

The steps we include in our analysis are related to the process of gaining independence and autonomy (moving out of parents’ home; having a job; being financially independent) and to the process of forming one’s own nuclear family (being in a relationship and having children). These steps correspond to dominant approaches in the study of life-cycle events and transition to adulthood, but have not been studied yet in relation to political participation.

In our analysis, we find that three important steps towards adulthood included in our analysis are predictors of political participation, have a job, being financially independent and being in a relationship. While the impact of the other two, leaving out of parental home and having children, remain entangled with other social processes that also affect political participation - political socialization through family relations and parenthood as time consuming.

ALCOHOL AND DRUG USE AMONG 12-15 YEAR OLD SECONDARY SCHOOL STUDENTS IN BELGIUM, THE NETHERLANDS, GERMANY AND AUSTRIA: THE EFFECTS OF TYPE OF EDUCATION
Hans Berten, Ronan Van Rossem, Nicole Vettenburg
Department of Social Welfare Studies, Department of Sociology, GENT UNIVERSITY, Ghent, Belgium

Abstract: Background: Risk behaviors tend to peak in adolescence and drop sharply when entering adulthood. Both alcohol and drug use are quite prevalent among high school students, and varies substantially over the various education types. This study addresses whether the effects of education type are independent of the socio-demographic characteristics of the students. Following Bourdieu’s argument one can expect that different education types develop distinct youth cultures which include differences in substance use.

Methods: Data from the second International Self-Reported Delinquency study for four countries (Belgium, the Netherlands, Germany and Austria) were used, which collected data from a large sample of 12-15 year old secondary school students (N = 11,110). The education systems in all four countries are characterized by the presence of a formal tracking system. Data were analyzed using multilevel logistic and negative binomial regression techniques.

Results: There is an indication that type of education affects both an adolescent’s alcohol and drug use; these effects prove robust for differences in socio-economic backgrounds. In all countries, the last month incidence rates of alcohol and drugs are higher in lower status education types than in higher status education types. However, for the lifetime prevalence rates the picture is less clear. Higher prevalence rates in lower education types were observed only for the countries Germany and Austria (lifetime alcohol prevalence) and Germany and Belgium (lifetime drugs prevalence).

Conclusion: The results of this study are in line with the literature on the role of the educational system in the reproduction of social inequalities. Students from lower status education types are at increased risk compared to those from higher status types.

NEGOTIATING RISK ACROSS GENERATIONS: INTRA-FAMILIAL DRINKING CULTURES
Clare Holdsworth, Louise Laverty, Jude Robinson
KEELE UNIVERSITY, Keele, University of Liverpool, Liverpool, United Kingdom

Abstract: The contribution of family practices to young people’s alcohol consumption is increasingly recognised in popular discourses, particularly in the UK, where recent proposals have considered raising the age at which young people may drink at home. Debates about young people’s drinking recognise the potential for children to learn about responsible drinking at home, but also the risks that home drinking may normalise excessive drinking practices. This paper considers how parents and young people articulate drinking cultures within the home, drawing on in-depth interviews and focus groups with separate groups of parents and young people. One of the key issues is how alcohol consumption is negotiated across generations and the resources that young people and parents can draw on in defining ‘safe’ drinking limits. The research includes families from different socio-economic backgrounds and the paper will address how social class shapes parents’ and young people’s articulation of responsible drinking practices.

THE RISK OF ADDICTIONS IN YOUTH: COMPARATIVE ANALYSIS OF LATVIA AND EUROPEAN COUNTRIES
Ilze Koroleva, Inta Mierina, Sigita Snikere, Aleksandrs Aleksandrov, Ilze Koroleva
Institute of Philosophy and Sociology, University of Latvia, Riga, Latvia

Abstract: The analysis of risk and protective factors is based on the comparative study surveying 15–16 years old students in the frame of the Drug prevention programme: “Youth in Europe.” The data have been collected in two rounds: 2006 and 2008. The paper presents the results of comparative analysis on trials and use of addictive substances, and seeks to estimate the power of factors that determine substance use among youth in seven European countries.

Grounded on approximately 300 variables Exploratory factor analysis was performed separately for each domain of risk and protective factors, which was followed by Confirmatory factor analysis. At the last phase, Hierarchical logistic regressions were used in order to determine the relative importance of various factors on substance use.
Several factors were identified, which appear to have a distinctive and strong link to the use of psycho-active substances — mental discomfort, anger and aggression, traumatic personal experiences form a group of personal factors, while patterns of substance use among friends and peers, spending nights out, attendance of entertainment places, poor academic achievements, hooking classes form another one. Speaking of the protective factors, the most powerful one refers to the parents: their strict position against substance misuse, staying well informed about leisure time of their children, spending time together with children, religious practices, sports activities.

In countries reporting high numbers of psycho-active substances use, the protective factors tend to be more powerful. For Latvia high values were found for such factors as low level of achievements at school, susceptibility to the negative pressure of friends, accompanied by low values for religious practices, having leisure with parents etc. Countries showing lower levels of drug use — Iceland, for example, — produced distinctively higher values for such protective factors as sporting, high grades, well informed parents with clear position on substance use, which is accompanied by low values for such risk factors as mental discomfort, disrespect to rules, negative attitude towards school, attendance of entertainment establishments.

The identified factor structure highlights a number of directions for state institutions and NGOs for education and information activities aimed at teenagers and their parents.

‘SCHOOL FOR SCANDAL’ – UNDOING PROFESSIONALISM IN CONTEMPORARY CLASSROOMS

Rachel Thomson¹, Mary Jane Kehily²

¹Health and Social Care, ²Education and Language Studies, THE OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: In this paper we consider the role played by ICTs in the very ‘public’ context of the state secondary school – considering the disruptions effected by the use of mobile phones and social networking media by students and staff within the ‘ unofficial’ school as well and the ways which the ‘official’ school employs technologies to transcend divisions between for example, the home and school. Our focus in this paper is on those incidents and encounters that both involve incursions into the private and result in the creation of public ‘scandals’. These scandals are in turn are represented and amplified within the popular media, inviting commentary from stakeholders through the same web 2.0 technologies that are often at the heart of the original transgression. Using these scandals as a starting point we consider how boundaries between the personal and the professional play a role in the formation of teacher identities and the ways in which this aspect of ‘professionalism’ is being re-made in contemporary classrooms. In order to do this we draw on press coverage of recent ‘intimacy scandals’ including the ways in which teaching unions have responded to these. Alongside these accounts we juxtapose material from our own long term research on the role of ICTs in youth cultures. Our overall aim is to consider the ways in which questions of privacy and publicness are implicated in emergent understandings of youth and generation, considering where the management of these boundaries in one particular setting (the school) may provide insights for a wider landscape.

RESEARCHING PRIVACY AND PARENT-CHILD INTIMACY

Jacqui Gabb¹

¹Social Policy and Criminology, THE OPEN UNIVERSITY, Milton Keynes, United Kingdom

Abstract: Parent-child relationships largely take place behind closed doors. The privacy of the family home alludes to personal freedoms, to make choices around the rules of affection, facilitating individualised forms of intimate practice, beyond public surveillance. In this paper I will look behind the closed doors and focus on how parents talk about and manage codes of conduct which structure parent-child interactions. In particular I will focus on how and where boundaries are set up around ideas of propriety and decency, including the management of nudity and privacy ‘at home’. This highlights some of the intersections between public-private lives and the cultural resources which parents draw on to sanction and police their personal ‘choices’. I consider the extent to which spec-tacles of intimacy have indeed created ‘contemporary paradoxes’ or continue to re-produce familiar stories, albeit re-packaged in different forms. For example, how parents perceive and monitor the publicness of photographic displays of children in the context of the cultural and virtual traces etched on hard drives and circulated via the internet. Through this, I will interrogate how new forms of exposure impact on ‘private practices’ of intimacy and ordinary everyday parent-child interactions. In opening out private life to academic enquiry I foreground research technologies required to study intimacy and personal relationships, advocating creativity in research design and methodology including the use of photo elicitation and participatory research techniques.

YOUNG MUMS, SOCIAL NETWORKING AND REALITY MEDIA

Imogen Tyler¹

¹Sociology Department, LANCASTER UNIVERSITY, Lancaster, United Kingdom

Abstract: For young people in countries with high levels of internet access, social networking has rapidly become a technology deeply embedded in their everyday lives, accessed and updated not only in ‘private spaces’, but in public through an expanding array of mobile devices. This medium, through features such as ‘ friending’, and ‘privacy settings’, lends itself to the kinds of intimate modes of communication which it might take much longer to establish through face-to face relationships. As one recent study suggests, young people currently engage in practices such as ‘ friending’ with relativity little thought as too the implications of enacting what we might once have termed as ‘private selves’ in a public, corporate domains. Social networking sites are exemplary surveillance media in which participants ‘opt’ to participate, They are arguably rewording not only public/private boundaries, but are establishing new modes of intimate identity practices with interesting social and political implications. In a current research project on the representation of young working class mothers on reality TV, I employed social networking as a research method initially intending to elicit the responses of participants in a reality programme, Underage and Pregnant (BBC 2009-2011), to the sensationalist frames of representation through which they were depicted. What emerged was a complex picture of the enmeshing of youth identities, reality media genres and social networking technologies. In this paper I will some
DO TRANSITIONS TO ADULTHOOD CONVERGE IN EUROPE? AN OPTIMAL MATCHING ANALYSIS OF WORK-FAMILY TRAJECTORIES OF YOUNG ADULTS FROM 20 EUROPEAN COUNTRIES

Laurent Lesnard 1, Anne-Sophie Cousteaux 1, Flora Chanvili 2, Viviane Le Hay 2
1COSP, 2CEVIPOF, SCIENCES PO, Paris, France

Abstract: This paper compares the timing and sequencing of work-family trajectories of young adults in 20 European countries using data from the third round of the European Social Survey (2006). It addresses the question of the convergence of transitions to adulthood in Europe. The life course is derived here from five standard events — employment, leaving-home, union formation, marriage and childbearing — retrospectively observed for men and women over 35 years old (N = 26,351), over four birth cohorts (before 1935, 1935-1944, 1945-1959, and 1960-1971). We employ optimal matching and cluster analyses to build an empirical typology of the transitions to adulthood in Europe. These methods reveal a great variety of family-work pathways in Europe that it is very difficult to describe with less than 14 types. We have grouped these 14 pathways into five major categories: Early Bird, Intermediate, Independent, Family, and Other. Multigroup information theory indices and correspondence analysis reveal that these patterns are highly correlated with welfare regimes, historical family systems, and cohorts.

We observe that although there was a convergence in the passage to adulthood in Northern and Western Europe following the post-war boom era, two new models have emerged with the youngest cohort that are characterized by an early independence from the family of orientation and more or less delayed couple formation and birth of the first child. If the transition to adulthood took longer for the 1960-1971 cohort in Western Europe than for previous ones, the duration of the transition to adulthood was greater for Conservative and Liberal countries than for Social-Democratic ones. These results confirm that during periods of economic stagnation or depression, welfare states can expand or condense the time they give to young people. Even if they are weakened, welfare regimes still continue to shape how global trends apply nationally, and to influence the life course.

The transition to adulthood in Southern and Eastern Europe remains marked by their respective historical family systems. Where-as the departure from the parental home is late and usually linked to couple formation in Southern Europe, the tradition of joint households is still pervasive in Eastern Europe.

NEW DIRECTIONS IN YOUTH RESEARCH: EUROPEAN AND GLOBAL PERSPECTIVES

Maurice Devlin 1
1Centre for Youth Research and Development, NATIONAL UNIVERSITY OF IRELAND, MAYNOOTH, Maynooth, County Kildare, Ireland

Abstract: This paper will set out some themes and questions relating to “New Directions in Youth Research: European and Global Perspectives” in a session jointly run with the Research Committee on Youth (RC34) of the International Sociological Association. Participants in the session will be invited to respond and to share their own perspectives on these themes and questions, as well as to posit others for consideration.

THE YOUTH MOVEMENT IN THE 21ST CENTURY: A SOCIOLOGICAL STUDY OF GENERATION

Ahmad Khalili 2
1PROFESSIONAL STUDIES/SOCILOGY, SLIPPERY ROCK UNIVERSITY OF PENNSYLVANIA, Slippery Rock, United States

Abstract: The people of the Middle East and North Africa have revolted against the old order, demanding for recognition of individual rights and development of civil society. In the forefront of these movements are the youths, a generationemerging generation youth movement expanding Mannheim’s sociology of knowledge and his concept of generation. This concept was not generally used by sociologists and social scientists for decades. The impact of globalization and the advancement of communication technology which made the emergence of the worldwide generation possible helped in bringing Mannheim’s notion of generation as a sociological phenomenon to the surface. According to Mannheim, a generation “becomes sociologically significant only when it also involves participation in the same historical and social circumstances” and exposes them to similar historical event. His definition of generation refers to specific age groups that can act as agents of social change and sources of opposition that are capable of challenging the existing societal cultural or political system through collective action. Mannheim distinguishes between two “generational units”: the active and the passive generations. Two conditions have to be met in order a generation becomes “active” and develops into a social force for social change: first, to acquire “generational solidarity” and, second, to develop “generational consciousness”, according to Mannheim. This paper examines the youth movements in the Middle East in the context of Mannheim’s sociology of knowledge. The study addresses the following research question: What factors have contributed to the development of youth’s political consciousness and solidarity, locally and globally, that have turned the new generation into an effective social force? The study is both empirical and interpretative. Data from the World Value Survey of Middle Eastern countries have been used to measure some levels of generational consciousness and solidarity combined with an examination of level of socioeconomic development of these countries and their historical locations in the global context. The study focuses on the momentums and the opportunities created by the youth movement to exercise a decisive role in historical change that coming of age in an era of communication revolution.

WHAT IS THE RELEVANCE OF NEGOTIATING INTERGENERATIONAL RELATIONS FOR THE CONSTRUCTION OF YOUTH IN CONTEMPORARY SOCIETIES?

Charles Berg 1, Marianne Milmeister 1
1Flora Chanvril, 2CESIS, 3INESCE, 4Centro de Estudos de Polis, 5FCE/UNESP, 6FCE/UNESP, 7UNIVERSITY OF IRELAND, MAYNOOTH, Maynooth, County Kildare, Ireland

Abstract: This paper will set out some themes and questions relating to “New Directions in Youth Research: European and Global Perspectives” in a session jointly run with the Research Committee on Youth (RC34) of the International Sociological Association. Participants in the session will be invited to respond and to share their own perspectives on these themes and questions, as well as to posit others for consideration.
Abstract: Youth as an element of a societal and sociological discourse is a complex semantic object (Jones 2009). The current evolution is characterized by a shift of emphasis away from an age towards a generation definition (Van der Velde, C. 2008). Therefore negotiating intergenerational relations and their normative background becomes more and more important in the understanding of youth and its structural changes in contemporary societies. The fore-mentioned semantic change is on the one hand linked to a conceptual movement from youth as a process to youth as a condition (Cavalli, A. 1980; Leccardi, C. & Ruspine, E. 2008) and on the other hand contextualized in a changing sociology of time (Nowotny, H. 1996; Leccardi, C. 2009).

On the indicated background, which will firstly be sketched, we intend to analyse interviews and focus group data, coming from a project on intergenerational relationships. We will show the devices employed in negotiating intra-generational relationships, reflect on their relevance for an understanding of youth. We will reach the conclusion that Mannheim's sociology of generation may well be a possible starting point. On the one hand, at least the Mannheimian conceptualisation could be a valuable alternative to the idea of a new generational contract, which already seems highly questionable in the light of Durkheim's sociology. But, on the other hand, it has to further develop into a new form which suits new formats related to post-linearist sociology (Machado Pais, J. 2003) as well as to a Deleuzian logic of multiplicity and sense (Rajchman, J. 2000).

NEGOITIATING DEFINITIONS, NEGOTIATING SUPPORT — YOUNG ADULT-PARENT RELATIONSHIPS DURING ADULTHOOD TRANSITIONS IN POLAND

Ewa Krzaklewksa

Abstract: Differing concepts of adulthood are potentially the cause of conflicts between parents and their adult children when negotiating family decisions during transitions to adulthood. As the European Social Survey data from 2006 has shown, young people in Poland are more liberal than their parents when it comes to family choices, and they delay the occurrence of events once indicative of the fact of being an adult. On the other hand, young people are aware of the difficult situation on the labour market and perceive adulthood as a time of hardship and responsibility. This vision is mostly connected to the fact that the difficulty in finding a stable job is seen as the main problem young adults in Poland face in their transition to independence (both residential and financial).

In this challenging economic situation, support from one’s family might prove crucial but also challenging. On one hand, transfers, both material and non-material, from the family to the young adult might ease and/or speed up certain transitions. On the other hand, more traditional visions of parents on how life trajectories of their sons and daughters should proceed might be an important factor in deciding whether or not to support their children’s life choices.

My paper first describes how parents’ and adult children’s concepts of adulthood are being negotiated within a family. Further, I analyse how young people negotiate with their parents the support available during the transition, and how the support depends on the match between children’s and parents’ visions of what it means to be an adult. I hypothesise that in the first place, economic hardships might lead to the increasing importance of parents’ support to their adult children. Secondly, the adult children’s need to adapt their decisions to the support provider’s standards or visions may lead to more traditional choices of the younger generation.

I base my analysis on qualitative data in the form of in-depth biographical interviews with young adults, as well as focus group interviews with parents. I also use secondary quantitative data for illustrating my arguments.

TIME, THIRD PLACES AND YOUNG PEOPLE. AN ETHNOGRAPHICAL RESEARCH IN THE CITY OF BOLOGNA

Barbara Grüning

Abstract: According to various authors the contemporary society is characterized by de-temporalization (Castells 2000), spatio-temporal pressure (Harvey 1998) and time acceleration (Castoriadis 1975). At a micro-level it implies that for individuals is difficult to put their own experiences in order and to construct a project of life. Thus young people are those mainly hit by the growing uncertainty of our society, since the same category has temporally unstable contours, which change in relation to the political, economical and cultural transformations of the society (Cavalli 1985). Furthermore it is also to consider how the conditions of instability that influence the young people life and perceptions of themselves have repercussions at a spatial level, as it is more and more difficult for them to find ‘their own place’ in the private and public-institutional sphere.

In this regard the author led an empirical research (participant observation and discursive interviews) in eight premises (bars, pubs, taverns) of Bologna that play a relevant role for the young people, especially for those that are not native of Bologna. The aim is to show how the places of the informal sociability (‘third places’, e.g. Oldenburg 1985), offer a space where ‘young people’ can ‘feel at ease’, and take their time, in order to reflect upon their life’s conditions and to build their individual, collective and generational identity.

VULNERABLE YOUNG PEOPLE, WHAT USE OF THE
SOCIAL AND HEALTH POLICIES?

Virginie Muniglia,

Abstract: In a general European context where youth transitions are
structured by uncertainties and risks, young people develop coping
strategies which impact social structures. These strategies take
place in the scope shaped by local and national policies and, at the
same time, they contribute to the social integration and the subjec
tive signification of life courses.

Thus, in the framework of the conference, we propose to analyse
the articulation between the scope shaped by French social and
health policies and the way vulnerable young people shape their
life course using or not using these policies. We will be interested in
the interaction between, on the one hand, individual trajectories, in
a biographic and comprehensive perspective, and, on the other
hand, the local contexts and the national tendencies of French
health and social policies. To be more precise, our contribution will
point out the young people’s reflexive capacity in their use or non-
use of the measures which address them. Doing so, we will high-
light the echo of these measures in the life course, especially on the
identity dimension.

We will lie on the results of a collective research (Juvenil, Vulnera-
ble young people in the social and health local policies (2009-2011))
and, more specifically, on biographic interviews led with vulnera-
ble young people, aged between 18 and 32 years old. By vulnera-
ble, we mean people who encounter difficulties in their transitions
to work and to housing, health problems and a lack of financial
support from their parents. The analysis of these interviews will be
made in relation with local contexts of public action and profes-
ional logics of the social and health workers.

Actually, our objective is to point out the possible distance between
policies which address vulnerable young people and vulnerable
young people’s expectations and practices.

ASPIRATIONS AND EXPECTATIONS IN THE SPANISH
SECOND GENERATION: THE CASE OF BARCELONA

Sonia Parella, Amado Alarcón, Jessica Yiu

1Department of Sociology, UNIVERSITAT AUTÒNOMA DE
BARCELONA, Bellaterra, 2Department of Business Management,
UNIVERSITAT ROVIRA I VIRGILI, Tarragona, Spain, 3DPT. OF
SOCIOLOGY, PRINCETON UNIVERSITY, PRINCETON, United States

Abstract: This paper examines the determinants of educational and
occupational aspirations and expectations among second genera-
tion in Barcelona (Spain). The analysis is based on a statistically
representative sample of 3578 children of immigrant, between 12
and 17 years old, who attend secondary schools (public and private)
in Barcelona Metropolitan Area. These data we collected by the
Longitudinal Study of the Second Generation (ILSEG in its Spanish
acronym), conducted by a consortium of Princeton University and
the Pontifical University of Comillas (Spain).

After reviewing and balancing the most representative studies on
this topic, most of them on the basis of US data, we focus on the
segmented assimilation theory to predict the main casual factors
and correlates of aspirations and expectations. We use different
multivariate regressions to study these influences. Data show that
age, gender, ethnicity, parental education, linguistic achievement,
peer influence and other social psychological correlates, as the level
of self-esteem, have significant effects on children’s aspirations and
expectations.

DOING ETHNICITY. PROCESSES OF NEGOTIATING
ETHNIC BELONGING AMONG CARINTHIAN SLOVENE
TEENAGE CLIQUES

Jonas Kolb

1Department of Sociology, INSTITUTE FOR ADVANCED STUDIES
VIENNA, Wien, Austria
Abstract: Belonging to an ethnic group is generally defined as an essential aspect of ethnicity and linked to cultural, historical, religious and linguistic aspects. Some scholars discuss ethnic belonging as a stable and steady group characteristic which is determined by structural aspects, others as an alterable notion challenged by ethnic organizations or media and still others as fluid and volatile-product of subjects’ human agency. However, those different points of view agree in most instances that ethnic belonging is socially produced and theoretically permeable in whatever degree. Contrary to that, the questions whether teenage members of ethnic groups negotiate and renegotiate ethnic belonging and whether effects of those processes have to be classified as political issues constitute the subject of controversial scientific discussions.

Based on ethnographic participant observations, empathetic interviews, analyses of artifacts and group discussions with Carinthian Slovene teenager cliques, the paper aims at analysing processes of negotiating ethnic belonging and distinguishing the political in those sequences. Applying a praxeological perspective, the research is able to consider different points of view on ethnic belonging by taking structuralist determinations as well as definatory power of ethnic organizations and teenagers’ human agency into account. The paper focuses on three issues: (1) Are there different notions of ethnic belonging among the teenagers regarding their different fields of activity, conditions of socialisation and involvement in organisational ethnic contexts? (2) What are the different levels and meanings of the political in the processes of negotiating ethnic belonging? (3) What role does autochthony play for teenagers in negotiating Carinthian Slovene ethnic belonging?

TRANSITIONS FROM YOUTH TO ADULTHOOD: DEALING WITH VULNERABILITY AMONG THE SECOND GENERATION IN SWITZERLAND

Claudio Bolzman, Laura Bernardi, Jean-Marie Le Goff

1GRADUATE SCHOOL OF SOCIAL WORK, UNIVERSITY OF APPLIED SCIENCES WESTERN SWITZERLAND, Geneva, 2PAVIE Institute, University of Lausanne, Lausanne, Switzerland

Abstract: This paper deals with theoretical and methodological issues related to the study of transition from youth to adulthood among the second generation in Switzerland. It is part of a research project within the framework of the National Centre of Competences on Research LIVES: Overcoming Vulnerability in the Life Course.

Our theoretical focus is the relationship between life courses and vulnerability during the transition to adulthood. More precisely, our aim is to identify young people main resources, to understand how they mobilize such resources to face the trials they meet during this transition, and which are the main outcomes in terms of social status and well-being in the early adult age. All these aspects will be examined considering the multidimensional aspects of life course trajectories: training and professional careers, family life, social life, health development, values, social perceptions, attitudes towards risk, as well as citizenship and social participation. We then present an innovative mixed method research design combining qualitative and quantitative instruments in a longitudinal perspective.

ASPIRATIONS, DREAMS AND LIFE PLANS OF YOUNG ITALIANS

Guido Di Fraia

1ISTITUTO DI COMUNICAZIONE, UNIVERSITA' IULM, Milano, Italy

Abstract: The paper presents the main results obtained in a qualitative research aimed at detecting the aspirations, life plans and dreams of young Italians. The research was carried out by conducting “visual narrative interviews” with 85 boys and girls aged between 20 and 24 years. To understand how the aspirations and life projects are social constructs that evolve over time, using the same method were also conducted 85 interviews with a sample of adults of both sexes aged between 45 and 65 years (the generation to which parents of boys belong). Through the research we tried to reconstruct: the origins of the aspirations (psychological, relational, social, etc.), the areas to which they relate (employment, economic, cultural, sporting, artistic, etc.), and the role played by the mass media in their production. The results were analyzed in relation to its feasibility and the aspirations of their time horizon. Were also detailed the differences between the aspirations, life plans and dreams of the two generations studied.

IS ONLINE POLITICAL ACTION FOR YOUNG PEOPLE? EXPLANATIONS BASED ON EXPRESSIVE NEEDS

Peter Thijssen

1Department of Political Science, UNIVERSITY OF ANTWERP, Antwerp, Belgium

Abstract: “Voting is for old people” proclaimed a T-shirt printed and distributed in 2004 by a popular American clothing company. With this slogan, the company wanted to draw attention to the relative lack of political participation among young adults, an issue that is also acknowledged by many analysts (Ammà, 2010). However, some authors point out that this assessment is too negative, since youngsters might not be participating less but rather differently. Dalton (2008), for instance, claims that youngsters prefer individualised forms of online participation to the traditional collective modes of offline participation. The issue remains unresolved, not in the least because claims on either side are based mainly on standardised survey data involving self-reported behaviour. In the present paper, we use unique behavioural data that shed new light on the age distributions of political participants. We rely on two case studies selected according to a most different design: the first concerns problem reporting by email to local authorities (population data based on the linking of 1950 problem reporters with the population register), the second relates to message posting on an online political forum (a random sample of 1329 members of the Belgian online forum politics.be ). On the basis of these two cases, we propose that online political participation should be differentiated according to issue-content and media use. As different participatory tools serve different causes, different age groups have different preferences in respect of online participation.

ON PARTICIPATION OF YOUNG PEOPLE: SOCIAL ENGAGEMENT AS PART OF POLITICAL PARTICIPATION?

Christiane Meyers 1, Helmut Willems 2

1FLSHASE/Research Unit INSIDE, UNIVERSITY OF LUXEMBOURG, Walferdange, Luxembourg

Abstract: In many western countries participation amongst young people has been on the political and research agenda for the last years. For a society to function according to democratic ideals, the participation of all its members is necessary. Especially young people have to stand up for their needs and interests for different reasons. One of them is demographic change: young people are and will continue to be a minority in society. Another one is the growing heterogeneity in society: an increasing fraction of young people will have an immigrant background. But European youth seem to be increasingly uninterested in conventional forms of participation (e.g. elections, party membership). In many studies adolescents and young grownups are described as apolitical and indifferent regarding political topics.

In our contribution we want to question this perception of participation as too narrow. A broader concept of participation that takes participation in many other domains than politics into account (e.g. family, school, associations and work) will produce a different view of youth participation. Our research establishes that there is a great potential for participation among young people. Young people in Luxembourg have always shown high levels of participation in civil associations and organisations; in European comparison Luxembourg is one of the countries with a high level of social engagement among young residents. These findings are also supported by data on attitudes and values of young people in Luxembourg: a majority of young people can be described as post materialistic and willing to help other people. So whereas political interest and engagement is rather low among young people, they present a high civil engagement and have a positive orientation towards actions of public interest. However some groups of youth are more likely than other groups to participate in different domains. The participation rate is still lower for girls, young people with an immigrant background and those from a lower social milieu.

YOUNG PEOPLE AND PARTICIPATION IN EUROPE. LACK OF INVOLVEMENT OR NEW ENGAGEMENT?

Simona Manuela Gozzo 1, Rosario D’Agata 1, Rossana Sampugnaro 1

1UNIVERSITY OF CATANIA, catania, Italy

Abstract: This paper uses data from the European Social Surveys and Eurostat to examine the relevance of young political participation in European countries. Nowadays, young people constitute an enormous potential for or against the European integration project. Unfortunately, a general decline of political participation among the new generations has manifested more and more clearly in the past years. The present work aims to investigate the causes of this intergenerational gap in political participation, showing the difference between young’s and adult’s involvement and discovering other kinds of young people’s involvement as a substitute of traditional political engagement.

Three hypothesis are considered:

First hypothesis - typologies of participation. Intergenerational gap can be explained considering the importance of the new channels of participation for young people, in opposition with traditional participation usually studied, that characterizes the old generation profile;

Second hypothesis - political participation and social networks. We suppose a relationship between social and political participation, that could improve young political commitment;

Third hypothesis – contextual effects. This hypothesis concerns the effect of contextual dynamics on political commitment, pointing out the importance of national trends for the improvement/inhibition of youth participation.

These hypothesis are not each other incompatible but complementary. In fact it is possible that, though young people avoid the political participation or they are more oriented towards new typologies of involvement, those more involved in social activity could be even more politically active (considering both traditional and new participation). Besides, as regards these trends of youth participation, European nations could be deeply different each others, in consequence of the less or more importance of contextual effects. The last step of this work will consist in considering the importance of each factor, adopting a statistical multilevel model. This model will permit to analyze at the same time both individual and contextual effects. According to the outcomes, the research team will also show some results about a case study that shows the influence of relational and motivational factors on the youth political activism in Sicily.

MARGINAL YOUTH TRANSITIONS IN EDUCATION

Mette Pless 1, Noemi Katznelson 1

1The Danish Centre For Youth Research, DPU, AARHUS UNIVERSITY, Copenhagen NV, Denmark

Abstract: Young people’s involvement in education is receiving enormous political attention in Denmark. The political aim is to ensure ‘education for all’. The background is the fact, that despite an ongoing political focus on the importance of ‘youth education’ over the past 30 years, a relatively stable figure of almost 20% of a youth-generation, still does not complete a youth education. Furthermore, research shows clear patterns in regards to, who is at risk in the educational system; Young people from a social background with little or no tradition for education are statistically less likely to attain success in the educational system compared to young people who come from backgrounds with a strong educational tradition.

Drawing on two longitudinal research projects (Pless & Katznelson, 2007; Pless, 2009) based on both quantitative and qualitative data, we will focus on the factors that seemingly shape and influence young Danish people’s educational choices and pathways from primary school and onwards – focusing especially on ‘youth at risk’ in the educational system.

The studies aim at understanding the narratives of young people at risk in regard to education and more broadly their dreams and visions of the future (as grown ups). In the paper we will illustrate some of the dilemmas and challenges that especially ‘youth a risk’

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
face as part of their life-and educational pathways from primary school and onwards. A main focus will be on the dialectic relationship between subjective narratives on education – and the dominant political discourses. How can political discourses on education be traced, in young people’s narratives, and to what extent are these discourses reproduced, or challenged in this process? Furthermore the paper will address a pivotal theme in youth research; that youth transitions and young people’s perceptions of education and work is changing profoundly. The view is that the notion of linear, focused ‘normal’ biographies increasingly is being outpaced by unpredictable, individualised and fragmented yoyo-transitions and ‘choice’ biographies (e.g. De Bois-Reymond, Wynn&Dwyer, Beck). Drawing on our researchstudies we will discuss to what extent the young people’s narratives can be said to support a movement towards choice biographies and yoyo transitions, or if alternative understandings are needed?

FROM “NEET SITUATION” TO “NI-NI GENERATION”: CONSTRUCTION AND EVOLUTION OF A PROBLEMATIC CONCEPT.

Pau Serracant¹

¹CATALAN YOUTH OBSERVATORY, Barcelona, Spain

Abstract: The paper presents a new indicator on the NEET population that aims to make it more precise and useful in terms of policy targeting. The ways of defining and measuring the concept of those who are not in employment, education or training have been diverse since its creation in 1999; recently both the European Commission and the OECD have included it in their official reports, contributing to the institutionalization of the concept. In Spain it has been translated as “ni-ni” (neither-not) and, due to its high youth unemployment rates, a whole generation has been labelled as “ni-ni” and somehow stigmatised as an idle one. However, since its creation the concept has been discussed as it includes people in different situations, ranging from positions close to social exclusion to situations of privilege. Its primacy in policy terms has shadowed the concept (and policies against) of unemployment, which is a clearer and more precise one, internationally measured in a standardised way. However, an advantage of the NEET concept is that brings into light problematic situations beyond unemployment.

The Catalan Youth Observatory, together with the Catalan Statistics Institute, has developed a new indicator on the NEET population that aims to focus on the situations close to social exclusion, in order to help to clarify the concept and policy targeting in Catalonia. The paper firstly presents the evolution of the concept, its particular development in Catalonia and Spain and analyses the stigmatisation of the young people through the media. Secondly, the paper shows the ad hoc operationalization of the concept. And thirdly it analyses the results, comparing them with those of the OECD operationalization.

UNPACKING NEETS: HOW TO GET THE ‘NOT IN EDUCATION, EMPLOYMENT OR TRAINING’ AWAY FROM THE X-BOX AND INTO LEARNING OPPORTUNITIES?

Vanessa Beck¹

¹UNIVERSITY OF LEICESTER, Leicester, United Kingdom

Abstract: The current economic climate along with related factors including the scrapping of the Educational Maintenance Allowance, raising the age of participation in compulsory education, the likely displacement of large proportions of young people out of higher education and the already high rates of graduate unemployment are likely to increase the rates of young people who are not in education, employment or training (NEET). Educational levels and participation rates are, by definition, crucial to understanding NEETs but we know little about what discourages or attracts NEETs back into learning opportunities and education (see Maguire and Rennison, 2005). Are there any factors that attract and encourage young people who are, have been or are in danger of becoming NEETs into learning opportunities? Young people who have come off the NEETs register and who are currently involved in learning opportunities are an ideal group to consider how to engage youths in learning.

This paper reports on the first stage of research into the provisions for NEETs and uptake of learning opportunities in Leicester/shire. The experience of Leicester College indicates that it is difficult to get NEETs out of their isolation, away from their X-box and encourage them to become interested in learning opportunities. Qualitative methods are utilised to explore the range of learning opportunities on offer from providers in Leicester and Leicestershire and consider the potential differences in approaches and success in reaching young people and retaining them in education, training or employment. Interviews with providers will allow an analysis of issues attracting (or discouraging) youths to (from) available provisions.

USING LIFE JOURNEY MAPPING TO UNDERSTAND THE EXPERIENCES OF NEET YOUNG PEOPLE LEAVING SCHOOL AND FINDING WORK

Barry Percy-Smith¹

¹University of the West of England, Bristol, United Kingdom

Abstract: In the UK one in ten young people are NEET (not in education employment or training). During New Labour the social exclusion of young people was high on the policy agenda, giving rise to a series of policy initiatives designed to support the inclusion of excluded young people. These included the Connexions Service which was set up to provide a universal support service for all young people with extra support for young people with multiple complex needs. In spite of the positive impact Connexions has achieved, the proportion of young people who are NEET remains high. This paper discusses the use of a visual life journey mapping approach with young people who are NEET to understand better the experiences, challenges and support needs of 16-18 year olds as they leave school and look for work. This research also comes at a time when the new Tory led coalition government has implemented devastating cuts to public services. Against this background the paper provides insights into some of the key findings and considers the challenges posed to personal advisors and support staff in responding to the needs of NEET young people in a time of major public sector cuts.
THE 'FRIENDSHIP BRIDGE': PORTUGUESE AND LOCAL YOUNG PEOPLE'S TIES IN MACAO
Inês Costa Pessoa

Abstract: The friendship relations developed between Portuguese young migrants and the local 'youth' settled in Macao in the two decades preceding the handover of the territory to China showed a propensity to be scarce, superficial and ephemeral. Indeed, during their period in Macao, Portuguese young people's integration process tended to be communitarian. This 'communitarian pattern was based on the one hand in a wide range of cultural differences and social disparity that according to Portuguese young people distinguished them from Macanese and Chinese young people, on the other hand it resulted from several common denominators recognized and valued within the Portuguese young migrants. Despite being quite exceptional, there were a few cases of acquaintance and friendship between some Portuguese and Macanese youngsters, which have favoured the exchange of knowledge, values, practices, consumption and cultural references, thus interfering with the development of Portuguese young people's identity. Basing our qualitative research on Portuguese young people's life stories it is our purpose to address some examples of cross-cultural ties, analyzing the factors that have motivated the development of such ties together with the platforms of interaction that framed them.

YOUNG INDIGENOUS IN SEARCH OF THEIR IDENTITIES
Maria De Lourdes Beldí Alcantara

Abstract: The main goal of this project is to show how young Indigenous of the Reserva de Dourados, MS, Brazil build a hybrid dialogue between their community and the city around it.

The Reserva de Dourados is considered the most populous in the country, with, approximately, 15,000 inhabitants in 3560 hectares. It is located 7 miles away from the second largest city of the state of Mato Grosso do Sul, Dourados.

The characteristic of these young people is to live in "transit" both, spatially and in terms of identities. Given this reality, the dialogue that these young people build with the older members, within the Reserva, becomes opaque, reflecting a big conflict, since they are young adults who should be married, but are not, should help their parents, but don’t do it. What is the place they occupy in their communities?

Outside the Reserva de Dourados they are seen with great discrimination and prejudice. They are young Indigenous who represent the barbarism within a developmental context. Expelled from both sides, they hold a tense dialogue, full of conflict, in which the places of belonging become ephemeral.

How do they feel in this transit? How do they reappropriate, create and recreate the cultural symbols that take part of that game of identity?

This work is the result of eleven years of research and action with the young Indigenous of the Reserva.

ASSISTED FREEDOM? LIFE COURSES, EXPERIENCES AND PERCEPTIONS OF YOUNG OFFENDERS ON BRAZIL'S LIBERDADE ASSISTIDA PROBATION PROGRAMME
Géraldine Bugnon

Abstract: This contribution analyses the experience and life courses of young people participating in Brazil's "liberdade assistida" (assisted freedom) juvenile probation programme. Brazilian law requires that alternatives to custody be the priority response to juvenile delinquency; "resocialization" is indeed the main objective of the socio-educational programmes (medidas socioeducativas) of which assisted freedom is one. This emphasis on allowing young offenders to remain in the community produces tensions and difficulties in institutional practices, notably resulting from the endemic violence and important spatial segregation in Brazilian cities.

Rather than considering the institutional perspective, however, the subjective experience of participants in the "assisted freedom" programme is investigated, along with the place and impact of the programme within the life course of the young people in question. Using biographical interviews, experiences of social control, expressions of agency and perceptions of justice or injustice are explored.

Preliminary results show that the control exercised by the justice system is weak, and that young people will not conform with the demands of the programme unless doing so makes sense for them.

For young offenders, the "real" sanction often appears to be their detention in the run-up to the hearing at which they are sentenced to probation; the "assisted freedom" programme itself, which depending on the behaviour of the offender can last up to three years, can sometimes lack meaning. Lastly, young offenders tend to narrate their journey away from criminality as arising from their own resolution and agency; for them, probation officers can at best offer support.

FROM EXPERTISING VIOLENCE AND DELINQUENCY TO REDEFINING TURBULENT POPULAR YOUTH.
Konstantinos (Costa) Delimitos

Abstract: In the late 90's, a group of people with different personal and professional backgrounds appeared in the French public debate on crime. Undertaking a significant publishing effort and enjoying an important media exposure, they rapidly established themselves as security experts specializing in "urban violences and security". In the frame of a sociology thesis, and by the means of a content analysis of their published works, we are interested in the rhetoric, the means of reasoning and the representations that the group henceforth referred to as "new security experts" convey.

A leitmotiv of the discourse in question is an explanatory substrate linking what is identified as a crime explosion to a non-declared, interior war. A war supposedly driven by young working class immigrants failing integration in the French society for cultural reasons and therefore drawn to all kinds of illegal activities, thus occupying and terrorizing the French popular suburbs. Through pointing out – while missing to present substantial proof- the age, the ethnic ori-
gins and the motives of the alleged authors of “urban violences”, the “new security experts” draw the outlines of a new internal enemy, the “popular suburbs youngsters” (jeunes de banlieues). A widely broadcasted figure interweaving a number of threatening figures haunting periodically the French collective imaginary over the last decades: the Young, the Poor, the Stranger, the Muslim, the Arab, the Banlieusard.

It is in this frame that this paper whishes to interrogate the “new security experts” phenomenon as a case of moral entrepreneurs who, at close quarters with anti-criminal policies decision makers, provide a (pseudo)scientific caution to a new-old fashioned French folk devil and thus manage to become a key figure in a moral panic with direct impact on the social reaction of an emerging risk society.

SOCIOEDUCATIONAL SUPPORT FOR DELINQUENT CHILDREN AND YOUTH IN CLOSED AND SEMI-CLOSED INSTITUTIONS: COMPARATIVE ANALYSIS

Jolanta Pivoriene

1Faculty of Social Policy, MYKOLAS ROMERIS UNIVERSITY, Vilnius, Lithuania

Abstract: The presentation is based on the data of research project financed by Lithuanian Research Council which one of the goals is to find out changes in socioeducational support for delinquent children in institutions in different European countries and to develop modern model of socioeducational support for delinquent children and youth in Lithuania. Developed European countries implemented reforms during the second half of XX c. while a new Juvenile justice programme in Lithuania is being implemented in 2009-2013. Comparative research of good practice examples in European countries and evidence based recommendations is contributing to the development of effective system and to the implementation of the Programme in Lithuania. Different data collecting methods were used in the research: field visits, interview with experts, survey of children and youth in institutions, observation and secondary data analysis.

In the countries under study minimal duration in the institution is emphasised. In Lithuania the duration is the longest in comparison with other countries, there are evidences of individualised support, but general support measures are still dominating. Data shows that resocialization systems in the countries are not effective. The lack of coordination of working with a family in community and with a child in institution is one of the most important factors which influence big re-enter rate. In studied countries cooperation with the families is limited to the providing parents with information about the daily routine in the institution. Data shows that in all studied countries a big attention is paid to the competences of the staff, however in Lithuania staff members are not so competent in providing socioeducational support for delinquent children. In European countries there are more number and diversity of professionals working with delinquent children in institution, activities are organized according to children needs, a big attention is paid to the competences of the staff, motivation and lifelong learning of the professionals. Diversity management and multicultural competences are more evident in the countries while Lithuanians are working with more homogeneous population.

All data is analysed in the light of integrative theory and used for the conceptualization of the model of socioeducational support in Lithuania.

(RE) CREATING THE TIME-SPACE OF THE CITY. YOUNG COSMOPOLITANS AND EVERYDAY PRACTICES.

Ilenya Camozzi

1DEPARTMENT OF SOCIOLOGY AND SOCIAL RESEARCH, UNIVERSITY OF MILAN-BICOCCA, Milan, Italy

Abstract: The paper explores the relationship between time-space experience and creativity, focusing on the everyday practices and strategies used by young people to tackle the contemporary processes of acceleration and compression of urban times and spaces. The proposal is based on qualitative research conducted in Milan on young cosmopolitans who were temporarily living in the city to further their academic careers in the artistic field (music, singing, dance), scientific research and design. In particular in my study I investigated whether these young people thematize contemporary time-space transformations, what the effects of this are on their experiences with the time-spaces of the city and in what way these consequences are handled and, if applicable, re-signified in their everyday lives. In my view this is where the dimension of creativity enters into the question, specifically in terms of recreating the city.

After presenting an initial theoretical fresco on the dimension of creativity and its link with the time-space perspective, the paper then focuses on the empirical research that highlights the relationship – for the most part a hostile one - that the subjects concerned have with the city of Milan. The need felt by subjects who are always on the move and in search of new life experiences to ‘domesticate the temporary’ leads to an investigation of the creative strategies deployed to modify and appropriate the city’s time-spaces. Lastly, I formulate a reflection on the elements which emerge from the young cosmopolitans’ narrations and the theoretical dimensions evoked. In particular I raise questions that will help to explore the fertility of the concept of creativity in sociological analysis.

MOBILITY AND EVENTS PARTICIPATION AMONG CASTELLÓN YOUNG PEOPLE

Vincent Alberto Querol Vicente,1 Artur Aparici Castillo

1Philosophy and Sociology, Jaume I University, Castellón de la Plana, Spain

Abstract: This paper is going to focus on mobilities among young people (18-35) living in the province of Castellón. Specifically, we’ll pay attention on events involvement in order to analyze how annual calendar determines these youths mobility. In the same manner we try to understand the events involvement weight in their everyday life and identity.

Castellón is a very imbalanced territory, in terms of demography and economic dynamism. The whole region has 600.000 people, with 80% of the population concentrated in the 20% of the territory.

Referring to this, we’ll observe social practices in two differentiated groups due to their main residence. Through these young people study object we try to compare their everyday life, visions, symbolic representations and social practices of those who, setting up the first group, are living in the main reference cities (Castellón metro-
politain area and Valencia) and regularly return for ‘village consumption’. The other group is built up from young residents in rural areas whose mobility points out lacks and virtues for their residence villages, besides their representations and social practices which entail relationships with the main cities.

We’ll attempt then to capture lifestyles which mobility allows symbolic and social representations that can contribute to understand specific aspects of the actual situation of this province.

A qualitative methodology will fit the aims of this research. 40 interviews to obtain the perceptions and social practices related to events in the mobility area.

• 20 interviews to rural residents from 10 different villages
• 20 interviews to urban residents linked to those 10 different villages

A better comparability about the different villages representations, the everyday lifestyles and their social practices related to events attendance will be possible due to a approach to each village from resident and non-resident point of view.

RURAL YOUTH – MARGINALIZED SOCIAL GROUP OR YOUNG PEOPLE NEGOTIATING THEIR TRANSITION IN INDIVIDUALIZED WORLD?

Ralli Nugin

Abstract: In postsocialist Estonia, rural areas have been marginalized after the collapse of the Soviet Union. The de-collectivization and privatization reforms of the 1990s put the rural areas in marginalized position. The reforms have resulted in the differences between rural and urban regions, which are one of the highest in Europe. 61% of the national GDP is produced in Tallinn and its surrounding county. Young rural people are usually seen in the wider context of the rural adult world. The incapacity of creating balanced regional development in Estonia has resulted in limited resources and possibilities among rural youth. Thus, rural youth are constructed as stigmatized and marginalized group. The presentation at hand relies on the qualitative data of in-depth interviews conducted in rural areas with young people and youth workers conducted in 2010 summer (11 youngsters and 3 youth workers) and (planned fieldwork) 2011 spring. The aim of the paper is to see how young people and the youth workers construct and negotiate rural identities in late modern environment? It will be argued that many young people create a ‘normalization’ coping strategy not to feel marginalized. As the situation of the rural areas was at its worst in the end of the 1990s, the current situation today is viewed as a better one. Also, migration to urban areas has been part of these communities lives for a while, so in a way it is seen as a normal development and often as a possibility. Estonia is a tiny country and travelling back and forth between home and town is not very time consuming. In addition, many young people see their rural identities as a resource, creating the ‘meaningful self’ - their rural home is a place where they can ‘always come back to’.

SPATIAL MOBILITY AND ATTITUDES TOWARD THE CITY: EMPIRICAL RESEARCH ON YOUTH IN BRUSSELS.

Perrine Devleeshouwer

1 Institut de Sociologie, UNIVERSITÉ LIBRE DE BRUXELLES, Brussels, Belgium

Abstract: Three main thematic orientations appear in urban sociology: distribution of movements and populations in space; individual practices and attitudes toward the city; and public action in the city organisation. Sociologists insist on the interactions between these orientations. Nonetheless the three themes remain mostly unconnected. Following Ramadier’s approach, this paper will show that practices of daily spatial mobility are closely linked to attitudes toward neighbourhood and representations about the city (Ramadier, 2002). Empirical results come from a sociological research about interactions between spatial mobility and educational practices of youth in Brussels. The enquiry is both quantitative and qualitative. The quantitative survey is made of 160 questionnaires distributed in 5 schools. The qualitative survey was realised in the same 5 schools and is made of semi-structured interviews with 40 pupils, 20 teachers and also 20 employees working with youth in the non-profit sector. Results lead us to a comprehensive understanding of youth urban experience. Youngsters develop several spatial mobility patterns and various practices in the urban space: some pupils move all around the city; others move mainly around the city centre; and some youth move generally around the area of residence. These patterns relate to similar motivations: youngsters move to meet each other. However they vary according to gender, location and length of residence. These patterns of mobility are linked with specific discourses about different parts of the city. This paper highlights the various ways in which urban life can still be a supporting element of one’s identity, attitudes and practices. This point moderates other researchers’ results stating the end of neighbourhoods as support for social practices. Moreover, in the context of turbulent time where youth can feel lost, the results show how urban mobility and attitudes toward the city help defining itself.

GENERATION LOST: PERSPECTIVES ON VOICE AND INFLUENCE, INCLUSIVE EDUCATION AND SEXUALITY

Darren Miguel Sharpe1, 2*, Chrissie Rogers1

1 Education, ANGLIA RUSKIN UNIVERSITY, Chelmsford, 2 The Centre, University of Central Lancashire, Preston, United Kingdom

Abstract: We are submitting this proposal to organise a panel at the forthcoming ESA conference. We are a newly formed team of Sociologists at the Childhood and Youth Research Institute at Anglia Ruskin University. Our Institute straddles the Faculties of Health and Social Care, Education, Arts, Law and Social Sciences, which provides us with a unique interdisciplinary vantage point to critically explore and report on contemporary issues affecting the construction of youth identities, lifestyles and wellbeing. Our collective work theoretically points to the diversity and complexities in young people’s everyday lives as they increasingly question the value of their social, cultural, and political place in the UK and how they make their voices heard. Therefore, the aim of the panel is to present papers that tackle the challenges in user voice and influence in the design, delivery and evaluation of children and youth support services; in terms of the pathways from empowerment to citizenship; the experiences of young people with respect to homophobic and transphobic bullying in the school environment; and on ‘inclusion/exclusion and rights discourses in education for children identified with SEN and their families. These debates are inherently
interconnected, cutting across disability, class, under and unemployment, sexuality, gender, and ethnicity showing just how complex it is for young people to construct a stable voice and build liveable lives in the UK.

HOMONEGATIVITY AND BULLYING IN FLEMISH HIGH SCHOOLS: INFLUENCE OF TRACKING

Saskia Aerts 1, Mieke Van Houtte 1, Alexis Dewaele 2, Nele Cox 3
1Department of Sociology, 2Department of Experimental Clinical and Health Psychology, Ghent University, Ghent, 3KATHO, Kortrijk, Belgium

Abstract: Homonegativity and Bullying in Flemish High Schools: Influence of Tracking

Previous research on the homonegativity of students in Flemish high schools shows that students in technical and vocational tracks have more negative attitudes toward LGBs than students in academic tracks. These differences in attitudes can be partly explained by differences in cultural background, participation in the social life and sex role ideology. Researchers suggest that two types of homonegativity can be distinguished: a traditional homonegativity that is characterized by an openly rejection of homosexuality; and a modern, more subtle form that is based on a discrepancy between attitudes and behavior.

We want to investigate if students in technical and vocational tracks still have more negative attitudes toward LGBs when religion, participation in the social life and sex role ideology are controlled. On top of that, we want to investigate if LGB students in technical and vocational tracks perceive more bullying.

The data for this study are gathered with an online survey in 2007. We analyzed the data of 1,745 respondents from secondary education, 162 of them are LGB and 1517 are heterosexual. To answer our first research question, we performed a step-wise multiple regression analysis with educational track as the central determinant. We controlled for differences in religion, participation in the social life and sex role ideology. To test if LGB students experience more discrimination in technical and vocational tracks, we performed another step-wise multiple regression analysis with sexual identification, educational track and an interaction term that combines both as the central determinants.

Our results show that students from vocational and technical tracks have more negative attitudes toward LGBs than students in academic tracks, even when controlled for religion, participation in the social life and sex role ideology. The interaction effect combining sexual identification and educational track however, did not show that LGB students experience more discrimination in technical and vocational tracks than in academic tracks. This confirms that more negative attitudes toward LGBs do not necessarily lead to more discrimination of LGBs, what gives evidence to the existence of a subtle, modern form of homonegativity.

TRAJECTORIES IN UPPER SECONDARY EDUCATION AND THE DEVELOPMENT OF SELF-ESTEEM IN SWITZERLAND

Sybille Bayard 1, Monika Staffelbach 1, Marlis Buchmann 2

1Jacobs Center for Productive Youth Development, 2Jacobs Center of Productive Youth Development, UNIVERSITY OF ZURICH, Zürich, Switzerland

Abstract: Adolescents’ well-being is an important indicator of their successful development. Well-being includes many facets, one of which is self-esteem (Baumeister et al. 2003), defined as favourable or unfavourable attitudes toward oneself (Rosenberg 1965). This paper investigates the factors that contribute to the development of self-esteem in adolescence. As schooling and vocational training play a prominent role in adolescents’ daily routine, we assume that the type of post-obligatory educational track should show direct effects on the development of self-esteem. Socialization and allocation theories postulate a causal connection between more prestigious educational tracks and higher competence development (Palas 2006). A successful transition to educational tracks characterized by high academic demand should therefore go along with an increase in self-esteem. Unstable job situations are on the other hand likely to be associated with destabilization and decrease in self-esteem. According to a second approach, competence development varies between educational tracks, especially between school and vocational training (Heinz 2008, Baethge et al. 2008). A partial entry in labour-market is a central biographical life-task. Adolescents engaged in vocational training are required to establish a professional identity, complying with the company’s rules and accepting the role of an apprentice (Lamamra/Masdonati 2009). According to this approach, adolescents in vocational training should experience an increase in self-esteem whereas adolescents who remain in academic tracks or who are in uncertain situations reveal slower growth of self-esteem.

The analyses are based on the first three waves of the Swiss longitudinal Survey of Children and Youth (COCON). Using late growth models, analyses are based on the cohort of the 15-year olds, examining change in self-esteemmat three measuring points between the ages of 15 and 18. Educational tracks are based on the complete information of the adolescents’ educational biographies. Exploratory analyses support the first theoretical approach mentioned above.

CULTURAL LIFESTYLES AND SOCIO-ECONOMIC STATUS OF ROMANIAN YOUTH

Valer Veres 1

1Sociology, BABES-BOLYAI UNIVERSITY CLUJ NAPOCA, Cluj-Napoca, Romania

Abstract: In this paper we analyse the cultural lifestyle of the 18-35 year-old population according to their place in the social structure and ethnicity. The empirical source is a representative survey for Romania, from 2008, out the 18-35 age group, with 998 cases ordered by ANST. Following the analysis of the formation of cultural lifestyles, we compare cultural capital and social class position formed according to traditional forms of economic and occupational status, based on an index constructed on economic and cultural capital. In order to measure the cultural lifestyle of young people we have formed four consumer groups by means of factor analysis. These groups are the following; screenagers who consume culture through computers and the internet, being informed from these sources, communicating with their help. They are followed by the Clubculture group, clubbing young people, while the third group consists of high culture consumers who indicated that they go to the theatre, opera, concerts and movie theatres. The fourth group is
the home book readers. We have analysed the association of socio-economic status with cultural lifestyle, ethnicity. We also analysed the social disposition of young people from socio-economic and cultural lifestyle perspective.

Our analysis shows that cultural lifestyle has strong associative ties with socio-economic class situation. As for social disposition, it may be demonstrated class specifically that young people from the upper and upper-middle class give priority to non-material problems related to the information society and globalization, let it be aimlessness, lack of culture, moral crisis, sometimes the crisis of family values, while those deprived and those from the lower class indicate problems related to material situation and poverty. It may be demonstrated that the screenager lifestyle is strongly associated with the upper and upper-middle class position of young people.

The social class position of screenagers is relatively better, they are overrepresented among non-manual workers and students. According to level of education, their proportion is prominently high among people with higher education and it is also above average among people with high school education and among the inhabitants of big cities and the capital.

WORK CENTRALITY AND WORK VALUES: STUDYING GRADUATE’S TRANSITION TO WORK

Miguel Chaves 1,2, Rachel de Castro Almeida 1,2*

1Faculdade de Ciências Humanas e Sociais, Universidade Nova de Lisboa, Lisboa, Portugal, 2Sociologia, Pontificia Universidade Católica de Minas Gerais, Belo Horizonte, Brazil

Abstract: The subjective relations that individuals and groups establish with work is one of the key problems that runs through the heritage of social sciences, both in the past and in the present. However, we believe that there is still much to do in terms of conceptual and empirical studies in this area, especially considering that the role of paid work, as economic and identity mainstay of individuals, currently suffers a profound destabilization. What is the importance that people assign to work in their life in comparison to other spheres of activity? What meanings do individuals assign to work? What aspects are the most valued? What is the relevance that individuals assign to extrinsic factors (amount of salary, symbolic benefits associated with the profession and professional status etc.) and intrinsic (opportunity to develop skills, opportunity to establish human relationships considered rewarding etc.)? How are these different ways of conceiving work distributed within the same society? What are the reasons that underlie this diversity and allowing us to understand it?

Focusing on graduates, these issues will be addressed by mobilizing data from a recent study accomplished in the largest public Lisbon universities. Within this research we developed an analytical model that allows us to examine the ways that work centrality and work values are distributed within this population. These subjective relations with work will be understood in light of dimensions such as gender, social origin and position held in the labour market. In addition, this study will allow a comparative analysis between the scientific areas of training of those individuals.

YOUNG ADULTHOOD IN ITALY: DEFINITIONS AND CONTRADICTIONS BEYOND STEREOTYPES

Valentina Cuzzocrea

1UNIVERSITÀ DEGLI STUDI DI CAGLIARI, cagliari, Italy

Abstract: This presentation seeks to secure a place, in the international debates, for the contested social category of Italian young adults. So far, such debates have failed to established proper links among different groups of youths in Europe, in terms of what unites or divides them.

On the one hand, there is an implicit agreement that European studies can be fruitfully directed towards those youths who have the age of the youth –it would be banal to state, but Italian youth not necessarily has this. Secondly, they are seen with interest if they belong to fast moving societies. The shared expectation is that these groups might vehicle innovative instances for the society at large.

On the other hand, Italian young adults appear relegated to an outdated, surpassed Mediterranean model of which they have acerbated all the characteristics. In performing this model in such an extreme way, they do not seem to correspond to any other social groups, and risks to be neglected in the analysis of European realities, being confined as they are to an easy stigmatization.

This paper has a theoretical focus, in that it proposes an exploration into the contradictions of the category of Italian young adults (a); it discusses why they can and / or should be considered young and not fully adults, despite their age (b); it puts at stake the welfare contradictions rendering so difficult for them to leave a stage of life which is often a penalising condition. I shall examine the ways in which Furlong and Cartmel’s idea of an epistemological fallacy for the youth (1997) might be powerfully confirmed in this case.

FACING UNFAMILIARITY – EXPERIENCES OF INTERNATIONAL STUDENTS TRANSGRESSING THE NATION

Carsten Yndigegen1

1Dept. of Border Region Studies, UNIVERSITY OF SOUTHERN DENMARK, Sønderborg, Denmark

Abstract: International student mobility has developed rapidly in the recent decades fostered by European Union mobility programmes and international university exchange agreements. This phenomenon runs parallel with an increase in general global mobility. The concept of unfamiliarity in border interactions has been proposed by Spierrings and van der Velde (2008) as a concept that explains factors that foster individual mobility or immobility. The paper will develop the concept from its offspring in geographical spatial theory to cover a broader sociological approach that reflects on current transnational mobility patterns on a global scale.

The paper builds on data from qualitative interview studies that have been conducted among international and transnational students in three sites in Denmark, Sweden and the Galicia region in the Polish-Ukrainian border region. It will be analysed how mobility incentives develop among young people, how cross-cultural interaction reveals unfamiliarity, how borderwork (Rumford, 2008) is imposed, and how spatial identifications become reflexive in the process of moving abroad.

The analyses show how diversity in handling the mobile conditions exists and develops among young people, and the paper will continue and develop the discussions put forward by Kennedy (2008, 2009, 2010) and Nowicka (2007), and draw on basic mobility theory (Urry, 2007).

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
FINNISH AND FRENCH FEMALE UNIVERSITY STUDENTS' LABOUR MARKET INTEGRATION

Aurelie Mary

1Department of Social Research, UNIVERSITY OF TAMPERE, Tampe re, Finland

Abstract: This paper is based on a comparative study on youth transition to adulthood in Finland and France. The research data consists of 22 in-depth interviews conducted among female university students in Finland and France. Four themes are examined: 1) Young women’s evaluation of the higher education system; 2) integration on the labour market; 3) plans for starting a family; 4) entering adulthood.

The present paper mainly concentrates on Finnish and French female students’ labour market integration. The paper examines young women’s opinions and attitudes towards the labour market, hopes and worries regarding transition from university to working life, and strategies of integration into the world of work. How do Finnish and French young women perceive the labour market in their country? What do they expect from working life? Is work per se and salary primary focuses regarding their professional choices? Or do they require more than work, such as a job related to their personal interests and values? Moreover, does the labour market offer good opportunities to young people, or is it hostile to them? And what is the situation concerning young women in particular? Many young women are in the heart of a dilemma, having to fulfil two roles; that of a professional worker, and a mother and family carer. The two roles are not always easy to combine and might bring conflicts in young females’ personal lives and professional goals. For instance, they might experience discrimination on the labour market with regards childbearing. Some young women thus decide to focus on their family, some on career, and most of them try to reconcile both aspects. The young women in my study discussed these issues, and raised significant perspectives on the subject.

‘SMILE! YOU’RE ON FILM!’ THE INTERPLAY BETWEEN SHAME AND THE USE OF MOBILE PHONE CAMERAS IN THE PROCESS OF EMERGENCE OF NORMS

FRANCESC NÚÑEZ-MOSTEO 1, NATÀLIA CANTÓ-MILÀ 1, SWEN SEEBACH 1

1ARTS & HUMANITIES, UNIVERSITAT OBERTA DE CATALUNYA (UOC), BARCELONA, Spain

Abstract: It is becoming increasingly common that teenager friendships end up in controversy, dispute and even fight because of pictures that have been shared in Fotolog or facebook without the permission of all those who are on them.

The easiness with which pictures can be taken and videos made with a mobile phone, and the easiness with which these pictures and videos can then be shared has generated many conflicts on many different levels. From public scandal to lawsuits because celebrities feel their intimacy invaded, to thousands of minor discussions among friends and lover for not having been asked before a picture of theirs was made public.

After the incorporation and generalisation of cameras and video cameras in mobile phones, a period of time has been necessary in order to domesticate the multiple possibilities, which are offered by these devices. These possibilities are still growing, but so are the routinized practises and norms of their use. Shame has been an emotion highly present in this process. It has facilitated the perception of the public dimension of an apparently innocent and familiar action, such as taking a picture, centred in a concrete place and time, and has helped become aware of the possible moral and social implications of taking that picture and publicising it.

From 2007 to 2009 interviews and discussions in focus groups with teenagers from Catalan schools were realised (56 teenagers aged between 15 and 18). These interviews and focus group discussions concentrated on finding out the use that these teenagers made of video materials in the Internet. This paper focuses on the results of the analyses of these interviews, emphasising the role that shame played in the regulation of the use of their mobile cameras, at a time in which the possession of mobile phones with cameras was becoming common among middle class and working class teenagers.

COMPETING OR COMPLEMENTARY AGENTS OF SOCIALIZATION? PATTERNS OF INTERGENERATIONAL ROLE DIVISION IN MEDIATING YOUNGSTERS’ INTERNET USE

Veronika Kalmus

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

Abstract: Alongside with the rapid growth of Internet use among the young generation and rising public concern about risks and vulnerabilities children and young people may face online, we can witness an increasing research interest in help and guidance that socialising agents (mostly parents, teachers and peers) provide to youngsters to support their online endeavours. Together with rules and restrictions set by parents and teachers, these practices are termed as ‘mediation of Internet use’. Previous research, by concentrating mainly on mediation by parents, has provided several typologies of parental strategies. Mediation by other socialising agents, however, has seldom been studied simultaneously to that of parents.

This paper will focus on three main agents of social mediation (parents, teachers and peers) to find out their relative importance and specific roles in mediating youngsters’ Internet use. Based on data collected from 9-16 year-old Internet users (N=25,142) and their parents in 25 European countries in summer 2010 by European research network EU Kids Online, the analysis aims to reveal how different types of parental mediation, peer mediation and mediation by teachers are related to the level of youngsters’ digital skills, their use of online opportunities, and experience of online risks. Possible effectiveness of mediation will, furthermore, be analysed in the light of socio-demographic variables.

Preliminary findings show that support from peers, followed by mediation by teachers, is more effective in enhancing youngsters’ digital skills and their use of online opportunities, while active mediation by parents helps to reduce children’s risky online experiences. Thus, different agents of socialisation seem to fulfil different roles in mediating youngsters’ Internet use. The paper will end with a short discussion on how policy measures could contribute to achieving a better cooperation between different generational groups to maximise youngsters’ online opportunities while minimising risks and vulnerabilities.
CZECH YOUTH: FORMING THE IDENTITY IN THE NETWORK SOCIETY

Katerina Gillarova

Faculty of Social Sciences, Charles University in Prague, Prague, Czech Republic

Abstract: The information communication technologies (ICT) have been anchored an important and an axiomatic element of the young people’s everyday leisure lifestyles and school-based experience (boyd 2008). Unfortunately, there is only a limited number of researches that would focus on the role of these new technologies in the construction of teenagers’ identity.

This paper will map the process of identity formation within a Czech teenagers’ group through ICT. It will be localized in the context of the network society conception, which thematizes the influence of massive penetration of the mobile and on-line technologies – popularly known as new media (Castells 2000). The objective of the project is to enrich the current views on the youth identities formation in the social group with new communication media perspective. It will be based on the qualitative research of the Czech youth social groups.

In particular, the work will envisage the way the teenagers use ICT to present, express and form their identities; the way both the individual and group identities have been formed, reproduced and structured through young people engagement with new media technologies and how they shape each other; also the way the identity issues have been positioned and framed in these every day on-line and mobile conversations.

I will approach the analysis from the interpretative sociology perspective. The topic frameworks that will mutually overlap are the issues of technology and change, youth and social group. The project has a nature of case study. I will research small social groups of the Czech 15 – 19 years old students from various social milieus using a set of various qualitative techniques: in-depth interviews, on-line observation, group discussions, nethnography of communication. I will apply them partly in the nature environment of research participants.

Bibliography:

THE CYBERNETIC FACES OF ‘EROS’ AND ‘FILIA’. LOVE AND SEXUALITY OF ITALIAN YOUTH ON THE WEB

Cosimo Marco Scarcelli

Sociology, UNIVERSITÀ DEGLI STUDI DI PADOVA, Padua, Italy

Abstract: The present paper seeks to explain part of the qualitative data presented in the author’s PhD dissertation, which deploys different methodological approaches (the latter part of the research is based on a survey, however the present work only focuses on the qualitative analysis). The data is drawn from four focus groups, forty in-depth interviews, and two focus groups conducted online, all of which involved Italian male and female teenagers in the age range of 16 to 18 years old.

Adolescents and youth are big consumers on the internet. Today, what we call online social media, such as social network sites (facebook, myspace, twitter, etc.), blogs, and chat rooms are an important part of young people’s life (Pujazon-zazik, Park 2010). Youth are increasingly utilizing these communicative tools to support or to enhance their “off-line” relations (Drusian 2005; Subrahmanyam, Greenfield, 2008).

The author’s research focuses on a field that is very much neglected by the Italian sociological studies, aiming to understand the current state of the youth culture in relationship to the internet and sexuality. The work seeks to understand how young Italians today use the internet to gain and access information (visual images, discussions, discourses) about sexual and intimate life and activities; to understand ‘how’ and ‘why’ they use (or choose not to use) this particular medium, and what kind of social impact can be observed in this relatively new phenomenon.

The research seeks to (1) understand what multimedia platform young Italian use to have access to information and discourses connected to sexuality; (2) understand why they use (or don’t use) this media; (3) define the extent of internet on the youth’s experience on sexuality and their social construction; (4) understand if there are gender differences in the use of internet regarding to this specific topic.

With this research, the author hopes to draw an attention to the problematic relationships between the real and virtual, between the everyday life experience and the everyday virtual life experience mediated by the social and cognitive space where the absence of the body plays a paradoxical role in their (self-learning) education of sexuality.

CULTURAL AND MATERIAL RESOURCES OF PARENTS AND GRANDPARENTS: EFFECTS ON EDUCATIONAL OUTCOME OF CHILDREN IN 13 EUROPEAN COUNTRIES

Nicole Tieben, Christian Deindi

1MZES, MANNHEIM UNIVERSITY, Mannheim, 2Cologne, Research Institute for Sociology, Cologne, Germany

Abstract: Educational attainment is depending on material and cultural resources of the parents. In many families however, it is not necessarily only the parents who provide resources but also the grandparents may provide resources that directly or indirectly stimulate children’s educational careers.

Cultural resources work directly on the cognitive ability and on school performance of the child which in the long run results in a better educational outcome. The transmission of knowledge requires intensive personal contact and effort. The mechanisms of material resources however, are somewhat different. Material resources can be easily transmitted from one generation to another and unlike the transmission of cultural resources an intensive contact between the giving and receiving side is not necessary for transmission. Material resources thus can be more easily transferred from grandparents to grandchildren than cultural resources. We suggest that parental cultural resources have a direct effect on educational outcomes of children while cultural capital of the grandparents is transmitted indirectly via the parents, as personal contact between grandparents and their grandchildren usually is less inten-
sive than contact between parents and children. Material resources of the grandparents do not necessarily work via the parents’ generation and therefore can have a direct effect on educational outcomes.

Using life-history data from the newly available third wave of the Survey of Health, Ageing and Retirement (SHARE) in Europe we link the educational outcome of children with the cultural and material resources of their parents and grandparents. Through pathmodels we are able to model the direct influence of grandparental resources on parental cognitive abilities at the age of ten and on the highest education achieved by parents as well as on their occupational status. In a next step we analyse the direct effect of parental resources and the indirect effects of the grandparents on the educational outcome of the children. Our preliminary results indicate that cultural and material resources of both previous generations play an important role for the educational outcome of children.

SOCIAL AND DEMOGRAPHIC ASPECTS IN THE TRANSITION TO ADULTHOOD AMONG PORTUGUESE UNIVERSITY STUDENTS AT THE BEGINNING OF THE 21ST CENTURY

Maria Da Conceição Reis Picoito 1, Maria Filomena Mendes 2

1Sociology, ÉVORA UNIVERSITY/ISEC, Lisbon, 2Sociology, ÉVORA UNIVERSITY, Évora, Portugal

Abstract: During the 1960s the evolution of fertility levels in developed countries gone deep changes.

Portugal followed the downward trend of fertility rates even shaper in Southern European countries and so, since the eighties, presents birth-rates levels considerably below replacement.

The demographic research points to several paths to explain this evolution in the Western countries and, of all sources, the strong link between fertility levels and the demographic events in the transition to adulthood is the most crucial one. Precisely in the ages between eighteen and thirty four old, the period characterized as “demographically dense” (Rindfuss, 1991 cit. Billari 2004), several events took place that have a seriously connection with fertility.

In the 1990s, the transition adulthood created an increased interest of research also because the complexity and diversification of young adult’s life trajectories (Gauthier, 2007); in the majority of the European countries there has been a delay on leaving parental home (Billari 2004) and changed the sequence and temporality of key events like marriage and union formation and having a first child.

This study contributes to the understanding of demographic events which take place in the transition to adulthood, in Portugal.

The research aims are three fold: to uncover university students’ hopes during the period of change to adulthood, to understand the mechanisms and agents that can affect the making of decisions concerning life project; and to apprehend the social and demographic consequences as transition to adulthood takes place.

For the purpose of the study data was collected via semi-structured interviews with six sets of students, attending different courses/degrees in Évora University. The content analysis of the data revealed that education and employment play a fundamental in the students’ decision making process (time and types of decisions) concerning their life projects.

The relationships between job prospects and self autonomy from parents in order to start their own family must be especially stressed out. In the same way, professional and personal stability are also important factors when considering tackling familiar engagements, particularly the possibility of having children. These kind of difficulties faced by the young people considered an important cause for the delay of marriage and childbearing.

SOCIAL DIFFERENCES, SOCIAL RELATIONS AND CLASSROOM CULTURE IN THE UPPER SECONDARY EDUCATION

Susanne Murning 1

1Dept. of Education, DANISH SCHOOL OF EDUCATION, AARHUS UNIVERSITY, Copenhagen NV, Denmark

Abstract: The subject of this paper is to explore the role of the classroom culture and the social background of the pupils in relation to in- and exclusion and learning opportunities in the Danish upper secondary education.

The paper is based on empirical studies of the teaching, the social positions and positioning in the classroom, identities and the processes of in- and exclusion in the Danish upper secondary education. The purpose of the project is to determine how the upper secondary education can support, acknowledge and include pupils from non-academic backgrounds. The analysis in this paper is based on observations and interviews during the pupil’s first two years.

The project will highlight the importance of the social context in the education, the pupils’ different opportunities of learning and participating within the social context of the classroom, and will consider the pupils difficulties as social challenges in the education and not (only) as individual challenges. In this paper I will focus on how to understand the classroom-culture in the upper secondary education as a social context, which produces different identities. The pupils’ different positions in the classroom are closely connected to the culture of the classroom and to the teaching: What is the definition of a good student (a good body) what are the pupils’ opportunities of participation in different settings of teaching, and how does this affect the pupils’ relation to each other, the teacher and the school. What are the pupil’s experiences and strategies in their fight for a central social and academic position in the class? And in what way are the pupils identities related to their social background, gender and ethnicity?

The questions will be discussed and answered in relation to the main question for this paper: How do the classroom and the pupils’ social relations produce different pupil-identities and how is this related to the pupils’ social differences regarding social background and gender?

The theoretical foundation of the project is socio-cultural and inspired by Bourdieu’s educa-tional sociology and theories of social relations, learning, identities and positioning (Elías, Lave and Davies).

YOUNG PEOPLE’S GENDERED OCCUPATIONAL CHOICES AT THE TRANSITION TO VOCATIONAL TRAINING: THE ROLE OF PARENTS’ SEX-TYPED ABILITY

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
BELIEFS, INDIVIDUAL ASPIRATIONS, AND INSTITUTIONS

Irene S. Kriesi 1, Marlis Buchmann 1

1Jacobs Center for Productive Youth Development, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: Young people’s gendered occupational choices are partly responsible for sex-segregation in the labour market, leading to unequal opportunities of young men and women. The choice of sex-typical occupations is particularly pronounced at the transition into vocational training. This transition is characteristic of dual educational systems prevalent in Switzerland or Germany.

Current sociological theories (Charles & Bradley, 2009; Ridgeway & Correll, 2004) consider gender-essentialist stereotypes and beliefs about innate gender differences in abilities, held by young people and gatekeepers (e.g., parents, teachers, or employers), as important causes for gendered occupational choices and allocation processes. However, the exact mechanisms leading to gender-segregation at the transition into vocational training are still under-explored. Little is known about the role of gendered ability beliefs and aspirations vis-à-vis academic qualifications, which serve as institutionalized selection criteria of trainees. Against this background, our paper examines whether parents’ gender-typed ability beliefs, adolescents’ own values and aspirations as well as academic qualifications affect the probability that young people train in a gender-typical occupation at the age of 18. We extend previous research by distinguishing between two different types of male and female occupations.

Our analyses make use of the Swiss Survey of Children and Youth COCOW, a representative longitudinal study including a cohort of adolescents. The respondents were 15 and 18 years old at the time of data collection in 2006 and 2009 (N=952). The data also includes information from primary caregivers. Results are based on multinomial regression models run separately for men and women. They show that specific aspects of parents’ gender-typed ability beliefs promote the choice of different types of male or female occupations. In addition, gendered aspirations as well as educational qualifications are important explanatory factors. The latter highlights the role of institutional allocation processes in explaining occupational gender segregation at the transition into vocational training.

YOUTH CliQUES AND ANTI-SCHOOL CULTURE

Valeria Ivaniushina, Daniel Alexandrov

1HIGHER SCHOOL OF ECONOMICS, St.Petersburg, Russian Federation

Abstract: The proposed paper deals with counter-school culture of Russian urban youth. It follows the established tradition of studying students rejecting school authority as well as education in general as a part of mainstream values. After seminal studies by Paul Willis of ‘anti-authority’ subculture and John Ogbu of ‘oppositional culture’ the research in this area was polarized into two rather distinct ‘subcultures’ of urban ethnography and quantitative sociology based on standard large-scale surveys.

We approach the problem of counter-school culture from the vantage point of social network analysis and mixed-method design (our original survey of schools in 2010 comprises 104 schools, 409 classes, 7300 students, and over 200 interviews with students and teachers). In the survey we elicited full class friendship networks and measured pro/anti-school attitudes, engagement in learning, educational and professional aspirations, parental SES, ethnic and migration status. The survey results are complemented and verified by the qualitative data from the same schools.

Our main thesis is that the counter-school culture emerges and persists in student networks through network cliques. Previous research on pro-/anti-school attitudes was mainly focused on the differences between schools (working class vs. middle class, vocational vs. academic track etc.). Differentiation-polarization thesis claims that differentiation of students between schools / tracks generates the polarization of attitudes toward education, and consequently the counter-school culture. While there is no doubt that different types of schools or educational tracks often differ in their level of pro/antischool attitudes, we would claim that there is al-
ways a certain diversity of students and their attitudes within schools.

Analysis of friendship choices in classes while controlling for gender, social class, ethnicity and migration background reveals homophily between students on anti-school attitudes and educational plans. We argue that students form small cliques that share certain level of anti-school culture, and it is on the clique level that anti-school attitudes are shaped and developed. The paper will discuss both network data and qualitative data focusing on the relation between ethnicity, migration background, social class and anti-school attitudes, and the emerging counter-school culture.

BETWEEN HEALTH-RESOURCES AND HEALTH-STRAINS: THE TRANSITION FROM CHILDHOOD TO ADOLESCENCE AND ITS IMPLICATION FOR THE HEALTH AND THE WELLBEING OF YOUTH.

Caroline Residori 1, Helmut Willems 1
1FLSHASE /INSIDE, UNIVERSITÉ DU LUXEMBOURG, WALFERDANGE, Luxembourg

Abstract: The transition from childhood to adolescence is characterised by major psychological, behavioural and relational changes. Young people at the onset of adolescence face the psychological challenge of developing an independent and autonomous adult identity. Their range of behaviour increases enormously during this transition and their behavioural choices become ever more independent of parental values and control. On a relational level, their growing autonomy can lead to a decrease of the closeness to their parents and families and an increasing importance of peer-relationships. In addition, societal resources and strains influence the way young people deal with the challenges related to the transition from childhood to adulthood. International comparative Studies such as the “Health Behaviour in School-aged Children HBSC” and international mortality rates show that there is a significant shift in health risks and strains between childhood and adolescence and that great differences between European countries exist.

In our contribution we will discuss the different aspects of this shift (wellbeing, rates of transportation accidents and suicides etc.) and the international differences in the manifestation of these health-related risks and behaviours. Here for, we will refer to the findings that the international comparison of the health situation of youth in Luxembourg, as a country with a high standard of living and a high level of economic wealth, and the health situation of young people in other European countries has yielded. On one hand, the focus will lie on the societal health-related resources and strains that young people have to learn to balance. On the other hand, the relationship between youth-health-risks and socio-economic as well as societal resources will be explored.

FAMILY STRUCTURE AND CHILD WELL-BEING: MULTIVARIATE ANALYSIS OF ANSWERS OF TEENAGE STUDENTS IN A ROMANIAN CITY

Adrian Hatos 1, Sergiu Baltatescu 2
1University of Oradea, 2Sociology and social work, university of Oradea, Oradea, Romania

Abstract: For many laymen and specialists child well being is dependent, among other things, on a proper family structure which is usually equated with children being raised together with both of their biological parents. According to the literature, decline in material resources, stress and lack of adequate control entail from the disruption of families provoking a presumed lowering in the outcomes taken customarily as measures of child well-being – academic achievement, psychological and social adjustment. Recent meta-analyses of results of hundreds of researches, done mainly in developed countries (Amato, 2001; Chapelle, 2009), raise doubts about this common view: the absence of one of the parents, usually of the father, has a weak, if any, negative effect on the above features of children’s quality of living while evidences for positive consequences of separation, divorce or widowhood are not absent. International variations of the results are typically accounted on institutional, economic and cultural differences, which make policy and explicative usability of results from non-similar areas difficult.

My article will investigate the effect of living in non-intact families, compared with families with both parents, on important measures of children well-being and adjustment like academic achievement and self-esteem, in a Romanian setting. I will use the answers of 2640 students in grades 8-12 from Oradea to a questionnaire that has been self-administered in December 2007. The structure of ...results” section of the paper will be as follows: 1) incidence of non-intact families in the sample; 2) comparisons concerning academic achievement and self-esteem between intact and non-intact families in the sample; 3) tests of the effects of family structure on the outcome variables controlling for important covariates using multivariate techniques; 4) comparisons of effects size with results found in the international literature; 5) conclusions and discussions.

FEAR AND LOATHING IN LONDON SCHOOLS: SITUATING YOUTH VIOLENCE AND DRUG USE IN THE CONTEXT OF ‘RISK HIERARCHIES’

Adam Fletcher 1
1Public Health & Policy, LONDON SCHOOL OF HYGIENE & TROPICAL MEDICINE, London, United Kingdom

Abstract: In order to explore how school experiences may shape young people’s health and wellbeing, qualitative case-study research – informed by theories of youth transitions in late-modernity, drug use ‘normalisation’ and peer-network formation – was undertaken at two inner-city secondary schools in London. Students’ and teachers’ accounts, and observations, suggested that London schools can constitute risky and insecure environments engendering fear and anxiety, and thereby act as structural forces in shaping how students form peer groups and respond to feelings of insecurity. Violence and cannabis use – and identities constructed in relation to these practices – appeared to be influential in how students managed insecurity: large, ‘safe’ ethno-centric school social networks were apparent in which ‘tough fronts’ and smoking ‘weed’ appeared to be an important source of bonding and identity. For some students this process of ‘fitting in’ exacerbated already difficult relationships with teachers and parents, entrenched disengagement (k)ing (k)ing and led to escalating drug use. However, there also appeared to be a diffusion of this ‘safe’ identity-construction beyond the most disengaged students: smoking cannabis could be an equally important strategy and source of bonding for pro-education students seeking to form ‘safe’ bonds and ‘escape’ the pressures of school. Harm reduction strategies need to be informed by the concept of ‘risk hierarchies’ in schools, and I will discuss the implications of this for further research, policy and practice.
INTRODUCTION OF YOUTH INTO SOCIETY: SOCIAL AND TERRITORIAL BELONGING IN YOUNG PEOPLE OF LATVIAN AND RUSSIAN ETHNICITY

Ritma Rungule, Ilze Koroleva, Ilze Trapenciere

Abstract: The problem analysis stems from the assumption that integration in a society is an individual activity which requires certain motivation and action. On the other side, there is need for predefined rules which make integration possible and ensure coherent integration of different social groups, which would be the task of a State. In order to analyse the subjective aspects of integration, we may look at them in the context of different life routines. This is why we choose two particular aspects to characterize the inclusion of youth: participation in social life and identity as the sense of belonging to social groups and territories.

The analysis presented in the paper is based on youth surveys held in Latvia in 2005 among high school students (n = 3046), and in 2010 among general population youth in the age groups of 13–16 and 17–25 (n = 1000).

The distinction between ethnic Latvians and Russians is the least distinctive, if we examine the level of expressed attachment to the place of residence. The analysis shows that such a kind of belonging, and promotion of it, form a good ground for integration of young people in the general society. One of the most important strengthening factors here is youngsters’ own participation in various events and organisations in their locality. Regarding the statuses which are of great importance for young people, differences between Latvians and Russians are not significant — just like in their orientations towards education, professional training, and the sense of belonging to the groups of family and friends.

The most distinct differences were found in ethnic and national identities. Latvian youth expressed coinciding sense of belonging to the Latvian ethnic group and to the State of Latvia — the two identities support one another. Russian youth presented a contrasting case: the two identities are seen as the separate entities, where the national one is perceived as a threat to the ethnic. Undoubtedly, the two are significant for each person: one presupposes that individuals are familiar with their ethnic culture and speak the corresponding language, while the other implies the knowledge of the State language and symbols. Thus, it is crucial for the integration policy not to oppose young people’s ethnic and national selves.

RUSSIAN YOUTH PATRIOTIC VALUES: HOW RUSSIAN STUDENTS IDENTIFY THEMSELVES IN THE TERMS OF PATRIOTISM

Irina Trotsuk

Abstract: In the year 2002 we conducted a survey in the Peoples’ Friendship University of Russia aimed at studying the students’ patriotic values within a range of other relevant social and ideological features. Together with analyzing the patriotic orientations we wanted to develop a methodologically adequate questionnaire to be able to conduct comparative surveys on the topic chosen in the cross-cultural and temporal contexts. That’s why we suggested an operational interpretation of the concept ‘patriotism’ as a complex three-level social attitude. The 2002 survey results showed that two components of the so operationalized concept ‘patriotism’ are most obvious – the cognitive and the affective (emotional) levels. The former includes a collective image of the country, awareness of its ‘strengths’ and ‘weaknesses’, its international and geopolitical status in the contemporary world and future perspectives. The latter seems to be the most significant part of the patriotism as a social attitude: most of the respondents unhesitatingly identified themselves in the terms of patriotism, felt a deep emotional connection with the country, looked quite optimistically in its future (while having no illusions considering the country’s current situation). The third, so called ‘activity-component’ of patriotism, was the least obvious and that’s the main distinction of ‘soviet’ and ‘postsoviet’ types of patriotism – the latter doesn’t have any active, practical, performative basis.

As we can see the official state ideology and rhetoric of the recent years focus on the patriotic education and patriots’ upbringing particularly emphasizing the emotional and the active components of the patriotism. So in the December 2010 we conducted another survey in the Peoples’ Friendship University of Russia to identify the nowadays structure and content of students patriotic values regarding the changes occurred and elements preserved the same over eight years.

“TO WITHDRAW OR TO REBEL? GLOBALIZATION AND YOUNG WORKERS IN JAPAN”

Tuukka Hannu Toivonen

Abstract: In the face globalization and economic crisis, different welfare states as well as different groups within them have been shown to react in divergent ways. This paper focuses on the behavioural and motivational responses of young labour market entrants in Japan, a strongly ‘conformist’ - and now aging - society known for its eroding company-based welfare system. Upon illustrating how Japan’s labour market institutions have themselves reacted to post-industrial pressures in predominantly resistant ways since the early 1990s, the account constructs a Mertonian-inspired, flexible framework to understand individual-level adaptations. Instead of confining the investigation to the presumably most excluded groups only, the first goal is to theoretically grasp dominant patterns of adaptation across the whole of the youth population. Next, the tendency of some Japanese youth toward disengagement and retreatism is analyzed. However, the paper also identifies a more dynamic layer of young people (‘quiet mavericks’) who adapt their behavior and motivations to an arguably maladapting system creatively. This group is of particular interest as it negotiates complex conformist pressures tactfully. The resulting analysis sheds light on just how differently the ostensibly same phenomena – globalization in general and the most recent crisis in particular – can impact on young people in conformist societies such as Japan and South Korea compared to more individualistic ones. At the same time, it appears that many of the changes that appear in such sharp form in Japan are also present in the West, suggesting that the present paper has important implications to young people and social policy in Europe.

OCCUPATIONAL VALUE ORIENTATIONS AND TEENAGERS’ JOB CHOICE DECISIONS: THE
IMPORTANCE OF VALUES IN THE BIOGRAPHICAL CONTEXT

Michael Weinhardt¹
¹Graduate Centre / SOEP, DIW, Berlin, Germany

Abstract: Traditionally, sociological value research has focused on the macro level, following trends over time and differences across cultures. Comparatively little attention has been paid to the effect that values have on the micro level and their impact on individual behavior. This dissertation investigates the relevance of values for explaining human behavior and life course decisions by looking at career choices of teenagers. This topic is important as occupation is a central component of an individual’s personal identity as well as a main factor in determining peoples’ life chances. The study uses data from the youth questionnaire of the German Socio-economic Panel (SOEP) which includes a set of questions on occupational interests and values addressed at 17-year old teenagers. The longitudinal nature of the data is used to model job attainment of young people and the role values play in the process. Employing a latent modeling framework, four underlying dimensions or value orientations can be identified: intrinsic, extrinsic and social job orientations, as well as a fourth dimension which indicates the relative importance attached to occupation compared to other life areas such as the family. Future employment status and occupation of young people is taken from succeeding waves of the SOEP. Specifically, occupational characteristics such as type of job, working hours and income are looked at as outcome variables. Findings indicate that social orientations are related to working in a social occupation later on, while the importance attached to occupation compared to other life areas is related to the weekly amount of hours worked. No effect of intrinsic or extrinsic orientations on income, prestige or work autonomy in the first job can be identified. The hypothesized impact of values on the career choice of teenagers is found therefore only for two of the four value dimensions.

STUDYING ABROAD: PREDICTORS OF PARTICIPATION IN THE ERASMUS PROGRAM

Vittoria Jacobone ¹, Giuseppe Moro ¹
¹UNIVERSITY OF BARI, BARI, Italy

Abstract: Despite the wealth of literature on study abroad, little is known about factors impacting the decision to participate in such programs. The current paper aimed to analyze the variables that predict participation in the Erasmus Program. The sample included 200 University of Bari (Italy) students applying to the program during 2010/11; their data were tested against a control group of students, matched by faculty and age. Both groups answered a self-report questionnaire, including a socio-demographic section and the following scales: International Study Expectancies (JSES), Academic/Career Orientation, Personal Report of Intercultural Communication Apprehension (PRICA), Interest in Foreign Languages, Self-efficacy, Community Attachment by Region and Intention to be Mobile, Academic and Social Integration and a Motivation and Expectation scale (experimental group only). The findings showed participation in mobility programs as not only connected with personal profiles yet also with other contextual factors, familiar and academic, which may promote or inhibit this decision.

THE FUTURE HAS TO NOT BEGIN: ITALIAN YOUNG PEOPLE AND THE FUTURE

Mariella Nocenzi²
²Statistical Sciences, SAPIENZA UNIVERSITY OF ROME, Roma, Italy

Abstract: The young condition is yet one of the main issue of the most recent sociological literature: young people is the most strategical part of the society for a better exploring of risk and uncertainty as new paradigms of the contemporary culture. In particular, as main actors of the change per excellents, young people shows the instability and insecurity characterize their identities. These characters – as interpretative keys of the society – are not more linked to the social class, the social belonging, the age, the gender or the job, but, above all, to the individual choices, that are life-long and that could get new re-socialization processes in adult age. The paper aims to propose the results of an interdisciplinary research of the Sapienza University of Rome. The research team has given a questionnaire (CATI System) to a sample of 1300 italian young and adult-young (25-44 years old) for exploring their attitudes towards precariousness. Their life courses, the insurance strategies, the economical and pension guarantees they choose in respect of their future will be analysed through the previous generations inheritance they feel to manage.

TESTING OF HEALTH SCIENCES STUDENTS’ STRESS LOAD AND SOCIAL EMBEDDEDNESS

Ezsterv Kovacs ¹, Agnes Sima ², Peter Balazs ²
¹Institute of Behavioral Sciences, ²Department of Public Health, SEMMELWEIS UNIVERSITY, Budapest, Hungary

Abstract: in a health sciences graduate training program, we studied the students’ mental condition and social embeddedness as well. Sample and methods: faculty distribution of 4th year students (n=473): 73.4% of General Medicine (GM), 10.1% of Dentistry (D) and 16.5% of Pharmacology (Ph). Our adapted Anderson questionnaire was used for assessing stress load. Students of increased load were separated as a risk group. Besides of stress load, there were also measured the family background, relations to the parents, friendships and social environment. Results: 30% (n=142) of students belong to the risk group. Faculty distribution: GM. 32.6%, D. 6.3%, Ph. 33.3%. Stress load distribution: 67.6% work related, 43.7% of mental and 26.1% of physical origin. Females are significantly more involved rather by physical and mental symptoms, while males are suffering from work-related problems. As to family background, 45.2% of students are living together with both parents and in 55% they have 1 brother or sister. Family ties are generally favourable (in 96.8% to the mother and in 89.3% to the father). Family tensions by parents were in 39.2% mentioned. Concerning social embeddedness, 76.7% belong to more communities. Our social variables are strongly related to the perceived mental stress. Significantly more endangered are those with unfavourable or damaged parental partnership or relationship to mother and father alike. Training output of students was considerably worsened by living together with parents of disturbed partnership. Problems with girl- or boy-friends proved also to be a considerable mental stress factor. Conclusions: there is an increased stress load in the sample. For decreasing it, there is a need for learning relevant coping methods. Safe family background is a pre- eminent protecting factor, further the safe and close relationship with both parents and
friendship with other students. **Key-words:** Anderson-scale, stress load, family and friendship.

YOUNG GENERATION: WORK, FAMILY AND FUTURE IN THE RISK SOCIETY

Minna Nikunen

**Abstract:** In my presentation I will introduce my research plan – and some preliminary results – on young people, their experiences and expectations on work and family. What discourses are influential when they think about their present situation and future possibilities? What are the rights and responsibilities they attach to themselves and their (future) employers, co-workers and intimate relations? I am especially interested in how and in what extent neoliberal discourses have influenced young people. How the recent recession has been experienced? The focus is on generation which has gone to school after the depression in the 90’s. I will gather the material to my research by interviewing young people and using their writings on the topic.

It has been stated that in the ‘risk society’ the responsibilities and rights of people, especially in connection to work, are different than they used to be. While individuals have become freer from traditional social constrains, they have acquired more responsibilities relating their future prospects. Individualization has affected social relations and ways to make the sense of them (but not to the same extent in every context). Competition, commercialism, consumerism are encouraged. Although at the same time the counter discourses of individualism and neoliberalism are (still) strong in Finland: equality in education and gender equality in work life are considered important. However, there are ways to shift the meaning of equality: the same freedom to everybody to choose what they want: go to good or bad schools, be on a mommy (or home husband) track or a career track. Also, local values can direct young people to choose differently. If the conscious policy has been to create innovative and competitive workers, there may also be consequences that are not indented.

**YOUNG GENERATIONS, PARTNERSHIP AND PARENTHOOD – OPINIONS AND ATTITUDES IN THE CZECH REPUBLIC**

Beatrice Elena Chromkova Manea

**Abstract:** The sociological, economic and cultural aspects of young generations have changed significantly over the past two decades. Among the central factors that lead to the occurrence of these changes in the Czech Republic are demographic development, individualization and socio-economic transition. The nature of the partnership, intimacy and childbearing is being transformed and it deeply characterizes younger generations in the population. Some researchers argue that the transition to adulthood has become less normative, pointing to an accelerating process of individualization of the life course.

This paper will discuss issues concerning attitudes and opinions towards partner selection, life course and parenthood. My focus will be on the meanings young people assign to partnership (entering into or breaking up) and parenthood. Data from a quantitative longitudinal survey carried out in the Czech Republic in 2008 and 2009 will be used in this paper. I will work with two age cohorts: 15-17 and 25-27. Firstly, I will describe the changes family has passed through during the last two decades. Further on, I will deal with the attitudes of young generations towards family formation and their preferences. Particular attention will be given to the role of sociodemographic background of the family of origin and own sociodemographic background on these attitudes and opinions. In the end, I will attempt to build individual biographies based on the expectations when the most important life events will occur (leaving parents’ home, living with a partner, entering into a marriage, having first child and having first stable employment).

**THE SPIRITUAL FAMILY – RELIGIOSITY AND ITS EFFECT ON ADOLESCENTS’ WELL BEING**

Eszter Kovacs, Bettina Franciska Piko

**Abstract:** Background: A growing body of contemporary literature focuses on protective factors in relation to adolescents’ health. Many studies suggest that different aspects of religiosity, such as religious involvement or religious coping and religious views may contribute to improved health.

Objectives: To explore the religious attitudes of young people and their family background, particularly focusing on the parental religiosity. Further, to investigate the effects of family religiosity on adolescents’ psychosocial health and well being.

Method: The data collection of the questionnaire survey was conducted among 656 high school students in Szeged (age range between 14-21 years, mean = 16.5 years, S.D. = 1.5 years of age, 49.1% of the sample was female). Regarding religiosity, religious affiliation, religiousness (subjective level of religiosity) and religious participation were assessed. Among health status indicators, occurrence of depressive symptomatology (CDI), level of satisfaction with life (SWL) and optimism (LOT), and self-perceived health (SPH) were determined.

Results: The findings showed strong association between parental religiosity and religiosity of adolescents. Namely, most of the adolescents internalize their parents’ religious attitudes during the process of religious socialization. The tendency of secularization was observed since 36.1% of the young people consider themselves as ‘not religious at all’. In terms of psychosocial health and well being religiosity played a dominant role. Optimism was increased by youth’s own religiosity. Satisfaction with life was affected by parental religiosity. Moreover, youth’s own and father’s religiosity had an impact on depressive symptomatology.

Conclusion: Parental religiosity plays an important role in adolescents’ life, thus adolescents’ well being is often influenced by parental religiosity.

Keywords: religiosity, psychosocial health, well being, parental attitudes, adolescents

THE IMPACT OF VALUES ON YOUTH RELIGIOUS BEHAVIOUR
Sebastian Nastuta\textsuperscript{1}

\textsuperscript{1}Faculty of Social Work and Sociology, "Petre Andrei" University of Iasi, Iasi, Romania

Abstract: Previous studies in sociology and psychology of religion demonstrated the consistent relation between people’s value system and their religious behaviour. Based on this assumption and starting from an annual research unrolled within Sociology department from “Petre Andrei” University of Iasi – “Youth barometer of values and social aspirations” – I tried to find out what is the specificity of the relation between youth’s values (measured using Rokeach value scale) and youth religious behaviour mainly religious fundamentalism and religious orthodoxims.

The families and the educational system have an important role in primary and secondary socialization both the value system and the religious behaviour being fundamental aspects of this socialization process although the values have more socially controlled and religion seems to be more personal.

The question I am trying to answer based on the results we have for our Romanian youth samples but also using data from European Value Survey or World Value Survey is if there is a relation of influence between youth’s values and their religious behaviour and what is the specificity of this relation.

ANTI-SEMITISM AND PSYCHOANALYSIS I: DIALECTIC OF ENLIGHTENMENT
Ilka Schroeder
1

Abstract: In the “Elements of Antisemitism”, the most well-known piece on antisemitism by the Frankfurt School, T. Adorno und M. Horkheimer investigate the systematic reasons for modern antisemitism, which lie in the specific form of bourgeois society. Their scientific question is why many find it plausible that Jews would be behind a number of decisive social evils. In their explanation they include the psychic constitution of the modern subject. By doing so, Adorno/Horkheimer partly leave the level of content and turn to what antisemites do not seem to be aware of about their j ew-hatred. Yet, Adorno/Horkheimer do not take a fully subjectivised perspective: They argue from the point of view what psychic processing of the social conditions is suggested by exactly those conditions.

It shall be presented what questions Adorno/Horkheimer aim to answer with this second sphere and how they see the psychic sphere relate to the content of antisemitism.

ANTI-SEMITISM, RACIAL IDEOLOGY, AND PALIGENETIC NATURE OF FASCISM: HISTORICAL AND COMPARATIVE PERSPECTIVE
Ivo Budil
1

Abstract: The main purpose of the contribution is to provide an analysis of the rise of the modern secular anti-Semitism and its integration into the Western political culture in the intellectual milieu of the fin de siècle. The emergence and the development of the anti-Semitism will be critically evaluated in the context of the debate on the palingenetic nature of fascism and Nazi totalitarian movement. The term “palingenesis” was coined especially by Roger Griffin who described fascism as “a palingenetic form of populist ultra-nationalism”. I am convinced that the reflection on the relationship and historical and intellectual link between modern anti-Semitism and fascist ideology circumscribed as palingenetic movement could provide a deep understanding of the function and rise of the anti-Semitic attitudes in the modern Western society. The traditional explanation of the emergence of anti-Semitism proposed for instance by Hannah Arendt will be critically discussed and some highly neglected intellectual sources for the emergence and expansion of modern anti-Semitism represented by Edward Augustus Freeman, professor of Modern History at the University of Oxford, and proponents of racial Anglo-Saxonism at the British isles and in the United States of America will be stressed and interpreted.

PSYCHOANALYSIS AND ANTI-SEMITISM II
Nicolas Bechter
1,2

Abstract: Adorno wrote on two levels on the problems of antisemitism. In the Dialectic of Enlightenment Horkheimer and Adorno deal with the macro level. The connections between Christianity, capitalism and civilisation in general with antisemitism. In the big study The Authoritarian Personality Adorno wrote on the micro level with the strategy of a zodiac in a daily newspaper and analysed radio speeches of the fascist and antisemitic preacher Martin Luther Thomas. In both studies Adorno used Psychoanalysis as the method to find the “secret sources” (Freud) of antisemitism and its function in fascist political speeches.

The paper will re-examine these – compared to The Authoritarian Personality – rather unknown texts, highlight the major topics and point to the connections with the macro level. Even though the focus will be on the original sources, examples from current public demagogues (such as US Radio and TV host Glenn Beck) will proof the enduring relevance of Adorno’s writings in the 21st century.

1 The author is aware of the simplification of this classification. Furthermore it has to be mentioned that none of the named texts deal with one level exclusively. It is rather a question of focus.

POSTCOLONIAL WHITENESS EXPLORED THROUGH TRANSDISCIPLINARY APPROACH
Barbara Samaluk
1

Centre for Research in Equality and Diversity, QUEEN MARY, UNIVERSITY OF LONDON, London, United Kingdom

Abstract: This paper is addressing the usefulness of transdisciplinary approach in researching racism by exploring commodification processes of migrant labour that operate across and between locations. Research that has been exploring migration and racialization processes has too often taken only the receiving society as the frame of reference. This void misses deeper understanding of migrants’ habitus that is defined through transnational fields. Or in other words migrants inhabit institutions of diverse fields and they carry with them a certain history that is either forgotten or rewritten and as such often remains embedded in colonial legacy. Using historical and macro socio-economic context as a point of departure the paper aims to uncover how cultural and other capital is being appropriated on the UK labour market with regard to white Central and Eastern European migrant workers by examining web-based employment agencies’ marketization strategies. In order to achieve that transdisciplinary approach has been devised by critically adapting Bourdieu’s general theory of field, habitus and capital in combination with critical realists’ approaches to critical discourse analysis. This enables transnational exploration of postcolonial whiteness that is interested in how specific history and power relations from diverse fields that are embodied, embedded or assigned to migrant’s habitus operate in the receiving society. Further it enables the exploration of racialization processes that on one hand transcend black and white dichotomies and on the other do not lose sight of how embodied and embedded colonial structures still importantly operate in order to maintain unequal power relations.
Based on qualitative discourse analysis of employment agencies’ websites the paper gives evidence of the operation of postcolonial whiteness, which is manifesting in (self) colonising practices that maintain the concept of whiteness as a cultural hegemon. Further it contributes by providing a theoretical ‘toolkit’ that allows the exploration of racisms through processes of power, rather than through fixed social categories and as such enables the uncovering of multiple intersections and power relations.

GENDER AND RACE CROSSCUT, BUT INTERSECTIONAL WOMEN ARE NOT WHITE? A CRITICAL REFLECTION ON WHITENESS AND PRIVILEGE IN EUROPEAN INTERSECTIONAL THEORY

Dieuwertje Dyi Huijg

Abstract: Out of the homogeneity of the concept ‘women’, in which (the location of) white women functioned as the invisible racial norm and black women were at most ‘other’, black and multiracial feminism was born. From this movement came the critique that the specific position of black women, whose location is crosscut by both gender and race and, subsequently, suffer racism and sexism simultaneously, goes unnoticed. To analyse this specificity, intersectionality (coined in 1989 by Crenshaw) offered a tool to understand ‘double jeopardy’, but it has not functioned in the same way to unravel this invisible norm.

Since the 2000s, a renewed and critical interest in intersectional theory can be observed in Europe. White feminist researchers have heavily engaged in this debate on multiply disadvantaged positions. Though it is important to acknowledge their contribution, it is also urgent to understand this as problematic. Instead of uncovering all the power dynamics in race relations, this application of intersectional theory runs the risk of reinforcing what it opposed; by ignoring to problematise the position of white women, it reinscribes the invisibility and normativity of the racial position of white women and their subsequent privilege – including of white researchers. Passionately looking at the Other subject, white women simultaneously marginalise structural advantage as a theme of analysis and, doing so, appear to exclude their own location.

But a commitment to racial equality also demands to question the invisible racial norm of intersectional theory and to make its whiteness explicit. To understand the location of white women and whiteness as intersectional, ‘double jeopardy’ cannot offer an adequate framework for analysis; we must think of a method to investigate this intersectional location in which both structural -racial advantage and structural -gendered- disadvantage, both normativity and subalternity, can be analysed in their multiplicity. In order to think this multiplicity, we must go back to the critique on the racial norm of whiteness and identify the place of structural privilege in intersectionality. With this objective in mind, I will look at the most important dialogueing articles, journal specials and conferences on intersectional theory in the period 1989 – 2011 to analyse the role of whiteness in European based productions of intersectional theory.

WHITE SWISSNESS? RACE AND NATION IN THE CONTROVERSY OVER THE “BLACK SHEEP” POSTER IN SWITZERLAND

Noémi Michel

Abstract: In 2007, the Swiss People’s Party (SVP), a powerful populist right wing party in Switzerland, launched a political campaign by means of a controversial poster. This poster included the slogan “for more security” accompanied by the image of several white sheep in a field composed of the colors of the Swiss flag. The image portrayed the white sheep kicking a black sheep out of their territory and supported the SVP’s campaign to collect signature for its initiative on the automatic expulsion of criminal foreigners. The display of this poster gave rise to a very strong controversy over public images and representations of Swissness and otherness. Some Swiss and international anti-racist associations denounced the racist message delivered by this poster, whereas the SVP argued that it was an inoffensive image which did not refer to racial representations. The complaint for racial discrimination lodged by some associations resulted in a nonsuit in Swiss federal Court and the SVP has continued to associate white sheep and the Swiss flag in political campaign’s posters.

In Switzerland words directly referring to the idea of race, such as “whiteness” and “blackness”, are only very rarely enunciated in public debates over diversity, discrimination or immigration. In consequence, one could ask whether the “black sheep” poster controversy was about race: do the white sheep and black sheep images refer to a racialised understanding of Swissness and otherness? In other words, is Swissness white? This paper addresses these questions by drawing upon conceptual and analytical resources of critical whiteness and race studies. By means of a discourse analysis of the corpus of competing claims that were expressed against or in defense of the “black sheep” poster in Switzerland, the paper seeks to grasp which collective subjectivities, which conception of the Swiss nation and which power relations were put in question or reasserted during this controversy. The results suggest that the controversy over the “black sheep” poster consists of a particularly revelatory moment to understand how implicit racialised representations inform public discussions and representations of Swissness in contemporary Switzerland.

CEREMONIAL CITIZENSHIP IN EUROPE

Bridget Byrne

Abstract: This paper takes the recent trend towards the ceremonialising and testing of citizenship in Europe to explore the extent to which the citizenship is racialised. Britain, the Netherlands and Italy, among others have recently reconceptualised the ways in which citizenship is achieved and marked for migrants. Passports matter. They determine individuals’ movements and work prospects, their ability to participate in a society through voting and foster a sense of belonging. Citizenship structures the relations between individuals (between citizens and between citizens and non-citizens). Citizenship also structures relations between individuals and state structures which determine work, welfare and politics. What do these newly ceremonied citizens tell us about the ‘rhetoric of citi-
zension’ in Europe which Laren Berlant has so effectively written about for the US? The paper will explore these new developments in legislation and ceremonialization and also interrogate the extent to which they should be understood as racialised. It will ask how the ceremonies offer a ‘welcome’ which, as Derrida would suggest, inevitably mark the new citizen as different from the white majority.

PREJUDICE AGAINST THE ROMA AMONG HUNGARIAN TEENAGERS – UNDERSTANDING THE ROLE OF THE SOCIAL CONTEXT
Luca Váradi 1
1 Berlin Graduate School of Social Sciences, Humboldt Universität zu Berlin, Berlin, Germany

Abstract: In the last few years the Hungarian society had to face a growing number of racist, anti-Semitic and homophobic manifestations in the public parallel to the emergence of the far right. The adult population in Hungary is highly prejudiced against different minority groups compared to other European countries (see ESS data), and prejudices are rather explicit: more than 60% of the adults have overtly prejudiced attitudes against the largest ethnic minority group, the Roma. Scholars in Hungary believe that the lack of social cohesion and the extreme level of racism are among the major problems of the country.

As the age of adolescence is crucial for identity formation and the crystallisation of attitudes it is important to know how the teenagers in Hungary relate to the minority groups around them. On this background I surveyed 1,000 Hungarian 12 – 19 year olds. Do the attitudes of teenagers mirror those of the adults? Analyses show that the vast majority of the adolescents are prejudiced against the Roma and prejudice against other outgroups (e.g. Jews and Chinese) is also remarkable. Based on the 2010 data, the impact of personality factors (as social dominance orientation or empathic perspective taking) and contextual factors can be identified. According to the results it is clear that the perception of the social context plays a crucial role in the formation of the individual attitudes. A vast majority of the teenagers included in the survey perceives the negativity in the public against the Roma: more than 70% of the respondents assumed that the majority of the Hungarians would agree with anti-Roma remarks. The teenagers identified the media and their peers as the major sources of their knowledge about the Roma and they claimed not to talk about such issues with their parents or teachers.

We argue that in order to understand the mechanisms leading to such high level of prejudice the role of the social context should be taken into consideration.

RACISM AND ITS DENIAL: THE CASE OF BOLIVIAN IMMIGRANTS IN SAO PAULO
Szilvia Simai 1, Rosana Baeninger 1
1 University of Campinas, Campinas, Brazil

Abstract: This presentation attempts to analyse contemporary forms of racism in the case of Bolivian immigrants in the city of Sao Paulo, Brazil. We examine the prominent role of denial of racism in contemporary discourse. The presentation is based on a qualitative empirical study conducted in Sao Paulo with Bolivian immigrants and with Brazilian university students. The study is eager to analyse various forms of denials in the discourse of both sides. While in the discourse of the members of the host society denial of racism appears in forms of euphemism, disclaimer and indirect blaming, the immigrants tend to deny the existence of racism in order to create a positive self-image, to avoid conflicts and to reduce anxiety and frustration during the acculturative stress.

LA RECHERCHE SUR LE RACISME AU PORTUGAL; UN BILAN TÉORIQUE ET CONCEPTUEL
João Filipe MARQUES 1, 2
1 Faculdade de Economia CIEO, Universidade do Algarve, Faro, Portugal

Abstract: Une des caractéristiques centrales des Sciences Sociales de production portugaise est le quasi absence de références au racisme ou à la discrimination raciale, surtout dans les premiers travaux, après la révolution des Œillets. Ce n’est que très récemment que ces concepts sont entrés dans le discours sur le social et que (anachroniquement) les scientifiques ont commencé à utiliser des expressions telles que « race » ou « relations raciales ».

Ce « daltonisme racial » des Sciences Sociales portugaises n’est pas négligeable, surtout quant il s’agit d’une ancienne société colonisatrice. On connaît la réserve typique de certains scientifiques en ce qui concerne l’explication des faits sociaux par le racisme ou le préjugé, mais on peut aussi faire l’hypothèse selon laquelle, dans un premier moment de la recherche sur les minorités ethniques, le racisme était un sujet quasi tabou pour les sociologues, anthropologues et psychologues sociaux portugais.

Dans les première recherches sur l’immigration et les minorités ethniques, la plupart des auteurs cherchaient d’autres causes pour expliquer, par exemple, les conflits entre Portugais et immigrés sans jamais toucher – ni même sous forme d’hypothèse – les préjugés ou la discrimination raciale.

Il faut aussi mettre en relief une autre caractéristique très généralisée dans l’approche de l’altérité par les Sciences Sociales : il s’agit simultanément d’un certain manque de clarification théorique et de l’importation presque directe et très souvent acritique de concepts, notions et théories produits et développés dans d’autres contextes nationaux. C’est ainsi qu’on voit proliférer des articles contenant des mots tels que « multiculturalisme », « ethnie » ou « relations de races » etc., directement traduits de l’anglais, sans le moindre effort soit de spécification conceptuelle soit de critique.

C’est seulement dans la dernière décennie, dans l’entrée dans le XXIème siècle, que des recherches théoriquement appuyées se sont dirigées explicitement vers le racisme, la xénophobie, les préjugés et les discriminations dans la société portugaise et qu’on voit paraître des thèses, des articles et des livres sur ce sujet.

Or, cette communication cherche précisément a réaliser un premier bilan – quoique imprécis et impressionnant – des résultats et des modèles théoriques et conceptuels des recherches les plus récentes sur le racisme dans le Portugal contemporain.

FACING THE “DARK PAST” IN CONTEMPORARY POLISH DEBATES: THE RAISE OF ANTI-SEMITISM AND ANTI-ANTI-SEMITISM?
**Abstract**

During the last decade we have witnessed in Poland a few very important debates concerning the Polish-Jewish relationship in the time of the nazi-occupation and in the years just after the II World War. We know more and more about the "Dark Past": about attitudes and behavior of some of the Poles, who were not only marginals, who took part (less or more actively) in the third stage of the Holocaust. I will discuss how these debates could influence or shape the actual opinions, namely the anti-Semitic and anti-Semitic discourse and how these debates can be seen as the work on our past and on our collective identity.

**DISINTEGRATION AND ETHNOCENTRISM - ANALYSING AND MEASURING TWO CENTRAL DEVELOPMENTS IN EUROPE**

Wolfgang Aschauer

**Sociology, UNIVERSITY OF SALZBURG, Salzburg, Austria**

Abstract: Integration problems in Western Europe are not only related to immigrants, they also apply to the host society. Signs of disintegration can be explained by current societal conditions, namely rapid transformations (in the context of the European integration policy), inequalities between groups (as a consequence of globalization) and insecurities (in the context of risk society). Higher classes may remain progressively orientated towards these challenges, while other groups at the lower bottom of society may shift their values in a defensive direction. They may use their own culture as a shield against foreigners and strengthen their identity in reference to their own nation.

The main aim of my paper is to present a concept of how these disintegration processes (societal crises states and disintegration feelings) and consequences of disintegration (e.g. ethnocentrism) can be analyzed and measured in empirical studies. To operationalize disintegration processes I use the theoretical approach, developed by Heitmeyer and Anhut (e.g. 2009). According to this approach, crises states emerge on three levels. The crisis of social structure is demonstrated by an increase in social inequality. Individuals express these crisis states in a fear of social decline. The crisis of regulation is aimed at the institutional integration of individuals. Crises states are obvious when a high disenchantment with politics and a lacking coherence of values and norms in society exist. The crisis of cohesion represents the sociocultural climate. In times, where cultural heterogeneity is seen as a major threat in Europe, social relationships may get fragile and can result in a lack of social trust in society.

If disintegration is operationalized, objective processes should be separated from disintegration feelings. The empirical part of my paper demonstrates a first approach to measure these constructs. Processes of disintegration (based on comparable indicators on the national level) are linked with perceptions of European citizens (based on items of the European Values Study 2008). Finally it will be measured with OLS-regressions, if disintegration feelings are able to explain ethnocentrism in Europe and if there are differences in the explained amount of variance between European countries and major European regions.

**COMMUNICATIONS AND NETWORKING AS FACTORS OF IDENTITY CONSTRUCTION AMONG ETHNIC MINORITIES IN CEE COUNTRIES**

Alexander Chvorostov

**INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria**

Abstract: The paper presents some outcomes and findings of the international research project ENRI-East (Interplay of European, National and Regional Identities: Nations between the States along the New Eastern Borders of the European Union, www.enri-east.net) funded by the European Commission.

The paper analyses various types of social contacts and networking patterns of members of ethnic minority groups in several CEE countries: Poland, Belarus, Lithuania, Latvia, Russia (Kaliningrad oblast), Hungary, Slovakia and Ukraine.

In the project, our main interest was to learn more about the construction of identities, especially to understand the ways in which European, national and regional identities are constituted and negotiated. The findings that will be presented at the ASN conference...
depart from a theoretical assumption that the quantity, quality and
density of social contacts of members of ethnic minority groups
provide good explanations with regard to the nature of their self-
identification in terms of social, political and national self-affiliation.
Therefore, we analyze the reference groups of respondents of the
ENRI-VIS ("Values and Identities Survey" carried out in 2009-2010,
N=6,800), preferred means and density of contacts with their close
people from the "keen-countries" abroad to conclude about the
main factors influencing their "feelings of identity and affiliation".
We are testing different age groups, gender variations and people
with different educational attainments. These results from quanti-
tative survey data will be complemented with a review of outcomes
of another methodological component of the ENRI-East project,
namely biographical interviews. For all researched ethnic minorities
we have interviewed three age groups (16-22, 35-50, and 65+),
thereby covering the young generation who was born and brought
up in the post-communist era, the middle generation who experi-
enced transition, and the older generation who would have experi-
enced World War II. Our focus was again on identity construction,
including topics on friends and networks. Finally, the empirical out-
comes will be contextualized using the country and minority groups' profiles collected for the ENRI-East series of "Minority re-
ports".

ADVANCES IN MEASURING RACISM AND
XENOPHOBIA THROUGH SURVEY METHODOLOGY

Mª Ángeles Cea D’Ancona 1, Miguel S. Valles Martínez 2
1Departamento de Sociología IV, UNIVERSIDAD COMPLUTENSE DE
MADRID, Pozuelo de Alarcón (Madrid), Spain

ACTUALIZATIONS

Abstract: Since the publication of the famous article by Richard
LaPiere “Attitudes versus Actions” in Social Forces in 1934, the suit-
ability of the survey for the measurement of attitudes in general
and of racism in particular has been discussed. What has been es-
pecially questioned is the preferential use of indicators that mea-
sure “overt” racism (expressive of social desideratum) rather than
“latent” and in accordance with modern, symbolic and aversive
racism. What is asked, how it is asked, in which order and which
survey mode is applied affect, due to its high vulnerability to the
social desirability bias.

This paper offers main results of MEXEES I (SEJ2005-00568),
MEXEES II (CSO2009-07295) and Living Together (JLS/FRC/036)
projects, and the series of surveys analyzed for OBERAXE (Spanish
Observatory of Racism and Xenophobia) from 2007 to 2011. Analyt-
ical attention is focused on main axes around which xenophobia
and xenophilia discourses are articulated. The empirical base con-
ists of qualitative materials gathered about the migration experi-
ence of both autochthonous and foreign people (focused-
biographical interviews and discussion groups with natives and
foreigners). But we also analyze survey errors that may co-occur
when trying to measure attitudes towards immigrants and ethnic
minorities. They include measurement errors due to survey mode
effects and how the concepts of racism and xenophobia are mea-
ured. After having evaluated the effectiveness of dimensions and
indicators of racism and xenophobia, some proposals of dimen-
sions, indicators and question formats are given in order to keep on
improving the measurement of racism and xenophobia through
survey methodology.

RACISM, XENOPHOBIA AND PREJUDICE.
METHODOLOGICAL AND THEORETICAL ASPECTS

Dario Padovan 1, Alfredo Alietti 2
1Department of Social Sciences, UNIVERSITY OF TORINO, Torino,
2Department of Human studies, University of Ferrara, Ferrara, Italy

Abstract: To study at empirical level the phenomenon of racism
implies a serious reflection on our tools for collecting and analyzing
data. From a conceptual point of view racism is understandable
from a variety of psycho-sociological features but they often fail to
know it in its completeness. Added to this is the peculiarity of the
study of racist attitudes, reported in 1934 by La Pierre, of the com-
plex relationship between hostility and subsequent actual behavior
in everyday life. Finally, there is to underline the complex relation-
ship between the possible explanatory variables identified by the
researcher and the definition of the phenomenon. The classic re-
search of Adorno on anti-Semitism and Fascism, to name the most
significant example, shows the difficulty to clearly identify the vari-
ables that explain the anti-Semitic attitudes within a defined theo-
retical model. For that reason, we must consider the differences of
a quantitative approach and/or a qualitative approach in providing
plausible explanations of social forms of racism. After a review of
quantitative and qualitative techniques used in research which
highlights limits and advantages, will try to outline a possible meth-
odological approach that may help to understand the characteris-
tics of explicit and latent new-racism. This route should take ac-
count of triangulation between the different theoretical approach-
es, techniques for collecting and analyzing data, and the responsi-

ability of the researcher in providing the most important results of
his research.

HOW TO SEARCH ANTI-SEMITISM? THE POLISH
EXPERIENCE.

Ireneusz Krzeminski 1
1Institute of Sociology, UNIVERSITY OF WARSAW, Warszawa, Poland

Abstract: During the last twenty years, Poles were placed rather
high in rankings of anti-Semitic societies. This position was defined
solely by taking into account results of sociological surveys, than I
would like to present some experiences concerned with studying
anti-Semitic attitudes in Poland. On the other hand, the results of
surveys of public opinion concerning anti-Semitic attitudes in Eu-

ope, which are carried out from time to time, are alarming. Are
these survey results really good indicators of anti-Semitic attitudes?
I would like to attempt to answer this question. Firstly, the paper
would present the results of methodological experiments concern-
ing the way people are asked about theirs opinions on Jews. Sec-
ondly, I would like to present the results of my own research on
anti-Semitism. These results were based on the original method of
identifying anti-Semitic attitudes, which were different than the
ones usually utilized. The traditional way was to build the scale of
anti-Semitism based on the acceptance of stereotypical opinions
about Jews. Our method was different. We assumed that not every
negative stereotypical characteristic about Jews is an indicator of
anti-Semitic attitudes. We differentiated between the national ste-
reotype of Jews and anti-Semitic ways of describing Jews. At first,
we assumed that anti-Semitic attitudes are deep cognitive and
emotional structures which are important parts of the person’s
world-view. Secondly, we assumed different ways of substantiating
the hostile attitudes by persons. Therefore, thirdly, we constructed
questions concerned with these substantiations of anti-Semitic attitudes. I would like to show how it was done and what results were gained by this method. This methodology was also confirmed in research conducted in the Ukraine. Our experiences are showing the very deep impact of the theoretical assumptions with the proper scientific method. And of course it has important consequences for the interpretation of survey results.

Lastly, in light of the results of this analysis, I would like to look at some survey research, like for example the one done by PEW in Europe. How could we interpret the results, taking as a base for research the analysis of some assumptions? Another question would be concerned with the ways in which this research method on anti-Semitism could be utilized for studying others hostile group attitudes.

EVERYONE'S INTERNET ANALYSIS: SIMPLE AND EASY-TO-USE METHODS IN RESEARCH AND MONITORING OF THE ANTI-SEMITIC WEBPAGES – EXAMPLES OF GOOD PRACTICE.

Zbynek Tarant

Department of Middle-Eastern Studies, University of West Bohemia in Pilsen, Pilsen, Czech Republic

Abstract: In my presentation, I would like to show several examples of a very simple and easy-to-use methods for research and monitoring of the webpages of the anti-Semitic movements. I would like to show my colleagues, how simple it may be to include some quantitative methods in their qualitative analysis. Through a smart utilization of an advanced Google commands and with help of a freeware office suite, everyone can achieve an interesting results, even if he/she is not an quantitative analyst or computer expert. In my presentation, I would like to show particular examples of good practice in utilization of these simple methods on selected cases, I have been dealing with. Examples include: proving the connection between two particular organizations, proving/refusing the hypothesis of (non)cooperation between neo-Nazis and muslim organizations in Czech Republic, documenting the radicalization of the neo-Nazi Workers' Party in Czech Republic etc. I hope that such a presentation would enable us to make our reflection of anti-Semitic manifestations on the internet little bit more advanced and systematic, without becoming an incomprehensible "bunch of numbers".

THE SHADE OF A CRIMINAL RECORD: COLORISM, INCARCERATION, AND RACIAL ATTRACTION

Steven Larrimore Foy, Victor Ray

Department of Sociology, Duke University, Durham, NC, United States

Abstract: Though race is commonly perceived by the general public as a fixed quality of individuals that is biological and tied to physical features like skin-tone, recent research suggests that social indicators like incarceration may also influence how we categorize people racially. This research, however, has largely ignored colorism—intra-racial differences in skin tone that are important for stratification outcomes. Therefore, how phenotype interacts with social factors to produce racial attributions remains unclear. We explore this issue via an experiment in which participants are randomly assigned to view a stock photo of a man whose skin tone has been digitally altered along a spectrum of phenotypical differences from very light to dark. Next, participants read a vignette in which the man depicted in the photo is described as being concerned about how an employer will perceive an 18-month gap in his employment history which is either left unexplained or explained as resulting from imprisonment for a minor drug charge. We then ask participants a series of questions including “What is the race of the person in the vignette?” to determine the extent to which incarceration alters racial attribution given differences in skin tone.

GO WEST - ISRAELI ABSORPTION POLICY AND ETHIOPIAN IMMIGRANTS

Hannah Ovnat-Tamir

1education/ public policy, HEBREW UNIVERSITY/ SAPIR ACADEMIC COLLEGE, Jerusalem, Israel

Abstract: This paper wishes to delve into the gendered and ethnic roots of present day Israeli absorption policy as applied to Ethiopian immigrants. The State of Israel encourages Jewish immigration from all over the world. The absorption of immigration in Israel is organized, state funded, and the outcome of thought out state policies. The rational for encouraging immigration originates in the founders of modern Zionism vision of the state of Israel as a national homeland and possible refuge for world Jewry. Immigration to the land of Israel was conceived even before the birth of the state of Israel as a healing and normalization experience for individual Jewish bodies and the body of the emerging Jewish nation. This healing and orthopedic process was informed by masculinist, euro-centric, and internalized anti-Semitic discourses, borrowed from European, 19th century national revival movement.

In this paper, I wish to study how present day absorption policy still acts out a Diasporic desire for gendered and ethnic western normalization. I am particularly interested in the gendered outcomes and production lines of a current Israeli immigration policy applied to immigrants from Ethiopia still manifesting the underlying Eurocentric masculinist and self stigmatizing yearnings of early political Zionism.

ETHNICIZATION FROM THE BOTTOM-UP

Dana Kachtan

1Sociology, Political Science and Communication, OPEN UNIVERSITY OF ISRAEL, Raanana, Israel

Abstract: The aim of this paper is to explore processes of ethnicization within the Israeli military which are carried out from bottom-up by the soldiers themselves. The Israeli army has always been regarded not only as a security organization, but also as a state mechanism central to the creation of Israel’s melting pot. It was considered a neutral body that fostered social cohesion and created a new, universal, ethnicity-free identity among its soldiers. I argue that ethnicity is created by the soldiers, from the bottom, through processes of ethnicization carried out in their daily activities and everyday behavior and practices.

The paper is based on interviews with 60 soldiers from two different infantry brigades. Each brigade produced its own ethnic culture, thus creating and reinforcing two different ethnic identities among its soldiers. The first brigade, the paratroopers, developed an Ashkenazi culture, which is associated with the culture of Jews from European countries. The second brigade, Golani, performs a Miz-
rachi culture, associated with Jews of Arab countries. The relations among the two units and their respective ethnic cultures resemble the Orientalist relations, as described by Edward Said. These two cultures became so prevalent among the units, that they are performed by soldiers of all ethnic origins.

Exploring the processes of ethnicization in the brigades reveals that Ashkenazis creates their own "white" experience for themselves by defining Mizrahi Jews as "black". This exposes the ethno-status distinction and hierarchy between ethnic identities, and adds another perspective to "whiteness" research that uncovers the normative, neutral, transparent points which signpost and defines others.

That is to say, ethnicity in the military is not related to ethnic origin, but to the culture of the specific unit that is produced through dress, music style, and language that created and perpetuated by the soldiers. Military ethnicities are thus understood as performative and temporary.

Paradoxically, not only do ethnic identities not disappear in the course of military service, but they become even more evident. Instead of causing ethnic identity to dissolve into a melting pot, as was originally intended by the State of Israel, the army is revealed as an organization within which ethnic socialization takes place.

THE DE-LEGITIMISATION OF CONCERN ABOUT ANTISEMITISM IN DISTINCT POLITICAL, GEOGRAPHICAL AND CULTURAL TRADITIONS

David Hirsh 1, Esther Webman 2

1Sociology, GOLDSMITHS, UNIVERSITY OF LONDON, London, United Kingdom, 2The Stephen Roth Institute for the Study of Antisemitism and Racism & the Dayan Center for Middle Eastern and African Studies, Tel Aviv University, Tel Aviv, Israel

Abstract: Hostility to Israel, which sometimes manifests itself as antisemitism, comes from starkly different political traditions: liberal, democratic, post-colonial, Stalinist, socialist, nationalist, fascist and Islamist. It also comes from different parts of the world, and different cultural and language traditions: Europe, America, the Middle East, Arabic, Christian, Muslim. These traditions are highly variegated and distinct, but they are also inter-twined. Elements of rhetoric and commonsense notions circulate and develop across them, moving easily from one to the other, not least through the new media. This paper tries to trace one particular discursive phenomenon across some of this complex terrain. The phenomenon is a particular response to the issue of antisemitism which seeks to have the discussion of antisemitism itself recognised as being outside of the boundaries of legitimate discourse. Named by David Hirsh, ‘The Livingstone Formulation’, it accuses those who raise the issue of antisemitism of doing so in bad faith in order to de-legitimise criticism of Israel. This paper looks at examples of this particular phenomenon which are similar in structure but come from radically different political, social and geographical sources, particularly from Europe, the Arabic speaking states of the Middle East, Iran, South Africa and North America.

JEWISH JEWS; NON-JEWISH JEWS; ANTI-JEWISH JEWS – SITUATING JEWISH ANTI-ZIONISTS IN HISTORY AND THEORY

Howard Wollman 3

1Honorary Fellow, School of Social & Political Science, University of Edinburgh, Edinburgh, United Kingdom

Abstract: Jewish critics of Israel have been vocal in recent years in invoking their Jewish identity in opposing the policies of the Israeli government and/or the existence of the state of Israel. In so doing they have incurred criticism from both Jewish Zionists and some supporters of the Palestinian cause. Key spokespeople for the organisations that have been formed in UK and elsewhere have been criticised, on the one hand, as being self-hating Jews or, on the other, of asserting Jewish identity concerns at the expense of the autonomy of the Palestinian cause they claim to support. Although some contemporary Jewish anti-Zionism originates among religious – indeed ultra-orthodox – Jews, most is rooted in secular, liberal, socialist and feminist politics and identities. As such, a number of anti-Zionist Jews have invoked positively the concept of ‘the non-Jewish’ Jew whose apparent universalistic values are in accord with their own world view. This paper situates contemporary Jewish anti-Zionist discourse in an historical context. It argues that the concepts of ‘self-hating Jew’ and ‘non-Jewish Jew’ originate in very different times, when most communist and other left wing movements had, at their core, universalism and, for Jews, an assimilationist discourse. (Those left wing movements that were organised around Jewish identity specifically did not make such universalistic claims.) These concepts cannot be applied unproblematically in the very different contexts of contemporary debates about Israel where those invoking universalism nonetheless claim to speak ‘as Jews’. A preliminary conclusion suggests that aspects of contemporary Jewish anti-Zionism are thus distinctive and do not fit easily into categories arising from earlier historical times.

ANTISEMITISM AND THE CHARGE OF GENOCIDE AGAINST ISRAEL

Philip Spencer 1, 2

1KINGSTON UNIVERSITY, London, United Kingdom, 2social science, KINGSTON UNIVERSITY, London, United Kingdom

Abstract: In recent years, the argument that the state of Israel is guilty of committing genocide against the Palestinians has gathered momentum. It comes in different forms and from different places, both geographical and political but has now become an important point of convergence. This paper looks at how the concept of genocide is an inherently political one which leaves open the possibility that it can be abused for what, in this case, have become antisemitic purposes or have antisemitic effects. It considers the different ways in which this abuse of the concept of genocide has taken place, beginning with the Nazi charge that the Jews were guilty of doing to the German people what they in fact were planning to do to the Jews. It then analyses, in the aftermath of the Genocide Convention, which was developed in reaction to the Holocaust, efforts to rework the term against Jews in the context of the formation of the state of Israel, by some in the Arab worlds, on the (Holocaust-denying) far Right and then among sections of the radical Left, before the term was enthusiastically deployed in this sense by Islamists (increasingly with support from sections of that left as well as the far Right ). Finally it looks at possible explanations for this convergence – some psychological having to do with feelings of guilt and shame; some historiographical, having to do with difficulties in understanding the history of anti-Semitism; some ideological, having to with hegemonic forms of nationalism; some (apparently) ethical, having to do with notions of universalism which are not
THE VISIBILITY OF THE HOLOCAUST AND THE INVISIBILITY OF ANTI-SEMITISM
David M. Seymour
Law, LANCASTER UNIVERSITY, Lancaster, United Kingdom
Abstract: The Visibility of the Holocaust and the Invisibility of Antisemitism
This paper identifies a paradox concerning the Holocaust and antisemitism. This paradox concerns the fact that recent sociological conceptions of “the Holocaust” act in such a manner as to not only dissolve the historical social and political specificities of antisemitism into that of a broader and universalised concept of “modernity” but that, in so doing, simultaneously masks the presence of contemporary, non-racialized and non-exterminatory expressions of anti-Jewish hostility. It is as a consequence of this paradox that the increasing visibility of the Holocaust can be said to result in an increasing invisibility of antisemitism.

ISLAMIC SONGS AND THE TRANSFER OF ANTI-SEMITISM IN THE NETHERLANDS
Remco Ensel
History, NIOD, RADBoud UNIVERSITY NIJMEGEN, Amsterdam, Netherlands
Abstract: This paper discusses a section of current research on contemporary antisemitism in the Netherlands. Media attention for the articulation of anti-Zionist and anti-Jewish feelings by members of the Moroccan-Dutch community dates from the Second Intifada. To account for these feelings as well as for the long-distance identification with Palestinians as either Muslims or Arabs, commentators have hinted at the influence of foreign media as hubs for the dissemination of anti-Jewish and anti-Zionist ideas. Thus far Dutch research has not corroborated or challenged this thesis. To explore the global transmission of antisemitism we have examined a collection of Arabic CD’s that are publicly available in stores in Amsterdam. Anasheed constitute a genre of religious music that originated in the Sufi ritual of recitation (dhikr) yet which underwent substantial influences from Arab popular music. From a restricted form of chanting, the consumption of anasheed has developed into a diverse and popular culture with some performers being revered as regular global stars. An analysis of the anasheed focuses on recurrent motives and stereotypes, references to religious texts and the depiction of global affairs. Our content analysis is part of an investigation into the circuit of production, distribution and consumption of these songs.

Our study is part of the research project ‘The dynamics of contemporary antisemitism in a globalising context’

THE SHOAH AS INSTRUMENT TO EXPRESS, TO DENY AND TO BLOW UP ANTI-SEMITISM - CONTEMPORARY ANTI-SEMITISM, PHILOSEMITISM AND ANTI-SEMITISM IN THE NETHERLANDS
Evelien Gans
1Modern Jewish) History / Antisemitism, AMSTERDAM UNIVERSITY & NIOD, Amsterdam, Netherlands
Abstract: 1. Hitler was a nice man compared to the Jews in Israel. All to the gas those pigs and then feed them to the dogs’, according to a hate mail, sent in 2008 to the Center for Information and Documentation Israel in The Netherlands (CIDI). This formula can illustrate the proposition that contemporary antisemitism attaches itself to the Shoah (Holocaust) as one of its most favorable expressions. The phenomenon in which the Shoah is turned against the Jews, has been called, in its early manifestation, in Germany, in the sixties of the 20th century, secondary antisemitism. We are talking here about a form of ‘actual existing antisemitism’.

2. Next to this there is the debate about antisemitism. And here a paradox becomes noticeable. At the one side there is a new taboo on defining contemporary antisemitism because the Shoah functions as a rule. (It’s not that bad as it once was, is it?) That serves the interests of antisemites but also of those who want to believe that antisemitism is something of the past – and a question of ‘Yiddisher’ exaggeration and need for attention. This reaction denies the multiformity of antisemitism. At the other side contemporary antisemitism is blown up and instrumentised by those who, for their part, think that serves their purpose. In fact, it is a matter of a mirror image. While the one uses the Shoah to deny or diminish the impact of contemporary antisemitism, the other makes use of it in order to warn that a new Holocaust threatens – this time from the part of ‘the Muslims’.

3. This paper will mainly focus on the latter aspect on the basis of the recent book of the Dutch Israeli Manfred Gerstenfeld Het Verval Joden in een stuurloos Nederland (The Decline. Jew in the disoriented Netherlands). Gerstenfeld received, also internationally, a lot of publicity, sketching a country in which Muslims, and leftist Jews and Gentiles created conditions for a new Shoah. In line with the anti-Islam party of Geert Wilders, the PVV, Gerstenfeld instrumentised the struggle against antisemitism, lapsing into, what the American-Jewish historian Arthur Herzberg once called, anti-antisemitism. The PVV nor Gerstenfeld can be defined as philosemitic, because they make a distinction between ‘good Jews’ and ‘bad Jews’. They use old antisemitic stereotypes (which were both reacted against and internalized by Zionism) against supposed leftist, anti-Israel, pro-Muslim and self-hating Jews.

ON TRANSFER OF IDEAS IN TURBULENT TIMES. DEBATES ON ANTI-SEMITISM IN POLAND AND THE NETHERLANDS
Iwona Gusc
1NIOD (INSTITUTE FOR WAR, HOLOCAUST AND GENOCIDE ST, Amsterdam, Netherlands
Abstract: This paper focuses on perceptions of Polish antisemitism and the debate(s) it provoked in Poland and in the Netherlands. The observations made in this paper cover the period of Solidarity revolution and of martial law in Poland (1981-1983). My analysis relies on printed documents such as official communist press; underground Solidarity press published in Poland and within the émigré communities; archived documentation of the Solidarity office in Amsterdam; and last but not least the Dutch press.
The rise of the Solidarity movement in the early eighties was a pivotal moment in the course of Polish history. It brought many social changes that were unthinkable during the entire communist era before. One of those changes was a revival of interest in the Jewish history in Poland. Due to the Solidarity press some historical taboos concerning this history (recognition of Jewish sufferings during WWII or the anti-Semitic purge of 1968) finally entered the public discourse. Intellecuals behind the Solidarity initiated also an open and critical debate on the past and contemporary antisemitism in Poland. Due to this debate it also became clear that antisemitism in Poland did not just belonged to the past and some antisemitism was even reported within the ranks of the Solidarity.

Polish emigrants and the Solidarity network abroad continued this debate outside of Poland. In this way the specific Polish historical perceptions were also confronted with the firmly established Western views on the Shoah and Polish antisemitism. In this paper I will address the question of how this debate echoed in the Dutch public opinion and among the community of Polish immigrants in the Netherlands. The main purpose of this paper is to compare (1) the original Solidarity debate on antisemitism within its Polish communist context and (2) the Dutch-Polish debate on antisemitism that at the same time took place in the Netherlands. The attention will be given to various perceptions of antisemitism among Dutch people, Dutch Poles and Poles in Poland. What were the attitudes they shared? What made both discussions different? How was the debate framed within the Polish historical context and how did the Dutch context reshape it? How have the ideas on antisemitism evolved, being (trans)formed or constrained by those diverse social contexts?

SITES OF ANTISEMITISM? PERCEPTIONS OF JEWS ON TURKISH WEB FORUMS IN THE NETHERLANDS

Annamarike Stremmelaar

1NIOD Institute for War, Holocaust and Genocide Studies, Amsterdam, Netherlands

Abstract: This paper explores the reproduction of anti-Jewish stereotypes found on web forums frequented by Dutch of Turkish descent and the methodological issues related to the use of web forums as source material. The paper deals in particular with the national and transnational transmission of anti-Jewish stereotypes and the function they serve in a social context.

Monitoring agencies and scholars alike have identified the Internet as one of the media in which expressions of Antisemitism are regularly found. In the Netherlands as elsewhere, Antisemitic content is not limited to web sites from the extreme-right, but has started to show up on left-wing and Muslim web sites, and is increasingly found on interactive websites generally. Nevertheless, scholarly examinations of online Antisemitism have mainly been confined to analyses of neo-Nazi websites.

As part of a research project about contemporary Antisemitism in the Netherlands I have examined a number of web forums frequented by Dutch of Turkish descent. In both academic and public debate, Muslims have been held responsible for importing Antisemitism from the Middle East into Europe. In the Netherlands websites created for and by people of Moroccan and Turkish descent have been under suspicion of disseminating racism and Antisemitism. Still, the extent to which people identified as Muslim, in this case Dutch nationals of Turkish descent, harbor and express Antisemitic attitudes, online or otherwise, has received little scholarly attention.

An examination of references to Jews on Turkish web forums in the Netherlands reveals that anti-Jewish notions are often expressed in the context of perceived negative media coverage of Muslims and Turks. This suggests that voicing anti-Jewish opinions answers forum participants’ need for a positive identity. While the impetus for expressing negative views on Jews thus often comes from public debate in the Netherlands, the perception of Jews as collective enemy is reinforced by discourses current in Turkey.

LEARNING THROUGH CONTACT? THE EFFECTS ON EARNINGS OF IMMIGRANT EXPOSURE TO THE NATIVE POPULATION

Tiit Tammaru

1Department of Geography, University of Tartu, Tartu, Estonia

Abstract: Factors influencing immigrant labour-market outcomes have received increased scholarly attention lately. A recent research focus has been the effects of residential exposure of immigrants to native population on immigrant labour market outcomes (neighbourhood effect literature). This study introducing the role of two other important domains of daily interaction — family and workplace — on immigrant labour market outcomes. The family domain is represented by a measure of ‘years lived with native partner’. Exposure to natives in workplaces is represented by the variable ‘Share of natives in workplace’. The study is based on Swedish longitudinal register data, and we apply ordinary least squares regression to examine the effects of previous exposure (during the first four years after arrival) to natives on earnings in three immigrant cohorts (1990, 1995, and 2000) at the fifth years after arrival to Sweden. Besides controlling for individual characteristics and various labour-market attributes, a two-step Heckman correction procedure is applied to take into account the selectivity of entering the Swedish labour market.

The results show that having a Swedish partner is strongly related to labour-market participation, but weakly related to immigrant earnings. Thus, having a native partner seems to provide valuable information on host-country labour-market opportunities for immigrants, whereas it appears to be of less significance for wage negotiations with the employer. A higher degree of exposure to Swedes in both neighbourhoods and workplaces exerts a statistically significant positive impact on immigrant earnings. However, prior exposure to natives at workplaces is much more important for current earnings than is previous neighbourhood exposure. When Global North (GN) and Global South (GS) immigrants are compared, the effects of both neighbourhood and workplace exposure are similar and of smaller importance than that of formal education. However, immigrants coming from GS face higher obstacles in converting formal education into decent income than do immigrants originating from GN. Thus, the relative role of exposure to the native population is more important for GS immigrants.

Abstract: This paper draws on data from a qualitative study which explores in-depth for the first time in Ireland the attitudes of Irish professionals towards immigrants. The turbulent socio-economic changes in Ireland since the 1990s, specifically economic growth and immigration followed by recession and emigration, provide a unique context and opportunity to contribute to sociological theories on the intersection of class and race/ethnicity/national identity. Throughout Europe the intersection of the indigenous professional social class and immigrants is under-researched with no in-depth qualitative attitudinal studies in Ireland until now. In 2008 as Ireland continued to enjoy the Celtic Tiger economy I interviewed Irish professionals, peers from a former career, on their attitudes towards immigration. By year-end the Irish economy had experienced a contraction large by historic and international comparison. In 2009, I re-interviewed those same professionals to establish if the recession had any impact on their attitudes.

This paper draws on this unique longitudinal data and contributes to theories on resource competition specifically in relation to members of this social class in the context of a period of rapid socio-economic change. Following the argument that resource competition is not confined to economic resources and can include competition for social, cultural, and political advantage, this paper will explicate if/how access to these advantages are manifest in the way this indigenous social class think about race/ethnicity and national identity.

The methodological framework is constructivist grounded theory. Undertaking peer research reduced the generic information and moved the interviews towards the personal for both interviewee and interviewer. The rich data gathered demonstrates the efficacy and challenges of the methodology.

This work is positioned within the theoretical framework of the intersection of class and race/ethnicity/national identity and Hall (1980), Gilroy (1987) and Anthias and Yuval-Davis et al(1992) who posit the existence of a mutual relation with ‘an agnosticism as to which is primary’. This paper argues that in the current turbulent socio-economic context, for members of this social class, perceptions of class are pre-dominant in categorising individuals as immigrants and informing attitudes about immigrants which, in turn, affect social relations in the professional and private sphere.

THE RISK OF UNEMPLOYMENT IN RECESSION TIMES: WHO IS NOT IMMUNISED?

Nabil Khattab1,2
1 Sociology and Anthropology, University of Bristol, Bristol, United Kingdom, 2 Sociology and Anthropology, THE HEBREW UNIVERSITY OF JERUSALEM, Jerusalem, Israel

Abstract: We use data obtained from the Labour Force Survey in Britain (2008-2010) to explore the question of how the economic recession which peaked in 2008 has affected the risk of facing unemployment amongst different ethno-religious groups in Britain. Previous studies using the 2001 UK Census data have shown that some ethno-religious groups, such as Muslim Pakistani, Muslim Bangladeshis and Sikh Indians face greater risk of unemployment than Christian White-British, Jewish White-British and Christian White-Irish.

Since 2001, there have been a number of national (inside the UK) and International terror attacks followed by the US led ‘war on terror’. All of these events have amplified the Islamophobia, have deepened the anti-Muslim feelings in the UK making some groups (i.e. Muslims) more vulnerable in the labour market.

In this study we aim to address the question to what extent, in times of economic recession, some ethno-religious groups face greater risk of unemployment than other groups (Christian White-British) and how rapidly they face this risk compared to others.

We carry out a survival analysis using Cox Regression to examine the question of how rapidly employees who belong to certain ethno-religious groups are being made redundant (fired) during times of economic recession. We use 10 subsequent quarters of the UK Labour Force Survey (2008-2010) in our analysis. The results of this analysis will be presented and discussed in the conference.

DEVELOPING METHODOLOGIES FOR COMPARATIVE RESEARCH ON RACISM IN EUROPE

Ben Gidley1
1 Centre on Migration, Policy and Society (COMPAS), OXFORD UNIVERSITY, London, United Kingdom

Abstract: This paper explores some of the methodological challenges of researching racism, antisemitism, Islamophobia and xenophobia, focusing in particular on the challenges for doing comparative research at a European level.

There is considerable research on the far right across Europe, and there are strong traditions of research on racism and ethnic relations in several European countries. However, there is a lack of research on the rise of anti-immigrant sentiment, and particularly a lack of comparative research. Old academic paradigms that are based on race and racism are increasingly inadequate for understanding the new forms of intolerance, just as old policy paradigms of race relations, multiculturalism and anti-racism are increasingly inadequate in responding. One striking gap in the literature is a robust account of the ways in which xenophobia shares common traits in different national contexts and yet manifests itself very differently, suggesting a variety of possibility of relationships between old racisms and new xenophobia.

The paper discusses two sets of challenges. The first is epistemological: the challenge of drawing comparisons between data developed out of very different methodological traditions, using illustrative examples from quantitative attitudinal research and qualitative ethnographic research on racism and xenophobia in different countries. The second challenge is how to account for the differences in different national contexts in Europe. Different national histories – such as colonial and postcolonial entanglements, anti-racist movements, regimes of citizenship and belonging – configure xenophobia differently, and place it in a different set of relationships with other forms of exclusion and intolerance.

THE NEEDLE IN THE HAYSTACK OR HOW TO FIND SOMETHING THAT DOES NOT WANT TO BE FOUND: NEW APPROACHES TO STUDY ANTI-SEMITISM

Heiko Beyer1, Ulf Liebe1
1 Chair of Rural Sociology, GEORG-AUGUST-UNIVERSITY GÖTTINGEN, Göttingen, Germany

Abstract: A qualitative research project leads to the question how to find something that does not want to be found. [...]
Abstract: Research on anti-Semitism is confronted with crucial methodological problems stemming from the specific character of its research subject. Since anti-Semitism is a sensitive and normative issue socially desirable responses in surveys and detour communication in public discourse are very common. Further, it has often been questioned whether survey data produces artifacts with regard to the expression of congruent anti-Semitic attitudes and their correlation with “real world” behavior. This paper elaborates on the weaknesses of previous empirical research and suggests three new approaches to avoid the mentioned problems. First, the paper argues in favor of cognitive context framing in surveys in order to reduce effects of social desirability. This can be done by activating a more private interpretation frame. Second, factorial surveys offer a more subtle way to measure racist or anti-Semitic primary group norms and individual attitudes. In such surveys, the description of situations and objects is varied systematically which is expected to decrease social desirable response behavior. Third, choice experiments – a rather new method in sociology – offer a more valid method to measure behavioral characteristics than simple items in surveys. Here, respondents are asked to choose between behavioral alternatives that differ in their attributes. It follows that correlation patterns of these more behavioral responses and attitudinal characteristics can be studied in a systematic manner. All three – combinable – approaches are easy to implement in large-scale surveys. Results of pilot studies demonstrate the fruitfulness of the methodological approaches proposed.

THE SOCIOLOGY OF ANTI-SEMITISM: METHODOLOGICAL AND EPISTEMOLOGICAL CHALLENGES

Veronique Altglas

Abstract: The idea of a ‘new anti-Semitism’ has triggered debates among social scientists. Is it an unprecedented phenomenon? Does it really break from a “traditional” anti-Semitism, and if so, in which respect? Is it a global phenomenon or does one need primarily to look at local factors to understand the presence and variation of anti-Semitism in western countries? Is anti-Semitism increasing or decreasing in Western Europe? The debates and disagreements on such crucial aspects of a social phenomenon are partly the result of difficulties that challenge the sociology of anti-Semitism. These challenges are:

1. Conceptual: scientific definitions of anti-Semitism are extremely diverse. In addition to the distinction between ‘traditional’ and ‘new’ anti-Semitism, the diversification of concepts itself, from ‘judeophobia’ to ‘anti-jewishness’ contributes to the difficulties of discussing a common object.

2. Methodological: furthermore, do we measure the same thing when we, for example, consider police data on physical and verbal abuse against Jews, conduct surveys on attitudes toward Jews, or analyse discourses (public statements, literature, artistic productions)? Are police data viable? Can we restrict anti-Semitism (as a sociological object) to a matter of opinion and representation on ‘Jews’? Are they comparable on European level? To what extent are public or published discourses indicative of a more general social trend?

3. Epistemological: finally, political stakes in the evaluation of the importance of anti-Semitism in European societies are difficult to neutralise and seem to invade scientific analysis. Over-estimation of anti-Semitism is denounced as an instrumentalisation to prevent any criticisms of Israel’s policies, whereas under-estimation can also be perceived as a dangerous legitimization of anti-Semitic acts of violence and verbal abuse. How serious anti-Semitism is remains a moot point among intellectuals and academics. Can we, and should we, analyse anti-Semitism without any consideration of moral and political matters? Otherwise, how may the values and norms of the sociologist prevent the production of a proper sociology of anti-Semitism?

The presentation of these difficulties aims to trigger a debate that is necessary for a solid sociology of anti-Semitism.

WORKING WITH AND AGAINST THE GRAIN? SOCIOLOGY AND THE POLICY AND POLITICS OF RACE RESEARCH

Karim Murji

Abstract: In this paper I seek to explore the relationship between research on race and racism and the capacity for and orientation of action in political and policy contexts. This is a debate enlivened by recent concerns about ‘impact’ in the UK, though my approach is broader than that. The specific examples I focus on concern issues of race and racism and the police. In this arena political/policy concerns cannot easily be detached from social research, indeed it could be argued that to do so would miss the key issue involved. But the question is not about being involved politically or not, but what kinds of involvement and engagements – and to what end – are at stake. The context for the discussion is quite well known, particularly the 1999 Stephen Lawrence Inquiry report. One of the consequences of that report was that all police forces were set targets for the employment of Black and Minority ethnic staff. I draw on my research to explore the background and policy and political manoeuvres around this target. That target and race-based categories aimed to achieve greater representation and equality in the police service. It reveals a dilemma about ends and means in social research and policy/politics, namely of striving for better race equality policy and practice while expressing doubts about the narrowness of the target and the essentialist race politics that supports it. It highlights the difficulties of researching race and racism in a highly politicised context, where there are complex issues and choices about which is the ‘anti-racist strategy’ and how to make that case. I draw on Michael Burawoy’s distinction between instrumental and critical orientations to suggest that, like the need for simultaneous engagement and detachment in qualitative social research, we need to consider ways of working ‘with and against the grain’ of campaigns against racism.

THE NATURE OF THE RELATION BETWEEN EDUCATION AND PREJUDICE

Toon Kuppens, Russell Spears

Abstract: People with higher levels of formal education report less prejudice in survey research. Here we present novel evidence on the nature of the educational differences in anti-Black attitudes.
Using two recent data sets of the American National Election Study, we replicate the education effect on direct self-report measures of anti-Black attitudes among Whites, but we find that education is not related to spontaneous, indirect measures of anti-Black attitudes. These indirect measures have been developed in psychology and reflect more spontaneous and affective aspects of attitudes. Importantly, indirect measures perform better than direct self-report measures in predicting spontaneous, nonverbal behaviour, or behaviour in situations where people have no opportunity or motivation to control their behaviour. These results shed new light on intergroup attitudes of the higher educated and, given the differential relation of direct versus indirect measures with behaviour, they have wide-ranging implications for the kind of intergroup behaviour and discrimination we can expect from lower and higher educated individuals. In addition, we find that educational differences in need for cognition do not explain the relation between education and prejudice toward Blacks.

EXPLORING THE NATIONAL MINORITIES’ RIGHTS WITHIN THE IMPLEMENTATION OF EDUCATION REFORMS – CONTENT ANALYSIS APPROACH ISSUES

Ines Elezovic

10 Centre for Human Rights and Democratic Citizenship, Faculty of Humanities and Social Sciences, Zagreb, Croatia

Abstract: of external evaluation of education in Croatia began in 2006, with the first national exams. Used procedures had a goal of setting an objective, valid and reliable indicators of the schooling system quality. One of the basic characteristics of wide scale knowledge, skills and competencies assessments are standardized exams identical for all participating students. This preconditions equal right of access to equal education quality in national documents and practices. In that respect, high school students educated in the language and writing of their national minority have an additional set of rules which prescribe their rights and obligations.

Implementation of common European documents into specific national environments reflects bureaucratic nature of such endeavors ‘laid down from above’. In this research international alignment activities in education were tracked throughout content analysis of relevant documents and practices. But, the actual value of key problems that are frequently mentioned showed to be hidden; these are not just concepts that are taken into consideration by the state authorities the most, but often also indications of the ones that are not dealt with in practice. Second main conclusion is that the extensively covered themes are not necessary best resolved ones within the national context; sometimes they are the problematic ones. Such solely theoretical, but widely advocated, theme is ‘human rights and democratic citizenship’ which in fact exists only as sub-integrated area in present Croatian general curriculum. This means that national minority issues in education should only be addressed randomly via different subjects, such as history or geography that completely depends on individual teachers.

If education indeed has a burden of deliberate unequal redistribution of knowledge, as one of the Bourdieus’s type of social capital reserved for elites, what better time to ensure its elitist goals then in time of worldwide social and economic crisis. National minorities in reality are protected only as long as they openly ask for a positive discrimination. These problems are not subject of quantitative methods research because of their delicate nature and we thus need to approach them from a qualitative perspective, but obviously, not exclusively through content analysis of accessible documentation in education.

AN EXPLORATIVE STUDY OF ETHNIC MINORITY STUDENTS’ STRATEGIES’ IN RESPONSE TO RACISM IN CYPRUS AND BELGIUM

Peter Alexander Joris Stevens1, Panayiota Charalambous2, Evgenia Mesaritou 2, Spyros Spyrou 3, Mieke Van Houtte 4, Linde Inghelbrecht 5

1Faculty of Political and Social Sciences, GHENT UNIVERSITY, Ghent, Belgium; 2EUC Research Centre, 3Centre for the Study of Childhood and Adolescence, European University of Cyprus, Nicosia, Cyprus; 4Department of Sociology, 5GHENT UNIVERSITY, Ghent, Belgium

Abstract: Considerable sociological research has focused on the nature, occurrence and consequences of racism in education, particularly in the UK. Most of these studies apply a social constructivist approach and focus mainly on students’ experiences of ethnic stereotyping and discrimination, teachers’ stereotypes of minority students and the processes and effects of selection, the distribution of classroom resources, and the nature of the knowledge and values taught and sanctioned in schools (for a review, see Stevens 2007). However, little systematic research has been carried out on describing and explaining variability in students’ strategies in response to racism. This is an important area of research as students’ coping strategies in response to racism in school and society can have an important impact on their social and economic success.

This study uses data collected from qualitative interviews with ethnic minority students in secondary schools in Flanders (the Netherlands, Dutch speaking part of Belgium) and the Greek speaking part of Cyprus. Students are selected from three different school types in each region: an ethnically mixed urban school, an ethnically homogeneous urban school and an urban elite school. In both countries students were interviewed using the same semi-structured interview schemes.

Analysis of qualitative data is currently being carried out and considers students’ national and school context and their socioeconomic and ethnic background. Initial analysis suggests the usefulness of Bourdieus’s theory of practice and related concepts of habitus, cultural and social capital in explaining differences in students’ strategies in response to racism. The conclusions will discuss the implications of these findings for social policy and future qualitative research. In addition, the discussion section investigates essential methodological issues related to doing cross-national comparative case-study research on the management of racism in two divided communities (Cyprus and Belgium).

ANTISEMITISM IN THE BRUSSELS’ SECONDARY SCHOOLS

Mark Elchardus

1Sociology, VRIJE UNIVERSITEIT BRUSSEL, Brussel, Belgium

Abstract: Belgium has three independent educational systems: The French, The Flemish and the German. Both the Flemish and French system have schools in the capital city of Brussels. The research on which this paper relies was conducted in 34 of the 42 Flemish secondary schools in Brussels. In each school a number of classes was
randomly selected and all the students (N=2513) in the selected classes were interviewed.

Brussels is a very diverse city. Only about one third of the interviewed students has parents of Belgian origin. About half (48%) of them is Muslim.

Anti-Semitism is measured on the basis of four statements (“Most Jews think they are better than other people”. “Jews are war mongers”. “Jews want to dominate everything”. “When doing business with Jews one has to be particularly careful”). Together the four statements form a reliable scale (Crombach’s alfa=.92).

Of the native students about 10% can be considered anti-Semite. In this group that attitude is not related to general feelings of xenophobia, suggesting that Jews are not considered as “strangers”. Among these students Anti-Semitism is higher among practicing Catholics and socially vulnerable pupils.

Of the Muslim students about one in two agrees with the four statements. Their attitude can not be explained by the social and economic position of these students. It is very strongly related to their identity as Muslim and to a lesser extent to their media use. Anti-Semitism is also somewhat higher in all groups of students, regardless of their individual characteristics, in schools with a high concentration of Muslim students.

CONCEPTUAL ISSUES IN RACISM AND ANTI-SEMITISM: CONNECTING SOCIOLOGIES

Robert David Fine 1
1Sociology, UNIVERSITY OF WARWICK, Leamington Spa, United Kingdom

Abstract: In 1964 two young Jewish civil rights activists were lynched by Ku Klux Klan members alongside their black comrade. Did this infamous episode testify to a natural solidarity between Jews and blacks as ‘brothers in misery’, to use Fanon’s expression? Cornell West writes: ‘there was a better age when the common histories of oppression and degradation of both groups served as a springboard for general empathy and principled alliances’. There is evidence to bear this out. In the first half of the twentieth century theorists like Du Bois and Fanon sustained an interest in how antisemitism and racism articulate with each other in ways that appear to have been downplayed in contemporary studies. In the postwar period evidence of a continuing concern for integrating questions of racism and antisemitism can be found, for example, in Arendt’s Origins of Totalitarianism in the first two sections of which, Antisemitism and Imperialism, Arendt addresses the ties that bound antisemitism inside Europe to the new forms of racism that accompanied colonial conquest outside Europe. Today in the UK Paul Gilroy has done much to re-establish connections between racism and antisemitism and the US Cornell West argued that antisemitism within the ranks of some Black activists compromises the prospects of anti-Black racism as well. Paul Berman recalls the popular enthusiasm among liberal Jews in the postwar period for the Civil Rights Movement. Of course, these examples of solidarity are not the whole story and in this period of radical disjunction the aim of this paper is to explore the possibilities of reconnecting sociologies.

ANTISEMITISM AND THE POWER OF THOUGHTLESS ANGER: ON THE CRITICAL THEORY OF A RESENTFUL RUMOUR

Werner Bonefeld 1
1Politics, UNIVERSITY OF YORK, York, United Kingdom

Abstract: The Nazi ideologue Arthur Rosenberg formulated the essence of modern antisemitism succinctly when he portrayed it as an attack on Communism and ‘Jewish capitalism’, by which he and his fellow antisemites, then and now, understand a capitalism not of productive labour and industry, but of parasites - money and finance, speculators and bankers. The paper examines contemporary forms of antisemitism and explores the arguments put forward by Adorno, Horkheimer and Postone to conceptualise the ‘rumour about the Jews’ as incarnation of hatred forms of capitalism, a rumour finds manifestation in the antisemitism of the right and the antisemitism of the left. Antisemitism offers a ready-made articulation for resentment and anger, and an enemy. It is all embracing – it comprehends nothing; and in this perversity lies the secrete of its enduring appeal.

ANTISEMITISM AND THE FINANCIAL CRISIS

Karin Stoegner 1, 2
1Nationalism Studies Program, CENTRAL EUROPEAN UNIVERSITY, Budapest, Hungary, 2Department of Sociology, University of Vienna, Vienna, Austria

Abstract: I would like to present some results of a study on Anti-semitism in Media Discourses on the Financial Crisis my colleagues and I have carried out at the Institute of Conflict Research in Vienna. We focused on the Austrian media discourse during the years 2008-2010, concerning reporting on the economic or, as it is mostly put, the financial crisis and analysed in what way these discourses operated with antisemitic stereotypes. Thereby we found only a few direct or manifest antisemitic statements in the media discourse, thus references to the antisemitic stereotypes of the “greedy Jew” or of “Jewish world conspiracy” were not put directly. Just like in secondary antisemitism that is not expressed openly, but finds encoded ways of expression, we found quite a number of encoded statements that could be interpreted as antisemitic, or at least as provoking antisemitic thought. Thus, we looked at the Austrian media corpus along several thematic categories that traditionally occur in connection with antisemitism, but which, however, maybe are not antisemitic themselves. In my paper I will present the most important ones, such as the encoding of antisemitic contents in sexist, anti-intellectual, and nationalist statements.

RUSSIAN MINORITY IN FINNISH LABOUR MARKET AND WORK COMMUNITIES – THE DEFINITION OF RUSSIAN MINORITY AS A PART OF A RESEARCH PROBLEM

Outi Eline Kähärä 1
1Departement of Social Sciences/Sociology, UNIVERSITY OF TURKU, Turku, Finland

Abstract: Russian immigrants form the largest minority group in Finland. Attitudes towards Russians among the native population can be relatively negative. Russians find several problems when integrating into the Finnish society and the Finnish labour market. Getting a job is often extremely challenging to Russians, who often work as short-term employed. Building relations between Finns and Russians is hard particularly in organizations, where workers aren’t
permanent, where there are no preconditions for so called social capital to be formed.

The presentation examines the meanings and a reconstruction of ‘a Russian’ in a community level in Finland. In a historical frame of reference the forming of a Finnish identity has been significantly in relation to distiction of Russian otherness, where the categorization of ‘a Russian’ as a negative antithesis to ‘a Finnish’ is still recognized in many societal, social and individual perceptions and practices. These kind of meanings, perceptions and practices are emerging as verbal remarks such as telling rumours, ethnic jokes, avoiding and discrimination, which can cause group segregation in ethnically diverse work communities.

According to theory of social identity, people define themselves by group categories. When we discuss about ethnic or national background and its impact on human relations, other social categories that may cause social divisions and problems in trust relations must also be accounted. In sociological talk there is a discourse about the meaning of intersectionality, which means that research is considering differences and inequalities such as sex, class, age and professionality, ethnicity and nationality as interconnected to each other. In this context the social meaning of ethnic or national background, in this case the meaning of ‘a Russian’, may remarkably vary in work communities where different kind of inequalities and differences are found.

THE ROMA PEOPLE: TRANSTERRITORIAL IDENTITIES AGAINST RACISM.

Mimar - Ramis-Salas 1, Marta - Soler-Gallart 1, Ariadna - Munté-Pascual 1,2,3

1Department of Sociological Theory, 2Department of Social Work and Social Service, UNIVERSITY OF BARCELONA, 3Department of Social Work, Ramon Llull University, Barcelona, Spain

Abstract: Racism and xenophobic movements have arisen in the last years in Europe, threatening the social cohesion in our territories. Among the most vulnerable groups we find the Roma People, which is the largest ethnic minority in Europe with around 10 million people living across the different European territories. The Roma have always cherished their transterritorial tradition as part of their identity as a people, and have historically not claimed a country of their own. This cultural element questions the theoretical contributions that have linked the processes of identity creation and preservation to a bordered territory, idea which is reinforced by the concept of the nation-state. In the context of the global era, the close ties that the Roma community have created across borders become a model of transterritorial bonds that prove the existence of another way of creating relationships. This alternative is linked to the common values and principles that the different Romá people have shared, which can contribute to overcome the limitations of the nation-states-linked identities. The case of the Roma People recognised by the European Parliament in the context of the Workaló research project (funded by the European Commission’s 5 th Framework Programme), becomes thus a key model for the study of more inclusive ethnic relationships that can contribute to European social cohesion.

A COMPARISON OF DIFFERING EXPERIENCES OF RACISM BETWEEN FIRST AND SECOND GENERATION AFRICAN MIGRANTS IN BRITAIN

Petra Aigner1

1Sociology, UNIVERSITY OF LINZ, Linz, Austria

Abstract: Inclusion, exclusion, racism and discrimination of migrants in host societies have been globally debated, amongst the large public, academics and within the political sphere. Racism and discrimination by definition, are expressed in two forms: overtly and covertly. Forms of overt discrimination and racism occur more so in micro social settings, such as the everyday sphere and often are expressed with verbal language, swearing, as well as facial expressions.(Van Dijk, 1995). Covert, subtle and hidden racism and discriminatory practices are ascribed to institutional settings, such as work settings, or educational settings, but expressed more so by way of processes, rather than in language (ibid.). Covert racism is defined as a hidden form of discrimination, oppressing ethnic minority groups in their access to rights and power (Berreby, 2000).

In a study of 20 African families (from Zimbabwe, Kenya, Sudan and Somalia who arrived in the UK between 1985 and 2003) and their experiences of discrimination, racism and prejudice in Britain, forms of covert and overt racism became apparent, however, first and second generation migrants had very differing experiences of discrimination and racism, correlating with and depending on their degree of identification with the culture of the host country and their type of acculturation (Berry, 2002). For example, mostly, first generation migrants, unlike the second generation migrants, maintained strong cultural identification with their country of origin, perceiving both, covert and overt, racism in all social settings. Their children, experienced hybrid identities, which impacted on very different experiences of racism.

This paper explores and compares differing experiences of racism and discrimination between first and second generation African migrants in the United Kingdom. The paper will additionally outline the correlation of experiences of racism and differing degrees of identification with the host culture. Such analysis will predominantly focus on the settings of paid work and education. The study was a British Academy funded project (2008-2009) which interviewed 20 African families in the North of England, mainly in the county of Yorkshire. Methodologically, the project utilized qualitative biographical interview techniques.

A MULTICULTURAL SHOPPING STREET: AN EXOTIC OR EVERYDAY EXPERIENCE?

Karin Peters1

1socio-spatial analysis, WAGENINGEN UNIVERSITY, Wageningen, Netherlands

Abstract: Public spaces are considered a reflection of society. People are differently attracted to various spaces, and spaces differently affect the everyday life of people. This paper focuses on the dynamic relation between being in public space and awareness and acceptance of multiculturalism. I draw upon research executed in a multicultural neighborhood in Utrecht, the Netherlands: Lombok, a neighborhood that has undergone tremendous social changes in recent decades. Based on interviews and observations, I argue that spaces of segregation and integration are not constructed in everyday life on the basis of conscious ethnic inclusion or exclusion. People in the neighborhood are very positive toward multiculturalism, and feel no desire to spatially segregate themselves. I will elaborate on the meaning of a multicultural shopping street, the Kanaalstraat.
Abstract: The goal of this contribution is to explore the possibilities and limits of such qualitative methods to tone down discussions about racism(s) and Antisemitism, and also bring the attention of research and intervention to the role of bystanders.

HOW WE ANALYZE (AND CONFRONT) IRRATIONALITIES WITH ARGUMENTS? SOME RADICAL QUESTIONS ON METHODOLOGY AGAINST HATRED

Achilleas Fotakis

1HISTORY, NATIONAL AND KAPODISTRIAN UNIVERSITY OF ATHENS, Athens, Greece

Abstract: Right after the Holocaust the French philosopher Jean-Paul Sartre wrote in his famous reflections on the Jewish question on the essence of anti-Semitism: “Indeed, it is something quite other than an idea. It is first of all a passion.” Adorno and Horkheimer, alike, drawing upon a pessimistic realism, grown out of the incapability of the Western intellect to foresee the upcoming destruction, often implied, if not suggested, that anti-Semitism – as a social relation – lies in irrational, destructive forces embodied in the western human spirit, forces that frequently and easily attach to the so-called rational arguments in order to humble, expel, and hunt this great Other, the Jew. The left’s or the liberal democrat’s failure to confront such destructive forces, when was so much needed, exactly before National Socialism put forward its annihilating work, left us alone with the probably correct impression that the Nazis could not be stopped rationally, scientifically, and, consequently, without the ‘criticism of arms’.

Today, that new forms of anti-Semitism arise and we observe an increase in numbers of the European extreme right, discussions have again arisen around the ways we should analyze and confront anti-Semitism in various sectors of social life, before we once again find ourselves amidst an upcoming war between two camps that cannot resolve anything without violence.

This is exactly the view from which I choose to focus on methodology. Since the discussion can still be found in its early steps we should attempt to put radical questions – all over again – around the use of science, its mixture with political work and commitment, as well as the use of accurate and scientifically valid methodologies which can provide us with the necessary tools to fight a passion that although it is not rational, it can still embody ‘rationality’ and objective figures. Is this an idealistic plan or are we really capable to halt ‘this passion’ scientifically? This discussion, as I see it, repeats itself after 80 years. One of the crucial differences is that today we know what happened in the past and, consequently, our belief in progress, development and rationality has waned. This is the blank, science, mostly social sciences, should fill.

Achilleas Fotakis

Phd Candidate in History, in the Kapodistrian and National University of Athens

METHODOLOGICAL ISSUES IN STUDYING THE POLITICIZATION OF ANTI-SEMITISM AND ISLAMOPHOBIA: INSIGHTS FROM THE FRENCH CASE

Brigitte Beauzamy

1Centre for Research on Ethnic Relations, SHSS, UNIVERSITY OF WARWICK, Coventry, United Kingdom

BETWEEN UNDERSTATEMENT AND OVERSTATEMENT. PERSPECTIVES ON RACISM(S) AND ANTI-SEMITISM: WHO IS TO PRODUCE RESEARCH DATA AND IN WHAT PERSPECTIVE: PERPETRATORS’, VICTIMS’ OR BYSTANDERS’ VIEWS?

Monique Eckmann

1Hets, Geneva, HES SO, UNIV OF APPLIED SCIENCES WESTERN SWITZERLAND, Geneva 4, Switzerland

Abstract: Research on racism(s) and Antisemitism has mainly focused on perpetrators’ motives, attitudes and behavior. In such, racism is defined from a perpetrator’s perspective. Recently, however, scholars are paying attention to victims’ perspectives, and how racism(s) affect targeted groups. Also, organizations advocating victims’ rights and filing complaints, monitor incidents occurring to members of the group, insofar as they have been brought to their attention.

But problems persist: researchers have rarely compared different victim groups (Blacks, Roma, Jews, Muslims, etc.), weighed victims’ and perpetrators’ views, or have observed compared evolution over time. Moreover, even studies that have compiled longitudinal quantitative data require complementary qualitative analysis. Another body of insights is given by the analyses of discourse-figures; however, the risk is to detect patterns of prejudice in every discourse, as racisms are deeply rooted in our societies. Interpretation of data tend often either to ignore victims or put an overemphasis on them. This contribution looks at research methods that contribute to overcome these two interpretive extremes: - tendencies toward banalisation, if not denial, or overstatement.

In my presentation I will consider two qualitative studies we have conducted, that focus on victims’ and bystanders’ perceptions of racism, giving only glancing attention to perpetrators’ perspectives. In addition, I will explore how research could overcome the polarization between victims and perpetrators. Following the principle of “multiperspectivity”, these studies deal with everyday racism as an experience and as contextualized situation, in which individuals act according to their representations. Based on my research involving an NGO running an “antiracist hotline”, I will look at the significance and effects of dealing with victims’ claims. A related argument is based on a research involving teachers’ and community workers’ dealing with critical incidents in their everyday job, and analyzing them in focus groups. Their perceptions of racism(s) influence the way they negotiate these incidents, may they respond to it or not.
Abstract: Anti-Semitism and Islamophobia are currently two hotly debated issues in France: on the one hand, the rise in anti-Semitic aggressions has been repeatedly denounced by various actors demanding new laws, even though the already repressive legal frame has not proved capable of successfully tackling the issue. The very nature of French anti-Semitism is today questioned, for instance by asking whether a “new anti-Semitism” rooted in the opposition to Israel would be harbored by new groups such as Muslim migrants and leftist activists. On the other hand, Islamophobia does not appear at first glance to refer to such a precise set of attitudes and activities as with anti-Semitism: a new, fuzzy concept in the French context, Islamophobia is an emerging theme and is chiefly used to denounce public policies such as the ban of the Muslim veil for schoolgirl or the recent debate on the burqa and mosques. However, both themes have many common features: they both question French integrationist ideology and put public intervention under scrutiny, and they tend to associate cultural diversity in the public space with social unrest, insecurity and contentious politics.

When one tries to assess how anti-Semitism and Islamophobia have been turned into major political themes over the past dozen years, one is confronted with some conceptual and methodological issues. Political discourses related to anti-Semitism and Islamophobia are deployed in a number of contexts – media, party programmes, policy briefs, texts by public intellectuals, to name but a few – and are produced by various actors, including but not limited to Jewish and Muslim community organizations. In fact, it may be argued that the most important aspect to be analysed is the appropriation of both themes by political actors beyond the communities which are most concerned by the phenomena, in order to examine how they reshape French political debates pertaining to many topics – from insecurity to immigration and to the management of the post-colonial history. The object of the paper will be to examine these methodological issues and to propose ways to solve them using an approach inspired by Critical Discourse Analysis.

CONTEXT AND METHOD: PRIVILEGING THE PERPETRATOR?
David Feldman

1Pears Institute for the Study of Antisemitism, BIRKBECK, UNIVERSITY OF LONDON, London, United Kingdom

Abstract: Interpretive social scientists such as cultural historians and social anthropologists try to understand the concepts that shaped the world view of others. This means that when we find other people communicating their beliefs we take those beliefs seriously as an attempt to understand the world and live in it. Moreover, we will also try to discover the connections between any one idea and the wider context of beliefs and practices that helped sustain it and give it explanatory power and meaning. These commonplace procedures, however, run contrary to much work that takes antisemitism and racism as its object of study. On one hand, the concept of prejudice animates studies by those who see racism and antisemitism as a failure of cognition; the malign triumph of reason. But the concept of prejudice makes a poor starting point because it prevents us from adopting the procedures historians normally employ when studying people whose beliefs and practices were different from our own. Others take as their starting point the ways in which minority groups perceive and experience racism and antisemitism. The self-understanding of the objects of racism and antisemitism is important but it may be a poor starting point from which to understanding the meanings and motives of perpetrators.

This paper will examine these dilemmas in the study of antisemitism and assess the extent to which methodologies which privilege a search for meaning through contextualisation can overcome them.

THE PROBLEMS OF ETHNIC TOLERANCE IN RUSSIAN PRESS
Anna Semenova, Maria Semenov

1Deptm. of Applied Research, INSTITUTE OF SOCIOLOGY OF RAS, Moscow, Russian Federation

Abstract: Mass Immigration began in Russia just after collapse of the former Soviet Union. Then it had become big social problem. Only in nineties of the last century about 8 million of immigrants arrived in Russian Federation. Among them there were refugees from the military conflicts areas, those who were forced to change living area and labour migrants from the former soviet republics. In this period communities from Caucasuses were significantly increased in various Russian regions. They were called common definition – persons of Caucasian nationality. This definition in everyday use has a negative sense. The reason of this fact is fears of the natives to lose their’ cultural integrity. That’s why they treat newcomers as potential criminals, look in them the reason of unemployment and decline of living level.

Exploitation of fears which are connected with the process of immigration (migrantophobia) is a very effective way to gain the electorate votes. Myth about natural cultural contradictions (or oppositions) is cultivated because of demonization of migrants’ image with the aid of specific “preservative” strategy of various mass media. In this strategy the main point is to conserve the order of the title nation, natives, “hosts”. In this strategy they treat political and social conflicts as ethnic ones. Violations by the newcomers their traditions, rules and order of the “hosts” are treated by the journalists as an attempt to install their own new order in the society. In this variant journalists write about state, region or city as about homeland only for natives, not for everybody. The whole population divides into “ours” and “strangers”. The nominations of newcomers in their publications commonly have negative connotations, also journalists often line on their differences from the natives. Presence of migrants in different areas commonly is linked with the number of different social, economical, criminals and other problems. They accent on the growing migrant’s population, their aggressive behavior, their intention to improve their welfare on the cost of the local people. All this journalist’s activity forms “image of evil (enemy)” and “complex of victim”, creates intolerance to the other style of life.

WHEN DOES ANTISRAEL BECOME ANTISEMITIC? A QUALI-QUANTI APPROACH TO POLITICAL CARTOONS IN THE SPANISH PRESS
Alejandro Baer

1Sociology of Culture and Religion, Universität Bayreuth, Bayreuth, Germany

Abstract: Cartoons published in the Spanish press in the last decade have made their way into the transnational institutional networks of anti-antisemitism, and are shown, pedagogically, as examples of how critique of Israel can embrace, without complexes or intellectual contradictions, the stereotypes that once were the exclusive
components of classic antisemitism. While this happens on the institutional level, and mostly outside Spain, there is no systematic study of Spanish political cartoons as a vehicle of antisemitism and, moreover, a significant lack of reflection on methods to approach this genre.

Political cartoons and caricatures in newspapers are a complex humorous genre with a significant role in shaping public opinion. Cartoons draw most of their specific meanings from the socio-political context of everyday news events, and from a variety of intertextual elements such as visual analogies and intra-cultural winks. Thus, an appropriate analysis of these representations demands an approach on several levels, beginning with classic content analysis and advancing with a socio-semantic method that looks at implied connotations, the viewer’s present and past cultural knowledge as well as the different discursive frameworks in which these satirical graphic commentaries make sense for their audiences.

This paper will focus on cartoons related to the arab-israeli conflict, published in Spanish newspapers between 2000 and 2010. The quantitative approach enables us to establish degrees of sympathy towards the sides in conflict and to determine what specific events spark off the creation and publication of vignettes and caricatures on the topic in different papers. With the qualitative approach we can identify the particular “Spanish” schemata of interpretation that allow both the cartoonist and the wider audience to perceive, identify and label events in the Middle East.

**ANTISEMITISM, ISRAEL AND THE LIMITS OF CRITICISM: THE CASE OF THE BRITISH PRESS COVERAGE OF GAZA**

David Kaposi¹

¹psychology, UNIVERSITY OF DERBY, Derby, United Kingdom

**Abstract:** The presentation will comprise a critical analysis of the now burgeoning debate on the presence of the "new antisemitism" in the United Kingdom and as well as of the discursive analysis of an illustrative case study of the British press’s coverage of the Gaza war.

In addressing the first issue, the presentation will seek to account for the diametrically opposite versions as to the phenomenon of the "new antisemitism": a version that describes it having a real and growing presence within the liberal, anti-racist and human rights-concerned political centre; and a version that describes it as a mere rhetorical ploy used by apologists in order to immunize the state of Israel from criticism and thus stifle free debate. The objective of the presentation will be to investigate the rhetorical practices and implicit assumptions these versions mobilize, respectively.

In the second half of the presentation, the analytical focus will be on a section of the empirical data that have been collected on the coverage of the mainstream British press of the "Gaza conflict" in 2008/2009. It will look at the relevance of antisemitism in this coverage, and how the "new antisemitism" may be approached in it either as an explicit or an implicit issue. In particular, debates will be rhetorically analyzed where the topics of antisemitism, Israel and the limits of legitimate criticism are invoked.

**ANTISEMITISM, RACISM AND XENOPHOBIA IN THE ROMANIAN ONLINE SPACE**

Elena-Irina V Macovei²

²Faculty of Philosophy and Political Sciences, ALEXANDRU IOAN CUZA UNIVERSITY OF IASI, ROMANIA, Iasi, Romania

**Abstract:** This study aims to analyze the opinions of the Internet users in forums and blogs, namely to identify the anti-Semitic, xenophobic and racist themes that they preferred to discuss, to highlight the context of their occurrence and the characteristics of the participants. With the development of the Internet, the Romanian forums and blogs have become ideal places where such ideas are disseminated.

Taking into account the specifics of the online space and the difficulty of studying the stigmatization and the ethnic relations, it requires the integration into a creative way of several research methods. First method is the observation, resulting in a vast documentary material, accumulated during a period of six years (2003-2009).

We observed: the forum of eight local and national newspapers, of some news sites and television, the international adapted specialized platforms, extremist or common and the blogs of some journalists, writers and politicians. Second, we conducted an interview with William Totok, one of the publicists who studied constantly this phenomenon. We are also proposing a case study on the online comments to articles about the receiving of the Nobel Prize 2009 by Herta Müller and about the problems raised by her, regarding the unofficial collaborators of the Romanian Security during the communist regime. In addition, we accomplished a multiple correspondence analysis, in order to verify how the comments pertinence or radicalism is linked to the manner in which the internet user addresses others (under his own name, individually or on behalf of a group, collectively) and to the stigmatized group type (Jewish, Roma minority, Hungarians, Germans, Russians).

Our results showed that the anti-Semitic opinions include a series of stereotypes: Jewish are transformed into scapingos and they are seen as the ones who want to lead the world and who brought the communism in Romania. Also, the Holocaust is seen as an event that did not actually exist, being a thriving business for them. The spite is also directed against Roma minority or against other nationalities such as Hungarians, Russians or Germans.

In conclusion, the freedom of expression and the access to the Internet is undoubtedly a positive factor for the Romanian society, but without some limits for the comments on forums, extremist ideas proliferate, contaminating some of the readers.

Key-words: antisemitism, racism, xenophobia, Romanian forums, Internet

**REGIONAL DIFFERENTIATION OF ANTISEMITISM IN POLAND: RESEARCH FINDINGS AND METHODOLOGICAL PROBLEMS**

Marek Kucia¹, Mateusz Magierowski²

¹Institute of Sociology, JAGIELLONIAN UNIVERSITY, Kraków, Poland

**Abstract:** The paper will discuss one of the main findings of the quantitative and qualitative research project on antisemitism that the author and his team carried out in Poland in 2010. The project consisted of a nation-wide survey representative of the country’s population aged over 15 years and focus group interviews carried out with members of different Catholic communities in various regions of the country. The survey employed questions indicative of four kinds of antisemitism: modern domestic, modern internation-
al, religious, and postholocaust. The quantitative part of the project found out and the qualitative confirmed that the amount of antisemitism in Poland differs according to regions: there are four Poles as regards antisemitism. The focus group interviews also revealed how antisemitism and its various kinds are related to the culture of a particular Catholic community. But the qualitative part of the project also highlighted the key methodological problem of surveys on antisemitism: the questions are sometimes understood not as their authors (the researchers) intended.

**RESEARCHING RACIST VIOLENCE – METHODOLOGICAL ASPECTS OF THE STUDY OF ISLAMOPHOBIC HATE CRIMES AND DISCRIMINATION IN SWEDEN**

Marta Kolankiewicz

1Department of Sociology, LUND UNIVERSITY, Lund, Sweden

Abstract: This paper focuses on the methodological issues I have encountered when researching racist violence and, more specifically, Islamophobic hate crimes in Sweden within my PhD project. It engages in a research-based discussion of specific aspects of studying Islamophobia, which I find relevant to research on racism in general.

In my PhD project, I study cases of hate crimes and discrimination reported to the police and other authorities in Sweden from 2006 to 2009. This point of departure makes it possible, in my opinion, to capture what Bulmer and Solomos call “the impact of racism in real-life situations”. Even though the analysed material is textual, it enables me to conduct a study that goes beyond the purely discursive sphere and to capture the material dimensions and consequences of racism.

The present paper addresses the methodological and theoretical consequences of choosing this particular research procedure for the study of racism. Moreover, the problems involved in researching the very politicized and infected areas of Islamophobia and hate crime are discussed. I critically reflect upon what this politicization means for the definition of key concepts. The discussion is placed in the broader context of the production of knowledge about this constantly changing phenomenon, the meaning of which is so often reformulated as a result of political and social debates. Finally, the paper includes a self-reflection on the research into Islamophobia in Sweden by a (non-Muslim) immigrant. I discuss here the usefulness of such concepts as ‘outsider within’.

**DOING RESEARCH ON EVERYDAY RACISM: COLLECTIVE TALKING ABOUT LIVED (COLLECTIVE) EXPERIENCES**

Vanessa Eileen Thompson

1Institute for Sociology (III), GOETHE-UNIVERSITY FRANKFURT/Main, Frankfurt/Main, Germany

Abstract: Empirical research on everyday racism is often based on the category of experience. Experiences are therefore relevant sources for studies on everyday racism because their notion is multidimensional and their embeddedness in social structures transcends the ‘individual’ content and reveals their social character. The reconstructions of experiences of racism in everyday life are thus suitable to grasp the multiple dimensions of the phenomenon and furthermore helpful to demonstrate that experiences of racism are more than just ‘personal’ ones; as racism is a social problem. Nevertheless most of the qualitative approaches in the field of social sciences and the humanities focus on the analysis of racist accounts gathered in single-interviews.

The aim of this paper is to further discuss the necessity of the inclusion of group-focused methods in the field of empirical research on racism. I argue that focus groups are more adequate to analyse the experiences of everyday racism because the degree of naturalness can be higher than in a single-interview situation. Furthermore the atmosphere created during a group discussion comes closer to everyday situations.

My presentation will follow two argumentative steps in which I intend to demonstrate that one-to-one interviews risk to miss out essential accounts of the experience and knowledge of everyday racism as everyday racist experiences are addressed dialogically and the knowledge on everyday racism is often constituted collectively. By drawing upon findings from my empirical research conducted with Black women in Paris and by referring to Frantz Fanons phenomenological category of ‘lived experiences’, I firstly give a rough draft of the collective character of lived experiences of racism in everyday life. In a second step I want to demonstrate how experiences of everyday racism are only revealed as such in and through a group process in which the participants re-articulate, remember and re-work episodes of everyday racism collectively.

**WHAT CAN BE SAID; „SHARED” AND THOUGHT IN WHITE WESTERN SPACES? METHODOLOGICAL REFLECTIONS ON DOING RESEARCH IN AND ABOUT THE UNIVERSITY AS A SPECIFIC SOCIAL CONTEXT**

Angela Kuehner1, Susanne Becker

2Gesellschaftswissenschaften, GOETHE UNIVERSITY FRANKFURT, Frankfurt, Germany

Abstract: In an ongoing participatory research project we invited students to group discussions, where they were asked to share reflections and experiences on “the University as a white, western, male space”. Starting point was a sociological and social psychological interest in how othering/ being othered is working in this specific context. For example, students who feel they are seen as “Muslim” or non-western women often report that they are confronted with strong stereotypes and/or addressed as “needing help”. It seems that even social practices which intend or pretend to be empowering can be stigmatizing and disempowering – a phenomenon often framed as “dilemma of difference”. From a theoretical perspective one might be inclined to analyze such experiences as ethnocosmism if not racism. As proposed in the cfp, the presentation will focus on the methodological decisions and how “calling it racism or not” reappeared at different levels of the research process and finally as part of the empirical phenomenon itself - which is mirrored in the research process anyway.

About the study: In group discussions with 3-6 students, 2 moderators presented 5 short “narratives of othering” which were taken from University real life experiences that had been collected by members of the research team. Students were told that “we want to hear what you think about these stories” and asked to contribute own experiences and interpretations. We had group discussions at social science faculties at two German Universities and to sharpen the participatory approach students are invited to interpretation sessions as well. This is work in progress and by now (03/2011) we can state that it is striking how much the groups differ in “what can
be shared, said and thought about". We can also see interesting interaction patterns of what one might call claiming, trying and refusing "solidarity".

In our presentation we want to revisit and reinterpret our methodological decisions. Can one say something about preconditions of both naming and reflecting experiences of discrimination and racism? Why do some discussions appear to be marked by an atmosphere of mistrust and anxiety whereas other groups seemed to allow sharing difficult thoughts, feelings and experiences?

**TERRORISM AS A FORM OF REALIZATION OF ETHNO-POLITICAL PROBLEMS**

Denis Lavrinenko

1 INSTITUTE FOR SOCIOECONOMIC AND HUMANITARIAN STUDIES, SOUTHERN SCIENTIFIC CENTER OF RAS, Rostov-on-Don, Russian Federation

Abstract: In 2009-2010 the escalation of violence and the growth of political extremism have come in the North Caucasus under the banner of Islamic movements. The relationship between the frequency of terrorist attacks and other events that can be attributed to manifestations of terrorism, and the growth of ethno-political tensions especially in the North Caucasus macro-region, is undoubtedly. Ethnicity plays an increasingly important role in the political process in the South of Russia. Transition from a moderately negative scenario to a negative scenario has already taken place. The analysis of the implementation of the ethno-political problems in the form of political extremism and terrorism requires the answers to a number of issues. Firstly, what is the dynamics of the regional ethno-political crisis in the North Caucasus? Secondly, what is the role of ethno-political plots in the modern terrorism ideology in the North Caucasus and how ethno-political conflicts are realized in political practice in the South of Russia? Third, which factors lead to the radicalization of ethno-political movements and their demands, and how ethnic re-politicization impacts on the life of the North Caucasus macro-region? Fourth, how political Islam is "embedded" in the ethno-political processes in the region and how it impacts on the radicalization of political movements? The dominant feature of the regional crisis in the North Caucasus are the ethno-political problems. The main ways to prevent terrorism are regarded as a resolution of the most egregious of ethno-political problems. In the middle of the last decade, the situation provided ample possibilities for transferring of the conflict processes in the way of de-escalation. These possibilities were not realized, decisions that could significantly change the nature of the impact of the state on ethno-political processes were not made. Today the religious factor plays a conflict-generating role; political Islam is included in the ethno-political processes in the North Caucasus, affects the radicalization of political movements.

**HUMBLING TURKISHNESS**

Ipek Demir

1 sociology, UNIVERSITY OF LEICESTER, leicester, United Kingdom

Abstract: Kurds make up about a fifth of Turkey’s population. The government in Turkey has recently been taking steps towards greater democratization and increased recognition of Kurdish rights. However, within Turkey there is also a steeply rising tide of Turkish nationalism, prejudice and intolerance towards Kurds, and increasing anti-Kurdish sentiment.
