In my paper, I will trace the relationship between Turkish modernity and the construction of the dominant identity, namely Turkishness. I will do this by turning attention to ‘strategies of exclusion and inclusion’ in the construction of official Turkish history, and relate these to how the tense borders between the two groups and interlinked identities are maintained and currently reproduced. I will discuss the ways in which spatial and temporal borders intersect with ethno-political ones and help shape the concretization of interactions in a particular way. By paying attention to both ‘strategies of exclusion’ and ‘strategies of inclusion’, I also aim to contribute to an understanding of the role of Turkish modernity vis-à-vis the Kurdish demands and predicament, and emphasize Turkish modernity’s continuing role in the construction of notions of superiority and inferiority between the Turks and Kurds in Turkey. In other words, I aim to point to the similarities and continuities that are involved in the policing of how Turkish history and modernity are constructed and told, and the way in which Kurdishness is currently perceived in Turkey. By way of these investigations, the paper will explore and divulge how certain processes hinder, and how some others ease the establishment of a meaningful interaction and relationship between the two identities.

**HRANT DINK’S BEING TRANSFORMED INTO A POLITICAL FIGURE THAT HAS BECOME A TARGET**

Kemal Goktas

1 JOURNALISM, ANKARA UNIVERSITY SOCIAL SCIENCES INSTITUTE, Ankara, Turkey

Abstract: The purpose of this presentation is to handle the process of forming the basis of public opinion in the ruling Turkish written media regarding the case of Hrant Dink, who was the victim of an assassination.

The process of Hrant Dink’s having been brought as target, has begun at the same time when he had made a news asserting that the first woman pilot in Turkey, Sabiha Gökçen, god daughter of Atatürk, first President of Turkish Republic, was Armenian concerning ethnic background. The campaign against Dink which had begun with the drastic explanation of General Staff related with that news, had continued up until the day when he was murdered.

In this work, it is explicated, the intervention of State on the process of forming public opinion in Turkey and it is displayed Media’s attitude toward this intervention with various examples. It is examined, the frame of language used in News and interpretations related with Hrant Dink in newspapers which are of the most important media in public area. The effects of Hrant Dink who was the most affecting Armenian figure, holding place with his own identity in public area in Turkey since 1915 s, being from Armenian minority in forming the perception of public is examined and the examples of hatred expressions are analyzed.

While analyzing the articles and interpretations written related with Dink, attitudes of central media and racist media are dealt individually. The character of interaction between two tried to be displayed.
ETHNICITY PREVAILS ETHNIC BOUNDARY THINING: THE CONVERGING OF ETHNIC AND THE SOCIAL DIMENSIONS IN MALAYSIA

Mansor mohd Noor1

1Institute of ethnic studies, UNIVERSITI KEBANGSAAN MALAYSIA, bangi, Malaysia

Abstract: Weber and Barth contributions to ethnic studies are of immense importance as they both provided an alternative approach to the understanding of ethnic relations. Ethnic, ethnic identity and ethnic group are studied not from the internal properties of these concepts but their boundaries. It gives the researcher to ability to study ethnic relations not only as a cause and effect but to locate the study by understanding social categories, social relations and society. With such a conceptual and theoretical frameworks, it is found out from studies done in Malaysia from 1990-2010 that ethnic choices do prevail but as Malaysians undergo social transformation arising from modernity, development and a middle class life style, ethnic choices are sacrificed as they embrace the concern for social gains. The instrument to analyse the fluidity of ethnic relations was developed by Banton and Mansor in 1990. These studies have been applied to study ethnic relations among the Asean countries. These studies show that ethnic identity and ethnic group will always prevail but, sociologically it might be the only dimension to influence an individual social action. But in times of political and economic crises, such individuals may find it is more meaningful to meaningful to protect their interest by mobilising their ethnic dimensions. However, these studies show that social preference seem to override the ethnic preference generating social cohesion and stability in the multi-ethnic society of Malaysia. Even the Global Peace Index of 2010 do reinforce the findings concluded.

ETHNIC, RELIGIOUS AND CIVIC IDENTITIES IN SOUTHERN RUSSIA: COMPLEMENTARITY OR CONFLICT

Victor Aavxentiev1

1INSTITUTE FOR SOCIOECONOMIC AND HUMANITARIAN STUDIES, SOUTHERN SCIENTIFIC CENTER OF RAS, Rostov-on-Don, Russian Federation

Abstract: The results of an empirical study of social and cultural identity among young people in Southern Russia, conducted in 2009, are discussed. The results are compared with other similar studies in the Southern Russia, as well as in the whole country. The southern region of Russia is well known for its ethnic and religious conflicts and tensions. Instability has spread far beyond Chechnya, moreover, Chechnya is nowadays more stable than other territories, namely Dagestan, Kabardino-Balkaria and Karachay-Cherkesia. The goal of the study was to assess the correlation between different types of cultural identities in four areas: the Krasnodar and Stavropol territories, Republics of Karachay-Cherkesia and Kabardino-Balkaria. These regions are located in the central part of the Northern Caucasus and were relatively stable for a long time since the collapse of the Soviet Union. The main idea of the study is to evaluate the role of cultural factors and identities in the stability/instability in the Northern Caucasus. It has been found that youth in the region has formed a stable civic Russian identity regardless of their ethnic and religious origin. At the same time the civic identity competes with ethnic and religious ones. The latter two types of identities were chosen by ethnic Caucasians respondents as more important in comparison with civic identity, while Russian respondents preferred Russian civic identity to Russian ethnic identity. The regional “Caucasian” identity is poorly recognized by the Russian part of the youth of the South. One more important feature, revealed by the study, is the correlation between modernism and traditionalism on the one side and ethnic and religious identities on the other. The contradictory character of the youth’s civilizational orientation was also identified. Though ethnic Russian and ethnic Caucasian respondents define in their majority Russia as a non-Western civilization, the part of non-Russians who define Russia as a part of western civilization is sufficiently larger, compared with Russian respondents. Such uncertainty in the civilizational orientations of young people of Southern Russia can be explained by the indefinite status of Russian civilization in globalizing world. The conclusion is made that Russian civilizational identity, compared with Russian civic identity is yet unstable, immature, optional.

REFLECTIONS ON BEING AN EAST ASIAN RESEARCHER RESEARCHING THE WHITE MAJORITY – COMMUNICATING RACE AND ETHNICITY IN COLOR-BLIND SWEDEN

Sayaka Osanami Törngren1

1International Migration and Ethnic Relations/MIM, Malmö University, Malmö, Sweden

Abstract: Criticism has been cast towards studies concerning race and ethnicity being traditionally dominated by middle class white men, and different responses and positions to this criticism have emerged. However still, the methodological discussions of the social positions of the researchers are circled around the issues of white researchers’ challenges in approaching the minority population, or concerns among researchers of ethnic and racial minority background in studying their own groups or other minority groups. I believe that there is an obvious lack of attention in the current methodological consideration in the field of ethnic relations: What happens when a researcher who is of ethnic and racial minority background researches the white majority population?

The paper attempts to open up a methodological discussion that is obviously missing in the field today. As a researcher of East Asian background in Sweden, interviewing white Swedes generates possibilities to observe how white Swedish interviewees interact and communicate the racial, ethnic and gender differences between the researcher and the interviewees. This paper will draw examples from the qualitative interview materials from my ongoing dissertation project on white attitudes towards interracial relationships. I argue that race of interviewer effect actually gives researchers the opportunity to examine how and when race are seen and negotiated within the interview process. The paper also questions the color-blind ideology and taboo of talking about race in Sweden.

CONCEPTUALISING ‘RACISM’ AND ‘HATE’ IN CRIMINAL LAW

Kay Goodall1

1UNIVERSITY OF STIRLING, STIRLING, United Kingdom

Abstract: In 2009, with only limited consultation and almost no academic comment, the OSCE produced guidance defining hate
crime. It has since led several EU states in drafting hate crime legislation and training police. Furthermore, the EU now imposes a consistent definition of 'racist' crime on all member states. There has been remarkably little discussion, yet these universalise a questionable model of 'hate'.

The two most popular conceptual models in hate crime research, the group animus model and discriminatory selection model, originate from scholarship in the United States. The discriminatory selection model preferred by the OSCE fails to convince as a prerequisite for a just means of punishment. It focuses on the effect on the victim rather than on the motivation of the offender and results in an unacceptably vague, not to say counter-intuitive, formulation. The group animus model recognises individual agency but lacks an explanation of animus itself: again a serious omission when we consider the controversial cases with which legal systems have to contend.

Both models furthermore inadequately capture the human rights paradigm established in the European Union, which requires a balancing of fundamental rights, in contrast with US jurisprudence which elevates freedom of expression. Indeed, the models do not even adequately conceptualise legal developments in the US.

The domain of hate crime law has moved far from such offences as incitement to hatred and war crime (e.g. Holocaust) denial, which were the original hate speech crimes, long a fundamental rights concern in Western Europe. This is not to say that the innovations have been unwelcome; rather that the paradigm of hate in criminal law, never fully theorised, has expanded in ways which states are reluctant to discuss because they raise questions around lay conceptions and legitimacy which encourage hostile attacks on protections only recently given to vulnerable groups.

PATTERNS OF PRESENT-DAY ANTI-SEMITISM
Klaus Hoedl1

1Center for Jewish Studies, UNIVERSITY OF GRAZ, Graz, Austria

Abstract: In my paper I want to analyze a wide array of present-day anti-Semitic occurrences and present some patterns according to which they 'function'.

Many studies in the “new anti-Semitism” have restricted themselves to depicting various incidences, and consequently lack in ‘structuring’ and categorizing them. In my presentation I intend to fill this gap and show how they ‘operate’, in which way they could be discerned from each other, etc.

REMEMBERING JEWS IN EUROPE. PERCEPTIONS OF THE HOLOCAUST AND CONTEMPORARY ANTI-SEMITISM
Kim Robin Stoller 1, Günther Jikeli 2, Doerte Letzmann 2

1INT INSTITUTE FOR EDUC & RESEARCH ON ANTI-SEMITISM, Berlin, Germany, 2INT INSTITUTE FOR EDUC & RESEARCH ON ANTI-SEMITISM, London, United Kingdom

Abstract: This paper will introduce a new research project on the relation between perceptions of the Holocaust and contemporary antisemitism in Europe. We first want to present different narratives of the Holocaust in Germany, France and the UK and how they are possible related to antisemitism. We then intend to present and discuss structural and methodological approaches of a research project that seeks to investigate this relation. In many European countries, the Holocaust is a constant theme in political discourses, the media, literature and art and a ‘Holocaust Remembrance Day’ has become a national event in most European countries, in most of them on 27 January, the day Auschwitz was liberated. However, the public discourses on the Holocaust are different in each country – depending on the historical role of the respective country, which are specifics of national narratives and other factors. What is actually commemorated on this day is not only often unrelated to the actual event, but it is based on a certain perception of what ‘the Holocaust’ was rather than on an adequate historical understanding.

In addition, ‘the Holocaust’ has increasingly become linked to expressions of contemporary antisemitism, which is often voiced with references to the Holocaust – be it by diminishing the Holocaust with inappropriate comparisons or by accusing “the Jews” of exploiting the Holocaust or perpetrating a new one against the Palestinians. Previous research suggests that such tropes are common in Europe and that many Europeans believe that Jews try to take advantage of their status as victims during the Nazi era. In order to understand the exact relation between perceptions of the Holocaust and contemporary antisemitism in Europe, there are therefore several relevant research questions: What is understood as ‘Holocaust’? Who is perceived to have perpetrated it? What is the perceived distinction between the mass murder of European Jewry and other genocides? How are Jews represented and what role do Jews play in the representation of the Holocaust? How is the Holocaust perceived in private? And in how far can one speak of a ‘Europeanisation’ of antisemitism in this context? This paper seeks to identify and discuss appropriate approaches to this complex subject area.

POLITICAL INFORMATION AND DIGITAL POLITICAL PARTICIPATION: THE SPANISH CASE.
Jose Manuel Robles 1, Stefano DE MARCO 1, MIRKO ANTINO 2, Cristobal Torres-Albero 3

1sociología iii, 2UNIVERSIDAD COMPLUTENSE DE MADRID, 3sociología, UNIVERSIDAD AUTONOMA DE MADRID, madrid, Spain

Abstract: Digital political participation is an emerging phenomenon that has attracted the attention of a great number of researchers. In most cases, analyses have focused on digital political participation as an independent variable to attempt to understand other phenomena such as, for instance, changes in political participation. However, it has been less common for specialists to seek to understand the factors that explain the digital political participation itself, taking it as a dependent variable. This is the approach of our research. In this paper we attempt to analyse to what extent the access to political information can help us explain the digital political participation in Spain. Through a factorial analysis, we order into dimensions a heterogeneous number of political information sources and we use these dimensions as independent variables in order to make a regression where digital political participation is the dependent variable. This approach allows us to analyse to what extent the access to political information helps predict digital political participation and what type of information resource has more weight in our subject of study. The results of this analysis serve as a basis for discussing the politically innovative nature of digital political participation.
POPULARIZATION OF POLITICAL LEADERSHIP IN ITALY. A CASE STUDY.

Marco Mazzoni 1, Antonio Ciaglia 2

1 Dipartimento Istituzioni e Società, UNIVERSITÀ DI PERUGIA, Perugia, Italy
2 Political Science, Sum - Istituto Italiano di Scienze Umane, Firenze, Italy

Abstract: Many scholars focusing on the links between media and politics (more specifically, on how the media cover political actors and events) claim that politicians make increasing use of communication models which, crossing the institutional threshold, are part of the gossip and entertainment world. As a result, there is a growing coverage of political and institutional actors in those magazines and TV formats which are dedicated to entertaining their readers/viewers. This phenomenon affects the political class as a whole (van Zoonen, 2005; Riegert, 2007; Mazzoleni & Sfardini, 2009).

In this case study the authors aim to emphasize some specific features of the Italian case. This research focuses on a content analysis of the major 4 gossip magazines and 4 entertainment programmes aired on the major Italian TV channels: RaiUno and Canale5. This study shows that, unlike in other Western democracies, the phenomenon we have described applies – almost exclusively – to the main Italian political party: the Prime Minister’s PdL, while the opposition parties are regularly left out of the “entertainment format”. The main reason for this lies in Silvio Berlusconi himself. According to a coverage logic that mainly applies to monarchs and royal courts, the entertainment programmes and gossip magazines see Berlusconi as an ideal actor to cover. As a result, they regularly focus on him, his family, his youth and the people around him: thus giving Berlusconi a total and absolute primacy in this specific media arena.

THE DEFENCE STRATEGY OF BELIEF IN CONFLICTING DISCUSSIONS : THE CASE OF THE CONSPIRACY THEORY

Aurore Van De Winkel 1

1 Economic, social and communication, University of Namur-FUNDP, Namur, Belgium

Abstract: In the NTIC era, the media has proven to be the diffusion channel and the informer of all sorts of conflicts. The media also creates the place for the conflict expression. This place incubates, develops and can even disintegrate the judgment communities which themselves defend their vision, their world and society beliefs in several fields. It is the case in the political field, where conspiracy theory believers will confront their sceptics and politicians at official speeches.

Considering that:

- beliefs are constructed by interaction with the environment, by interpersonal discussion or interaction with others, or even a mix of this elements;
- beliefs are not always radical and they can evolve, be qualified or be reinforced by discussions or conflicts;
- beliefs are an identifying factor and their sharing & defence have a socializing effect;
- conflicts inject dynamism into strategic, tactical and organization- al competences of the people defending their beliefs;

the paper will present content analysis results of fifty conflicting discussions on conspiracy theories involving Europe or European politicians. These discussions are randomly collected on websites, chats, forums and social networks. They reveal opposite or complementary beliefs by the judgment communities on these conspiracy theories. This content analysis allows the finding of indications on cognitive, identity and social strategies developed by the judgment communities in order to construct, adhere, reinforce, share, promote or defend their beliefs in a conflicting situation while interacting. This content analysis also allows the understanding of the conflict’s effect on construction, defence, promotion or disintegration of a secular belief in these communities.

THE ORDER AND THE INVERSION: UNDERSTANDING CORRUPTION IN MEDIA

Ana Beatriz Moreira 1, Emilia Araújo 2

1 Sociology, University of Minho, 2 sociology, UNIVERSIDADE DO MINHO, Braga, Portugal

Abstract: Democracies are strongly based on the idea of separation between judicial and executive powers. They are also feed by the idea of the politician as someone who performs a collective role, being elected to so. That is, someone with a special mission, based on authenticity, rational and charismatic authority. The explosion of media systems throughout the twentieth century has made clear that the exercise of politics is more and more at disposal of a new public space in which politics itself became an exercise of drama, that is to say, of theatricalization by which politics try to seek or to maintain legitimacy. Within the plethora of new realities carried out by that centrality of media as public arena where discourses became principal protagonists, there is the specific denounce and control over the political man/women behavior in diverse spheres and forms. With or without motive, media acquires a desiccative function of the “public” man/women through which citizens may assist to a insidious anatomy of political man/women touching directly their intimacy. Grounded on these assumptions, largely supported by wide literature on the relation between media and justice, this paper seeks to explore how Portuguese media covers episodes when political man/women is pointed out as suspected of using his/her function in his/her own interest thus gaining the classification of dishonest, fraudulent and corrupt and until what extent does this coverage signals a special mediated way of doing politics today in which media not only become the space par excellence of denouncing, control and judgment and counter argumentation, but also the place in which corrupt politics performs its own inversion by using the own media as source of legitimation of its own failure, particularly visible when dealing with the ethical issues posed by the use of confidential information named as the “segredo de justiça”. The paper is presented using information provided by documentary analysis collected through a systematic review of media materials, mainly national newspapers and informative magazines. It also uses data provided by interviews to judges regarding their idea on concept of secret in situations involving deviant behavior of political man/women.

ABOVE THE PARTIES OR JUST AT THEIR LEVEL? THE SWISS PRESIDENT’S STRATEGIES TO COMBAT THE RADICAL RIGHT

Sébastien Salerno 1

1 Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Just as government coalitions are opening up to radical right-wing groups, or starting to do this, new questions are being raised relating to national populist parties. These concern, in particular, the strategies employed by the national populist parties that have taken on governmental responsibilities. They have two main options: either their representatives blend in with the government, or they play the double role of being in the government and in opposition to it, destroying the collegial atmosphere as soon as the political debates touch on subjects dear to their party. When they choose the latter option, the other members of the governmental coalition have to decide between acting indifferent; marginalising the populist representatives, or confronting them openly.

This study focuses on the confrontational scenario and the political turmoil it causes. In 2007, Micheline Calmy-Rey, the Minister of Foreign Affairs, became head of the rotating Swiss Presidency for one year. That year was marked by legislative elections in October, then governmental elections in December. Her party, the Social Democratic Party, was in bad shape in the opinion polls, whereas the national populist party, the Swiss People’s Party, which is represented in the government by its leader, Christoph Blocher, was heading toward a resounding victory. By placing some of her actions as President under the seal of the opening up of Switzerland internationally, social justice, and the liberalisation of society, Micheline Calmy-Rey could give the Social Democratic Party a boost, while counterattacking the Swiss People’s Party, which was highly critical of the Swiss government and of its political system in general. In 1999, faced with a very similar situation, President Ruth Dreifuss had chosen to remain above the radical parties, by ignoring their attacks, whereas Micheline Calmy-Rey placed herself at their level, voicing her opposition to them, and in doing this redefining the presidential function.

Through an analysis of the printed Swiss press from 1999 to 2007, and interviews we were fortunate to obtain with former Presidents Ruth Dreifuss and Micheline Calmy-Rey, our study attempts to explain how the oppositional actions carried out by the radical right have been shaking up Swiss institutions, what strategies have been adopted by the authorities endeavouring to halt its advance, why and with what results.

BEYOND THE « MODERNISATION LOSERS » THESIS. THE VARIOUS LOGICS OF COMMITMENT WITHIN THE SWISS PEOPLE’S PARTY

Cécile Pechu1, Philippe Gottraux1

1Institut d’Etudes Politiques et Internationales, UNIVERSITE DE LAUSANNE, Lausanne, Switzerland

Abstract: The rise of right-wing populist parties is often explained by macro-social factors (socio-economic transformations) and is linked to the ability of these parties to attract mainly economically weakened people. This paper discusses this thesis from a micro-sociological point of view. Based on a qualitative research (40 in-depth interviews) among activists of the Swiss People’s Party (SPP), it highlights the various logics that lead people with different social and political profiles to become activists of this party, which is often labelled as right-wing and populist.

Our approach shows how socio-political properties of individual actors meet a political supply located in a broader context. On the actors’ side, we consider the numerous and different factors that will generate their political dispositions (primary and secondary socialization, economical and cultural capital, social slopes, inscription in various spheres of life). On the political supply side, we consider the practices of the party (orientations and discourse, selective incentives offered to activists, socialisation in the party), which we examine with regard to competing political offers.

Such an approach makes it possible to criticize the mechanical explanation of the success of this type of parties in terms of « modernisation losers ». This explanation associates objective situations and political orientations without considering the mediations between these two phenomena. Moreover, it reduces the success of these parties to logics of frustration. Our results show that: 1) several types of SPP activists are not « losers » 2) the objective situation of “losers” does not alone explain the choice of the SPP : the other properties of the actors and the specific context has to be taken into account.

Qualitative research allows to analyse the complexity of the processes of commitment within this party, taking into account both individual actors and their properties and the role of the political supply side.

POPULIST RADICAL RIGHT PARTIES IN WESTERN AND EASTERN EUROPE: SIMILARITIES AND DIFFERENCES

Dietmar Loch1

1Department of Sociology, UNIVERSITY OF GRENOBLE II, Grenoble, France

Abstract: Since the 1990s, there is a rise and persistence of populist radical right parties in several European countries. We can observe similarities and differences in the forms of this phenomenon and in its explanations. On the one hand, all these parties appear in a modernization process (globalization) and succeed in mobilizing “modernization losers”. Similar is furthermore that they defend national identities and confront ethnic and national minorities with nationalism and racism. Similar is finally that most of these parties criticize European integration and in a very populist style political establishments. On the other hand, there are apparent differences. The modernization process depends in both, in West and East European countries, on globalization, but in the latter first of all on post-communist transformation. Furthermore, the cleavage structures are different. In Western Europe, the radical right is on the closed side of a polarization between open and closed positions (integration and decarization) to globalization. In Eastern Europe, we find an old polarization existing between centre positions (pro-ex-URSS/urban interests) and peripheral positions (nation/rural interests), which is changing to a cleavage structure with, on the centre side, global, pro-European and urban positions and, on the periphery side, protectionist, Euro-sceptic, nationalistic and rural positions. The radical right is on the second side. And additionally, in the context of these new cleavage structures, the nation state and ethnic nationalism are linked in Western Europe to a changing and in Eastern Europe to a regained national sovereignty. But most of all, there are differences in the historical legacy and the political culture of these regions and countries leading to different electoral success of the populist radical right parties. Finally, the political opportunity structures, that are also responsible for this success, vary considerably. In this contribution, the populist radical right parties will be analysed according to this comparative research design which is based on data of several European countries, especially France, Austria, Denmark, Germany and Hungary.
POLITICAL AFFAIRS - WORLD ECONOMIC FORUM AS AN ACTOR BETWEEN POLITICS AND BUSINESS
Adrienne Sörbom1, CHRISTINA GARSTEN1
1Stockholm Centre for Organizational Research, STOCKHOLM UNIVERSITY, STOCKHOLM, Sweden

Abstract: In the social sciences, politics and market are usually studied as separate systems. In recent decades, however, certain market actors have tried to more socially responsibility, and participated to an increasing extent in activities earlier considered political. These changes can be described in terms of the development of a new public domain in which the boundaries between the two systems are not as clear.

This paper introduces the World Economic Forum (WEF) as an actor between market and politics in this public domain. As such the WEF transgresses the alleged boarders between politics and markets. Based on interview data, observations and analyses of documents the paper studies how the WEF as an organization handles their self-taken role of bridging politics and business.

Theoretically the paper relates to the discussion of governance and the role of corporations within the domain of the global domain. It asks the question of how the WEF seek to organize authority for them selves and their members within this domain. What is the role of politicians from nation-states in the realm of the WEF? How does the WEF balance between possibly diverging interests related to corporate and nation-state rationalities?

The empirical analysis indicates that the bridging between the spheres are done both at a normative and an organizational level. The so called "davos equation" indicating that no social development may occur without economic development and vice versa, is used as a guide line for the practical organizing of the WEF. Possible tensions between politics and business are thereby seen as irrelev- ant. This idea has consequences for the actual formation of the WEF.

THE FORMATION OF CIVIL SOCIETY IN RUSSIA: PRO AND CONTRA
Svetlana Novikova1,2
1INSTITUTE OF SOCIO-POLITICAL RESEARCH (RAS), 2sociology, Russian State Social University(RGSU), Moscow, Russian Federation

Abstract: In contemporary Russia fundamental conditions have been built for the development of civil society. First, the institution of private property, the observance of civil rights and liberties have become not only legal but accepted by the absolute majority of the citizens. According to the Institute of Sociopolitical Research data, 57% and 61% of the Russians believe that the state ensures correspondingly the freedom of speech and the freedom of political choice. There is a tendency of increasing interest to defend the rights of the majorly that can be violated by the dominance of the rights of different minorities.

The most poorly realized citizens’ rights are those related to the supremacy of law, local self-government, and trust in governmental bodies. In collective consciousness of the Russians the notion of elections has been formed as of a formal procedure with results known in advance which are often obtained by ballot rigging. More than 60% of the electorate shares this opinion.

Second, the high potential of social activity has been formed, especially among the young people. Apathy and social infantilism gradually give place to social energy, to readiness to self-organization, self-employment, and defense of one’s rights. The rise of social activity and potential of social protest is a prerequisite of not only civil but uncivil society. Deviant self-organization and the radicalization of social views present an “internal” threat to civil society.

Despite the increasing influence of the third sector, the institutions of civil society only gradually compensate the deficiency of resources and experience for full-scale citizens’ participation in solving urgent problems, organizing public discussions, and self-governing. The major contradiction preventing the development of civil society in Russia is that civil society, its institutions and values have not been so far accepted by the majority of the citizens as effective means of solving their everyday problems.

TRANSFORMATION OF THE POLITICAL POWER IN TURKEY
Sonay Bayramoğlu Özuğurlu1
1Faculty of Administrative and Economics, GAZI UNIVERSITY, ANKARA, Turkey

Abstract: This study takes the issue of governance as a political model by which state, society and political power relations are fundamentally transformed at the example of the regulatory reforms in Turkey.

The first part of this study focuses on the question of how and in which way the transformations of power relations are analysed. Critical exploration of the governance model is based on the conceptualisation of the concentration and centralisation of power relations.

Second part of this study will be about conceptual meaning of this transformation. It can be mentioned that there is at least two results: On the one hand, there is the concentration of the political power of bourgeoisie; on the other hand, there is sweeping laboring classes from an opportunity to enforce indirectly on the relations of distribution by undermining the initiative of parliamentary mechanisms. In fact, settling the ‘regulatory state’ is seen to be a permanent interruption within the poor experiences of parliamentary democracy in Turkey.

CITIZENSHIP AND GOVERNANCE AT A TIME OF TERRITORIALIZATION
Lavinia Bifulco1
1Department of Sociology, UNIVERSITY OF MILANO BICOCCA, Milano, Italy

Abstract: Governance comes forth at once as a core and elusive topic. It is in fact an umbrella notion, referred to a variety of phenomena and ideas not always consistent with each other. A least
common denominator of what governance actually is could be established anyway, on the basis of four key points. The first one is the presence of a plurality of actors in the design and implementation of policies. The second one is the emergence of complex environments of public action with a low level of integration. The third point is the demand for coordination raised by these situations. The fourth point is the delegitimization of forms of coordination based on public authority, for the benefit of the growing importance acquired by contractual or consensual logics.

However, these key points are controversial per se. The coordination of actors and organizations, far from being a premise of governance, is rather an issue at stake. As to the role played by citizens, on the one hand governance entails the involvement of individuals and communities in the decisions affecting them or, more broadly, the perspective of participation and active citizenship; on the other hand it shows the setting up of decisional arenas exempted from the democratic control. Besides, on the one hand, the local level seems to fuel practices and experimentations of participatory governance; on the other hand this develops in the context of the “post-democracy” which sustains peculiar networks between public and private powers at the global level.

The paper deals with the relationship between governance and citizenship focusing on the processes of territorialization affecting local policies. In outline, territorialization stresses the contexts in which public action takes place and considers them as resources, targets and actors of policies. The possibility that reference to the territory may facilitate the involvement of subjects in their life contexts, thereby bolstering both social cohesion and the democratic nature of collective choices, is only one side of the picture. The other side is the development of a citizenship based not on equality but, rather, on the disparity between contexts.

The paper refers in particular to the field of policies against social exclusion in Europe. The aim is to outline an analytical scheme regarding the territory as medium of the present relationship between citizenship and governance.

CONSTITUTIONAL ANOMIE AND CONTESTATION IN POST-WESTPHALIAN EUROPE

Paul Blokker

Abstract: Constitutional democracy is showing clear signs of obsolescence. The modernist form of state-centric, uniform constitutionalism is increasingly out of touch with societal and (post-)national developments. National constitutional orders are rivalled by supranational (quasi-)constitutional developments, sub-national constitutionalization, as well as an internal plurality of legal systems. In addition, constitution-making is affected and contested by populist tendencies (not least, with regard to the European Constitution).

The paper explores the radical transformation of modern constitutionalism in post-Westphalian Europe. Existing research overwhelmingly focuses on two aspects: 1. The classification of new forms of constitutionalism beyond and below the state; and, 2. The relation between national constitutions and European law. In contrast, this paper will analyse the wider complexity of constitutional metamorphosis – in terms of both tangible legal change and shifts in perception - for national constitutionalism itself.

The analysis focuses on the metamorphosis of constitutionalism from a social-political perspective. The main foci are national constitutional repertoires, trajectories of constitutional change, and constitutional critique and populist contestation. The paper proceeds, first, by analyzing national constitutional repertoires and change in Europe from a comparative perspective. Second, a socio-legal interpretative approach analyses constitutional critique and justification as expressed by significant legal and political actors.

DO EUROPEAN CITIZENS ACCEPT THE EU’S POLICY OF EQUAL RIGHTS OF OPPORTUNITIES? EVIDENCE FROM A COMPARATIVE SURVEY

Holger Lengfeld, Juergen Gerhards

1School of Business, Economics and Social Sciences, UNIVERSITY OF HAMBURG, Hamburg, 2Institute of Sociology, Freie Universität Berlin, Berlin, Germany

Abstract: Since its founding, the EU has gradually replaced the nation-state concept of equality by a European citizenship status, intended to enhance equal rights and life chances for every European, regardless of actual place of residence within the EU territory. The “freedom of movement” rule guarantees that EU-citizens may look for employment in every member state under the same conditions as a national of that country. It includes additional rights, i.e. the entitlement to the same social security and tax benefits as nationals and equality in housing. Finally, the EU guarantees a number of political rights for all EU-citizens, among others the right to vote and to stand as a candidate for municipal elections in the member state of residence.

We analyze to what extent citizens from EU- and accession countries support the idea of Europeanized equality, and how occurring differences in the level of support can be explained. To do so, we use insights from British sociologist T.H. Marshall who defines citizenship as consisting of civil, political and social security rights. Following cleavage theory and social threat approach, it can assumed that the process of opening up the borders of the nation-states will challenge the traditional symbolic code of equality held by citizens, and impact negatively on the existing distribution of resources. In particular, those people who lack economic resources and hold more traditional or right wing political orientations are likely to oppose the notion of Europe-wide equality.

In order to test these assumptions we analyze data from a comparative survey conducted by the authors in 2009 in Germany, Poland, Spain and accession candidate Turkey (n = 4000). The survey asks for the respondent’s support of the notion that citizens from other EU-countries (and from Turkey) should enjoy the same economic, social, and political rights in their country as themselves. Findings show that the majority of the respondents in the three EU countries supports the idea of Europeanized rights, whereas most Turkish respondents reject it. By using regression analysis we show that there is little evidence that those rejecting Europeanized rights share strong social-structural or ideological characteristics. Hence, the probability that social cleavages, which might form the basis for populist political parties in the four countries, will occur, seems to be rather low.

EU SOFT LAW AND THE EQUALITY HIERARCHY: OPPORTUNITY OR CONSTRAINT FOR MOBILIZATION ON GENDER EQUALITY?
Pauline Cullen
1Sociology, NATIONAL UNIVERSITY OF IRELAND MAYNOOTH, Maynooth County Kildare, Ireland

Abstract: Women’s rights organizations and feminist scholars argue that the last decade has been marked by a functional, economic and bureaucratic reduction of the EU gender equality agenda. A shift towards non binding Open Method of Coordination (OMC) related measures in the form of gender mainstreaming has indeed altered opportunity structures and disrupted power dynamics between gender equality advocates mobilizing on women’s issues at EU level. Antidiscrimination law and in particular the Race Equality Directive now outpace gender equality in terms of material scope of protections. The European Women’s Lobby (EWL) assert that this soft law approach to gender equality combined with the uneven nature of EU anti-discrimination policies and provisions has worked to shade out gender issues while recognizing other forms of disadvantage. In this paper I argue that while OMC processes (gender mainstreaming included) are roundly criticised by civil society actors and gender advocates they have also worked to establish institutions, administrative and knowledge infrastructure that creates new opportunities for actors to exercise influence on gender equality issues. OMC processes can pull numerous initiatives and experts from across often compartmentalized EU institutional contexts to generate powerful comparative data and political will to advance gender equality issues. While this altered political opportunity structure represents a challenge to gender equality advocates including the EWL there is evidence to suggest that feminist NGOs and gender equality experts are creatively responding to this soft law environment and deploying a variety of instruments within a number of venues on issues including migrant women’s rights, disabled women and violence against women. The overall EU equality context is also evolving and as such opportunities (including the revision of Article 19 Antidiscrimination directive) do exist for alliances between different equality interests supporting a comprehensive and intersectional approach to equality and discrimination at EU level. Interview data and analyses of communications of NGO actors and EU officials are used to examine the challenges posed by an EU political context characterised by an equality hierarchy for NGO mobilization on gender issues and a wider equality agenda.

EUROPEAN PARTICIPATION BY PAN-EUROPEAN MOBILIZATION. A FIRST INQUIRY INTO POSSIBILITIES AND LIMITS OF THE EUROPEAN CITIZENS’ INITIATIVE (ECI)

Stéphane Carrara
1

1UFR de Science Politique, UNIVERSITY PARIS 1, Paris, France

Abstract: The European Citizens Initiative (art. 11-4 of the Treaty on European Union amended by the Lisbon Treaty) providing that “not less than one million citizens who are nationals of a significant number of Member States may take the initiative of inviting the Commission, within the framework of its powers, to submit any appropriate proposal on matters where citizens consider that a legal act of the Union is required for the purpose of implementing the Treaties” makes panEuropean mobilization as a condition to European participation. The ECI therefore raises same issues as euro-protest regarding the obstacles to such mobilizations. Can the ECI bring new answers to the lack of European public sphere and open/foster citizens’ participation? What conditions are required for an ECI and what consequences does it have on the organization of pan-European mobilization campaigns? What do the first ECI tell us about the possibilities and limits in leading ECI campaigns?

Firstly, I expose the genesis of the ECI from the work of the Convention on the Future of Europe to the latest activities of citizens and activists of the European civil society who took part to lobbying and mobilization phases to demand the introduction of the ECI.

Secondly, using pre-legislative and legislative documents (EC Green paper, EP Committee reports, etc.), I underline key-debates between the European Commission, Parliament and Council around the final provisions of the ECI.

Thirdly, using data collection, documentary studies, interviews and participative observation, I address the question of the possibilities and limits of the ECI as a new EU participatory democratic tool. I analyze several of the first ECIs in order to identify specificities of the ones which reached the highest requirements (entrepreneurs, resources, mode of publicity, mobilization and collection of signatures).

In conclusion I underline the relatively weak potential of the ECI despite enthusiastic institutional comments. Rather a legitimizing than democratic/participatory tool, the ECI even creates new obstacles which could reduce its use to an additional means of traditional global/European NGOs lobbying in Brussels. Indeed the ECI does not bring answers to the lack of a European public space and leaves the transnational mobilizing issues to the capacities and social/political/economical qualities of the ECIs entrepreneurs therefore privileging traditional ones.

“GIVE US BACK SWEDEN!” A FEMINIST READING OF THE (RE)INTERPRETATIONS OF THE FOLKHEM CONCEPTUAL METAPHOR IN THE SWEDISH RADICAL RIGHT POPULIST DISCOURSE

Ov Cristian Norocel1,2*

1Department of Political and Economic Studies, UNIVERSITY OF HELSINKI, Helsinki, Finland, 2Department of Political Science, STOCKHOLM UNIVERSITY, Stockholm, Sweden

Abstract: Acknowledging that the construction of radical right populism around the metaphorical depiction of the national family at the beginning of twenty-first century is a little researched area, this article explores the discursive redefinitions of Swedishness enabled by the folkhem conceptual metaphor so that to accommodate centrally located heterosexist masculinities at the intersection of gender, class, and “race”, as it is heralded by the main Swedish radical right populist party, the Sweden Democrats (SD) and its leader Jimmie Åkesson. In order to do so, the main tenets of the conceptual metaphor theory are discussed and criticisms to the present methodologies are presented leading to the suggestion of a new, genealogical approach. The research material is then analyzed with the help of the proposed method, evidencing Åkesson’s use of the national family metaphor over time. The concluding part provides with an overview of the findings and indicates possible extrapolations for studying masculinities in radical right populist discourses with the aid of the suggested methodological apparatus developing conceptual metaphor theory.
A NEW AND SUCCESSFUL POPULIST RADICAL RIGHT IN SPAIN: UNDERSTANDING ITS VOTERS AND PARTY MEMBERS

Aitor Hernández Carr

Abstract: Spain is one of the few European countries that has not seen how a new extreme right party obtains major electoral support. Different issues such as the link between the Spanish extreme right and the Francoist dictatorship or the lack of centrality of immigration in the political arena, could explain this situation. However, changes in Spanish society, especially the growing anti-immigrant attitudes of citizens and the disaffection towards political parties, are widening the structure of political opportunities for new political actors. In this sense, a series of "new" political parties are trying to cut their links with the traditional extreme right and adopt the discourses and political behaviour of the successful European populist radical right parties (French National Front, Austrian FPO, etc.). Specially relevant are the electoral results obtained by a new populist radical right party in Catalonia (Plataforma x Catalunya).

The paper will analyse the situation in Spain. That is, why the social and political context is everyday more propitious for the emergence of a populist radical right party, and, what is it in the political offer of the new parties that is making them more attractive to voters. Finally, the paper will present the work the author has developed through a series of interviews with voters and party-members of the populist radical right party Plataforma x Catalunya. This will allow us to understand what kind of party this is, who are its voters and if these are comparable to the European populist radical right.

NORDIC POPULISM - CHANGES OVER TIME AND SPACE

Björn - Fryklund

Abstract: The objective of this draft paper is to improve the understanding of the development of populism within the Nordic countries in an European context. Point of departure is a Nordic comparative perspective combined with a retrospective analysis of the Nordic populist parties of yesterday and today. The history of Nordic populism can be described as a process, where different types of populism have been present in different periods of time. In the early 1970’s focus was on taxation-issues in combination with populist appeals of political discontent. From the beginning of the 1980’s until today, populist appeals evolve around aspects connected to questions of immigration. The aim of the draft paper is therefore to understand how we could interpret the development of populism in the Nordic countries. Could we, through a historical reconstruction of the development of Nordic populism during the past 50 years, make a contribution to the understanding of the populist parties and their presence within a contemporary Nordic and European context? Of special interest is also the development in Sweden where a successful populist party has not been present on the Swedish political scene until the beginning of the 20th century. Understanding the development in Sweden could therefore be a key to identify central aspects that either promotes or blocks populism. This could, in turn, be essential to a more general understanding of populism as a political phenomenon in the political discourse of today.

RIGHT POLITICAL CULTURE IN SPAIN: THE NEO-FRANCOIST DISCOURSE

Fernando Ampudia De Haro

Abstract: The aim of this presentation is to propose a general approach to the historiographical revisionism on the Spanish Civil War (1936–1939) and Franco’s dictatorship (1939–1975); a phenomenon which can be related with certain aspects on the Spanish political culture and the public debate about the legitimacy of the political parties. In Spain, the revisionist discourse has an important public diffusion through certain mass media and books with a significant volume of sales and successful re-edicitions. This discourse is connected with the changing power balances in Spanish society and it represents a symptom of a broader movement for the restoration of the mentalities and cultures of the Spanish political right.

POPULISM AS RADICALIZED CONSERVATIVE THINKING. ON UTOPIAN VIEWS OF SOCIAL RELATIONS IN TURBULENT TIMES.

Florian Elliker

Abstract: This presentation will focus on a discourse analysis, based on the sociology of knowledge approach to discourse (Wissenssoziologische Diskursanalyse). The case study examined the public debate in the field of politics and the mass media focused on a so-called ‘popular initiative’ that proposed a change in the Swiss constitution concerning the acquisition of citizenship (i.e. naturalization). The initiative was decided upon by a nation wide plebiscite. It was launched by one of the major Swiss political parties, the conservative right-wing party Schweizerische Volkspartei (known for their provocative use of symbols).

In the tradition of interpretative sociology, the study analyzed printed texts and images, using theoretical sampling (Grounded Theory) and two approaches of qualitative methods – ethnographic semantics and the analysis of patterns of interpretation – to reconstruct the interpretive repertoire of the discourses at hand. Discourses in this tradition are understood as being constituted by a central frame of interpretation and multiple patterns of interpretation that relate to that frame.

The debate connects to manifold issues of sociological interest: populism, conservatism and structures of thinking (Mannheim), ‘identity politics,’ citizenship, nation state/national identity/nationalism, inclusion/exclusion, xenophobia/racism, marginalization, migration, etc. While one or several of these could somewhat arbitrarily be chosen to examine the debate, the study shows what is at the core of the discourses organizing the debate. The reconstruction provides evidence that four discourses structure the debate: (1) ‘democracy as (absolute) popular government,’ (2) a ‘non-fitting’-discourse, (3) ‘democracy in a constitutional state,’ and (4) ‘inclusive democracy.’ Most positions use one or two of these discourses.
The presentation will illustrate that one of the most prominent discourses is best understood as a populist discourse, whereby populism will be interpreted as a radicalized version of the Swiss tradition of conservative thinking. Contrary to the popular notion, its tradition of ‘identity politics’ centers around self-determination of local, rural communities (Gemeinschaften). While it shares a nativist affinity with the ‘non-fitting’-discourse, the latter – promoting skepticism about migrants – is identified as a distinct discourse, whose use is not restricted to right-wing ‘populist’ parties.

DEMOCRACY IN TURBULENT TIME. IS ANOTHER DEMOCRACY POSSIBLE?

Maria Cristina Marchetti¹

¹Department of Political Studies, SAPIENZA UNIVERSITY OF ROME, Rome, Italy

Abstract: The recent financial crisis and the turbulence that are interesting different areas of the world has stressed that democracy has to cope with new challenges and sometimes it seems to be inadequate for this goals. However a crisis can be considered a time of decadence or an opportunity to test new models and practices.

The last decades political debate often focused on the notion of democracy either to underline a growing request of “more democracy” or to look at its transformations, crises and even its end (Crouch 2003; Dahrendorf 2003; Eisenstadt 2002; Ginsborg 2006). Democracy is used to critics and transformations; as Bobbio said: democracy is dynamic, despotic regimes are static (Bobbio 1984).

Opposite to the democratic deficit reported by literature, new forms of democracy are emerging (bottom up democracy): participative democracy, subsidiarity democracy; the Big Society project proposed by PM David Cameron seems to go in this direction. They design a new “geography of power”, which redefines the relationship between citizens and institutions and the actors involved in the decision making processes; they also imply new forms of legitimacy and governance, active citizenship and the involvement of civil society in the decision making process.

The paper will focus on the following topics:

• Democracy in time of crisis
• From representative democracy to “mixed democracy”
• New actors and practices at national and European level

FEMICIDE IN ITALY: AN EVALUATION BASED ON AVAILABLE DATA

Consuelo Corradi¹

¹LUMSA UNIVERSITY, Rome, Italy

Abstract: In a cross-national perspective, Italy is not a violent society. In recent years, the annual rate of homicides in Italy is decreasing. If we compare the number of homicides in 1990 with the same rate today, we find that it is three times lower. But if we gender this rate, we can easily observe that the killing of men is definitely lower, whereas the killing of women is stable, i.e., one every other day.

The presentation will show and analyze available data on femicides in Italy. Considering the general context of national and regional policies that have been put in place in order to fight violence against women, the presentation will also attempt to explain why there is such a gender imbalance in fighting crime, and what actions can be taken to prevent femicides.

PATERNALISM AS A PATTERN OF POLITICAL PARTICIPATING IN CITY PERM

Natalia Shushkova¹

¹Perm Branch, State University - Higher Economic School, Perm, Russian Federation

Abstract: The paper is focused on the established patterns of political behavior (electoral participation) in a large Russian industrial city. The bases for this paper were mass surveys and qualitative studies of political behavior.

The basic characteristic of the Perm urban space is it’s depoliticized. The opinion dominates among a dwellers that a policy - is the destiny of regional and city administration’s functionaries. Politicians are not considered as a politics if they do not occupy a position in the state powers apparatus. Intermediate position is occupied by members of City Council (Duma). Few of them are an honest public politician, but occasionally (it is correspond with an elections), they enter to the public arena and are perceived as a politicians. NGOs include a small number of people, mostly intellectuals. Spontaneous associations and public protests are extremely rare (in case if they are not organized by a candidate in election campaigns).

Policy comes to the city during the elections. Candidates begin election campaign, involving a population on it. The prototype of the Perm politician’s ideal still serves as Mayor of the City Y.Trutnev (1996 - 2000). An ideal Perm politician - is a traditionalist type patron: he is ready to give to those in needs what they need to (to fix a tap, to build a children’s playground, to remove a trash, to present a bottle of wine, etc.). Politicians avoid any criticism of competitors and substitute the political program by narratives about themselves. Their voters are a people of the “third age”, who ready to exchange their vote for a temporary attention to them (or a cheap gift). Elections for them it is a feast. The dominance of these patterns is nullified participation in the election (as voters) those dwellers who economically successful, have an independent opinion, by visibly devaluating their social achievements.

It is might be recognized that paternalistic institute in the political environment of city Perm has grown up. Politicians are the patrons; voters (senior dwellers) are clients. Electoral district is a “patrimony” accordingly.

What are the causes and grounds of paternalism? It is suggested that major of them are: personal character of political power in modern Russia, the Soviet political heritage, dissociation and atomization of society, accompanied by the marginalization of large segments of the population.

AN EVALUATION OF 8 BATTER INTERVENTION CENTRES IN SWEDEN - TREATMENT OF MEN USING VIOLENCE IN A CLOSE RELATIONSHIP

Susanne Elisabeth Boethius¹

¹Sociology, LUND UNIVERSITY, Lund, Sweden

Abstract: Treatment of men using violence against women in a close relationship is a controversal topic in Sweden. Proponents
argue that it is important to give the violent men tools to stop their abusing behaviour to end violence against women. Opponents claim that treatment is not effective enough, and furthermore makes male violence into something that can be understood, instead of unilateral condemned and punished.

Lately, however, activities focused at men using violence in close relationships have expanded and today there are over 100 projects and programs oriented at violent men in Sweden. This is partly a result of increased funding from the Swedish government aiming to reach the goal that violence against women shall end. Societal efforts are split up in many different activities but more and more attention has been given programs directed toward treatment of the violent man.

In Sweden today there are over 50 centres offering treatment to men using violent against a partner, working with slightly different ideologies and methods. Most of these centres and their treatment programs has never been evaluated. The existing evaluation studies of the treatment programs are rare and deficient.

In this study, supported by the National Board of Health and Welfare in Sweden, the effect of the treatment of violent men in eight centres in Sweden are being evaluated. The centres were categorized into three different groups regarding theory and method. 188 men that took part in the centres’ treatment programs and 16 of their abused partners filled out repeated questionnaires, including assessment instruments. The result shows that the treatment improved the men’s psychical health and decreased their alcohol and narcotic abuse. The men also reported that their violent behaviour decreased after they started the treatment, this independent of what kind of treatment program they took part in. The few women that were included in the study also reported that the violence decreased and that the relationship with the spouse and their children had improved one year after the treatment start. There were no signs of difference in effect depending on the kind of method used in the programs and the most important factor for the violent reduction tend to be a contact with the centre. The result is discussed in relation to method and sample.

PERCEPTIONS OF THE GOVERNMENT AND POLITICAL ACTS IN LITHUANIA" SUPPORT TO DEMOCRACY OR MASS PROTESTS ACTS?

Jurate Imbrasaitė

Department of Sociology, VYTAUTAS MAGNUS UNIVERSITY, Kaunas, Lithuania

Abstract: Abstract. Democracy is rather fragile, when it is based on formal democratic institutions. Support for governmental institutions and citizen participation in the process of political governance is an essential condition for the functioning of democracy and ensuring the stability of society. Support for democracy, high levels of institutional trust and conventional modes of participation constitute a precondition for a stable democratic system. On the other hand, other authors argue that participation in legal protest actions may be considered as acts of self-expression and it is not dangerous for stability of democracy.

The goal of the research is to compare and to explain the impact of individual and structural factors on satisfaction with democracy, institutional trust, external efficacy, interest in politics and conventional or/and unconventional participation in Lithuania. Based on the survey conducted in Lithuania in 2010, the study employs cluster analysis to identify four citizens groups (trusting and moderate, trusting and optimistic, not trusting and active; not trusting and non-active) and their distribution in Lithuania in accordance with levels of trust to political institutions, satisfaction with democracy, satisfaction with democracy in the future, external efficacy, interest in politics and participation in conventional and unconventional political acts. Various methods and techniques of statistical analysis are applied in order to measure the impact of individual factors such as resources, social networks, attitudes to democracy and attitudes to the role of the state as well as structural factors that explain differences among the groups of citizens. The article draws conclusions that the characteristics of identified groups (trusting and moderate, trusting and optimistic, not trusting and active; not trusting and non-active) are mixed, because of socioeconomic and cultural conditions in Lithuania.

Keywords: satisfaction with democracy, trust, political participation, conventional participation, unconventional participation.

SOCIETY AND VIOLENCE AGAINST WOMEN: THE SPANISH CASE, A TECHNICAL AND IDEOLOGICAL CROSSROADS

Chaimé Marcuello Servós, Santiago BOIRA SARTO

1 Departamento de Psicología y Sociología, Universidad de Zaragoza, Zaragoza, Spain

Abstract: Spanish society has changed, at least formally, their attitude towards violence against women. Programs for male abusers in Spain have developed mainly after the Act 1/2004, "Integral Protection Measures against Gender Violence". This forced to undergo treatment for those convicted of a crime of domestic violence. That reignited the debate about the effectiveness of these programs and their contribution to the eradication of such violence. At present coexist different treatment programs, either voluntarily or as a result of a court, with no state wide regulation on its design and execution, beyond what is expressed in general terms of RD. 515/2005.

In this paper, we review the existing programs and their relevance as a measure of intervention "socio-legal" as a form of supplementing the suspension of the sentence. It also discusses some of the main topics to be considered in the improvement of intervention strategies and some recommendations are proposed. Among them: (a) the development of integrated strategies to overcome some discussion located exclusively on a radical ideological field, (b) the consideration of programs for men as a social and public response by coordinating with other devices specialized (legal, social) and compliance with minimum quality standards, and (c) the design of individualized programs that take into account the different contexts of intervention (in the community or in prison) and mandatory.

POLITICAL VALUES AT WORK IN CHANGING TIMES

Ivan Sainsaulieu

1 Social Sciences, UNIVERSITY OF FRIBOURG, Lausanne, Switzerland

Abstract: Is there a link between professional changes and the evolution of personal political values? Is political socialization currently still happening at work? These are the questions our research project, funded by the Swiss National Science Foundation, aims to an-
In order to study this phenomenon, we have chosen three different professional groups: farmers, human resources managers and engineers (sixty interviews). All these professionals are facing a context of change (e.g. the recent economical crisis), but their professional groups are following different trends: they are either declining (farmers), emerging (human resources managers), or highly changing and getting more specialized (engineers).

According to our results, farmers keep going on with their traditional attachment to the Union démocratique du Centre (UDC). But, facing structural problems of modernization of their occupation, they reinterpret their political affiliations. They are still supporting the UDC’s traditional faction and do not “mechanically” follow the UDC’s shift to extreme-right populism. At a professional level, they are nowadays frequently open to some propositions of a radical trade union (Uniterre). They acknowledge that it defends their rights, but they do not completely consider it as legitimate. Our second case study is about human resources managers in banking and watches industry sectors. Their profession has lost a part of its prestige and becomes more and more dependent of the marketing and financial departments, which are less autonomous from the CEO. In these circumstances, they have reoriented their professional and political opinions, according less attention to social preoccupations and more to economical ones. Regarding the engineers, we consider those working in the nanotechnology sector. In an inking company, engineers need to work harder in order to face the crisis. Some of them have been fired or have left, while those who have stayed rally behind their company against market concurrency. In this situation, private life is important in their values and their civic and local political involvement (in associations, neighbourhood committees, etc.). We call this trend « private politicization ». We will present at last three different kinds of socialization processes that help to understand these links between professions and politics.

VIOLENCE AGAINST WOMEN: COMMUNICATION, COOPERATION AND STRUGGLE

Nurşen Adak

SOCIOLGY, UNIVERSITY OF AKDENIZ, Antalya, Turkey

Abstract: Violence against Women: Communication, Cooperation and Struggle

Violence against women is one of the important social problems causing several physical and psychosocial problems in all societies. Studies on how to stop violence against women have been carried out all over the world by using different methods and techniques. Prime ministry in Turkey published a circular in 2006 to struggle violence against women. In addition to Social Services and Child Protection Agency, this circular delegated responsibility to the local authorities and civil society organizations. In this context, the purpose of this paper is to investigate the studies aiming at the struggle to stop violence against women in Antalya.

To struggle violence against women, a project has been prepared under the coordination of Governorship of Antalya. The administrative staff of a variety of official and non-governmental organizations such as the Governorship, Municipality, University and Police Department of Antalya has participated in the project. The project has provided an opportunity to the related institutions to get in touch with each other and struggle together to stop violence against women.

In the scope of the project, the number of women exposed to violence and asking for help was primarily determined to explore the current situation. Tasks and responsibilities of the related institutions about the prevention of violence, struggle against violence and solution proposals were discussed firstly and then possible solutions were implemented. In the paper, communication and cooperation among the related institutions in Antalya and the obtained gains in terms of combating violence against women will be discussed in detail.

ANTI-DISCRIMINATION MOBILIZATION AT THE EU LEVEL: RECENT SUCCESSES AND DIFFICULTIES OF ARTICLE 13 PUBLIC INTEREST GROUPS

Carlo E. Ruzza

Sociology, Leicester, Leicester, United Kingdom

Abstract: This paper assesses recent changes in political and cultural opportunities for advocacy groups focussing on the anti-discrimination issues regulated by article 13 of the Amsterdam Treaty. On the one hand it seeks to explain why European Institutions and in particular the European Commission support a range of anti-discrimination public interest groups and the political opportunities connected to this institutional support. On the other hand it points to recent macro-economic and political factors that hinder the impact of these groups. It argues that supported groups are notably those that provide political legitimacy to the European project, those that provide an alternative channel of representation for politically vulnerable groups thereby offering them a needed and alternative channel of representation, and those that contribute to a mythology of the European Union by emphasising the concept of human rights and thus providing the EU with a distinctive and needed political identity. Among these groups are Article 13 organisations. The paper points to their key role in combating discrimination. However, it argues that this role has recently become more difficult as a less tolerant political climate is emerging spurred by increased ethnic rivalry related to advances of the xenophobic right and a backlash against multiculturalism. The impact of increased competition for resources of the welfare state and reactions against a perceived negative economic impact of a range of anti-discrimination programmes are also discussed.

NEW MODES OF GOVERNANCE FOR EQUALITY AND NON-DISCRIMINATION IN EUROPE: ENHANCED LEARNING ACROSS STATES AND CIVIL SOCIETY ENGAGEMENT

Ronald Holzhaecker

Department of International Relations and Internat, GRONINGEN, Groningen, Netherlands

Abstract: The European Union (EU) has been moving ahead over the past 20 years with a policy of equality and non-discrimination, driven by the European institutions after Treaty language empowered the union to move ahead, but largely implemented by the member states. This has been part of a broader trend toward developing a social policy within the EU. It is a policy area where multi-level engagement by civil society has been especially critical, in the areas of policy development, monitoring member state implementation, and pushing for broad societal change following a change in the law. Thus the interaction between institutions and
the NGOs involved in the Social Platform, for example Europeans Women’s Lobby (EWL) European Network against Racism (ENAR), the International Lesbian and Gay Association (ILGA-Europe), and the European Disability Forum (EDF), has been important.

In this article, we will first map the institutional architecture for the protection of equality and non-discrimination in the EU. Here there is interesting interaction between the various institutions of the EU, the Council, Commission, and Parliament and the institutions of the Council of Europe. After this initial institutional mapping of this area of social policy, the paper in the analysis section proposes that a new mode of governance is emerging with new relationships between the center, the member states, and civil society which demonstrate the continual evolution of governance forms of the EU. We are focusing on the implementation phase which is assisted by the exchange of good practices and discussion between the member states. During this phase, the process is not as formalized as the Open Method of Coordination used in other policy areas, but instead is a yet weaker and more flexible governing method which we label ‘Enhanced Learning across States’ (ELS). Here the EU and the member states have established ways to share good practices and involve stakeholders in a discussion on combating discrimination and ensuring equality. Civil society is playing a critical role in the ELS governing method across the member states.

STUDYING ILGA-EUROPE AS AN ATTEMPT TO DEFINE EUROPEAN ANTIDISCRIMINATION ORGANISATIONS

David Paternotte

Abstract: European antidiscrimination NGOs are strange animals in social movement literature. They have often been overlooked by social movement scholars while students of EU politics, if considering them, would probably label these groups as mere EU lobbies. It is true that these groups have often become highly organised and professionalised and they use more often lobbying or litigation strategies than street protest. However, they still pursue social movement goals, related to social justice, and their staff members are often appointed by a board representing social movement organisations.

Therefore, this paper proposes to explore the definition of European antidiscrimination NGOs through the example of ILGA-Europe, the European umbrella of LGBT organisations. ILGA-Europe was created in 1996 as the European branch of the International Lesbian and Gay Association (ILGA), an earlier organisation founded in 1978. However, since then, ILGA-Europe has become an autonomous organisation, which pursues its own goals and strategies towards the EU, the Council of Europe, and the Organisation of Security and Cooperation in Europe (OSCE). It employs nowadays more than ten people, and it has been mostly funded by the EU after the adoption of Article 13.

This paper, which should contribute to the study of the NGOisation and professionalisation of social movement organisations, will attempt to grasp the nature of ILGA-Europe, and will compare this organisation to most common definitions of organisations in social movement and EU politics literature. It will focus on two elements: the type of relations established with member organisations, the average profile of staff members. ILGA-Europe will also be compared to ILGA, its mother organisation. While ILGA-Europe has adopted a lobby pattern, ILGA, which is still poorly funded and employs only five people to cover the whole world. Hence, it seems closer to its origins as a (rather classic) social movement, and relations with ILGA-Europe are sometimes tense.

TRANSFORMING EQUALITY POLICY IN EUROPE: CIVIL SOCIETY GENDER ORGANISATION AND THE CHALLENGE OF ‘NON/ANTI- DISCRIMINATION’

Alison E. Woodward

Abstract: Civil society organizations formed around social identities (gender, ethnicity/race, sexualities, beliefs) were instrumental in gaining treaty recognition of the need for firm non-discrimination legislation in the European Union. The Treaty of Amsterdam was promulgated in parallel with a growing transnational organization of civil society interest groups. Since 2000 policy directives and institutions at the national and European level have been promulgated to implement the requirements of non-discrimination. This paper examines the institutional changes from 2000-2011 dealing with the issues of gender equality as cross-hatched with diversity issues such as race and religion. To what extent have institutions of the European Union become less hospitable to claims making from gender activists? Does a focus on non/anti-discrimination lead to changed tactics on the part of civil society? The changing context of Europe, with Enlargement has challenged the organizational capacity of the gender movement. It is the purpose of this paper to trace these developments through the vantage points of new forms of interest associations in European civil society, with a particular focus on the representation of ‘difference’ and ‘diversity’.

Transforming Equality Policy in Europe: Civil Society Gender Organisation and the challenge of ‘non/anti- discrimination’

BEHIND THE FAÇADE OF HOMOGENEITY: CIVIL SOCIETIES IN SIX EAST AND CENTRAL EUROPEAN COUNTRIES REVISITED

Erle Rikmann, Liisi Keedus

Abstract: The paper will present an analysis of some of the more recent developments in the civil societies in six Eastern and Central European countries: Hungary, Poland, the Czech Republic and the Baltic states. These are all countries that have been relatively successful in their political and economic reforms – forming hence a distinct group within the whole post-socialist region. Yet there is still considerable diversity in how the civic sectors have and continue to mature in these countries. Proceeding from an organization-centered perspective, the aim of the paper is to look behind the façade of the relative homogeneity, as well as to critically reassess the weaknesses and strengths attributed to the civic sectors in the region.

The paper begins by re-examining the arguments highlighting the common experiences within the CEE region. We sought to balance these by pointing out the various circumstances and factors that have resulted in a much greater differentiation of the CSOs both in the region and within particular national contexts than is commonly acknowledged.
The first key divergence is a structural one, based on different legal definitions of organizational forms. Variations in formal categorizations of organizations result in divergences in who are the CSOs’ potential donors and partners, or which are their more common fields of activities. In long-term perspective, this is bound to have an impact on the orientation of civil society as a whole: it may direct organizations to relate to and collaborate more closely either with the state or other CSOs.

The second thematic point of comparison is the alleged professionalization of CSOs in Central and Eastern Europe. The paper argues that this is not unidirectional a process than is sometimes thought. For instance, according to data from a number of countries, CSOs have not improved their capacity to hire salaried staff in the past decade.

The paper will furthermore examine the process of civic-public sector partnership consolidation. Although the CSO sectors and their operational environments have been developed more systematically in the CEE countries than in ‘older democracies’ they do not follow a standard model but grow in strikingly different directions.

INSTITUTIONAL TRUST AND MOTIVES FOR PROTEST
Mattias Wahlström1
1Dept. of Sociology, UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: This paper focuses on the motives for participation in political demonstrations in Western democracies and how the decision to take to the streets in protest relates to the level of trust in political and bureaucratic state institutions, across protest issues and countries. Specifically, typical motivational links between general trust in political institutions and becoming mobilized for protest are explored. The guiding hypothesis of the study is that the trust-motivation relationship varies across countries with different protest cultures, and – not least – across protest issues and participating groups. To the extent that protest is viewed as an alternative to the “proper” channels of influence, protest should generally indicate a low degree of trust in the political institutions, and can be regarded as a means of forcing politicians towards decisions they cannot be trusted to take otherwise, i.e. protesters’ instrumental motives dominate. On the other hand, in contemporary European democracies, demonstrations have become a largely institutionalized means for citizens’ communication of grievances to politicians. From this perspective, a low degree of trust in politicians would hypothetically result in a low salience of instrumental motives for protest and correspondingly a high salience of expressive and ideological motives. These assumptions are explored through multilevel regression analysis of postal questionnaires disseminated during political demonstrations on different issues in Belgium, Great Britain, the Netherlands, Spain, Sweden, and Switzerland.

SOCIAL LIFE AND DEMOCRACY IN HUNGARY
Krisztian Szél 1, Janka Kalocsai2
1Education and Society Doctoral School of Education, UNIVERSITY OF Pécs, Pécs, 2UNIVERSITY OF SZEGED, Szeged, Hungary

Abstract: According to the majority of research on civil society in post-socialist countries, fewer people are linked to non-governmental organizations and associations compared to the citizens of Western European countries. These countries show a decrease in the likelihood of participation, because less people feel that they can actually influence the decisions that are made. So the existence and size of formal communities and the civil society are key elements of democratic functioning. The same can be said for the wider community life, social networks, and the resulting social capital, because the mentality that evolves in humans during disputes or discourses in communities may increase their desire for a say over affairs of the wider environment. In essence, this is the starting point of the ongoing research (MTA-OTKA). The results of our research are based on a series of in-depth interviews with civil society leaders, and a quantitative survey-based questionnaire study carried out with a nationally representative sample. Our presentation is focused mainly on the current Hungarian society’s sense of influence over decision-making, as well as advocacy and democratic attitudes, and their community embeddedness and determination.

We tried to uncover the factors that are present in the Hungarian democracy and proved to be decisive in influencing in decision-making processes. In this context, particular attention is paid to the ways established advocacy attitudes, isolation and the deficit of trust determine advocacy skills and the sense of influence over decision-making.

We are also looking for answers as to whether people’s ideas of democracy may affect the way they think about public participation. In this context, we examine the assets people regard as effective in achieving change, and the community actions they participate in or not. During our analysis of people’s ideas about democracy we also tried to group these along the different characteristics and describe the resulting categories. Our results suggests that democratic attitudes have an impact on participation in community actions. Those respondents who have a positive image of democracy can be characterized by higher membership levels in NGOs, and higher participation in community actions. The group completely disillusioned with democracy showed the inverse of this pattern, being underrepresented both in civil associations and actions.

GLOBALIZATION AND POLITICAL PARTICIPATION IN A TECHNOLOGICAL ENVIRONMENT CHARACTERIZED BY THE INFORMATION TECHNOLOGY
Raúl Ruiz-Callado1,2, Adrián Ivorra-Aleñáy
1Sociología I, University of Alicante, Alicante, Spain, 2Chaire de recherche en immigration, ethnicité et citoyenneté, Université du Québec à Montréal (UQAM), Montréal, Canada

Abstract: The technological environment has been changing so rapidly in recent decades and is not expected that this trend will change or medium term or long term. Year after year, the technological environment is transformed, giving way to new and different processes sometimes difficult to explain and predict. The technological environment conditions and affects the whole society.

While this process is happening, politics, at different levels of action and implementation, citizens, politicians, political parties and the various institutions, both nationally and internationally are involved in this process seem to have difficulty adaptation to the change process.

Given these facts, we ask, what is the role or should play politics in a globalized world marked strongly by technology and technological development? Are the political parties and their representatives
sufficiently enhance the use of these new technologies to bring their proposals and decisions to citizens?

Do people use all the technological tools available to get involved in politics and thus shape their opinions for public representatives to take them into account? In this technological environment, could reduce the political apathy and disaffection for the use by both politicians and by people of all existing technological tools?

These questions frame the subject matter of this paper is to examine the impact of technological development in politics, but referred to it from two different study areas. A macro level study, which examined the impact of technological development in one dimension of globalization and political globalization is a second area of study that will focus on analyzing the impact of technological development in political participation citizens through the use of Information Technology and Communication.

With the analysis of these two fields of study will answer all the questions raised. This analysis was completed with quantitative data. The paper investigates a case study and examines some data on the use of I.T. worldwide.

The case study we use is Spain and explores the alienation and apathy that many Spanish citizens feel toward politics. The quantitative method used in this article to discuss the results of a study by the Center for Sociological Research (CIS) from Spain.

ANTI-ISRAELI SENTIMENT IN TURKEY: THE NEWEST CASE OF ANTI-SEMITISM

Nazım Arda Çağdaş

Abstract: In comparison to other European societies, Anti-Semist sentiment has not been strong in Turkey. Opening its borders to Sephardic Jews expelled from Spain during Reconquista, Turkey was one of the safest places for Jews until the republican period. In contrast to Christian Europe, where the emergence of Anti-Semitism is anonymous, political authorities fomented Anti-Semitism in particular times or maliciously neglected the rise of Anti-Jewish propaganda. Anti-Semitism has found itself a special place in the discourse of political Islam in Turkey, which has been gradually strengthened since 1970s. Two main determinants of the rise of Anti-Semitism is the status of political Islamist tendencies in Turkish cabinets and the relations between Turkey and Israel. Strategic partnership between Turkey and Israel in 1990s also signed a decrease in Anti-Semitism, which could not exceed its marginal level during the Cold War. However, a populist Anti-Semitism campaign has begun after second electoral victory of centre-right conservative Justice and Development Party (JPÖ) in 2007 unexpectedly fast. Israel’s military campaign in Gaza and famous “One-Minute” quarrel between Recep Tayyip Erdoğan and Shimon Peres in Davos, World Economic Forum opened a special phase of tension between Turkey and Israel that enabled JPÖ authorities to use Anti-Semitism as a political tool in domestic political context. Recently rising anti-Jewish sentiment in Turkey is a serious example of how an artificially constructed populist xenophobic propaganda can be influential even in a society which has never experienced massive Anti-Semitism before.

ITALY BETWEEN FEDERALISM AND SECESSIONISM: THE LEGA NORD FEDERALISM. STEREOTYPES OF

FOREIGNERS AND SOUTHERN ITALIANS AS DETECTED IN UMBERTO BOSSI’S NATIONAL-POLITICIAN SPEECH.

Gabriela Octaviana Jianu

1History, UNIVERSITY OF ROME TOR Vergata, Roma, Italy

The decentralization of Italy’s political and administrative power represents a recurring theme of the local political issues over the last twenty years.

Federalism is seen as the solution aiming at overcoming the economic and cultural differences between the North and the South of the Country. In fact, as opposed to what has been proposed by the Lega Nord, a so called “soft federalism”, having nothing to do with secessionist policies, shouldn’t hurt the awareness of the national unity – a goal achieved, in practice, only 150 years ago.

The implementation of a set of rules leading to this type of “soft” and “compassionate” federalism brought forward by different other political forces, is not easy in a Country, where the political and cultural background is incompatible with the excessive interests in local policies of the Lega Nord – the political party representing the so called “padano nationalism”.

The Lega Nord leader – Umberto Bossi - Minister for the Federal Reforms – is backed in this task by his “colonels” Roberto Calderoni and Roberto Maroni who play important administrative roles in the Berlusconi Government. The Lega Nord ideology is also characterized by pagan elements such as - the rite of the “river Po water ampulla” -typical of intolerant and closed political cultures.

Just a simple glance at the main guidelines of the Lega Nord program such as the bills proposed on federal matters, both at local and national level, gives us a clear idea of the self-centeredness of the politicians of this party.

This paper aims at portraying a federal Country as envisaged by the Lega, or better said, a federal – secessionist Country as a result of the political actions of the exponents of the Lega party. The grounding idea on which this strategic project is based, is the so called “municipal federalism” which would allow income to remain mainly where it is produced, that is to say in the North of Italy and – at the same time having the rest of Italy especially the South take on the responsibility for its own expenditures.

At the same time the paper wishes to detect, using the analysis content, the main stereotypes attributed by Umberto Bossi both to southern Italian people and to foreigners in his national-populist speeches with the relevant political and administrative consequences.

"PADRONI A CASA NOSTRA*": AN ETHNOGRAPHY OF NORTHERN LEAGUE IN A PROVINCE OF VENETO (ITALY). *("MASTERS IN OUR OWN HOME"** IS THE ENGLISH TRANSLATION OF A FAMOUS POLITICAL SLOGAN OF NORTHERN LEAGUE)

Elisa Bellê

1Sociologia e Ricerca sociale, UNIVERSITÀ DEGLI STUDI DI TRENTO, Trento, Italy

Abstract: The Northern League is an Italian party that originated in the geopolitical context of the so-called "white" political subculture (subcultura politica “bianca”): an economic and sociopolitical model
characterizing large areas of Northeast Italy, where small businesses prevail, a productive structure that often coincides with family and social structure, a widespread urbanization and a long and absolute dominance, in the past, of the catholic church in the public sphere and of the Christian Democratic Party (DC) in politics.

Whether the Northern League should be inserted in the political family of extreme right parties is still debated, and in this respect there is no agreement among scholars. In any case, the League may fully fall within this classification if some of the most important and structural of its features, i.e. the use of populist and xenophobic strategies, languages and rhetoric, are considered. Indeed, the Northern League has constructed a political and cultural hegemony based on the populist dichotomy friend/enemy, us/them, utilized as tool of defensive identification.

The League’s populism has often been very effectively analyzed in terms of political communication, but rare are the contributions that explore this dimension in a situated perspective of daily activities and practices, enacted by party activists and leaders. The specific questions I’d like to assess are: “How is the League’s populism declined in the everyday political life of the party?” and “What is the role played by this dimension in the construction processes of organizational and political identities of the organization’s members?”

In order to answer these questions, the League in a province of Veneto (an area of north-east Italy) has been selected as research context. Such area was once part of the already mentioned “white” political subculture, in which the League is deeply rooted, also strongly characterized by localism and regional culture. The research is based on an ethnographic approach and uses data collection techniques like participant observation, informal interview and in depth-interview. The fieldwork involved activists and local political leaders, as well as institutional representatives at various levels, and it was conducted by taking part in different party activities (meetings, demonstrations and public gatherings, parties...) for a period of six months.

**DOES TROUBLED TIMES MEAN NEOLIBERALISM IS IN TROUBLE?**

Amit Avigur

1Political Science, HEBREW UNIVERSITY, ISRAEL, Jerusalem, Israel

Abstract: Troubled times, in terms of economic crisis or economic slowdown, may cause social tension and trigger political change. Or else, they may not do so, at least not at the degree the economic crisis would seem to suggest.

When evaluating the potential political and social consequences of what seems to be a crisis of the neoliberal economic model, one should keep in mind the different effects and meanings the crisis may have for various social groups. Some groups may be dramatically negatively affected while others remain virtually unaffected. Furthermore, for some of the affected groups the crisis may work as motivation for social and political mobilization while for others it may not. This variety of responses raises the question: How does a certain social group come to oppose the neoliberal model, or on the other hand to express consent (or even support) to it?

Appropriating the conceptual framework introduced by Antonio Gramsci, this paper argues that three “dimensions” and their interaction should be taken into consideration: 1) Material dimension – Was there any significant deterioration or improvement in the group’s material well-being and interests as a result of the crisis? 2) Ideological dimension – The world view, values and concepts it holds or adopts, especially regarding economic issues. 3) Historical context – Specific past experiences and national settings inform the environment in which groups act as well as their position and behavior.

The current crisis is sometimes viewed as bringing to an end the neoliberal era. While not rejecting this notion all together, the paper aims to suggest a framework to critically evaluate the likelihood of such change.

**PARTY ATTITUDES STRENGTH AND THE AFFECTIVE IMPACT OF POLITICAL TALK IN SOCIAL NETWORKS**

Oana Pintea

1sociology, BABES-BOLYAI UNIVERSITY, Cluj-Napoca, Romania

Abstract: Recent evidence suggests that people who are embedded within attitudinally congruent social networks have more stable attitudes than those embedded in diverse networks, but only few studies have explored the link between this attitudinal stability and emotions generated by political talk.

In view of these data, current study examines the relation between party attitudes change, disagreement and the emotions generated by political talk within social networks. This research based on a panel study whereby during 6 months we have applied two measures of participants party attitudes, disagreement and emotions generated by political talk in their social networks.

This research design provides an opportunity to address a range of questions. There is a positive relation between disagreement and party attitudes change? Is this relation mediated by emotions experienced during political discussions in social networks?

**SOCIAL COHESION: CONVERGING AND DIVERGING TRENDS**

Andy David Green

1Lifelong and International Education, Institute of Education, University of London, London, United Kingdom

Abstract: Social theorists frequently argue that social cohesion is under threat in developed societies from the multiple pressures of globalisation. This paper seeks to test this hypothesis through examining the trends across countries and regions in key indicators of social cohesion, including social and political trust, tolerance and perceptions of conflict. It finds ample evidence of long-term declines in cohesion in many countries, not least as exemplified by the erosion of social and political trust, which is particularly dramatic in the UK. The trends are not entirely convergent, since on most indicators Nordic countries has become more cohesive, yet each country faces challenges. In the final section the authors argue that different ‘regimes of social cohesion’ can be identified in specific clusters of countries which are based on different cultural and institutional foundations. In the ‘liberal model’, which applies in the UK and the US, the greatest threat to cohesion comes not from increasing cultural diversity, but from increasing barriers to mobility and the subsequent atrophy of faith in individual opportunity and meritocratic rewards – precisely those beliefs which have traditionally held liberal societies together.
THE POLITICS AND PRACTICE OF 'ANTI-EXTREMISM' IN BRITAIN
Joel Busher1

1School of Law, UNIVERSITY OF EAST LONDON, London, United Kingdom

Abstract: Since 2001, extremism has again come to constitute a major policy issue in the UK, and recent pronouncements by the Prime Minister and Deputy Prime Minister have intensified political and public debate about the threat posed by and how to respond to various hues of extremism, with a particular focus around ‘Islamic extremism’ and ‘far right extremism’. As extremism has risen up the political agenda, Britain has witnessed a rapid expansion of what might be called its anti-extremism sector: the many university departments, research institutes, think tanks, protest groups, community-based organisations and government offices concerned with understanding, tackling, addressing or generally doing something about ‘extremism’.

This paper first outlines the evolution of Britain’s anti-extremism sector during the last decade. Drawing on concepts of organisationial fields, it focuses in particular on the rise of civil society anti-extremism organisations. Second, it explores how recent efforts to define extremism and identify extremist organisations have shaped social representations of ‘extremism’ in political and public discourse during this period. Finally, using the case study of the English Defence League (EDL), the paper describes how those designated as ‘extremists’ have sought to resist this epithet, and why they have often failed.

SOCIAL MOVEMENTS FOR REGIONAL AUTONOMY AND DEVELOPMENT: THE CASES OF CATALONIA IN SPAIN AND UPPER SILESIA IN POLAND
Marta Alicja Klekotko1

1Institute of Sociology, Jagiellonian University, Krakow, Poland

Abstract: The paper covers problems of social mobilisation and political struggle for regional autonomy and development in two historical regions in Europe: Catalonia (Spain) and Upper Silesia (Poland). Both regions are characterized by strong regional identity and tradition, both have similar historical experiences, and both of them aspire to political autonomy. However, despite many similarities, the regions follow different trajectories.

The paper aims at cross-regional comparative analysis of mechanisms, determinants and factors of political struggle and social mobilisation. It explores dynamic of regional development as well as public policy structures (actors, institutions and institutional settings). To do so, it applies different theoretical perspectives: it tries to combine historical sociology with concepts of social capital, social movements approach, cultural policy analysis, concepts of governance and public policy networks.

SOCIAL-PSYCHOLOGICAL PECULIARITIES OF POLITICAL MENTALITY OF THE TUVAN ETHNIC GROUP
Aimira Bolzen1

1Psychology, TUVAN STATE UNIVERSITY, Kyzyl, Russian Federation

Abstract: The dramatic economic and political changes in our society resulted in transformation of social consciousness which created a need for psychological understanding and consideration of global social processes and for analyzing changes in the political mentality of ethnic group as the subject of these processes. The problem of studying political mentality is essential due to social-political changes in Russian society. People do not just share values, but also try to make a common sense. Wilhelm von Humboldt wrote: “Different languages do not only give the different names for the same object but they are also differently represented by their native speakers.” Relations between the phenomena of the reality and their evaluation reflected by consciousness are quite fully reported in language. The latter is one of the subjects of analysis in the study of mentality. Nowadays, the Tuvan language is widely spoken in various communication fields. High communicative level of the Tuvan language is primarily due to the geographic (distant location and isolation), demographic and social (late joining Russia) conditions. This is proved by a big number of Tuvan people speaking their native language. There is no doubt that the language plays an important role in the formation of a sense of community. The majority of the contemporary Tuvans speak their native language (Tuvan), as well as Russian; they also learn the past experience of their ancestors and different areas of ethnic culture. In current turbulent times the social-psychological Tuvan ethnic image is changing due to the political, historical, social-economic and other conditions such as Internet, telecommunications, information technology, etc.

THE LEGA NORD IN THE "RED BELT" OF ITALY
Giovanni Barbieri1

1PERUGIA UNIVERSITY, Perugia, Italy

Abstract: During the last years, the Lega Nord party has spreaded beyond its traditional boundaries and territories (Northern Italy). In particular, it has got good results (in terms of votes) in those central Italian regions (Toscana, Umbria, Marche and also Emilia Romagna), which constitute the so called “red zone”, where the main left-wing party (Italian communist party till 1991; Democratic party of the left and Democrats of the left from 1991 to 2008; Democratic Party from 2008) has been in charge for ages.

The issue is very interesting, because of the presence, in that zone, of a red subculture that should constitute, in theory, a solid dam against the populist, anti-immigrant and non-solidaristic messages of the Lega Nord.

The research whose main results I intend to present, concerns with the insight of the Lega Nord in the red zone. Using data from interviews to a sample of Lega Nord local leaders, the research focuses on: reasons of insight; sense of belonging; sense of distance from the central and local government; features of the regional party organization; etc.

BUDGETS FOR CITIZEN’S INITIATIVES: BOOMING MUTUAL EXPECTATIONS OF CITIZENS AND LOCAL GOVERNMENT
Imrat Verhoeven1, Evelien Tonkens1, Marjolijn Heerings1

1Sociology and anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands
**Abstract:** One important innovation in urban governance has been the governance of civic engagement. After deliberative governance and empowered participatory democracy, we now witness a turn to ‘citizen’s initiatives’, particularly in The Netherlands. Most Dutch cities have policies geared to ‘stimulating’ and ‘facilitating’ citizen’s initiatives on neighbourhood level, such as organizing neighbourhood parties, clean up actions, shared gardens or youth activities. Local civil servants and social professionals invite citizens to take up such actions and offer guidance, knowledge and often also a budget. After funding became available for deprived neighbourhoods in the city of Amsterdam, the Netherlands, in January 2009, some thousand citizen’s initiatives have been granted a budget. Budgets for citizen initiatives are hoped to activate particularly those outside the ‘participation elite’, and increase their civic competence and social capital.

In this paper we analyze the degree to which budgets for citizen initiatives do indeed fulfil these hopes. Do budgets activate new groups or do they merely reach the participation elite (male, 50+, white, higher educated), as tends to be case with deliberative governance and empowered participatory democracy? We base our findings on a survey among 300 applicants and 50 qualitative interviews with a selection of these, who all received a budget in the city of Amsterdam. We find that budgets can indeed activate new groups such as lower educated citizens and migrants, depending on the quality of their interaction with local government. The interaction is delicate, particularly as high governmental expectations of citizens are met with even higher expectations of citizens toward government.

**MANUFACTURING THE ‘GHETTO’: DISCOURSES OF FEAR AND RENEWAL IN THE CENTRE OF ATHENS (GREECE)**

Panagiota - Penny Koutrilikiou 1,2*

1Architecture / Urban Planning, NATIONAL TECHNICAL UNIVERSITY OF ATHENS, Athens, 2Architecture, University of Thessaly, Volos, Greece

Abstract: The discussions about ethno-religious diversity have witnessed a significant change in the last decade. From the 1990s ‘celebrations of our creative diversity’, the 2010s are ridden with declarations about the failure or death of multiculturalism, the rise of a far-right influenced public discourse and arguments pushing for ‘more’ integration (with integration meaning different things to different people). The current context of crisis further intensifies these views, burdening even further the relations among different ethno-religious groups. Since ethno-religious diversity is strongly associated with cities, this public discourse has significant spatial connotations that present (actual or not) neighbourhood segregation and ghettoisation as outcomes of the failure of integration and multiculturalism (rather than of poverty).

Through the case of Athens’ centre, this presentation analyses the political, social and spatial discourses that reshape the realities of particular neighbourhoods and of the city centre as a whole. It examines the emergence of the ghetto discourse in media and government policy and explores the impact that this discourse has on specific neighbourhoods, which differ substantially from each other.

This impact is multifaceted and differs according to neighbourhood characteristics and representations. Socially it presents immigrant residents as the main cause of inner-city problems, burdening further local relations and the life of immigrants. With a pretext of an ‘emergency situation’ in the centre of Athens, it adopts tough measures (such as clearance operations and stricter controls), while simultaneously validating far-right voices and practices expressed through concerns about neighbourhood revitalisation and ‘re-conquering’ of neighbourhoods.

Spatially, while the state promotes large scale renewal programmes (mainly beautification ones) and wishes to attract their ‘preferred social groups’ in the city centre, real estate speculation is growing rapidly in the ‘ghettos’ and practices of ‘reclaiming’ neighbourhood squares from far-right and specific ‘residents’ groups’ violently prevent people from using these public spaces. Moreover, the public representation of certain neighbourhoods as ‘ghettos’ influences the opinion of nonlocals and through a ‘politics of fear’ minimises the chances of nonlocals to visit or move to these areas.

**PLASTIC CITIZENSHIP AND/OR URBAN CITIZENSHIP?**

Anna-Maria Konsta 1

1Humanities and Social Sciences, THE AMERICAN COLLEGE OF THESSALONIKI, Thessaloniki, Greece

Abstract: Different degrees of citizenship apply as far as migrants are concerned in the national and European context. There is fluidity between these different degrees of citizenship in cases where boundaries are blurred and processes of becoming or not are fluid, changing over time and influenced by notions of who should belong and who should not, who is entitled to what rights and who is not. Therefore, a plastic citizenship (from the notion of plasticity) has been developed.

The legal framework on migration constructs the unprivileged legal subject in Europe today. The unprivileged legal subject is the bearer of rights and obligations provided by the plastic citizenship notion; a citizenship that is fluid and mouldable; it is shaped according to the interests and needs of the states or supranational entities involved in each law-making process.

Plastic citizenship creates plastic subjectivities. In this way, people from different ethnic backgrounds and cultures do not remain entrapped in their ‘new’ subjectivities, which are rigidly shaped by the national and European public authorities but can resist bearing elements from their old self and formulate their own subjectivities, which are moulded in terms of plasticity.

At a different level, there are good reasons to reconnect citizenship with the city, especially if we focus on a ‘bottom-up’ approach of citizenship and on citizenship as practice and participation. Contemporary urban theorists emphasize a number of characteristics of cities and city living that reinforce this connection. The demographic complexity of cities and their attractiveness to migrants established the conditions and the need for citizenship as a process of political engagement between diverse groups and individuals. Cities today are more diverse than ever, strengthening the need for forms of citizenship that are sensitive to difference while promoting engagement. In this sense, an urban citizenship has emerged which is connected to active or activist citizenship.

Is the idea of plasticity a ‘top-down’ approach which neglects a ‘bottom-up’ approach on citizenship, such as urban citizenship? Or, could we claim, instead that plastic citizenship and urban citizenship may potentially complement one another and serve as useful tools for improving the lives of migrants in the city?
CLASS AND POWER RELATIONS IN A GENTRIFYING NEIGHBOURHOOD IN ISTANBUL

Ebru Soytemel

1CRESC, THE UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: In recent decades, urban policies in favour of transforming Istanbul into a global city have created places favoured by, and suited to, the middle and upper classes. The selection of Istanbul as ‘The European Capital of Culture’ in 2010 accelerated this process and preserving cultural heritage and rescuing historical buildings came to dominate the public agenda. However, the emphasis on cultural heritage was defined only with respect to houses and the architectural style of buildings. These processes resulted in speculation in housing market and urban interventions like urban regeneration, urban rehabilitation and gentrification processes led to growing inequalities and social tensions. Additionally, in contrast to the mainstream global city research, manufacturing and low-wage work increased and this had not only had impact on income inequality but also led to drastic changes in the housing and labour markets in Istanbul. In mainstream gentrification literature, gentrification is considered an automatic macro/inevitable process that appears after certain restructurations in the labour market. Considerable amount of gentrification literature fails to address the impact of local processes on gentrification. Local demographic dynamics and tensions, contestations between different groups and the experiences of non-gentrifying groups are not considered. This paper examines the new power relations between different social classes by investigating the dynamics of the conflict, and the nature and limits of the relationship between gentrifiers and non-gentrifying groups in the Halic-Golden Horn area of Istanbul. In order to see the peculiarities of gentrification experience of Istanbul in a globalized era, mixed method approach was used during the field work of this study. The qualitative data is obtained through participant observation, life history interviews and focus groups. 50 life history interviews, four focus group discussions and 200 household questionnaires were conducted in Fener Balat Ayvansaray and Haskoy neighbourhoods between June 2007 and August 2008. While exploring the embedded patterns of inequality, this research also considers the networks of neighbourhood-based solidarity, and the strategies of ‘making ends meet’, of primarily low-income groups and poor households, and reveals/identifies the processes of social and spatial dislocation that they face.

CONTENTIOUS DYNAMICS AND RESIDENTS POLITICAL MOBILISATION IN EL RAVAL, BARCELONA: A WEAKENING OF THE PUBLIC SPHERE OR THE QUEST FOR OTHER FORMS OF REPRESENTATION?

Roberta Marzorati

1Department of Sociology and Social Research, UNIVERSITÀ DEGLI STUDI DI MILANO BICOCCA, Milano, Italy

Abstract: The neighbourhood constitutes a significant scalar dimension where to observe the effects of contemporary social and political conflicts on social relations and people daily life. The aim of the paper is to analyse recent conflicts between groups and residents political mobilisation in the neighbourhood of El Raval, Barcelona; traditionally characterised as a working class and marginal neighbourhood, El Raval hosts a very heterogenic population in terms of ethnicity and social features, having experienced the massive setlement of non European immigrant groups, and processes of urban reform that have attracted new and wealthier residents while transforming it into a place for leisure and consumption. Conflicts and consequent protests over the control of space - especially related to noise, dirtiness, street prostitution, petty delinquency, drug dealing and consume - have become routine, and committees of neighbours with a clear anti-institutional discourse have gained prominence. These conflicts and the political mobilisation of residents, refusing more conventional forms of political participation, result as the product of two main sets of reasons; the latter, despite involving the city as a whole, take a particular meaning on the level of the District of Ciutat Vella and El Raval neighbourhood: 1. the shortcomings of the model of urban restructuring known as “Modelo Barcelona” which have become evident after the decision to rely more heavily on the market and the private sector to the detriment of political planning; 2. the features of the Barcelona governance model and its local participatory dimension in particular, which has partially failed in empowering citizens leaving a feeling of disenfranchisement in many sectors of society. A general declining of the neighbours associations movement in facing the contradictions of the Barcelona Model and the ambiguous role that such associations have played in El Raval can further help to understand the neighbourhood complex situation. In conclusion, the paper aims at scrutiny the thesis that sees the emergence of weakly structured and apparently spontaneous neighbours committees as a weakening of the public sphere, better interpreting them as the result of more complex political and social phenomena which involve the governance and political economy of the city.

LOCAL POLITICAL ARENAS AND GOVERNANCE. ANALYZING A MAIN TOOL TO COMPARATIVE ANALYSIS

Clemente J. Navarro1, María J. RODRIGUEZ

1CENTRE FOR LOCAL POLITICAL SOCIOLOGY AND POLICIES, UNIVERSIDAD PABLO DE OLAVIDE, Sevilla, Spain

Abstract: Basically, local or urban governance suppose interaction patterns and coalitions among different actors. According to the influence of different actors main models of local governance are delimitated in specialized literature: pro-growth (local government with business groups), progressive (local government with local associations), and intergovernmental (local government with upper public authorities). The literature also shows the importance of these governance arrangements depends on local governments’ institutional design.

Analytically, this implies local authorities interact with two main kind of actors situate in different local political arenas. Arenas are groups of political actors that normally interact and influence on local politics according to common interests and orientations. Tow main local political arenas could be defined: intergovernmental arena, where local public authorities and upper levels of governments are the main actors; and local civil arena where associations and business groups, in addition to local governments, are their main actors. These are the vertical and horizontal dimension of local governance.

This supposes that comparative analysis of local governance should verify that these political areas exist as a main element of local political societies. This paper tries to develop this exercise using comparative surveys among local public officials across European municipalities. The survey asks public officials about the influence
of different actors on local government decisions. Previous exploratory analysis show these areas could exist. However, in this paper confirmatory factor analysis is applied to confirm the existence of these local political arenas across countries, their main components (political actors), as well as differences among then according institutional designs of local government systems.

In sum, the paper will tries to validate the construct validity of political areas as a main analytical tool to study local politics and governance. This could confirm the importance of political arenas as an analytical tool to develop comparative analysis, as well as orientations to elaborate a validated scale to be applied in other studies on local politics, local governance, and studies about local political elites (what items –actors- should be included in survey questions).

RATIONALITY AND UTILITY OF EVALUATION RESEARCH IN POLICY-MAKING

Anda Lake†

†Culture management and sociology, LATVIAN ACADEMY OF CULTURE, RIGA, Latvia

Abstract: Rationality and Utility of Evaluation Research in Policy-making

Application of evaluation research is a topic for reflection in many social disciplines, sociology included. This article explores evaluation research and its application in the context of development rational action strategies of socially political subjects. My research is grounded in the following problem: The Latvian Government and politicians had to draft and adopt politically sensitive decisions on the consolidation of the state budget under the conditions of the economic crisis. The adoption of these decisions took place under the circumstances of time shortage and strain caused by conflicting political goals and values. Under the above-mentioned conditions, formal rationality, so typical of the bureaucratic system, starts to prevail in the strategy of political actors. In addition, less attention is paid to the value of the set political goals and expected results (substantive rationality). Moreover, in terms of communicative practice, the situation is characterized by barely recognizable or practically invisible communicative actions and, as a result, scarce manifestations of communicative rationality (J. Habermas’s interpretation), i.e., features that let a political community constitute a uniform system of political goals and values. The main questions raised in the research are: Can evaluation research improve the quality of policy-making under the circumstances of prevailing impersonal quantitative calculation or formal rationality in decision making? Which forms of evaluation research facilitate the development of communicative rationality in a policy-making environment?

The problem explored refers to the following parties involved: researchers, civil servants and politicians (ministers of the government). These parties function as sources of data for the research, which is based on the quantitative methodology and employs profound interviews (carried out by experts) as data gathering methodology.

The results of the research lead to the conclusion that certain application-oriented approaches to the realization of evaluation research, i.e., participatory evaluation and developmental evaluation, weaken manifestations of formal rationality and facilitate the construction of communicative rationality in action strategies of political subjects.

CO-OPERATION OR CONFLICT? AUTONOMY OR INTEGRATION? THE ROLE OF CIVIL SOCIETY ORGANIZATIONS IN FINNISH PUBLIC SERVICE PROVISION

Anna Riikka Perälä

†Department of Social Research/Sosiology, UNIVERSITY OF HELSINKI, Helsingin yliopisto, Finland

Abstract: The presentation explores the changing relationships between non-profits and public power in the Finnish social and health care sector. In Finland like in the other Western countries, many postwar institutional arrangements are being abandoned and new arrangements are shaping instead. An especially increasing emphasis has been put on the renewing of the public policy by strengthening the role of communities and non-profit organizations in welfare policy and by prioritizing networks and partnerships over hierarchical modes of governance. In the current discussion there has been, however, a growing understanding that these ideals and prospects have been realized only partially. The presentation is based on a case study of negotiations that took place between local-level public officials and the representatives of a civil society organization working in the field of substance abuse treatment vis-à-vis the establishment and organization of a needle exchange services for injecting drug users in Finland from 2003 to 2007. Ethnographic method reveals present, but rarely unseen power relations at the everyday level of public service transformation. There is a growing uncertainty in Finnish service provision about how different social problems should be handled and who or what stake is mainly responsible. In the presentation the situation is referred to as “the new negotiated order of the Nordic welfare state”, where especially the services for the most marginalized groups, such as drug users, are constantly under re-evaluation. Also the funding of these services is increasingly dependent upon the activity and negotiation skills of the civil society organizations, which makes the position of these services very vulnerable. The new partnership governance has been a step towards liberal welfare regimes in Finland. At the same time the Finnish nonprofits are lacking in tools of how to use power in the new system in an effective way.

HEALTH SERVICES AND THE ADVOCACY ROLE OF CIVIL SOCIETY ORGANIZATIONS ON BEHALF OF VULNERABLE GROUPS

Ming Lim†, Ellen Annandale‡

†Management, ‡Sociology, LEICESTER, Leicester, United Kingdom

Abstract: This paper examines the functions that civil society organizations play in their health advocacy role on behalf of socially vulnerable groups. Several types of vulnerabilities will be considered but among them a particular attention will be devoted to groups advocating on behalf of migrants and more generally ethnic groups. It proposes a typology of civil society functions which consists of an examination of its information-providing role, connections with other levels of governance, policy monitoring and monitoring of implementation of legislation, addressing the public sphere to mobilise public opinion support, liaising with different levels of governance to improve the acquisition and utilisation of resources, providing expert advice on controversial social issues related to health. It will then examine the implications of the recent economic crisis and the related cuts to health services on the ability of these organizations to perform their roles. In particular it will concentrate...
on their governance functions and information providing functions. It will argue that a recent loss of resources and political legitimacy are undermining these roles.

MOBILIZING HEALTH RISKS. THE DEVELOPMENT OF PROTEST AGAINST MOBILE PHONE MASTS

Christian Bröer 1, Jan Willem Duyvendak 1

1Department of sociology and cultural anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: Why do people in some neighbourhoods start rallying against mobile phone mast because of health threats and not in others? The answer, we argue, lies in the political process, especially in mast siting policy. First, health risks of mobile phone technology have to framed as relevant by policy (makers), which then creates an entry point for mobilization. Second, this entry point has to be perceived as such, which happens in localized political conflicts. Health risks are constructed as such in specific interactions between citizens and authorities.

Theoretically, this article builds on Discursive Opportunity Theory (Bröer & Duyvendak 2009) and the growing literature on health social movements (Brown et al. 2004).

This article is based on comparative research in three cases of conflicts about mobile phone antennas. In the first case, local politicians actively put forward the issue of possible health effects. In the second case, local politicians reacted to citizens concerns. In the third case, local authorities hardly reacted at all. These differences are crucial for the emergence of electromagnetic fields as an health issue and growth and decline of local opposition.

SOCIAL ASPECT IN GOVERNANCE AS A CONSEQUENCE OF THE CONTRADICTIONS OF GLOBALIZATION: ANALYSIS OF TRENDS AFTER 2008

Arydas Guogis 1, Mantas Bileišis 1

1Public administration department, MYKOLAS ROMERIS UNIVERSITY, Vilnius, Lithuania

Abstract: In this report an analysis of the contradictions of globalization with a particular emphasis on the period since the beginning of the global financial crisis in 2008 is presented. The authors reveal both positive and negative impacts of globalization to public and private sectors concerning the trends of social development. Threats to the development of public and private sectors alike are identified and questions are raised about the further necessity of privatization and market oriented reforms. Although, in abstract terms the humanity has never been so prosperous, we can also state that the disparities within societies are unacceptable. The authors debate about various public-private relational models and their relative merits for social effectiveness. Relying on sociological research data (two empirical surveys) the report discovers that for the majority of European nations a socially responsible and democratically organized model appears to be most acceptable in terms of their return on contemptsness about policy. Nevertheless it is perilous to argue for a single model and claim its absolute suitability (for example – Scandinavian social model because of its economic costs). But it is evident that in some countries the free market and liberal democracy model does not function properly and even worse in some other cases.

New Governance (not New Public Management) can be an alternative in the present world of contradictions, inequality and social polarization. Is New Governance the opposite model or the supplementary (additional) to New Public Management is the matter of discussion. But the accent put by New Governance emphasize more the aspects of citizen than consumer and client, stress democratization, participation, openness, transparency, non-corruption and active role of non-governmental organizations. If Welfare State could be connected more to left-orientated paradigm and New Public Management more to right wing paradigm (related to liberal-marginal model), New Governance with its emphasis on empowerment and participation is the paradigm for both left and right and for all possible driving forces (if we accept the concepts of sustainable development, social capital, social trust and social responsibility).

CONTINUITIES AND CHANGES. A PERSPECTIVE ON SOCIAL CLASS AND CITIZENSHIP IN LISBON.

Tiago Carvalho 1, Susana Cabaço 2

1Sociology, ISCTE-IUL, Lisbon, Portugal, 2Governement, University of Essex, Colchester, United Kingdom

Abstract: In this paper our objective is to explore continuities and changes on the exercise of citizenship, debating practices, inequalities, political culture and institutions in the urban area of Lisbon. We try to provide a framework for this analysis. The paper will be divided in 3 parts, addressing different but interrelated objectives and methodologies:

1) In the first part, based on the literature produced about Lisbon, the objective is to identify and describe the structural processes of changes related with the city integration in the European and global space logics. This involves changes in the social composition of the city with loses in the total amount of population in the core area, but with the rising of the “new middle class” segments associated with gentrification processes – an emergent elite with its own political agenda and strategies of participation, as will we see. This framework will shape the subsequent analysis of the processes of change.

2) Following this, using available data, we identify patterns of political participation and involvement linked to social classes. The objective is to show how structural class inequalities continue to shape the relation with political participation. We use a multidimensional conception of social class based on Bourdieu proposes, as well as others. Along with the results from the first topic, here too, the “new middle class” emerges as a key actor in the processes of political participation and involvement.

3) Finally, we debate the potential impact of 2 platforms of political action that emerged in the last decade and the associated changes: the use of the internet by citizens groups and the participative budget based on the Brazilian experiences. The first one is associated with the political projects of the citizens and constitutes a sup-
port platform to a broader political action of certain groups associated to professionals (or "new middle class" which empower them to participate in the questions of the city). On institutional level new forms of decision in which the citizen is able to take part in the deliberation gives the opportunity to all citizens to equally participate.

In this context there is continuity in the structure of inequalities, but at the same time, new groups of citizens mobilize and new tools of participation are institutionalized.

THE INSTITUTIONALISATION OF INEQUALITIES IN PARTICIPATORY URBAN GOVERNANCE: THE CASE OF SLUM-UPGRADING IN NAIROBI.

Andrea Rigon¹

¹Sociology, TRINITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: Community and democratic participation are an essential component of current mainstream development practices. Development agencies need community partners in order to implement their programmes and therefore "build" communities and their governance structures. However, Nairobi informal settlements host heterogeneous and fragmented residents socially divided into two main groups: landlords and tenants. By looking at a slum-upgrading programme, the paper seeks to contribute to critical participation studies analysing the effects on equality of the technical implementation of participatory policies aiming to get community democratic representation in a context of pre-existing consolidated power imbalances. The process of creation of local governance structures was hijacked by the local elite of landlords, who have found ways to subvert democratic policies and maintain their leadership through patronage politics. Community elections become tools to institutionalise pre-existing power structures by turning landlords into the legitimate representatives of the entire community. Development agencies obtain formally democratic community governance structures that fulfil their overarching participatory policy frameworks; however such structures are dominated by one particular class of landlords. This is very functional to a smooth programme implementation since recognising the established elite as the official representatives of the community creates an alliance between development agencies and those who have the resources to generate conflict. The analysis of the participatory enumeration, conducted by development agencies together with the community representatives, will show the progressive process of exclusion of a part of the residents. This may have consequences on the increase of inequality and lead to gentrification, evictions, and exclusion of vulnerable categories. However, the interplay of conflicting political interests at different levels may counter the actions of the dominating elite; an exploration of local constellations of power will illustrate the complexity of urban governance and its conflicting nature.

THE POLITICS OF ‘COMMUNITY DEVELOPMENT’ IN THE INNER CITY OF DUBLIN

Alessandro Zagato¹

¹NIRSA-SOCIETY, NATIONAL UNIVERSITY OF IRELAND MAYNOOTH, Maynooth, Ireland

Abstract: Between the end of the 1960s and the beginning of the 1970s, under the generic aegis of “Community Development” (CD), the Dublin inner city subaltern struggles raised implicit and explicit political questions which differed substantially from those previously raised by the ‘traditional’ republican and socialist left. These questions concerned the lives of marginalized people and led to unprecedented forms of political organization; not being concerned with entering the domain of representative state power they emerged at a subjective distance from it. However, this form of independence had a short life. In the second half of the 1970s CD projects began to be rearticulated and ‘depoliticised’ under a bureaucratic framework of management, expertise and service delivery. The prevailing emphasis on state defined concerns, concepts and modes of organization, as well as the decline of the original intellectual independence from the state apparatus, has progressively led to the present, paradoxical situation in which the taking away of state funds—officially justified by the financial crisis—is experienced by CD groups as their death knell.

Through the concept of ‘living politics’, as formulated by the activists of a South African shack dwellers movement (Abahlali base-Mjondolo), I will evaluate CD’s original political approach. After analysing CD’s history as a ‘political sequence’, I will give a brief overview of actual tendencies, drawing from both oral contributions by activists and ethnographic observation. As a provisional conclusion, I will point to possible future scenarios and give some political recommendations for a possible re-politicisation of CD, which, in my view, can only be achieved by returning to the micro-events shaping life in Dublin’s inner city popular neighbourhoods’.

URBAN GOVERNANCE – THE RELATIONS BETWEEN NONPROFIT SECTOR AND PUBLIC AUTHORITIES IN URBAN AREAS FROM ROMANIA

Maria Roxana Atesoae¹

¹SOCIAL WORK AND SOCIOLOGY FACULTY, PETRE ANDREI UNIVERSITY, IASI, Romania

Abstract: From the perspective on governance, nonprofit sector and public authorities from Romania can work together on the common areas. This article addresses this key issue of the relationship between non-government and government organisations, and how this delicate relationship between these often contradicting entities is sustained, especially especially in what concerns policy agendas on sensitive topics.

At the outset, the article focuses on the four-C model of NGO–GO relations, suggesting that the equation between an NGO and the government can be perceived within four sets of relationships, such as cooperation, confrontation, complementarity and co-optation. Based on this conceptual framework, the article seeks to address NGOs and public authorities relationships in Romania, especially in urban areas. It also describes the characteristics of these relationships and highlights the possible ways through which governments can influence the operational environment for NGOs and vice versa.

OF TRUE FINNS AND DEMOCRATIC SWEDES: A FEMINIST READING OF THE (RE)INTERPRETATIONS OF THE NATIONAL CONSTRUCTIONS IN THE NORDIC RADICAL RIGHT POPULIST DISCOURSES

Ann-Cathrine Jungar¹, Ov Cristian Noroche² ³

¹NESSE, UNIVERSITY OF HELSINKI, Helsinki, Finland
²RADICAL RIGHT POPULIST DISCOURSES
³THE NATIONAL CONSTRUCTIONS IN THE NORDIC
Abstract: Of True Finns and Democratic Swedes: A Feminist Reading of the (Re)Interpretations of the National Constructions in the Nordic Radical Right Populist Discourses

Acknowledging that the construction of radical right populism around the depiction of the national construct as an extended family at the beginning of twenty-first century is a little researched area, this article explores the discursive redefinitions of Finnishness and Swedishness that accommodate centrally located heterosexist masculinities at the intersection of gender, class, and “race”, as it is heralded by the main radical right populist parties in Finland and Sweden: the True Finns (Perussomus) and Sweden Democrats (Sverigedemokraterna). The empirical material was collected from the party’s own media platform, PS-Lehti and SD-Kuriren, and stretches over the first decade of the third millennium in an attempt to account for the constant rise of the aforesaid parties on the mainstream political scene in both Finland and Sweden, with a particular focus on the parliamentary elections from 2007 and 2011 in Finland, and 2006 and 2010 in Sweden. The research material is then analyzed evidencing Soini’s and respectively Åkesson’s use of the national family discursive construct over time. The concluding part provides with an overview and respectively Åkesson’s use of the national family discursive of the findings and indicates possible extrapolations for studying radical right populist discourses in other settings across Europe.

Keywords: Finland, Sweden, True Finns, Sweden Democrats, radical right populism, welfare states.

PRIVATE ROOTS OF GENDER IN-EQUALITIES IN SLOVENE POLITICS

Milica Antić Gaber

Faculty of Arts, Department of Sociology, UNIVERSITY OF LJUBLJANA, Ljubljana, Slovenia

Abstract: The paper will present preliminary results of the research on the population of male and female politicians in Slovene national politics and the obstacles and support they have encountered on their way to political positions. In Slovenia women’s presence in politics is, after two decades of political party pluralism and despite their active engagement in political parties and civil society organizations, proportional electoral system on the one side and despite their high achievements in the educational system, high employment rate and low gender pay gap, still low (under 15 percent). The main research questions is why this is still so.

Departing point of the research is the hypothesis that women and men are in the different starting positions concerning their political socialization, their different experiences in civil society activities and different position in the private (family life) where women are still primary care givers to children and elderly family members and those who spent significantly more time performing activities (like cooking, cleaning, washing and others) in households. This is probably even more so in the turbulent times and times of crisis when gender relations and division of tasks in everyday life often even deepen. In addition women in Slovenia, being better educated than men, gaining better jobs than in the past and at the same time taking care for the position of themselves and their families, are not willing to take risk of entering into the politics which is in Slovenia an activity with low prestige.

We will test our hypothesis on the group of male and female politicians in Slovene politics. Through their answers we will try to find out how different obstacles and support mechanisms are determining trajectories of male and female aspirants for political positions; how different is their cultural, social and political capital (Bourdieu, Putnam, Inglehart, Norris); how strong obstacles are their private obligations (Burns, Sholzman, Verba); how their positions in society and professional life support or block their decisions of entering in politics and how strong is still masculine defense of the main political bastion of political male domination (Bourdieu) in Slovenia.

WOMEN AND POLITICAL LEADERSHIP IN EASTERN CENTRAL EUROPE

Paulina Sekula

Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: In recent years, there has been a significant increase in the number of women political leaders around the globe, including heads of state and government, members of cabinets, members of parliament and local self-governmental representatives. The tendency towards reducing gender inequalities in public space is not limited neither to one country nor to one cultural zone or political system, as it can be identified both in advanced industrial stable democracies and developing countries having little experience with democratic institutions. It has not been either slowed down in recent economically and socially turbulent times.

In this context the aim of the paper will be to analyse the issues of women’s representation in national executives and legislatures of European post-communist countries undergoing the processes of democratization and marketization since late 1980ties. According to statistical data, proportions of women political leaders in these countries are on average lower than in many Western European states. Moreover, there are as well considerable differences in the level of women’s political representation within the group of Eastern Central European societies. Both observations deserve further investigation. Based on the comparative analysis of the situation in five countries (Czech Republic, Estonia, Hungary, Lithuania, Poland) discussion will therefore include the questions of: 1. whether over twenty years of democratic transition there has been an intensification in women’s political recruitment?, 2. what are the main similarities and differences in the patterns of women’s political representation?, 3. what are the main structural, cultural and legal correlates of women’s presence at political posts? Is women’s political activity related to such factors as levels of women’s employment and education, vitality of women’s movements, social orientations towards women’s public activity and type of electoral system (including presence or absence of quota system)? The analysis will be based on related statistical data (including data gathered on Worldwide Guide to Women in Leadership website) and international surveys devoted to social orientations towards men and women in public space (including World Values Survey).

ATTITUDES OF POLITICAL ELITES AND PUBLICS TOWARD THE EUROPEANIZATION OF POLICY-MAKING

Gyorgy Lengyel, Jose Real-Dato

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Starting point is the conception of European Union integration as a process of allocation of policy-making competencies from member states to supranational institutions. In this respect, national publics’ and elites’ preferences on which policy areas should be Europeanized and to what extent are crucial to understand the present and the future of EU. In this paper we aim to shed light on the factor influencing the formation of general public and national (political) elites’ preferences on the Europeanization of policy-making. We will use data from the first wave of mass and elites surveys of the project IntUne (www.intune.it), collected in 2007 in 15 EU countries. Among other pieces of information, these surveys contain questions concerning the preferences of national elites and masses over the Europeanization of policy areas (fighting against crime, environment, health care, unemployment, agriculture, social security, immigration, taxation, and foreign policy).

Our research design will consist, first, of an analysis of the patterns explaining the policy Europeanization preferences of political elites and general public separately. For both samples, we will test three different kind of theoretical arguments accounting for their respective policy-making preferences: 1) functional/instrumental; 2) ideological – paying attention to which configuration of the ideological space offers a better explanation; and 3) identity based arguments. Besides, we will adopt a multilevel approach, paying attention both to individual and country level factors.

The second part of our analysis will focus on the consequences that differences between political elites and general public may imply concerning the future of the governance of European Union. According to a post-functionalist proposition of Hooghe and Marks public opinion plays an increasingly important role in European matters, and the unquestioned role of the elites gave way to a “constraining dissensus” since the ‘90s. We investigate how elite-population division influences long term preferences when controlled for individual and country level factors.

DYADIC REPRESENTATION IN THE RESPONSIBLE PARTY MODEL? - THE GERMAN CASE
Lars Vogel\(^1\)

\(^1\)Sociology, FRIEDRICH-SCHILLER-UNIVERSITY JENA, Jena, Germany

Abstract: Since the groundbreaking study by Miller and Stokes from 1963 the discussion on political representation is connected to issue-congruence but has followed two paths. In the United States responsiveness is understood as dyadic issue-congruence between legislators and the population in their electoral districts. In Europe and esp. in Germany responsiveness is defined as collective issue-congruence both between all MPs of one country and the respective electorate and/or between MPs and the electorate of their parties. These traditions are grounded in the different structure of opportunities: in the US MPs have to take cues from their electoral-districts in order to secure their re-election, whereas in Europe the party secures re-nomination and demands party-discipline.

It is, however, questionable whether electoral districts are marginal in the setting of the German dual voting system, since MPs may be interested in referring directly to “their” constituencies as a means to become politically independent from their party. Moreover, the decline of party-voting and increasing personalization suggests a changing relation between MPs and both their parties and their electorate. Thus, we assume the district-opinion as influential for the opinion of those MPs who are elected in those districts - independently of party-affiliation.

The level of dyadic and collective issue-congruence will be analyzed by referring to a variety of issues on how governmental processes should be organized (politics and polities) and on basic policies like primary policy goals or the degree of state-intervention. Data for our study is provided by the combination of two surveys: On the one hand the German Parliamentary Survey, which comprises a three-wave panel covering 2003, 2007, 2010 with app. 1000 active German MPs in each wave, whereby half of them entered parliament in single-member-districts. We combined the wave of 2010 of this elite-survey with a population survey conducted in the same year, in which at a first stage 40 electoral districts were randomly sampled and within each of these districts 50 inhabitants were randomly sampled bringing the total number of interviews to 2000. This design allows us to compare the totality of all MPs and the German electorate as well as to establish dyadic issue-congruence between 40 MPs and their respective electoral districts.

SOCIAL TRUST IN EUROPEAN SOCIETIES: MULTILEVEL ANALYSIS OF INDIVIDUALS AND CULTURES
Marios Vryonides\(^2\)

\(^2\)Social Sciences, EUROPEAN UNIVERSITY CYPRUS, Nicosia, Cyprus

Abstract: Social trust is widely regarded as being an extremely important individual and social property. As an individual property it is associated with individual characteristics, such as class, education, income, age, religion and gender. Social trust is also regarded as a property not of individuals but of social systems. According to this view the study of social trust should focus on the properties of societies and their central institutions. As such according to Putnam (2000) it is an important facet of social capital which has been at the core of much of recent sociological research and has been characterized by Portes (1998) as the most popular export of sociology to popular discourse. Social capital to which trust lies at its core, according to Putnam (2000), refers to connections among individuals (social networks) and the norms of reciprocity and trustworthiness that arise from them. Social capital has an element that has been called ‘civic virtue’, which is an intrinsic element of a ‘healthy’ society. For Putnam, ‘social capital has ‘externalities’ that affect the wider community. When the members of the community are well connected and trust each other the benefits are much greater than in a social context where the community is poorly connected (2000:20). Using HLM we will attempt to bridge these two approaches (individual and social) in a single model with two levels and test it using the integrated European Social Survey dataset which contains data from 30 European countries. The first level of analysis will correspond to the individual level while the second will correspond to the social/ country level. Greece and Cyprus will come under closer scrutiny in order to identify the effect of selected variables on social trust in these two countries.

THE ELITE-POPULATION GAP IN THE FORMATION OF POLITICAL IDENTITIES. A CROSS-CULTURAL INVESTIGATION

Heinrich Hugo Best

Abstract: A constructivist understanding sees elites as playing a pivotal role in the composition and imposition of mass political identities. Elites are considered to have a wide leeway in “inventing” and shaping the concepts of sameness, belongingness and common destiny or purpose that are at the core of collective identities. The present paper challenges this view of a unidirectional, top-down process of identity formation and suggests instead a concept of “historical constructivism”. This maintains that the invention or construction of mass identities is constrained and directed by specific historical givens and experiences that shape the collective memories in the general population. This view is supported by comprehensive empirical evidence on collective identities at the level of elites (political and economic) and in the general population in eighteen European countries that was gathered in the context of the INTUNE-project. Results show that political identities reflect historical experiences (sometimes even very distant ones) and show vast differences in the expressions of political identities between elites and the general population. These differences indicate wide divergences between leaders and masses in the norms and sentiments underlying their political communities.

BIFURCATION MECHANISM OF POLITICS (THE ELITE AND ERSATZ-ELITE)

Lessya Nikolaevna Vasilieva

1Philosophy, MOSCOW STATE UNIVERSITY OF RAILWAY ENGINEERING, Novopetrovskoe, Istra district, Moscow region, Russian Federation

Abstract: The theory of elites is also regarded within synergy approach in the binary system in particular. “Elite” and “Ersatz-elite” are described as structural elements of society which assign certain qualities to social actions. Elite and ersatz-elite aren’t separate society strata. Their representatives are presented on all levels of social hierarchical pyramid. The representatives of elite have such mental qualities as sophisticated cognitive intellect, diverse range of behavior and social attitudes and aims allowing them to bring maximum benefit to the society. The ersatz-elite have some common qualities with elite. But its representatives haven’t diverse range of behavior and their ideas of values are mainly targeted at satisfaction of personal interests not regarding public interests.

When we consider the bifurcation mechanism of social development it is important to have certain idea about quality of opinion leaders. The elite always choose the values while the ersatz-elite choose short-term aims of development.

The definition “political elite” is usually used to relation of conglomeration of political functionaries which are able to influence into all State organizations. These political functionaries decided what to do in political structures, but quality of these decisions and their consequences do not take into consideration. Hence, the meaning of the notion “elite” makes vapid. We are not able to have a conversation about representatives of “elite” without taking into account their motivation, values, professional qualities.

The political elite is the group of persons with such qualities as beings with sophisticated cognitive intellect, diverse range of behavior and social aims. They consolidate into such foundation as definite political ideas and social base. The representatives of political elite are able to institutionalization into political realm the relations and decisions of their groups. The representatives of political elite occupy top levels of social pyramid because they should perform their functions of institutionalization.

The quality of political institutes of society depends from qualities of political leader as a representative of elite or ersatz-elite. The quantity of representatives of elite in the political power is a key factor of political life for progressive development.

HOW DELIBERATION WORKS IN DIRECT DEMOCRATIC VOTING. EVIDENCE FROM A FIELD EXPERIMENT IN SWITZERLAND

Marco Steenbergen

1UNIVERSITY OF BERN, Bern, Switzerland

Abstract: So far, the link between direct democracy and deliberation is largely unexplored, while at the same time contested. While some scholars emphasize that direct democratic campaigns can make voters aware of the different argumentative frames surrounding a policy issue (representing a minimal democratic goal) other scholars are more skeptical about the deliberative effects of direct democracy. Recent research, for instance, shows that direct democratic campaigning mainly leads to the reinforcement of pre-existing attitudes. This, however, is in contradiction of deliberation’s goals. This study reports on the first deliberative field experiment in Swiss direct democracy, conducted on the expulsion initiative of the Swiss People’s Party in October 2010. Our results show that online deliberation makes a difference in direct democratic voting: the online deliberation group became more favorable to the counterproposal of government and parliament, especially compared to the control group with no balanced information. However, preference transformations via deliberation occurred in more complex and different ways than previous studies have found. Deliberation had mainly a consolidation effect on preference transformations, and the latter were largely the product of a simple structuration effect rather than the result of a substantive transformation of preferences.

IMMIGRATION, INTEGRATION AND POLITICAL RIGHTS: DOES NORMATIVE THEORY HAVE ANYTHING TO LEARN FROM CITIZEN DISCUSSION?

Conor Cradden

1UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: Citizen discussion tends to be viewed with a certain scepticism by both academic experts and professional politicians. The technical and political problems in question are often seen as too complex or esoteric for lay persons even to understand, still less resolve. However, in the field of immigration and integration policy these same elites can hardly be said to have had any great success. The begs the question of whether it might not be a good idea to listen more carefully to the needs and fears expressed by ordinary citizens or even to ask them to contribute their own policy ideas.
From a strictly academic perspective, there are two possibilities for learning from citizen discussion. On the one hand, a comparison between the scope of the ideas and concepts used by citizens and existing normative theory in the field would give an insight into the extent to which theory reflects opinions and beliefs that actually exist among the voting public. On the other, such a comparison could point towards those issues and aspects of the debate that are the cause of the most confusion, interest or disquiet.

The paper will present the results of such a comparison based on small group discussions organised at the University of Geneva in 2010. Participants were asked to discuss whether cantonal (regional) level voting rights should be extended to resident foreigners.

SHOULD RESIDENT ALIENS VOTE? LESSONS FROM A DELIBERATION EXPERIMENT
Lucio Baccaro 1, Conor Cradden 2, Marion Deville 3
1UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: The identification of the criteria of membership in the body politic is one of thorniest issues in normative political theory. Who’s to be included in ‘We The People’? Should arbitrary characteristics like conditions of birth and possession of a particular passport determine access to political rights? Is not the basic self-understanding of democracy inextricably linked to the principle that all those who are affected by the law should have an equal right to participate in its formulation? In what conditions would citizens accept to extend political rights to resident aliens who have settled in their midst? Can deliberative policy-making promote such an extension?

This paper tackles these questions by reporting on the results of a field experiment conducted in Geneva in March 2010. Geneva is a peculiar city due to her status as the international capital of human rights and the high proportion of foreigners (40 percent). A Constituent Assembly was elected by the people of Geneva in 2008 to decide inter alia on whether foreigners should be granted political rights (vote and eligibility). Participants in the field experiment were asked to debate on these issues in different procedural conditions and thus to contribute to the Assembly’s reflections. Results suggest that deliberating makes participants significantly more favorably disposed towards extending political rights compared with equivalent controls, but only when the discussion is free, i.e. non-moderated. When the discussion is moderated, and participants are primed to take a position and justify it on the basis of principles and/or the common good, preferences are frozen and no preference change is noticeable. A follow-up paper by Cradden (see below) analyzes the citizens’ speech acts under different procedural conditions.

BEYOND ASSIMILATION AND MULTICULTURALISM: VARIETIES OF INCORPORATION REGIMES IN POST-ENLARGEMENT EUROPE. EVIDENCE FROM ITALY AND SPAIN
Roxana Barbulescu 3
3Social and Political Sciences, EUROPEAN UNIVERSITY INSTITUTE, Florence, Italy

Abstract: Traditionally, scholars concerned with incorporation policies have taken the national models as their units of analysis by downplay the role of sub-state as well as supra-state (i.e. EU) actors. While the national level is still the political arena where most of the policy decisions are taken, in EU member states and in semi-federal states such as Italy and Spain, the European level as well as regional and municipal level are key actors at all points in the policy process: agenda setting, policy-making, and policy implementation and evaluation. Indeed, the old national models are negotiated at the European table but pursued and reinvented by the regional and local governments. This paper analyzes the incorporation regimes across these four levels of governance: European, statist, regional and municipal in order, to on one hand, have a more comprehensive and accurate description of the incorporation regimes migrants are faced in their host societies and, on the other hand to move away from explanations centered on the nation-state and avoid methodological nationalism.

Drawing on Rinus Penninx’s (2004) typology, I also consider the immigrant policy in the legal/political dimension as well as socio-economic and religious/cultural dimensions but further split these dimensions in more concrete variables. For instance, I consider voting rights in local elections, reduced time for naturalization, possibility for deportation and easy transition from temporary to permanent residence for the legal/political dimension and record the presence or absence of the respective policy.

Based on the data collected at the four levels and along the three dimensions mentioned above, I construct a typology of incorporation regimes. The models found fit perfectly to particular foreign groups: generally assimilationist approaches for non-EU migrants non-Christian, to a less degree assimilationist for the co-ethnics and to an even lesser degree for the new EU citizens and, finally, more multicultural for EU-citizens. In conclusion, this paper argues there is a continuum of models, from less to more inclusive, for different foreign groups that are simultaneously pursued and enforced within one Member State.

NATIONAL ECONOMIC CONTEXTS AND ETHNOCENTRISMS: TESTING A CULTURAL EXPLANATION FOR THEIR RELATIONSHIP
Katerina Manevska 4, Peter Achterberg 5
4CROCUS, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: A common finding in research on ethnocentrism is that less economic prosperity in a country leads to more negative thinking about ethnic minorities. One way of understanding this finding is through an economic logic. Since competition for scarce resources is stronger in times of economic deprivation, a clearer rejection of ethnic minority group members takes place when competing for similar resources. Likewise, various studies have shown that authoritarianism is closely related to economic fluctuations, illustrating that authoritarian values are more salient in times of less economic prosperity. Given that authoritarianism is positively related to ethnocentrism, both findings seem to support the idea of an economic explanation for ethnocentric ideas. However, several studies have shown that an individual’s cultural position is at least as important for the extent to which someone holds ethnocentric ideas as an individual’s economic position is. The question thus arises whether the negative relationship between a person’s cultural position and ethnocentrism is influenced by the economic context of a country. In this paper, it is argued that such an influence indeed exists and that it should be understood through the
concept of interpersonal trust. Hence, given that it is negatively related to trust, an unfavourable economic context will be accompanied by relatively low levels of interpersonal trust. Such low degrees of trust are expected to result in stronger feelings of cultural insecurity among individuals with a weak cultural position, leading to more negative ideas about ethnic minorities. Using time series analysis, this cultural explanation for the relationship between the national economic context and ethnocentrism is tested with longitudinal data from the Netherlands. The results thus obtained underline the importance of our cultural approach and some suggestions for integrating it into the existing lines of research on this topic are presented.

THE RITUALIZATION OF CITIZENSHIP IN FRANCE, THE NETHERLANDS AND THE UNITED KINGDOM

Semin Suvarierol

Abstract: The valorization of national citizenship in Europe manifests itself in various ways. Nowadays, prospective citizens are required to go through a pre-defined initiation program which aims to facilitate their (civic) integration and to stress the meaning of citizenship for the nation-state in question. For those who complete their citizenship trajectory successfully and demand citizenship, the entry to citizenship is marked by an official ceremony which (re)emphasizes the value of the acquired citizenship. Citizenship is thus transformed from being a formal procedure of changing a legal status to a series of (national) rituals marking the importance of citizenship and the values and virtues attached to it.

This paper analyzes citizenship as an initiation ritual to membership of a given national community and describes the practices that are currently used by the state in France, the Netherlands, and the United Kingdom on the basis of empirical data gathered through interviews and participant observation. The analysis of rituals of citizenship addresses the following questions: Why have states opted for the current rituals? Which conceptualizations of citizenship do these rituals reflect? Which symbols and values of the nation are emphasized during these rituals? By contextualizing the different manifestations of the ritualization of citizenship, the paper thus aims to contribute to our understanding of current citizenships and new nationalisms.

EUROPEAN INSTITUTIONS AND ITS 'TRUE EUROPEAN MINORITY'/ ONE-SIZE-FITS-ALL-BUT-ROMA

Marek Szilvasi

Abstract: The aim of the paper is to address the relevant dilemmas and inconsistencies linked with the introduction of the institution of a European (Roma) minority. The recent European call for a specific Roma targeted policy and the establishment of specific Roma focused departments within the European Union (EU), Organisation for Security and Cooperation in Europe (OSCE) and Council of Europe (CoE) is neither challenging responsibilities of national governments nor effectively fighting the gap between Roma and their European co-citizens.

Initially, after the collapse of the Cold War European division, the European treaty-based organizations such as the EU, CoE and OSCE classified the Roma issue entirely as a security concern (crime prevention, population regulation, assimilation) mostly in a reference to the Roma migration from east to west. In the late 1990s, these concerns were reformulated into human rights politics and extended to the post-communist countries. Thus, principles of minority rights, non-discrimination and addressing socio-economic inequalities were appropriated by new eastern democracies as a part of human rights politics since they became a criterion for the membership in the international organizations such as the EU, CoE and OSCE. Through the promotion of reputable memberships, western security concerns relating to the Roma were redressed to the top-down European Roma rights advocacy. The underlying reasoning of the European organizations is united in seeing the Roma people as fitting neither to the category of compact national minorities (produced by previous forced nation-state incorporation), nor that of immigrants. The Roma have been recognized as “a true European minority” (Decision No. 1203/1993, Council of Europe) and as a “nation without a state” (Declaration of Nation, the Fifth World Romani Congress, July 2000, Prague). Due to these perceived misfits, when it seems that classical liberal and multicultural strategies on inclusion do not work, these European organizations launched a call for a particular Roma recognition and inclusion on a transnational level. Accordingly, the key puzzles this paper will address is how the Europeanisation of Roma (Vermeersch 2010) challenges the dominant socio-political theories of liberal pluralism, and whether it effectively fights the severe Roma discrimination.

INCLUSION AND EXCLUSION - FRAMEWORK TRAPS FOR MIGRANT NETWORKS

Silvia Ioana Neamtu, Bogdana Alexandra Buzarnescu

Abstract: Studies on migration have centered until now on the negative aspects of individuals’ mobility and the negative reflection it has on development of both the origin and host countries. The recent steps taken by the European Commission in its strive to harmonize immigration policies has only proven that most of them are still reluctant to relinquish responsibility to a transnational body – therefore non-binding documents are still the norm (Lutz, 2008). Even if several states have started implementing regularization programs in their strive to fix the illegal immigrant worker problem, others are still strongly in favor of tighter border surveillance, stricter migration and admission policies, and a more effective return and removal policy (Apad et al. 2000, Papadopolou 2005 in Lutz, 2008).

Using a line of thought similar to Everett Lee’s 1966 descriptive model of migration theory based on dual forces (the pushes and pulls), the present paper examines the impact that the legal framework of a European host country has on the social networks of working migrants.

We use social network analysis to map out the structure of the migrants’ networks in the receiving country. We thus hypothesize that the legal framework affects these structures, making the integration of immigrants dependant on their networks’ structure. Based on Siegel’s network typology (2009) we expect that a constraining legal framework, like the Dutch one at the moment, will create small-world and village types of networks, which make the social integration of the immigrants harder. Conversely, the second
expectation is that the German legal framework produces opinion-leader and hierarchical networks, which will advantage the integration of immigrants in the German society through weak ties.

The implications of such a study are significant in two ways: first, the link between policies and social integration of immigrants is directly measured, which makes it easier for policy makers to spot the level of intervention in making immigrants better integrate in the society. Second, this specific methodological approach to relational data sets the ground for innovation in migration studies and social integration, adding insights on social network analysis, generally.

YOUNG MIGRANTS AND SOCIAL PARTICIPATION IN CATALONIA

David Dueñas I Cid1
1Sociology Unit, UNIVERSITAT ROVIRA I VIRGILI, Tarragona, Spain

Abstract: The presentation develops a comparative analysis of the different attitudes towards social participation developed by young migrants in Catalonia.

Young migrants are divided in three groups in order to compare them (young migrants that have chosen their own migration project after being educated on their origin countries1, young migrants that have migrated due to their parents decision and have studied both in the origin and in the reception country, and young migrants that have migrated when they were children, so they have been mostly educated in Catalonia, or they have born in Catalonia due a previous migration of their parents), and a comparative analysis is developed in order to make visible their different approaches to social participation as a way to facilitate their integration, to defend their interests and to develop a global sense of citizenship.

DELIBERATION UNDER CONDITIONS OF LANGUAGE PLURALISM: INSIGHTS FROM THE EUROPOLIS DELIBERATIVE POLLING EXPERIMENT

Hans-Joerg Trenz2
2ARENA, UNIVERSITY OF OSLO, Oslo, Norway

Abstract: In this paper, we confront some commonly held assumptions and objections with regard to the feasibility of deliberation in a transnational and pluri-lingual setting. To illustrate our argument, we rely on a solid set of both quantitative and qualitative data from EuroPolis, a transnational deliberative experiment that took place one week ahead of the 2009 European Parliamentary elections. The European deliberative poll is an ideal case for testing the viability of deliberative democracy across political cultures because it introduces variation in terms of constituency and group plurality under the controlled conditions of a scientific experiment. On the basis of our measurement of both participants’ self-perceptions and changes of opinions through questionnaires and of group dynamics and interactions through qualitative coding of group discussions we can draw the following generalised conclusions: 1) The EU polity is generally recognised and taken as a reference point by citizens for exercising communicative power and impact on decision-making, 2) the EuroPolis experiment proves that citizens are in fact able to interact and debate across languages and cultures, thereby turning a heterogeneous group of randomly chosen participants into a constituency of democracy.

DEMOCRACY IN TRANSLATION: A NEW MODEL OF POLITICAL DELIBERATION IN EUROPE

Nicole Doerr1
1Sociology, FREIE UNIVERSITÄT BERLIN, Alsfeld, Germany

Abstract: In the literature on democratic deliberation and linguistic heterogeneity, the potential of translation remains undertheorized. Political theorists have proposed both policies aimed at ensuring language diversity and the establishment of a ‘lingua franca’ as solutions to the language question. My sociological study will explore the case of translation as a third perspective on the question of linguistic difference and democratic deliberation. Practitioners of deliberative politics in the global justice movement introduced translation in order to work together in linguistically heterogeneous groups. Treating their diversity as a basis for radical democracy based on translation, they were able to include socially disadvantaged groups. My study presents evidence on the impact of translation in the European Social Forum (ESF). Activists who created the ESF take decisions on the EU constitution, and on specific EU policies in European meetings. Comparing activists’ practices of translation in these European meetings with meetings without translation at the national level in Germany, Italy and the UK, I came to a counter-intuitive result: it was the European meetings that had a higher degree of inclusive, transparent and egalitarian decision-making and not, as would have been expected, national meetings. I show that it is a distinct practice of translation that underpins this finding. As practiced in the Social Forums, translation not only bridges linguistic differences; it also crosses non-linguistic barriers such as those based on identity and ideology. My paper explores translation as a way to enhance the inclusivity and equality of deliberative democracy in multi-lingual movements and civic forums.

HOW DELIBERATIVE ARE DELIBERATIVE OPINION POLLS? EVIDENCE FROM EUROPOLIS

Andre Baechtiger1
1UNIVERSITY OF LUCERNE, Lucerne, Switzerland

Abstract: The past decade has experienced a strong surge in citizen deliberation. Despite the increasing popularity of mini-publics (such as Deliberative Opinion Polls), research has mainly focused on the outcomes of mini-publics (such as opinion changes or knowledge gains), while systematic research on the exact quality of citizen deliberation is largely absent. This paper attempts to fill this gap by analyzing the deliberative quality on immigration in the context of a pan-European Deliberative Poll (Europolis). The quality of citizen deliberation is analyzed on the basis of the amended Discourse Quality Index (DQI) which represents a comprehensive measure to track deliberation’s content. To assess deliberative quality, we will not only report on the frequencies of the various components of deliberative quality (such as justification rationality or respect) but also explore how the different components hang together. On the basis of a Bayesian Item Response analysis, we will aggregate the different components of deliberative quality into different interaction modes (rational vs. conventional ones). Finally, we will also apply a sequential analysis and track the dynamics of the deliberative process.
POLITICAL PARTIES AND NONGOVERNMENTAL ORGANIZATIONS OR ON PROBLEM WITH POLITICAL REPRESENTATION IN CONTEMPORARY SOCIETY

Uros Vojislav Suvakovic
Faculty of Philosophy/Department of Sociology, UNIVERSITY IN KOSOVSKA MITROVICA, 11070 Novi Beograd, Serbia

Abstract: Since the appearing in the bourgeois society, political parties have been the basic institutional intermediary between the will of citizens and institutions of representative democracy.

Considering the fact that parties have appeared together with national state, and that these were “made simultaneously with elections and parliamentary procedures” (M. Duverger), the question is if in “the global society” (Giddens) the necessity for parties to perform the function of political representation stops. Regarding the Europe, organizational, political and other adaptations of parties are not comparable with measure of moving the field of making political decisions from national states to Euro-institutions. Even in the case of establishing European parties, these are far away from the citizen-individual in order to feel like a part of them. The reason for this insufficient adaptability of parties to the integrated Europe is that the contemporary Euro-institutions are being established according to a bureaucratic-technocratic principle, and not according to the principle of representing the will of citizens. The similar situation is with global institutions, like the OUN. On the other hand, the influence of NGO’s within national states pretending to represent political subjects strengthens even more, regardless the absence of legitimacy from the citizens and often without the internal election legitimacy within themselves. Their international connecting, influence to public opinion, pressure for making different state decisions – give them political strength and influence that even political parties do not have.

Political parties are burdened with problems of political corruption, loss of ideological identity, “concern for votes”, which force them additionally into non-principle coalitions for gaining power. All this additionally compromise them in the eyes of citizens on whose support they rely and whose interests they should represent. All this lead us to the question if political parties live their last days and if we can imagine democratic institutions that will not be based on party political representation?

Key words: political representation, political parties, NGO’s, globalizing.

THE CAUSES AND EFFECTS OF CITIZENSHIP POLICIES: COMPARING POLICY INDICATORS AND NATURALIZATION RATES

Maarten Peter Vink, Marc Helbling, David Reichel, Thomas Janoski, Jan Willem Duyvendak, Thomas Huddleston

1Political Science, MAASTRICHT UNIVERSITY, Maastricht, Netherlands; 2WZB, Berlin, Germany; 3ICMPD, Vienna, Austria; 4Department of Sociology, University of Kentucky, Lexington, KY, United States; 5Sociology, University of Amsterdam, Amsterdam, Netherlands; 6Migration Policy Group, Brussels, Belgium

Roundtable:
Over the last decade there has been an important development in the citizenship literature. After a long period of case study research and small-N comparisons, various scholars and projects have start-ed to compare a relatively large range of cases. This new research agenda has inevitably led to a quantification of the data under study and to a renewed debate about policy indicators. Scholars have constructed citizenship indicators both to explain policy differences as well as the effects of these differences. Critics have argued that there are now almost as many indices as there are large-N studies. Regarding the effects of citizenship policies scholars moreover disagree about the usefulness and cross-national comparability of naturalization rates. In this roundtable we discuss the question of the usefulness of citizenship policy indicators and naturalization rates for comparative research.

CHALLENGES OF COMPLEX MULTI-LEVEL GOVERNANCE - BALTIC SEA FISHERIES AS A CASE

Christian Stöhr

1Department for Applied IT, CHALMERS UNIVERSITY OF TECHNOLOGY, Gothenburg, Sweden

Abstract: This article provides and empirical study of Baltic Sea fisheries governance. It aims to illustrate and elaborate the important role of power, appropriate linkages between expertise and regulatory processes on the different levels, and of the tensions and conflicts in the functioning and transformation of governance systems. Baltic Sea fisheries governance is an example of a complex, multi-level commons governance case that involves multiple regulatory processes that operate on different scales and with a diversity of public and private actors involved. Conceptually, the article uses an institutional approach stressing the structural contexts that shape the social relations and interdependencies of the different actors as well as their situational action opportunities and constraints, their knowledge and models of reality, their values and interests, and particular rationalities.

After a brief theoretical and conceptual introduction, the article summarizes the current Baltic Sea governance system under the Common Fisheries Policy (CFP) framework in a way that allows for comparison with other governance cases within and outside the commons framework. The institutional analysis identifies problems and key factors that led to the failure of the CFP and suggest directions, reforms might take to increase effectiveness. The last part elaborates on key issues of participation and representation on national and international level in the context of the ongoing shifts towards more participation and stakeholder inclusion within the Baltic Sea fisheries governance system in general and the case of Poland in particular.

GENDER GOVERNANCE IN THE EUROPEAN UNION

Dolores Calvo

1Department of Sociology, UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: This paper examines the governance of gender relations at European Union (EU) level. It discusses the concept of governance and analyses the internal dynamic and the workings of the European Commission (EC) when it comes to the governance of gender.

The idea of governance helps to understand processes where several different actors are involved and where different types of institutional arrangements are developed. Governance refers to a complex of social steering processes where competencies are shared...
among multiple actors, public as well as private, and results in changes in activities, outcomes, and developments. The concept of governance is useful to understand the political dynamics and the workings of policy formulation within the EU in general and the EC in particular. The concept is useful to capture the dynamics of proposals and policy frameworks’ formulation. The analysis of gender governance at EU level includes examining how gender is done by identifying what actors and structures are involved in the governance of gender and investigating the relationships among them. The EC is a main actor when it comes to gender governance. However, it is not the only one and within the Commission itself the workings of gender are much complicated, calling for detailed examination.

The analysis of gender governance within different policy sectors at EU level is of particular relevance because the governance of gender constitutes the context where gender discourses are produced. This context of gender governance has implications for how gender is produced and how (and why) gender inequality is reproduced. When it comes to the governance of gender, there is a question of definition of what is being governed. The object of governance is not gender relations per se but the policy strategies (i.e. gender mainstreaming, positive actions and equal treatment legislation) through which gender relations are regulated. This is to be examined in the paper and some examples from different policy areas will be presented.

THE 2007-20XX FINANCIAL CRISIS: EXPLANATION (ONE FEASIBLE MODEL) AND PREVENTION (A PHARMACEUTICAL MODEL OF REGULATION)

Alberto Martinelli 1, Tom R. Burns 2

1Department of Political Science and Sociology, UNIVERSITY OF MILANO, Milano, Italy, 2Department of Sociology, University of Uppsala, Uppsala, Sweden

Abstract: Money, banking, and finance are special social constructions -- socio-technical systems -- inherently vulnerable to crashes, as we argue in this paper. Such systems are characterized by many types of crises (vulnerabilities): inflation, exchange rate crisis, domestic and sovereign default crisis, banking and financial crises, equity and real estate/housing crises. Some countries graduated from sovereign crises (e.g., advanced countries such as the USA, France, Germany) but all countries with banking systems, whether developing countries or advanced economies have had and continue to have banking crises.

The focus in these notes is on banking and financial crises and the factors that influence their operations and make them vulnerable and, under some conditions, highly unstable: (i) ideology of regulation/regulatory paradigms; (ii) meta- and other forms of power including the powers of credit creation and of political and expert influence; (iii) key processes of credit formation, provision of loans, and debt formation; (iv) market instability and destabilizing dynamics; (v) regulatory and governance dilemmas and inherent failures; (vi) systemic vulnerabilities including bubble formations, panics, and collapses.

The explanation of banking and financial crises lies in the key (power) processes of credit-creation (and money creation) which together with crowd-type behavior (diffusion of self-fulfilling beliefs and imitation) generate unstable market processes, particularly tendencies to bubble formation and collapse with respect to particular markets and sectors subject to speculative rushes and panics: equities, real estate, financial instruments, etc.

The sociological model presented in this paper substantially diverges from an economic rationality model; the latter assumes rational agents and market properties with high self-equilibration capacity. Our arguments suggest that the governance arrangement for banking and financial systems is inherently flawed and that a substantially different governance arrangement with substantially different guiding principles and rules, a different configuration of agents (in particular, not just market and state agents), and a different type of regulatory regime (family resemblance to pharmaceutical regulation)

CONCEPTS OF STAKEHOLDER INVOLVEMENT IN ENVIRONMENTAL POLICY MAKING: APPLICATION TO THE CLIMATE CHANGE DEBATE IN EUROPE

Ortwin Renn 1, Eugene Rosa 2

1SOCIAL SCIENCE V, STUTTGART UNIVERSITY, Stuttgart, Germany, 2SOCIAL SCIENCE V, Washington State University, Pullman, United States

Abstract: Environmental policy making demands many skills: dealing with complex causal relationships, coping with uncertainty in data and models and handling plural values and preferences of those who are involved or affected by these policies. Inviting stakeholders, experts and the public to take part in drafting environmental policies to deal with environmental and health challenges and facilitate a transition into a sustainable future has been a major objective in many countries of the world. However, many of these attempts have not lead to satisfactory results or were abandoned due to difficulties about the appropriate concepts of involvement and decision making structures. The paper will develop a systematic overview of these implicit and explicit concepts of stakeholder involvement, analyse their relative strength and weaknesses and demonstrate how these concepts have been played out in the climate change debate.

DISCRETIONARY DEATH: GOVERNANCE MECHANISMS IN THE ANALYSIS OF END-OF-LIFE DECISION MAKING

Nora Ines Machado 1,2

1CENTER FOR RESEARCH AND STUDIES IN SOCIOLOGY, LISBON UNIVERSITY INSTITUTE, Lisboa, Portugal

Abstract: The author examines a major shift in the conceptualization, governance and practices relating to death and dying in Western and other societies with advanced medicine. This shift is the result of socio-technical and cultural developments characterized by but not limited to the routine widespread application of life support technologies in the hospital together with notions of increased patient rights. It has resulted in a class of end-of-life situations, which the author defines as “discretionary death.” The concept of discretionary death underscores the role of contextual and discretionary factors in end-of-life decision-making. The author identifies and discusses the necessary and complex process of norm formation and governance that informs and regulates end-of-life medical practice and establishes societal consensus across society with respect to legitimizing “discretionary death.”
FROM A CHARISMATIC BUREAUCRACY TO A GOVERNANCE REGIME

Helena - Flam

Abstract: Quite a lot has been written on the clerical sexual abuse of children in the US after WWII. But most texts were written by journalists or theologians. They show that in confrontation with this thorny issue, raised by victims, their families and the mass media, the Roman Catholic Church in the US at first denied the facts but in the end acknowledged and let investigate these facts. It also introduced some internal reforms. My concern will be to show that in the process of handling the accusations of sexual abuse by the Catholic priests the RC Church willy-nilly became transformed from a charismatic bureaucratic organization into a governance regime. It changed its way of framing issues, its mode of decision-making and rules for (inter)action with its clerics and believers as well as some of its institutional structures.

POWER, KNOWLEDGE, AND CONFLICT IN THE SHAPING OF COMMONS GOVERNANCE:

Thomas Burns, Christian Stohr

Abstract: This article aims at contributing to governance conceptualization and its application to case study analyses. Two of the challenges which the theoretical and empirical work in the article addresses concern facilitation of the comparability of diverse governance cases and a specification of several key mechanisms of governance formation and reform. A proposed model of the architecture of governance systems – their major components and interlinkages – contributes, as argued and illustrated here, to greater comparability among cases and with the possibility of improved accumulation of knowledge about governance systems. The work also identifies a few key drivers explaining how governance systems are established, maintained or changed through power, knowledge, and contestation/conflict processes. These tools are applied to empirical cases of governance structure and their functioning and reformation. I consider briefly for comparative purposes food security, chemicals, gender relations, and Baltic fisheries as areas of EU governance. The paper is divided into three sections. Section I introduces the basic conceptualization and tools of analysis. Section II elaborates the key concepts and tools presented in Section I, in particular considering a variety of cases of the functioning and transformation of governance systems. Section III is a brief conclusion pointing out the originality of the theory as well as its applicability.

BEFORE AND AFTER MIGRATION: VIETNAMESE FAMILIES’ CHANGING FAMILY LIVES AND CARE ARRANGEMENTS WITH CZECH NANNIES

Adéla Souralová
1

1Sociology (Social Anthropology), Masaryk University, Brno, Czech Republic

Abstract: Vietnamese families in the Czech Republic often pay Czech women to care for their children. My ongoing research seeks to develop a holistic understanding of this phenomenon in the context of contrasting arrangements in the pre-migratory and post-migratory organization of family lives. There are four crucial interrelated dimensions. First, being mostly labour migrants, parents of small children need to intensively participate in the labour market and find ways of balancing work and family lives. Second, different care practices in the Czech Republic compared to the experiences of Vietnamese migrants from their homeland that – together with working hours mentioned above – make the paying for caregiver “normal” for Vietnamese families, but simultaneously “abnormal” or incomprehensible for Czech caregivers themselves. Third, this leads to the competition of different ideologies of motherhood between Czech women having their own experiences of mothering and the actual mothering by Vietnamese mothers. And finally, the changes in the family structure after migration (uprooting from the extensive kinship that the care can be delegated on) result in finding a “substitute” grandmother and developing a fictive kin with her and her family to simulate the family arrangements intimately known from Vietnam.

The paper will discuss the case of majority women working as caregivers for migrant families in the context of the established social science knowledge about the care-migration-labour market triad. Using intersectional approach, I will explore how interlocking social divisions (notably gender, ethnicity, migrancy and body) create specific mothering strategies in the context of the employer-employee relationship and ethnicity based hierarchies.

GENDER RELATIONS IN PERSIANS’ INTERETHNIC PARTNERING RELATIONSHIPS IN THE MULTICULTURAL UK

Ali Amirmoayed
1

1POLISI/Sociology, UNIVERSITY OF BIRMINGHAM, Birmingham, United Kingdom

Abstract: There have been extensive discussions on multiculturalism and its relationship with the ongoing socioeconomic turbulence in Europe. Echoing the recent comments by the Chancellor of Germany Angela Merkel, the British Prime Minister David Cameron criticized “state multiculturalism” in his recent speech. In this paper, I will theoretically evaluate whether gender relations in interethnic partnering relationships may present challenges in the multicultural British society. Given that gender roles vary among different traditions and cultures, I will initially discuss the manner in which ethnicity may influence gender relations in a multicultural state. Further, focusing on the Persian culture and traditions, I will explore how gender relations are socially constructed within their communities in the UK. In particular, I will discuss how Persians understand the household structure, women’s rights, and gender responsibilities in a partnering relationship. I will explain how their understanding of these issues differs from the British, or in a wider sense, Western understanding of the same. To present a clearer picture, I will discuss the importance of how Persians attach to preserving a female’s virginity before marriage as an example of the cultural values that may lead to gender inequalities, thereby affecting gender relations. Therefore, by exploring the Persian gender constructs and expectations pertaining to the factors that make one a good wife or good husband, I will argue how these cultural values may influence gender relations in Persians’ interethic partnering relationships in the wider context of social change in the UK. More specifically, I will conclude the paper by evaluating the role of a multicultural society in changing gender relations in interethnic partnering practices, that is, I will investigate whether the state can influence such relations to a certain degree and the manner in which gender relations in interethnic partnering practices challenge the state.

GLOBAL CARE WORK: GENDER AND MIGRATION IN NORDIC SOCIETIES.

Lise Widding Isaksen
1,1

1DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF BERGEN, Bergen, Norway

Abstract: This paper is based on a study of gender and migration in Scandinavian welfare states. Here I want to discuss how the global transformation of the economy affects and commercialises women’s traditional work in the family and the labour market. The study has uncovered an emergence of new ethnic hierarchies, a regulated and gendered access to social citizenship and new social inequalities. Here I will examine the Nordic welfare states critically through an examination of the work and living conditions for migrant care workers. The Nordic societies have a long history of active policies on gender equality and social welfare for all. But today an increasing number of families “outsource” gender equality conflicts to the global market and hire au pairs and cleaning services. At the same time the national health services are now global work places. Public elder care services rely on international recruitment of skilled and unskilled care workers.

The paper presents recent empirical research on the lives of care workers and au pairs and their transnational families in welfare societies. The focus will be on a discussion of the legal and social regulation of gender, migration and social citizenship.

MOROCCAN IMMIGRANT WOMEN AS CITIZENSHIP GENERATORS

Carlota SOLE 1, Olga SERRADELL 1, Teresa SORDÉ 1, Ainhoa FLECHA 1, Rosalina ALCALDE 1, Alisa PETROFF 1, Iskra PAVEZ 1, Enrique SANTAMARÍA 1, Leonardo CAVALCANTI 1

1SOCIOLOGY - GEDIME, UNIVERSITAT AUTÔNOMA DE BARCELONA, Cerdanyola del Vallès (Barcelona), Spain
Abstract: Strong stereotypes fall on Moroccan women that live in European societies which, frequently, are connected to passivity and submission. But these women are contributing to the development of the citizenship in multicultural societies, such is the Catalan and the Spanish.

In agreement with authors of international scientific relevance such as Amartya Sen, women are the active social agents who are leading major changes in the world, from cultures, origins and highly diverse realities. In Morocco, the Women Forum had a key role in the reform of the Civil Code or Moudawana in 2004. In the residence societies and in the current contexts of financial crisis, while the occupations developed by immigrant men are drastically reduced, those mainly developed by women such as the domestic work or caring services still the same. This situation generates changes in the gender roles, in and out of the family. Women with their own migratory projects acquire greater relevance, but also those coming from the family regrouping, actively participate in the reception society, either from the labour market, by means of the management of time and family resources, or as fundamental axis for the transmission of values to the children and minors members of the family.

By means of the projects “DIC.CAT. Women, Immigration and Citizenship: Moroccan women as generators of citizenship in Catalonia” (Catalan Government, 2010-11) and “CIMUMER. Civic Citizenship and Social Inclusion: Strategies for Moroccan, Ecuadorian and Romanian women” (Spanish Government, 2010-12), strategies through which immigrant women and specifically Moroccan women contributed to the active and plural citizenship were identified, in which they participated in public spaces of the city but also from the private sphere, through the transmission of civic values in spaces like the family from which an important socializing role is exerted.

MEN’S MOVEMENTS IN POLAND: A BACKLASH OF WOMEN’S MOVEMENTS?

Katarzyna Małgorzata Wojnicka

DEPARTMENT OF SOCIOLOGY, JAGIELLONIAN UNIVERSITY, KRAKÓW, Poland

Abstract: The issue I would like to explore in my presentation concerns phenomena, which contemporary sociology calls ‘men’s social movements’, which are the type of new social movements focused on gender identity. The issue of men’s movements has been present in American and (western) European sociology for twenty years. In Poland this issue is still absent in the academy and therefore I decide to conduct my research on it. I would like to examine three types of men’s movement – pro-feminist movement, spiritual movements and father’s rights movement since these types are the most popular in Poland.

The aim of my presentation is the analysis of a specific character of men’s movements present on Polish social arena. I have carried out sociological interviews with Polish participants of number of organizations and associations which constitute the most important part of contemporary men’s movements. I am confronting and comparing the results of my research, and then find similarities and differences between four types of polish men’s movements. This manner of procedure will be helpful in finding answers to my key research questions:

1. Can Polish men’s movements be considered a typical example of new social movements?
2. What kind of social actors are participants of Polish movements? What kind of goals do they have? What kind of strategies do they use?
3. How do these social phenomena affect women’s movements in Poland?

My research is based on a variety of sources: sociological interviews with Polish participants of number of organizations and associations which constitute the most important part of contemporary men’s movements. The case studies of the following Polish associations has been provided: Mężczyźni na Rzecz Równości (Men for Equality), Centralne Stowarzyszenie Obrony Praw Ojca (Central Father and Children Rights Association), Stowarzyszenie Obrony Praw Ojca (Capitol Father and Children Rights Association), Men’s Forum (Men’s Loop), Mężczyźni Świętego Józefa (Saint Joseph’s Men). I have gathered sufficient materials from several Polish cities: interviews, newspapers articles and also numbers of opinions from specific websites or discussion groups created by men connected with specific type of men’s movements.

NGOISATION OF WOMEN’S MOVEMENTS IN TURKEY: AMBIVALENT CONSEQUENCES FOR FEMINIST POLITICS?

Anıl Al-Rebholz

1Sociology, UNIVERSITY OF FRANKFURT, Frankfurt am Main, Germany

Abstract: Two important aspects characterise very much the dynamic and nature of women activism in Turkey. The first aspect relates to the extensive NGOisation of women’s movements since 1990s and the further acceleration of this process in 2000s during the Process of Turkey’s Accession to EU. The second aspect which is very much related to this first one, is the striking transnational character of women’s movements in Turkey which means that the political engagement of women activists in NGOs in Turkish civil society, take place in an environment of extensive organisational, ideological and financial exchange with other International NGO and supra-national Organisations such as EU and UN.

The history of second wave feminism in Turkey makes now more than three decades (1980-2010) and its transformation from the feminist movement into women’s movements in the 90s has been accompanied by institutionalization of it in the form of foundation of different women’s NGOs (Turkish, Kurdish and Islamic Women’s NGOs). Together with the institutionalization of the movement we witness also the ideological/intellectual diversification and pluralisation of women’s groups and organizations, which can be interpreted at first sight as the internal democratization of the movement, but which at the same time is accompanied by the rise of project feminism and by the establishment of elitist/competitive structures within and among the Women’s NGOs. In this framework, similar to the developments which feminist politics undergone in other contexts (Alvarez 2004; Lang 1997 & 2009), it has been complained about the loss of critical voice of the movement and loss of contact with local/grassroots women’s movements in Turkish context too. So in my presentation I want to look at the
implications of this process in the 90s and 2000s for women’s politics in Turkey.

Accordingly the following questions will be addressed in this paper:

What are the consequences of the NGOisation on the landscape of women’s activism in Turkey? What does it mean for the definition of feminist politics, does it change the relationship between women and the Turkish state and how?

What are the consequences of the NGOisation of women’s movements for the knowledge production processes and social processes in general and how would this influence women’s social situation coming form different segments of the society in particular?

THE FORMATION OF WOMEN-ONLY PARKS IN IRAN: (RE)GENDERING THE SPACE, (RE)SHAPING THE STATE:

Nazarin Shahrokhni

1Sociology, UNIVERSITY OF CALIFORNIA-BERKELEY, Berkeley, United States

Abstract: Since the establishment of the Islamic Republic of Iran in 1979, gender segregated spaces have become a prominent feature of the Iranian urban space. On the buses, women are relegated to the back; at the universities men and women are asked to sit in separate rows and enter from separate entrances; there are women-only parks and hospitals; and soccer stadiums are open only to men. These spatial practices are often lumped under the all-encompassing term “gender segregation,” which is considered to be part of the state’s larger project of the Islamization of society, allegedly aimed at excluding women from the public sphere.

This paper draws on a larger project that focuses on women-only parks, soccer stadiums, and buses, as the major sites of segregation in Tehran, and contends that gender-segregated spaces represent different features of the Iranian state’s paternalistic stance towards women; they operate differently, produce different effects, and engender different modalities of action.

By taking into account the variations across these cases, this paper complicates the unidimensional theorization of gender segregation, and asks the following questions: How and through what (macro and micro) mechanisms are gender-segregated spaces produced? What are the implications of these segregated spaces for the Iranian state? What do the variations across these gender-segregated sites tell us about the Iranian state, beyond reducing the explanation to “Islamization of society”??
from the welfare-state to the neo-liberal policies, have been taken discussed, in relation to the concepts of “state” and “citizen”. As a first step, the definitions of “state” and “citizen” have been discussed, together with the change in their tasks and responsibilities and the place of women as citizen has been examined. Multiple citizen positions (“disadvantaged” and “responsible/volunteer/rescuer”) and the tensions and power relations among them have been discussed.

PARTNERING WITH MEN IN WOMEN’S EMPOWERMENT IN TURKEY
Senem Elcin Korkut¹, Fatma UZ²
¹Sociology, HACETTEPE UNIVERSITY, ²ANKARA UNIVERSITY, Ankara, Turkey
Abstract: Addressing and articulating women’s sexual and reproductive health and reproductive rights provide clear benefits in terms of girls’ education, women’s involvement in paid employment, their control of economic resources and decision – making at all levels. Advancing gender equality and women’s ability to control their own fertility are cornerstones of population and development – related programmes and States should take all appropriate measures to ensure, on a basis of equality of men and women, universal access to healthcare services, including those related to reproductive health care, which includes family planning and sexual health.

Reflecting women’s disadvantages in reproductive health and empowerment, the Gender Inequality Index (GII) ranks Turkey 77th out of 138 countries, below its neighbors like Armenia and Georgia. Turkey needs to take affirmative action in strengthening measures to ensure gender equality in social, economic and political fields. In this sense, including men in efforts on women’s empowerment will be crucial to reach the gender goals.

The Project “Innovations for Women’s Empowerment in Turkey’s Southeast Anatolia Region”, which is a cooperation between GAP Regional Development Administration, UNDP and Swedish International Development Cooperation Agency, aims at women’s empowerment in social and economic life. The third target of the project is to increase women’s participation in social life through reproductive health and gender trainings given by a special expert in this field. In this context, a total of 384 men as representatives of different public and civil society organizations attended the trainings during 2010.

The aim of this paper is to examine concepts such as “human rights”, “reproductive health” and “gender” having crucial importance in defining the concept of “women’s empowerment” from the point of view of the male beneficiary; to discuss possible problems in terms of positive/negative attitudes and behaviours that may occur as a result of different interpretations of the meanings of these concepts; and to form a model to overcome these differences.

An interview with the reproductive health and gender expert was carried out and the progress report of the training written by the above-mentioned expert was benefited from within the scope of the research.

Key Words: Women’s empowerment, reproductive health, human rights, gender

RELATIONSHIP BETWEEN INFORMALISATION OF EMPLOYMENT AND WOMEN’S POVERTY: A RESEARCH ON WOMEN TEXTILE HOMEWORKERS
Gulhan Demiriz¹, Yasemin Dolan²
¹SOCIOLOGY, ²ADNAN MENDERES UNIVERSITY, AYDIN, Turkey
Abstract: An increase in poverty as results of neo-liberal economic policies in Turkey since 1980 and economic crises force people, especially living in urban areas, to develop new living strategies. One of those strategies for women who are not in paid work or become unemployed after layoff is to work in informal jobs. One of the main reasons behind ‘the women’s poverty’ and ‘the feminisation of poverty’ is women’s involvement in informal jobs. It is argued in this research that poverty and formalisation re-produces each other. This relationship can briefly be formulated as; poverty forces women to accept informal jobs despite its all disadvantages, and in return, low payment and other factors restrain women within a vicious circle of poverty.

However, women’s poverty cannot be fully understood by an analysis of economic factors and crises behind it. The place and role of patriarchal ideology should not be left out of an analysis of ‘women’s poverty’ and the ‘feminisation of poverty’. Because, for example, in terms of homeworking (or piece-work) one of the reasons for women to take this work instead of outside employment is that the first one does not conflict with their ‘primary roles’ as housewives. This research argues that an analysis of the relationship between women’s poverty and formalisation requires also an analysis of their interactions with patriarchal ideology.

In this respect, this research aims to examine the role of patriarchal ideology in the understanding and explaining women’s poverty by looking at women who are employed in informal sector via working at their homes doing piece-work. By doing so, it is thought that the interactions between formalisation, patriarchal ideology and women’s poverty can be revealed. In order to realize these aims in-depth interviews were carried out with a total of 40 women pieceworkers in textile sector in Bursa/Turkey.

A MEDIA ANALYZE: IS HAVING A BABY VIA SPERM BANK CHALLENGE AGAINST MASCULINITY?
Gonul Demez¹
¹Sociology, AKDENIZ UNIVERSITY, Antalya, Turkey
Abstract: The perceptions and roles accepted inevitably in a traditional society are being discussed in contemporary society in where gender roles are redefined; values of masculinity and femininity are reproduced. In this study, it will be examined that new perceptions concerning motherhood which is accepted as the most determinant role of women and patriarchal challenging against these perceptions. The discussions took a place in Turkish media in 2009 relating to a famous woman being a mother via sperm bank will be argued by using discourse analyze. This analyze may bring interesting discussions to the agenda because Turkey has a social structure in which both traditional and modern lifestyles and values exist in the meanwhile while using the advanced technology and scientific knowledge. Having a baby via sperm bank is perceived as a challenge against traditional patriarchal family values and, specifically, position of men and thus masculinity. The news, in this study, tak-
ing a place in media concerning the woman got pregnant via sperm bank will be analyzed in the context of masculinity.

BUILDING A SENSE OF WORTH WHILE UNDOING HEGEMONIC MASCULINITY

Marion Pajumets¹

¹Sociology, TALLINN UNIVERSITY, Tallinn, Estonia

Abstract: Estonia is a rather typical post-communist country that has not yet gone through a culture shift from materialist to post-materialist values (Saar 2009). Subsequently Estonian culturally exalted form of masculinity is heavily based on working, earning and spending money. The segregation of labour by gender is rather strong both in Estonian labour market as well as at homes. This analysis focuses on the interactive processes of doing masculinity by and for men that do not live up to the career centred ideal. Instead, they are involved in cross border labour movement due to their partners’ careers in EU institutions or in health sectors of old Europe. Detached from their homes and important social networks they are active fathers to their children while having only minimal relations to professional sphere. Strategies of building masculine identity and a sense of worth in such an unconventional situation is the focus of this presentation. Men’s as well as their partners’ pursuits to reconstruct masculinity are analysed.

Data consists of semi-structured interviews conducted separately with female and male informants. Analytic framework is social constructionist and employs theories of ‘doing’ and ‘undoing gender’ (Deutsch 2007) and ‘degendering’ (Lorber 2005).

FROM WORKING MOTHERS TO CARING FATHERS

Constanza Tobio¹

¹Political Science and Sociology, CARLOS III UNIVERSITY, Getafe (MADRID), Spain

Abstract: Care, hardly visible until not so long ago, has emerged as a new dimension of society and as a field of research. Feminist theory has identified the complex social practices it entails, as well as the ethics of responsibility which underpins it, built, according to Gilligan and others, along the process of girls’ socialization. As men become carers too, the gendered specificity of such activities is questioned and new issues regarding female identity are posed. On the other hand, gender as a dichotomous category is challenged by authors like Butler or Hearn who problematise not just women’s identity but also masculinity. If in the forties of the past century Simone de Beauvoir asked, ahead of social constructionism, what is a woman and how does one become one, at the beginning of the 21st century it makes sense to ask: what is a man?

The paper discusses the involvement of men in care as a necessary condition for gender equality, once women have assumed employment as their responsibility. There are though obstacles for men to assume direct care of children or elderly which relate to a patriarchal perception of masculinity. It is concluded that care requires knowledge (knowing how to do it), power (being able to do it) and desire (wanting to care), all of which often lack in men.

GENGERED PERCEPTIONS OF DNA PATERNITY TESTING ORDERED BY COURTS

Helena Cristina Machado ¹, Susana Manuela Silva ², Rosa Adriana Silva ³

¹Department of Sociology, UNIVERSITY OF MINHO, BRAGA, ²Department of Hygiene and Epidemiology, University of Porto Medical Schoo, Porto, ³Department of Sociology, UNIVERSITY OF MINHO, BRAGA, Portugal

Abstract: We examine the gendered constructions of intentionality of paternity in cases of children born outside marriage that don’t have the name of the father in the birth certificate. Our analysis is based on a questionnaire with 130 participants (mothers and alleged biological fathers). All the respondents were involved in DNA testing ordered by a court of law to investigate paternity and determine legal fatherhood. We focus on the assessment of the importance of doing the paternity test and expectations regarding future involvement of the biological father on caring and contributing for children bearing. The data demonstrated symbolical and binary constructions of maternity/feminity and paternity/masculinity. Mothers considered the paternity test very important less often than alleged fathers (77.4% vs 89.9%). There were gender differences in the importance attributed to the reasons that justify the performance of genetic paternity tests ordered by courts. When compared with mothers, alleged fathers classified the following motives as important more often: for the father to fulfill his financial obligations (100% vs 76.9%); for the man to be sure of paternity (98% vs 82%); to establish relationships with the child (95.9% vs 79.2%); for the child to have her/his father’s name on identity card (75.5% vs 69.8%); for the mother not to have to raise the child alone (89.4% vs 56.6%). However, a higher proportion of women considered the paternity testing important for the mother to prove to the father that she is not lying (92.5% vs 83.7%). To expect no changes on alleged father-child relationship after knowing the result of genetic test was more frequent in women (41.5% vs 18.4%). The majority of the alleged fathers planned to meet his child at least once a week (82.9% vs 14.3% in mothers), but 47.6% of the mothers estimated rare/no future contacts between alleged father and child (vs. 8.6% in men). We argue that the social effects produced by the technology of DNA paternity testing generate gendered modes of citizenship and (re)create gender inequalities, which are visible in women’s emotional, financial and caretaking responsibilities’ overload regarding their children and in the flexible and intermittent financial and emotional contributions by the part of biological fathers.

FILLING THE GAP. ENTREPRENEURSHIP: A POSSIBLE SOLUTION FOR WOMEN FROM ROMANIA TO COMBINE TRADITIONAL AND MODERN FEMALE ROLES

Orsolya Gergely¹

¹Department of Social Science, SAPIENTIA UNIVERSITY, Miercurea Ciuc, Romania

Abstract: We propose a sociological approach in order to analyze female entrepreneurs’ motivations for starting up and managing small and medium sized businesses (SMEs) in two Romanian counties. Our goal is to analyze in a case study the socio-demographic profile of female entrepreneurs and to analyze the cultural context of female entrepreneurial behavior. We study the profile of these businesses and describe individual and collective patterns of managing small enterprises from a life/work balance perspective. In order to achieve these goals, both quantitative and qualitative
methods are used: a survey conducted among female entrepreneurs (518 respondents selected through random sampling in March-April 2010) and 33 interviews (carried out during 2010). We define as entrepreneur the person who owns and runs an officially registered company. The strata of female entrepreneurs in the rural counties under study (Covasna and Harghita) is an emerging and atomized group, with a low level of business culture. Entrepreneurial identity of women running SMEs is a multifaceted construction: women, mother, wife, “family task manager” are all related and often conflicting social roles. We propose four ideal types of female entrepreneurs along four criteria: according to the type of work/task, life/ work balance, entrepreneurial values and motivation.

The Soviet socio-ethnical norms put forward a paradox situation for women: besides the uptake and the expression of gender equality (eg. women’s education, work), being “housewife” and the role of the motherhood were also parts of the female role in society. Thus, since the last two decades of the twentieth century, women had to engage to multiple burdens. The four decades of socialism provided women living in Romania the opportunity, the desire and the aspiration for self-realization, without means to achieve all these. Nevertheless the labor market opportunities for female population is very poor, especially in rural and semi rural regions. In this context, the innovative role of female entrepreneurs occurs in terms of economic activity, but also as leaders in the process of reshaping female social roles. Therefore, we conclude that female entrepreneurs in rural Romania may have a multi-innovative role on a community level.

PATHOLOGY OR NORMAL DISTRESS? EXHAUSTED WOMEN NEGOTIATING THE MEANINGS OF DEPRESSION IN THE CONTEXT OF WORKING LIFE

Sanna Maria Rikala

Abstract: Consistent findings in research on depression show that the prevalence of depression is approximately two times higher among women than men. These findings have been discussed widely in the field of feminist research. A shared agenda within recent feminist research on depression has been to build a theoretical framework that could take into account both the social causation of gender inequalities in health and the social construction of disease categories. Indeed, many scholars have adopted so called material-discursive approach in order to understand the complexity of the social, material and cultural processes intertwined in the gendering of depression.

This paper reports the preliminary findings of an ongoing PhD study on women’s work-related depression. Bringing together the material-discursive approach of feminist depression research and recent discussions about the new pathological developments in working life, my study explores how the discourses of depression materialize in the context of contemporary work. Within work life research, it is suggested that the proliferation of work-related pathologies manifests an ongoing shift from a political conception of problems at work towards a medical-psychological framework. Drawing from this notion, this study explores how women, who have been diagnosed as depressed when reporting symptoms of work-related exhaustion and distress, give meanings to their condition after-wards. The data consists of 16 semi-structured interviews with female burnout sufferers.

The analysis shows that the medical construction of depression organized women’s accounts of exhaustion. The idea of depression was used as a standard according to which burnout sufferers estimated their health condition and hence made sense of their experiences. However, a strong resistance towards individualizing or pathologizing the problems at work was also present in women’s accounts. Work-related depression was not perceived as an illness, but rather a reasonable reaction to a burdensome life situation, for example excessive workloads or mistreatments at work. Further, the interviewees stretched the medical conception of depression and were after a broader definition. Accordingly, the negotiations concerning the meanings of depression aimed at overcoming the strict dichotomy between health and illnes.

ROMA SOCIAL CITIZENSHIP IN TURBULENT TIMES: THE EMPOWERMENT GENDER IMPACT OF PORTUGUESE ROMA CIVIC PARTICIPATION

Raquel Rego

Abstract: Roma people were expatriated from France and Italy with a quite conspicuous presence in press news last year. Some protests against these measures were organized and encouraged by national and international associations, in particular by the Spanish Fundación Secretariado Gitano. Also, recently, several Roma and non-Roma organizations have sent a letter to the Hungarian European Union Presidency in order to request the right to be consulted on European Union framework for national Roma integration strategies. In fact, associations are a privileged form for citizens to have a voice.

Portugal has one of the lowest rates of civic participation in the European Union. Our country belongs to the pattern of lower civic participation together with Greece, Spain and Italy, according to the Eurostat data. In this group of countries, the engagement in an associative activity covers about 30% of citizens in average. But in a closer view we realise that this pattern is heterogeneous concerning Roma civic participation in particular.

In Portugal, the Roma empowerment has been promoted through education, housing and health care. Social and political participation does not seem to be a priority.

This paper is the result of an on-going research which intends to: a) contribute to characterize Roma Portuguese associations, b) understand how these organisations contribute to Roma inclusion and empowerment, and c) know their position in an European context.

In this paper we propose to analyze the impact of Roma voluntary associations in gender empowerment using, on one hand, exploratory interviews with institutional representatives from the Government, the Catholic Church, NGOs and experts; and, on the other hand, interviews with associations’ board leaders.

According to our data, one of the main indicators of the low investment in empowerment through civic participation is the discretionary support given by the institutional network. We have identified nine Roma voluntary associations, all in an early stage of development despite their foundation in the mid 1990s. From those associations, three are headed by women, with one being probably the most influential and dynamic of all.
With this paper we intend to discuss how the engagement of this particular association in local and European forums and projects has given its members an opportunity to get a job and to be heard, and also why it is an isolated case.

CONSTRUCTIONS OF CARE: ALTERNATIVE PATTERNS - A STUDY OF CARE WORKERS' NARRATIVES -

Judit Acsády¹

¹HAS, SOCIOLOGY RESEARCH INSTITUTE, Budapest, Hungary

Abstract: The research exploring care workers' narrative about their vocation is a part of a comparative, trans-national project on the social construction of gender, called, "Transitions in Central and South Eastern Europe - Changing Gender Perspectives". The project was completed in 2010 and the volume containing the results is to be published soon.

Care, in terms of Virginia Held’s approach is seen as one of the basic expressions of human relations that essentially contributes to the integration and well functioning of society.

What is the understanding of and the significance attributed to care, responsibility in recent post-communist society? To what extend care is a gendered notion? What is the value of the work of those employed in institutional care? What are care workers’ motivations, gains and challenges in their everyday work?

The paper aims to answer these questions by the analyses of narrative interviews with two groups of care workers, compared to the views of members of two other professional groups. The presentation will begin with a detailed description of care workers’ social situation and the values, social attitudes concerning care nowadays in Hungary. This part of the presentation is based on the secondary analyses of data of different international and national statistical data bases (ESS, Turning Points, and KSH). In the course of the research the narrative interviews followed the statistical analyses. The texts of the interviews can serve as a source of a typology of different approaches to gendered understanding of care. Also they reveal expressions of both man and woman care workers’ vocational motivations.

The data collection and the recording of the interviews were delivered by a small research team at the Sociology Research Institute of the Hungarian Academy of Sciences.

GENDER INEQUALITY IN CHILDREN’S SUPPORT TO OLDER PARENTS: THE IMPACT OF CULTURAL AND INSTITUTIONAL FACTORS

Tina Schmid¹

¹INSTITUTE OF SOCIOLOGY, UNIVERSITY OF ZURICH, Zürich, Switzerland

Abstract: Elderly persons with functional limitations are predominantly cared for by family members. It is undisputed that daughters -apart from partners and spouses- provide most of the care work in European countries. However, there is still a debate about the causes and consequences of the gendered organization of intergenerational care. So far, the higher involvement of daughters has been mainly explained with socialized gendered behavior and gendered employment patterns. However, gender is not only a socialized role carried by individuals and enacted in family relations. Gender differences are also institutionalized in cultural and institutional systems.

The study therefore examines the impact of welfare state policies and cultural norms on daughters and sons care involvement and gender inequality in intergenerational support using the Survey of Health, Ageing and Retirement in Europe (wave 1 and 2). Which gender inequalities exist in intergenerational support in Europe and which cultural and institutional factors affect the care work of daughters and men gender inequality respectively? The influence of cultural factors and institutional structures, such as social service provision, financial support of family care (cash-for-care), legal obligations to contribute to care for parents, family obligations and cultural beliefs about gender roles is tested in logistic multilevel models. Control variables include opportunity, need and family structures on the individual and household level.

The empirical analyses show that welfare state programs and cultural norms do have an impact on gender inequality in intergenerational care. Whereas formal care services reduce the care burden of women, cash-for-care benefits and legal obligations advance intergenerational caregiving of women and strengthen gender inequality. Moreover, strong normative family obligations and traditional beliefs about gender roles increase daughters care involvement and gender inequality in intergenerational support.

RECONCILING WORK AND FAMILY AT DIFFERENT STAGES OF LIFE IN FRANCE AND SPAIN.

Julie Jarty¹

¹CERTOP CNRS, TOULOUSE LE MIRAIL UNIVERSITY, TOULOUSE, France

Abstract: This presentation proposes to compare women’s experiences of work/life balance according to their societal belonging, profession and generation. In order to reach this aim, it will cross the results of two empirical researches that have been conducted between 2007 and 2011: 1/ an European project entitled Quing, based on the frame and voice analysis of gender equality policies 2/ a PhD that have been presented on December 2010 on the gendered experiences of work/life balance by secondary school teachers in France and Spain.

A first part of the paper will present the evolution of French and Spanish gender regimes from the 1970s until today, with a specific attention to the political regulation of care work. Care work will be apprehended both through the perspective of child and elderly care. Regarding Spain, it will shed the light on the transformations of the ideal place of men and women in French and Spanish societies, from Spanish Franco’s dictatorship and the French development of family policies until the emergence of "reconciliation" issues in all European countries.

A second part of the paper will be focused on the impact of care work and family responsibilities on women’s professional involvement in the teaching profession. A specific attention will be paid to their different preoccupation according to their age and generation so as to seize the incidence of the “societal effect” and the specific problematic of care work regulation at different stages of life. Our purpose will be enhanced by more than 80 semi-directed interviews with male and female teachers aged of 30 to 65.

We will argue that Spanish women teachers from the different generations have adopted practices in opposition to the dominant gender regime during the first part of their career in order to face a
very high level of work/life conflict. Such practices contrast with their French counterparts, who continue to adopt traditional career paths and to stay the main carers in their family. However, we will show that in both countries, women are confronted to their first assignment to the care of their ageing parents during the last part of their career.

SOCIAL CITIZENSHIP AND THE GENDERED DISTRIBUTION OF CARE WORK, PAID WORK AND VOLUNTEER WORK IN SWITZERLAND

Sarah Kersten¹, Martin Gasser¹, Michael Nollert¹, Sebastian Schief¹, Ruedi Eppl²

¹UNIVERSITY OF FRIBOURG, Fribourg, Switzerland

Abstract: Following Marshall’s (1950) seminal definition, we take social citizenship to entail “the whole range from a modicum of economic welfare and security to the right to share to the full in the social heritage and to live the life of a civilized being according to the standards prevailing in the society.” These rights are to be understood as de facto rights and not only as de jure rights. Social citizenship is therefore linked to gender inequality in outcome by asking: do both sexes have equal access to social rights and do social rights benefit both sexes equally? This link between social citizenship and inequality has a normative and a descriptive element. In what follows, we briefly state the two elements and outline our contribution to each.

Firstly, social citizenship constitutes a normative benchmark for gender equality when taken together with the premise that gender ought not to make a difference in terms of access or content of citizenship. Pursuing this line of thought, it has been suggested that the right to give care be included in the concept ‘social citizenship’. In the same vein, we propose to include, in addition to care work, an often neglected dimension: the right to participate in the civil society by doing volunteer work. The latter partly overlaps with care work but also includes all forms of unpaid work in organisations.

Secondly, social citizenship points to a description of overall gender inequality in the spheres of work. As social citizenship concerns de facto rights, it is not enough to study only the legal and institutional rights. We propose instead to investigate actual and unequal realizations of the rights. To this end, we compare Swiss cantons systematically with respect to gender inequalities in paid work, care work and volunteer work. Specifically, we classify the gendered patterns of time allocation to the domains of work. We will present the typology of these working patterns. Each of these patterns corresponds to a type of mixture of practical, institutional, and cultural constraints on social citizenship rights. In other words, by looking at the gendered work time distribution we try to infer the de facto rights to work, to care and to participate in the civil society.

THE (RE-)CONSTRUCTION OF GENDER? IDENTITIES BETWEEN EMPLOYMENT AND FAMILY.

Anke Kerschgens¹

¹FB Gesellschaftswissenschaften, J W GOETHE-UNIVERSITÄT FRANKFURT, Frankfurt, Germany

Abstract: I would like to present first results of a new research project in progress concerned with the (re-)constructing of gender in

the context of giving birth to a first child or experiencing the birth of a first child (for the father) in Germany. The theoretical background of this research is the notion of the “neoliberal equality”, though at the same time structural discrimination and inequality continue. Emancipation in the sense of employment and market integration connected to the feminist goals of economic independence and the opportunity of careers and individual autonomy, get entangled with requirements of the neoliberal subjects – independence, self-reliance, competitiveness, flexibility and subjectivization. The resulting new and seemingly gender-independent identities connected to motives of acknowledgement, agency and autonomy are challenged by becoming parents, as new needs for care and bonding arise. Gender becomes relevant in a new way and identities are re-constructed. A historical background of the gender order in Germany are the gendered characters of the “bourgeois” middle-class, with its divisive allocation of employment and family and autonomy and bonding to men and women. Though the connected gendered labour division is in decline it may still be seen as a part of a genealogical matrix of gender constructions today. Thus the still unmediated opposition of autonomy as formerly connoted with masculinity and bonding as formerly connoted with femininity which is newly loaded by the de-gendered imperative of market-integration and devaluation of care may cause new ambivalences and conflicts. This includes possible backward-movements and new constructions of “naturalness”. Birth thus is a crucial point for identity constructions in at least two ways: It implies the necessity for subjects to revalue the spheres employment and family, to negotiate responsibilities and opportunities for participation, acknowledgement and power within a partner relationship and to draft a new balance of motives connected to employment and childcare. On the other hand, birth as a physical experience can be researched in its connection to the gendered or de-gendered identities of becoming mothers and fathers. How is it experienced and interpreted in connection to subjective and societal scripts of agency, bonding, autonomy and dependency and how are these (still) connected to constructions of gender?

CONSTRUCTING OF FEMININITY AND MASCULINITY CATEGORIES IN AN ACADEMIC DISCOURSE. THE CASE STUDY OF "SCIENCE AND SCHOLARSHIP IN POLAND INFORMATION SERVICE"

Katarzyna Leszczyńska¹

¹Faculty of Humanities, AGH University of Science and Technology, Krakow, Poland

Abstract: In this paper I would like to present the results of the analysis of content more than 100 articles published on the bulletin news “Science and Scholarship in Poland Information Service” concerning femininity and masculinity issues. This bulletin is supported and subsidized by The Ministry of Science and The Higher Education in Poland and its main aims are: popularization of the world’s science and information about achievements of Polish researchers. It is dedicated not only to researcher’s and academic’s societies but also to Internet users interested in scientific news. Content of this bulletin is multidimensional, includes both the natural sciences as well as humanities and the social ones. One of the problems which is quite regularly taken up by the authors are discoveries and scientific achievements related to gender issues. Some of paradigms and theoretic streams (especially evolutionary ones, sociobiology) are accented and displayed in the contents of the site, the other ones (queer, social constructionism, relative perspective) are ignored or
appear casually. This selectivity contributes to the consolidation of stereotypes about femininity and masculinity. The aim of this paper is therefore the presentation of ways of constructing of gender category in the official and mainstream discourse which represents the standpoint of The Ministry of Science and The Higher Education.

The assumption, which is the basis of my analysis, is the conviction that gender understood as a symbolic construct - both conceptual and linguistic one - is an element used in public discourse and political life and therefore is an element of power relation. Conceptualization of gender in culture depends on dominant discourses and anti-discourses. Following the thoughts of Judith Butler and Henrietta Moore, the phenomena that gender seems natural and constant for us (but not discursive one) it is due to the fact that is performative one, what means that is constantly played and performed both on a linguistic level, as well as on the other symbolic embodiments (gestures, behaviors, activities, etc.).

DE-TRADITIONALIZATION, GENDER AND NEW FORMS OF IDEOLOGY IN (FORMER)YUGOSLAVIA
Stefica Fiolic¹

Abstract: Focussing on a female biographical narrative of a former Yugoslav in Croatia, this presentation discusses the de-traditionalization of gender relations against the backdrop of socialist modernization, the breakdown of Yugoslavia and ethno-nationalism. Contrary to the widely held notion that patriarchal gender relations were simply revitalized or invented in the context of a totalitarian, ethno-nationalist ideology this presentation suggests a change of perspective. Based on Detlev Claussen’s concept of Alltagsreligion (everyday religion), which as modern ideology does not lay a claim to truth but rather offers a set of flexible and fragmented certainties and prejudices, I want to discuss how ethnic notions of gender allow women to deal with individual and collective crises albeit in an ideological -yet specifically modern- manner. Furthermore the presentation tries to show how everyday-religious interpretations have become part of a contemporary scientific common sense.

HIGHLIGHTING GENDERED PROCESSES IN RESEARCH ON ROMANTIC LOVE
Cosima Rughinis¹, Daniel Puju Latea ²

¹Sociology, University of Bucharest, Bucharest, Romania,
²Anthropology, University of Michigan, Ann Arbor, Michigan, United States

Abstract: One of the core theoretical problems in gender research consists in highlighting gendered processes. The issue of accounting for the relevance of a specific category is, of course, not particular to gender, and it has been brought to the forefront of social research by scholars in the ethnomethodological and conversation analysis schools of thought. The question is pertinent for common sense and scientific perspectives alike: how is it that one comes to see the relevance of a particular categorization (such as gender) in a specific situation? This paper discusses scholarly accounts of observations of gendered processes, in empirical research on the topic of romantic love. Researchers of romantic love have often looked at the ways in which love bears on the reproduction of gender inequality, and on hetero-normativity – as well as, in a reciprocal perspective, at how gender is brought to shape love experiences and relationships. We investigate research articles from several disciplinary perspectives – sociology, women’s and gender studies, psychology, history and philosophy – in order to understand what methods authors employ to highlight gendered processes. We discuss several strategies of using gender classifications to elicit and to structure information – especially by observing interactions of men and women, by comparing accounts of women to accounts of men, and by relying on men- or women-only accounts. We also discuss different methods for finding gendered processes – including a naturalistic approach aiming at unobtrusive observation, the creation of gender-relevant research interaction situations, and more directive solicitations of gender-focused accounts. We look into researchers’ interpretive work to use empirical arguments in order to answer gender-relevant questions. Last but not least, we discuss our attempts to observe gender in pieces of research on romantic love that do not invoke gender classifications literally.

UNDERSTANDING THE INTERACTION BETWEEN PATRIARCHAL IDEOLOGY AND GENDER FROM THE STRUCTURE/ AGENCY RELATIONSHIP
Ayben SONER¹

¹SOCIOLOGY, ADNAN MENDERES UNIVERSITY, AYDIN, Turkey

Abstract: The main objective of this research is to examine, in the base of gender, the theories which emphasize individual’s power of resistance and emancipating potential under the power relations within the society, and to investigate whether the women within those theories preserve the same resistance potentiality in the face of patriarchal system.

When we look at the historical development of feminist theory we see the dominance of a dualistic approach and a women/men dualism. But in this research a different approach which will bring to the fore the interactions between gender and patriarchal ideology and change and resistance potentials which gender holds in itself will be adopted instead of adopting dualisms and segregations. Bringing the agency to the fore in terms of this interaction indicates, on the one hand, freedom and potential for change which gender preserves within, and on the other hand, underlies the limiting, dominating and mostly internalised aspects of patriarchal ideology over men and women.

This research adopts an approach which emphasises the changeable structure of power and its interactions in terms of gender. In addition, this research also drive from the idea that the patriarchal ideology does not only dominate and restrain women but also men.

Since the research subject and main arguments progress over everyday life, it requires not only a theoretical analysis and discussions but also a practical application field for the research. Therefore, in this research we tried to choose a field which can both reveal the oppressions of patriarchal ideology and can expose the freedom potential which gender holds within itself. In this respect the field-work of this research will be based on the analysis of photographs. The relationship between the photographer and photograph -as it is in the relationship between agent and structure- works in a process that on the one hand artist is affected by the political, cultural, economic and social conditions, art movements and dominant ideologies but on the other hand activates her/his own potential for
freedom and resistance points. In this research it is expected from this analysis of everyday life photographs to bring to light that how the interaction between patriarchal ideology and gender, within the everyday life, re-produced.

**IDEAL LOVE: CAUSE OR PREVENTION OF GENDER VIOLENCE.**

Tatiana Santos Pitanga¹, Lidia Puigvert²*, Emilia Aiello Cabrera³

¹University of Girona, Girona, ²University of Barcelona, Barcelona, ³Empresa, Autonomous University of Barcelona, Cerdanyola del Vallès, Spain

Abstract: Especially in Spain, in both academic and public debate and campaigns to prevent violence, the concept of ideal love is pinpointed as one of the causes of violence, without this causality first being scientifically proven.

Theories related to this concept (Barron, 1999; Bleeder, 1993, Stephen and Tavora, 2008) argue that the pursuit of ideal love leads to frustration because real love can not correspond to the false expectations caused by the former. They also affirm that ideal love entails the subordination of women to power relations, since women are invalidade and subjugated by the person they consider to be their ideal love. In short, according to these theories, ideal love is incompatible with the freedom and independence of women and is connected to suffering and unequal relationships between men and women.

In Spain, these theories are providing the theoretical basis for programmes to prevent gender violence, identifying ideal love as being responsible for this kind of violence. Campaigns, educational material and training courses with an impact at a national level, funded by government agencies, rely on these theories, without them having been validated scientifically. However, international scientific studies question the direct causal link between ideal love and gender violence. Munck & Korotayev (1999) indicate that societies that strengthen equality for both sexes place more importance on ideal love than those societies that legitimise unequal attitudes. International research (Bukowski, Sippola, & Newcomb, 2000, Duque, 2006; Goldner et al., 1990; Gómez, 2004; Melgar, 2009, Oliver & Valls, 2004) also argues that attraction models that reproduce unequal relationship are linked to engaging in violent relationships and remaining in them.

This paper forms part of the research carried out by SAFO, CREA’s women’s group, on the preventive socialisation of gender violence and also the research on theories of love initiated by Jesús Gómez. In this paper we describe how it becomes essential to look for scientific evidence and arguments that allow the idea of “ideal love” to be either accepted or rejected as the cause of gender violence or, conversely, as one of the best ways to prevent it. Through this new approach we would like to support prevention programmes by providing a scientifically valid theoretical basis.

**WHEN EMOTIONS IMPOSE CAPTIVITY: BATTERED WOMEN MAINTENANCE OF VIOLENT CONJUGAL RELATIONSHIPS**

Sara Dalila Aguiar Cerejo¹

¹CesNova, Faculdade de Ciências Sociais e Humanas, Lisbon, Portugal

Abstract: This proposal represents an attempt to deepen knowledge within the thematic of gender violence from the sociology of emotions perspective. The objective is to shed light on some questions such as the perpetuation of violent situations, while carefully analyzing the victim’s reaction: why they never tried to separate from the aggressor, reasons for the continuity of the violent conjugal relationship, why they never reached out for help from qualified institutions, amongst others. Several projects, that the research team from Universidade Nova de Lisboa developed, showed that most women demonstrate a seeming “passiveness” towards the violent acts that they suffer.

This paper aims to present some new interpretations and results, collected from 60 in-depth interviews with women who experienced domestic violence situations, and to deepen knowledge on the importance of specific social emotions in the experience of violent situations, particularly within conjugal ties and the way that those emotions can, eventually, conditioning social action. Our hypothesis was that some social emotions can inhibited an explicit reaction towards the acts of violence. We used shame and guilt as two specific indicators to understand battered women’s passiveness.

Women’s passiveness towards the acts of violence they suffer, and the maintenance of the violent relationship, can be explained as the willing to correspond within a normal pattern is always present in the social agent, therefore, when a person perceives that «identity behavior is not meeting normative expectations or that behavior is failing to realize that values imposed by cultural frameworks, this individuals will experience negative emotions, particularly embarrassment, shame and guilt» (Turner & Stets, 2005:119). Thus, the shame and guilt that a battered women might feel, can be induced by her perception that the failure to correspond to a normative conjugal relation. Scheff & Retzinger also consider «shame to be the basic engine of repression - the cause of complete inhibition» (2001, xix).

Hence, an approach from sociology of emotions, particularly with the emphasis on the gendered emotions, allowed us to understand how women’s reaction in specific contexts of domestic violence, are conditioned by particular social emotions, such as shame and guilt, as some theoretical discussions have showed women to be more prone to experience.

**WOMAN BATTERERS IN THE LAND OF GENDER EQUALITY**

Lucas Gottzén¹

¹Department of Social Work, LINKÖPING UNIVERSITY, Linköping, Sweden

Abstract: Swedish family policy has for several decades promoted equality between men and women, and has aimed to create a ‘new’ man. This gender-equal masculinity has been pivotal in representing Sweden as a progressive and modern country; there is today a collective self-conception of Sweden as a gender-equal country and, consequently, Swedish men as generally being gender equal. This paper argues that the notion of the gender-equal man is construed through an exclusion of Other, problematic men. Drawing on a qualitative study of men in treatment for using physical violence against their female partners, the paper shows that the ‘woman batterer’ is an excluded masculine subject constructing violence against women as a practice that regular Swedish men do not practice. Drawing on Deleuze and Guattari’s work, identity is here seen as in constant becoming in relation to discourses and materiality.
Thus, one is not born a woman batterer; it is a constant becoming of relations between, for instance, bodily practices, subjects, and normative notions of masculinity and violence. The wife batterer subject position is consequential for combating violence against women in that (i) many men do not understand their practices as violence, but as fights or self-defense and a man could therefore go on beating his partner for long time without becoming a woman batterer. (ii) Some men are reluctant to join group therapy since they unerstand the other men as woman batterers. (iii) Finally, most men in the study are hesitant to tell friends and family about their violence in fear of being seen as woman batters. Consequently, the violent men’s silences and fears of becoming woman batters reproduce notions of Swedish men as gender equal and non-violent.

**BODY, SEXUALITY AND DOING GENDER IN WORK AND ORGANIZATIONS**

Päivi Korvajärvi1

1School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: My aim is to address the theoretical challenges of how to conceptualize gender in feminist sociological research on work and organizations. The contents and requirements of work, on the one hand, and the activities of the employees, on the other, are intertwined in the current service economy. Further, recent research results show that the body and embodiment are becoming crucial aspects as both the requirements and skills of work. Affective and aesthetic presentations including sexuality have become more and more central in everyday work.

Thus far, the concept of doing gender has formed the background of such influential conceptualizations as gendered processes, practicing gender or ceremonial and remedial ways of doing gender which are widely used in feminist research on work and organizations. Originally based on the principles of ethnomethodology and accordingly on interactional and micropolitical activities, the researchers have stretched the meaning of doing gender to also concern wider ways of conceptualizing social life. Doing gender has also been used as a tool for analyzing images, symbols and discourses as resources in creating femininities and masculinities in interaction. Studying discursive gender has its roots in feminist poststructuralist thinking and particularly in the concept of performativity. However, neither ethnomethodological nor poststructural approaches have provided conceptualizations which would include the body or sexuality in their analyses of doing gender in work and organizations.

The main message of the Finnish and European studies of doing gender in organizations is that in everyday work gender – femininities and masculinities – are undone and dissolved. At the same time, however, the research results show that the employees reflected gender both unconsciously and consciously in work. My aim is to open and examine the problems of the concept of doing gender when analyzing the current requirements of using affective and aesthetic presentations in work. My argument is that it is necessary to integrate the body and sexuality into the conceptualization of doing gender when doing feminist social research on the current work and organizations. Furthermore, the argument is that the analysis of the body and sexuality is crucial in order to conceive of doing gender, whether as undone or reflected, in work and organizations.

**FROM DOING TO UN-DOING GENDER? ON THE SOCIAL REPRODUCTION OF INEQUALITY AND THE POSSIBILITY TO DEACTIVATE GENDER**

Heidemarie Winkel1

1Sociology/Gender Sociology, UNIVERSITY OF POTSDAM, Berlin, Germany

Abstract: Within gender sociology, it is a hard and fast knowledge, that gender had become a universal classification schema in the modern era. As a consequence of the new mode of social differentiation, new forms of female and male sociality had emerged, namely as dualistic relation of two and only two sexes. The social gender arrangement had been established as relation of categorical inequality. Since the 1950s (Garfinkel) - and differentiated in the 1970s and 80s (Kessler & McKenna, West & Zimmerman) - this has been theoretically developed on the micro-level as interactive ‘making’, known as doing gender; since then gender is conceived as a characteristic of social situations, routinely generated within interactions.

During the second half of the 20th century, gender has experienced a considerable weakening as universal principle of categorization. This is due to the cutback of formal barriers (law) as well as the institutionalisation of equality standards. As a consequence, women face a high inclusion in some social fields like politics and law; but in others – like for example in education and employment – we can still find a high range of inequality. This led sociologists to the question how inequality is still reproduced despite the equality norm. One answer indicates that interaction has a particular function for the maintenance of gender inequality (despite the de-institutionalisation of inequality). In particular, workplace studies are showing for example that gender is predominantly an effect of its situational making and fabrication. This leads me to the theoretical question whether gender can be irrelevant within social relations. I argue from a micro-sociological, interactional perspective that there are possibilities to refrain or to avoid doing gender, but not its decomposition or systematic disregard in general. This will be discussed within the paper using the example of father’s behaviour in the domestic sphere. I argue that gender can be irrelevant in certain situations in the sense of a situational ‘shutdown’ or abandonment.

Key Words: Interaction – Ethnomethodology – Microsociology – Un-doing Gender – Gender Sociology

**STABILITY AND CHANGE IN GENDER RELATIONS FROM A PERSPECTIVE OF STRUCTURATION THEORY**

Heike Kahlert1

1Department of Social Sciences, UNIVERSITY OF HILDESHEIM, Hildesheim, Germany

Abstract: The title of the ESA 10th Conference seems primarily to pay attention to changes in social relations. “Turbulent times” seem to be times of change. But current social analysis, especially with regard to questions of gender, makes clear that there is not only change under conditions of turbulence but always also stability in social relations. This poses a challenge to analytical tools.

Theoretical and empirical studies from the field of women’s and gender studies describe stability and change in gender relations in very different forms and with different theoretical frameworks.
IDENTITY MATTERS: DONOR OFFSPRING’S NARRATIVES OF SELF

Gabriele Griffin 1, Ruth Holliday 2, Stevi Jackson 3*, Petra Nordqvist 4

1Centre for Women’s Studies, University of York, University of York, York, 2Sociology, University of Leeds, Leeds, 3Centre for Women’s Studies, University of York, York, 4Sociology, University of Manchester, Manchester, United Kingdom

Abstract: This panel seeks to address the ways in which social relations, and in particular intimate relations to self and other, are changing as a function of the turbulences created by advances in biotechnology and globalization, and their effects on gender constructions of self/other and gendered relations. The four papers, in very different ways, argue that turbulent times, articulated through accelerated change, impact forcefully on gendered identities as these are embodied and lived.

THE EMERGENCE OF SUBVERSIVE DISPOSITIONS IN WOMEN

Laurence Bachmann 1

1Gender studies / Sociology, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: How can we understand what makes a woman gender sensitive? What gives her a relatively critical attitude towards the gender order? Our study seeks to analyze the emergence of dispositions towards gender change over feminine life courses. These dispositions are expressed in discourse and in belief, as well as in practical forms or actions which may not be perceived as such. They are rooted in a process of self-transformation which takes place over time.

This presentation is based on semi-directive, qualitative interviews with 30 women seen in their unconventional discourse or practices related to gender as being concerned with gender transformation. Through them we will identify the different socialization instances (family, education, work, friends, etc.) that have forged these dispositions. We will also be building up an understanding of the trigger events in a woman’s life course that act as socialization agents with the capacity to change her outlook. Dispositions to gender transformation will be approached within a dynamic framework. We will identify the different life course phases, moving, for example, from a propensity for gender reproduction to a propensity for gender subversion, or from an absence of gender-related problematization to gender problematization, or vice versa. Then we will define the contexts for the activation and suspension of attitudes towards gender transformation (professional or conjugal, public or private, women-only contexts, etc.).

Our approach, based on dispositional sociology, aims to provide an understanding of the factors which incite some women to transform gender through analysis of the socialisation processes contributing to dispositions towards gender transformation and by circumscribing the contexts of activation and suspension of those dispositions. Women, sometimes disposed towards reproducing gender and at other times disposed to transforming it, are thereby considered in a pluralistic sense as having heterogeneous dispositions. The dispositional approach comes within a sociology of individuals which takes into account the balances of power such individuals are involved in.

THE GIRLS WHO WON THE LOTTERY?

Elina Oinas 1

1Sociology, UNIVERSITY OF HELSINKI, University of Helsinki, Finland

Abstract: The paper discusses contemporary girls in Finland – the girls who internationally are viewed as the ones who won the lotter by being born in an assumedly gender equal society, with world’s best primary education for everyone – in the context of another societal development: the growing uncertainty, anxiety and disillusionment among youth and the “porousness” of society. Contemporary societies are permeated with both incredible promises and demands on girls; the contradictory pressures showing also in the statistics on mental ill-health among Finnish youth. Located between the extremely different views on what constitutes the context of today’s girlhood, girls themselves need to develop new kinds of “intelligence” and skills to cope. This paper focuses on ideas of selfhood, self esteem and individuality on the one hand, and social bonds on the other. The data deals with young students’ social lives on facebook, touching upon expressions of assumed freedoms, future hopes, the limited space for socially acceptable presentations of self and embodiment, and issues of shame, embarrassment, decency and affect.
"THE SEXUALIZATION OF YOUNG GIRL BODIES IN COMMERCIALS"

Laura Maria Corradi

Abstract: Girl’s sex appeal is today used to make whatever product look more sexy. Their silhouette, intriguing smiles and sights, have been used for cigarettes, alcoholic beverages, cars – from the most desirable objects to the common ones. Nowadays practically any product can be associated with girl’s body. The siren effect of youth and femaleness plays an important role. From clothed bodies to gradually more revealing poses. From the exposition of legs and decolête to the exhibition of other naked parts, girl’s intimacy has been discovered as an adding value device. From bare bodies, to the semiotic mutilation – from the use of very young girls and sexualized children to degrading allegories and settings – the speed of change in commercials has been acquiring momentum. Some countries have come up with regulating publicities – others didn’t. Censorship seems to have little power, when commercial are sent on internet and become available also in orthodox countries. The latest phase in publicity is given by 3 elements: the use of pornographic scenery – made it softer and adapted to the larger public; a growing trend in ‘spicing up’ the situation with a hint of violence; the suggestion of children’s and adolescents’ innocence just waiting to be corrupted.

These 3 elements have been insinuating commercials in the last decade first with allusions and then in a more open way. Often what I had found as a dash, a whisper in the paper publicity – was an overt statement in the website (mentioned somewhere in small letters in the commercial). So part of the methodology became searching on internet (and investigating the related links) for those elements that were only ‘suggested’ in the advertisement. By following secretly induced traces in widespread publicity we found backgrounds of studies and previous versions explicitly referring to pedophilia or to the eroticization of young girls’ body.

The paper focus on this 3rd aspect of the research - and presents the semiotic analysis of recent paedophilus commercials.

YOUNG CANADIAN WOMEN’S DISCURSIVE CONSTRUCTION OF HEALTH AND THE BODY IN THE CONTEXT OF THE CURRENT DISCOURSE ON OBESITY

Haifa Tlili, Geneviève Rail

Abstract: The general goal of this project (funded by the Social Sciences and Humanities Research Council of Canada 2008-2011) is to examine and deepen our understanding of the connections between, on the one hand, dominant obesity discourse and biopedagogies (Wright, Rail, MacDonald, MacNeill & Evans, 2006) and, on the other hand, young women’s discursive constructions of the body and health.

Using a poststructuralist orientation, we are interested in understanding power and the ways in which differences—particularly those embedded in modern binaries such as thin/obese, normal/pathological, masculine/feminine, White/Other—are constructed and maintained within discursive strategies. Our use of the term construction reflects the poststructuralist notion that reality is made and not found. Young women construct “reality” through language and cultural practices (Rail, 2002; Wright, 2001).

In the first facet of the project, we have investigated the deployment of the obesity discourse and biopedagogies across “texts” (e.g., oral texts, writings, and images) found in a sample of (dominant and marginalized) contemporary cultural sites targeting young adult women in central Canada. In the second facet of the project, we have organized participant-centred conversations with young women. The participants were 100 young women between 18 and 25 years of age and from the Ottawa and Montreal regions (50 English-speaking and 50 French-speaking young women and include: (a) young women from varying sexualities, race, ethnicity and dis/ability; (b) young women from rural/urban and work/study environments; and (c) young women from diverse socio-economic milieus).

For instance, the North African Immigrant women living in Montreal construct their immigration as a breath of fresh air that enables them to live rich bodily experiences (e.g., freedom to go out without the fear of the others’ gaze and to participate in a wide variety of physical activities). Most participants reproduce dominant Canadian discourses on obesity and individual responsibility for health. As hybrid subjects, however, most have strong Maghreb references around the body, food as well as cultural and religious practices. A few women manifest resistances toward both Canadian and Maghreb discourses and norms around bodily practices.

BECOMING PARENT IN TURBULENT TIMES: THE IMPACT OF ECONOMIC INSECURITY ON FERTILITY DECISION IN FRANCE AND GERMANY

Marie-Thérèse Letablier, Anne Salles

1Centre d’Economie de la Sorbonne, Paris, CNRS /CES UNIVERSITÉ PARIS 1, 2German studies, Université Paris-Sorbonne, Paris, France

Abstract: Variations in fertility level across Western countries have been widely explored by demographers who highlight the structural aspects leading to these variations. France and Germany display contrasted situations with regard to fertility behavior: France has one of the highest fertility levels in Europe whereas Germany has one of the lowest. We suggest here to explore the impact of economic insecurity and labour market uncertainties on fertility decisions in the two countries. We hypothesize firstly that the impact varies according to gender and class and secondly that the impact depends on the institutional and cultural context. Methodology uses a comparative qualitative approach, analyzing the narratives from a sample of young men and women living in two medium sized cities in Western Germany and France. Results emphasize the strong effect of norms related to gendered parenthood and to the value of children in the two countries, and notably the acceptance of external childcare. They also underline the effect of policies supporting parenthood in reducing the perception of insecurity, therefore enabling a transition into parenthood.

GENDER INEQUALITIES IN THE PORTUGUESE LABOUR MARKET: JOB SATISFACTION AS AN INDICATOR

Ana Lúcia Teixeira Dias

1CesNova, Faculdade de Ciências Sociais e Humanas - UNL, Lisbon, Portugal
Abstract: The labor market is a privileged arena for the analysis of gender inequalities. The recent massive entrance of women into it, the conditions in which this access occurred, the social representations and the values associated with the concept of femininity and the issues of work-life balance contributed to frame women’s participation in the labor market. With this presentation we intend to address a less common topic of interest when gender inequalities at work are concerned: could job satisfaction be an echo of persistent gender inequalities entrenched in common routines and, most important, in the perceptions of both men and women regarding their responsibilities as professionals? Job satisfaction, besides an independent field of research, could be a relevant set to understand the mechanisms that underlie the objective differences between men and women at work (e.g. pay gap) and to realize the extent to which gender roles are embedded in the intellectual structures of men and women.

To accomplish this research plan we resorted to a previous work on job satisfaction trajectories of Portuguese workers between 1998 and 2001 and isolated the gender dimension. The data comes from the European Household Community Panel, a longitudinal survey led in 12 EU member states on an annual basis until 2001. This panel is representative of the population both at cross-sectionally and at a longitudinal level and covers many subjects, such as demographic information, employment, health, social relations, and migration, among others.

While some findings seem to indicate that there are no obvious differences between men and women’s satisfaction in their workplace they also seem to demonstrate that men and women apparently perceive the labor market and manage their personal life distinctly. This is, in fact, correlated to distinct evaluations in terms of job satisfaction and to the fact that men and women dissimilarities in this field are closely linked with different types of work relations. So, our starting question for this presentation is not if women are more or less satisfied than men with their job, but how are women interpreting their personal and professional trajectories and how this mirrors expectations that are built upon unequal gender roles.

GENDER-SPECIFIC OCCUPATIONAL SEGREGATION, GLASS-CEILING EFFECTS, AND EARNINGS IN MANAGERIAL POSITIONS: RESULTS OF A FIXED-EFFECTS MODEL
Anne Busch 1, 2, Elke Holst 1
1German Socio-Economic Panel Study (SOEP), German Institute for Economic Research (DIW Berlin), 2Berlin Graduate School of Social Sciences (BGSS), Berlin, Germany

Abstract: The study analyses the gender pay gap in private-sector management positions based on the German Socio-Economic Panel Study (SOEP) for the years 2001-2008. It focuses on occupational gender segregation, and on the effects of this inequality on earnings levels and gender wage differentials in management positions. Our paper is, to our knowledge, the first in Germany to use time-constant unobserved heterogeneity and gender-specific promotion probabilities to estimate wages and wage differentials for persons in managerial positions. The results of the fixed-effects model show that working in a more “female” job, as opposed to a more “male” job, affects only women’s wages negatively. This result remains stable after controlling for human capital endowments and other effects. Mechanisms of the devaluation of jobs not primarily held by men also negatively affect pay in management positions (evaluative discrimination) and are even more severe for women (allocative discrimination). However, the effect is non-linear; the wage penalties for women occur only in “integrated” (more equally male/female) jobs as opposed to typically male jobs, and not in typically female jobs. The devaluation of occupations that are not primarily held by men becomes even more evident when promotion probabilities are taken into account. An Oaxaca/Blinder decomposition of the wage differential between men and women in management positions shows that the full model explains 65 percent of the gender pay gap. In other words: Thirty-five percent remain unexplained; this portion reflects, for example, time-varying social and cultural conditions, such as discriminatory policies and practices in the labor market.

PATTERNS OF CONFLICT MANAGEMENT AND DECISION-MAKING IN TOP MANAGEMENT TEAMS (TMT): GENDER PERSPECTIVE
Helena Desivilya 1, Michal Palgi 1
1Department of Sociology and Anthropology, Max Stern Academic College of Emek Yezreel, Emek Yezreel, Israel

Abstract: The current article constitutes a component in a research program, which aims to elucidate the dynamics of involvement and participation of women and men in top management teams (TMT), focusing on conflict management and decision-making processes. Specifically, the investigation attempts to discern the subtle and hidden aspects of gender construction in such senior teams and their effects on power relations between women and men as reflected in decision-making and conflict management processes.

The emphasis of research program is on group dynamics in teams characterized by diverse membership, due to the mounting prevalence of these structures in organizations and the organizational reality of highly heterogeneous workforce. Notwithstanding the burgeoning research on diversity in work teams, studies highlighting this feature in the dynamics of TMTs, especially gender diversity have been scarce. The importance and potential impact of strategic decisions made in such groups and the fact that women are more likely to be involved in these processes warrant in-depth examination of the internal dynamics of TMTs, particularly patterns of participation and influence exerted by women in comparison to men.

The research is based on integration of two corpuses of knowledge: the role of conflict and diversity (notably gender) in the processes of decision making and conflict management in teams and gender perspective on management. Based on these bodies of literature, we study women’s formative experiences as members of TMTs; namely, how women, in comparison to men, engage in negotiating authority (or legitimacy), value (or recognition and reward), support (organizational networks) and commitment (definition of “successful” TMT member).

Initial findings of the pilot phase of this research will be presented, including the results of content analyses of non-participant observations and individual interviews with members of TMT in one or two organizations.

TRACING GENDER INEQUALITIES IN THE WORK EXPERIENCE OF CZECH WOMEN
Alena Krzikova 1
Abstract: In the paper I trace the options women have, choices they make and strategies they create to cope with barriers to their self realisation at work and to combine work and family life according to how these are shaped by the socio-economic and political processes in the Czech society, actual life cycle stage and by other characteristics such as age, education level, maternity etc. The main research focus is types of discriminations and discriminatory practices and experiences reflected in women’s narratives and shaping women’s working and life paths.

The research applies the biographic-narrative method focused on work biography in the life story of Czech women. When analyzing the “professional biographies” I analyze 60 biography narratives of women in various stages of the life cycle and in situations where they are at risk of being disadvantaged in the labour market, in relation to the key categories of maternity, education level, and age. Social constructivism, grounded theory and reflexive interpretation form the project’s research paradigms.

Using qualitative data it is possible to find interconnections between different levels of the society and multiple variables. For example a historical comparison by studying women who are currently mothers and older women who were mothers during the period of state socialism it was possible to compare the disadvantage factors and discriminatory practices that existed in both of these historical periods. The current forms of discrimination are the result of the structural changes that have occurred in the labour market over the past two decades, the increase in wage differentiation, new job prestige, job insecurity, and the competition for jobs. Individual types of discrimination in the current system of working relations and social policy arrangements are strongly linked to care issues and maternity.

Women in every education group encounter discrimination, but specific forms of disadvantaging of women vary by education - in terms of the opportunities available to them to solve or avoid disadvantaging situations. Discriminatory practices, the gendered and complex arrangements of the state’s social policy, and the strategies women adopt in response to and mainly in acceptance of this system influence each other to form a labour market in which the mechanisms of discrimination and the threat of discrimination are constantly reinforced.

ORDER, PLEASURE & POWER - DOING GENDER EQUALITY AT WORK

Annika Jonsson

1Department of Social Studies, KARLSTAD UNIVERSITY, Karlstad, Sweden

Abstract: Despite the progress that has been made in this area, questions of gender equality should perhaps still cause turbulence when handled at work. The problems are often still big enough to stir emotions and make people take different stances. Or? This paper explores how the employees at a museum deal with, or do, gender equality. Gender equality is primarily used as a resource when the employees organise the museum in a moral and practical sense. They perform what is termed the body count routine and is thus able to place different units at their workplace in a hierarchy – sex-mixed units are placed higher than non-mixed. They also enact gender and as women and men they create pleasure by staging amusing fake arguments, or homely bickering, about gender equality. Referring to gender equality is, finally, a method used by some of the men in order to coerce women to interact with them. When a gender equality-card is played by a man, most women enter the “woman-part” (albeit only symbolically at times) in an opposite, hierarchical sex drama. Gender equality is, in short, done in a multitude of ways, none of which actually problematises or challenges issues of gendered power in the organisation. It is argued that this way of dealing with, or doing, gender equality is not uncommon in the Swedish context and that it underpins class-related inequality as well as a heterosexual norm.

The paper departs from my dissertation entitled “A Nice Place – The Everyday Production of Pleasure and Political Correctness at Work”, and develops some of the themes presented there.

GENDER, CULTURAL CAPITAL, AND SIGNALING OF CLASS MOBILITY: CULTURAL CONSUMPTION AS A SIGNAL OF FEMALE CLASS STATUS IN KOREAN MARRIAGE MARKET

Dongyoub Shin 1, Margeum Kim 1, Kangsan Lee 2, Sookyoung Ji 2

1YONSEI UNIVERSITY, 2Seoul National University, Seoul, Korea, Republic Of

Abstract: This paper explains the asymmetry in the consumption of high culture between females and males in Korea from the perspectives of status signaling, gendered division of status labor, and class mobility. We argue that the accumulation of cultural capital through the consumption of high culture can be more important to females than to males, since cultural capital serves as a status signal needed for upward class mobility by females in marriage market.

The existing literature of cultural consumption suggests that females not only have a stronger taste for high culture, but also actually consume a larger amount of high culture, than males. According to our data on cultural consumption in Korea, 2000-2009, Korean females also turned out to consume a far larger amount of high culture than males. Also, not only Korean women consume a greater amount of high culture than men, even among female population, there was a clear asymmetry between married and single women. Single females turned out to consume a significantly larger amount of high culture than married females in Korea. Moreover, we found that female members of upper-middle class are the most active consumers of high culture in Korea. The current paper explains this asymmetry by focusing on the role of cultural capital in upward class mobility for females in marriage market.

We attribute this interesting observation to the signaling of attractiveness in marriage market by Korean upper-middle females under the unique situation in which first, the accumulation and maintenance of family status symbol are considered as a female work in gendered division of labor, second, the other bases of class distinction have lost discriminating effect, and, thus, third, cultural capital is regarded as one of the most effective ways to distinguish between members of upper class and the others.

As cultural capital is likely to be perceived as an effective status signal, in marriage market, those who aspire to upward class mobility may send a signal of their attractiveness by aggressively consuming high culture. This tendency of achieving distinction through high culture is likely to be most salient for single females in which marriage is the most effective way of class mobility.
We empirically test our arguments using a data-set that contains information on cultural industries and cultural consumptions in Korea.

**ALIENTATED FORMS OF HEGEMONIC MASculinity IN THE LOW WAGE SECTOR**

Lisa Pfahl 1, Lena Schuermann 2, 3

1 Skill Formation and Labour Markets, Social Science Research Centre Berlin, 2 Department of Business and Economics, Berlin School of Economics and Law, Berlin, Germany

Abstract: This contribution addresses the relation between identities and discursively constructed subject positions in the service sector, which is a main part of the low wage sector with an impact on the practises of gendered workers. In Germany, over 916,000 people are working in this sector with a rising proportion of men, who still hold a minority status. They therefore develop special self-images and identities, which are at the center of our methodological and empirical concern.

A discourse analysis (Keller 2005) of the German cleaning industry over the 20th century, using an archive of journals, allowed us to reconstruct the changing strategies of the sector association in gaining men as cheap labor force. In 1934, the cleaning sector became a recognised occupation requiring formal training ('Handwerk'). Nevertheless, the sector remained devaluated, because of its symbolically female character as unpaid work and its precarious working conditions. The contemporary strategy of the sector's associations is to actively raise the status aiming to 'masculinise' the skills and demands of the job. While the discourse adresses cleaning as skilled work the working conditions remain insecure and unprotected. The workers lack benefits, have no job perspectives and cannot support a household.

The paper builds on this double perspective on knowledge and practices in the field, which was developed in a dissertation research project on "Knowledge and Subjectivity of low wage workers". The reconstruction of the discourse reveals how binary stereotypical types of masculinity are created: the criminal worker vs. the bourgeois manager. The male workers however identify with different forms of this hegemonic masculinity: not the manager, but the healthy and loyal worker, the specialist or the entrepreneur. In order to embrace higher status subject-positions habitually, the men therefore identify with alienated hegemonic forms of masculinity in the cleaning sector. Biographical case studies of male janitors will be presented to discuss questions of adaptive and alienated forms of hegemonic masculinity in the low wage sector.

**BETWEEN INVERTING AND PERVERTING GENDER AFFILIATION? DOING RESEARCH ON MEN IN FEMALE DOMINATED PROFESSIONS**

Isabelle Valérie Zinn 4

1 Faculty of Social and Political Science, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: While scientific research has been primarily focused on women who occupy professions that are considered to be 'masculine' - particularly on women who embrace a professional career in executive functions - little investigation has been conducted on men who work in female-dominated occupations. When investigating masculinities, a valuable contribution is to not only focus on men in traditional business or in the private sector but also men and their role within occupations that have long been primarily associated with women.

This paper looks into the transformation of the Swiss labor market and will shed light on its segregation and the construction of masculinities. Acknowledging that the construction of gender is an ongoing and multi-factorial process, we should recognize the existence of "multiple masculinities" (Kimmel; Messner, 2010). We can assume that people produce themselves as gendered beings, but we still need to know how exactly they make sense of the every day world in gendered terms. We thus aim to explore the management of gender affiliation taking place in different occupational contexts.

We also tackle the question of what makes society consider a profession to be feminine or masculine. We deal with this issue by stating that a simple statistical majority of either men or women in a profession is not reason enough to consider it as gendered. It is more likely to be a matter of qualities being exclusively associated with one or either sex.

Our epistemological posture does not allow us to consider the 'group' of men as a homogenous category in search of a common social identity (Young, 1994). Although the affiliation to a gender may be 'true' it is not necessarily relevant in every situation (Cefai, 2010). In arguing thus, we draw attention to the fact that we should beware of taking gender differentiation as a starting point in our analysis, in order to avoid an ideological bias and a search for simple confirmation of our assumptions.

**HARSH WORKING CONDITIONS AS A TOOL OF MASculinity. THE EXAMPLE OF THE CONSTRUCTION SECTOR**

Marta Ibanez 1, Claudia Narocci 2, Capitolina Diaz 3

1 Department of Sociology, UNIVERSITY OF OVIEDO, Oviedo, 2 ISTAS (Union Institute of Work, Environment and Health), Madrid, Spain

Abstract: Most jobs continue to be shaped around the ideal of the masculine breadwinner who is available to work anytime, anywhere, as long as is necessary, and in any health/unhealthy and un/safety working conditions. Furthermore, dated masculine conventions still dominate some workplaces and are a major barrier to health and safety. In particular those associated with physical risk taking, minimizing or ignoring pain and / or injury. In this sense, during the Fordist decades, unions, labor law and its effective enforcement, imposed limits to market pressures in the workplace and encouraged men to break from these roles. But in the last decades, as neoliberalism grew, and union power in the workplace has been reduced, a new masculinisation process is taking place. The present crisis is (or can be) a new arena for the construction of masculine cultures in the workplace that will set new barriers for women working in them, who because of their gender have the
challenge of proving that they are good enough workers to remain at work.

The aim of this presentation is firstly to show the complex web of factors related to the reduction or the possible strengthening of this male working class sub-culture: knowledge of the law and occupational risk prevention, the role of institutions responsible for enforcing it, the effect of company size and management style, deregulation of the sector (sub-contracting and false self-employment),... Secondly we analyze the role that these working conditions, particularly those related to health and safety, in the phenomenon of occupational segregation by gender. Information for the first objective is drawn from secondary sources which will be presented with a "state of the art" on these features of the subculture of male workers. The sources of information to achieve the second objective are in-depth interviews carried out by the authors in the construction industry through research being developed with funding from the Spanish Ministry of Equality and Ministry of Education.

**RECONFIGURED HEGEMONIC MASCULINITY: CONTROLLING TRANSNATIONAL ECONOMIC OPERATIONS AND THE SELF**

Diana Lengersdorf¹

¹Institute of Sociology, TU DORTMUND, Dortmund, Germany

**Abstract:** The "former" hegemonic masculinity was characterized by an industrial-societal/bourgeois masculinity. Those men who were the winner of the "old " configuration of practices controlled the key industries in the local economy, so the locally hegemonic patterns of masculinity were typically integrated with the local patterns of capitalism as R.W. Connell and Julian Wood (2005: 348) stresses. With globalisation transnational operating companies get significant. By including the findings of Foucault (2006), Niklas Rose and Peter Miller (1994), we can not only observe an expansion of economic processes in a territorial sense, but fundamentally an economisation of the social. The whole life has to align to the market. This includes the "external" force to live a market-oriented life and the "inner" force to do so by own criteria that are build up in sense of the market (e.g. self-optimizing, self- commodification). This interminable process of becoming (a subject) is described as enterprise self. The enterprise self is analysed as a new hegemonic form of subjectification.

In the presentation I will argue that enterprise self has an impact on hegemonic patterns of masculinity. Therefore the first findings in men’s studies regarding a new configuration of hegemonic masculinity, describes as "transnational business masculinity", have to be amended. The thesis is that the winners of the "new" configuration of practices not only control transnational economic operations but also control themselves in sense of enterprise self.

**COMMUNICATIVE ACTS WHICH PROMOTE NEW MASCULINITIES. OVERCOMING HEGEMONIC MASCULINITY IN THE WORK-PLACE**

Oriol Rios¹, Marta SOLER ², Laura LOPEZ ²

¹SOCIOLOGY, AUTONOMOUS UNIVERSITY OF BARCELONA, Cerdanyola del Vallés (Barcelona), ²SOCIOLOGY, UNIVERSITY OF BARCELONA, BARCELONA, Spain

**Abstract:** Scientific literature has emphasized how the reproduction of hegemonic masculinity has derived into several social problems, like gender violence, criminality or bullying (Connell 1987, 2005, 2006; Kimmel 2000, Messerschmidt, 1993, Bourdieu 1998). Labour inequalities are not an exception; in fact there are several findings about the influence of this model in cases of sexual harassment suffered by women in the work-place (Mackinnon, 1979; Thomas & Kitzinger1997; Wise & Stanley 1987). However, there is a lack of research and analysis about the processes for overcoming the problems caused by the hegemonic masculinity in the work area. In this paper we will present evidences about these processes of overcoming raised from the research Impact of communicative acts in the construction of new masculinities funded by the Spanish Ministry of Science and Innovation, in the Research and Development Programme (2010-2011), and leaded by the University of Barcelona. The research illustrates the influence of communicative acts in the promotion of new masculinities, far from the hegemonic one, which are based on values like equality and solidarity. One of the case-studies carried out in the project is settled in the work area. So, we will present some data about how specific communicative acts can favour the recognition and visibility of new masculinities in the work-place, specifically in a Small and Medium-size enterprise and a health-related organization. The aforementioned research shows the link between based on desire communicative acts— including verbal and non verbal ones - and new masculinities; and at the same time their usefulness to prevent gender inequalities.

**GENDER DIFFERENCES IN STEMM STUDIES AND CAREERS: TOWARDS A NEW PARADIGM**

Clemencia Cosentino ¹, Beatriz Chu Clewell ², Linda Kimmel ³

¹MATHEMATICA POLICY RESEARCH, ²The Urban Institute, Washington DC, ³Michigan State University, East Lansing, MI, United States

**Abstract:** Gender is a significant predictor in almost all educational studies and it is especially important in thinking about careers in STEMM (science, technology, engineering, mathematics, and medicine) in the United States. Gender disparities used to be ascribed to differences in course-taking and performance, which prevented women from pursuing STEMM studies at the post secondary level. Although gaps in course-taking and performance have narrowed if not disappeared, recent research that focuses on persistence of talented women in the STEMM career pipeline suggests that factors other than performance and course taking may be discouraging women from continuing on this career path. We contribute to this literature by using data from the Longitudinal Study of American Youth (LSAY) to chart the educational progression of students in the United States towards a STEMM career and uncover the junctures at which the paths for men and women diverge. In so doing, we identify and describe a potential STEMM talent pool made up of participants adequately prepared to pursue university studies in STEM. We then use structural equations to model two key outcomes for this subpopulation (enrollment in a STEMM university studies and subsequent employment in STEMM) and uncover differences in factors associated with each outcome for men versus women. Leveraging the richness of the LSAY data set, we are able to study factors such as parental and teacher encouragement, attitudes towards math and science, and post-secondary school educational plans. The analyses lead to several important conclusions regarding gender differences in the factors associated with enrollment in STEMM university studies and employment in STEMM.
Most importantly, results highlight the inadequacy of the existing (male-driven) paradigm to study women’s persistence in STEMM.

FEMICIDE ACROSS IBERIAN FRONTIERS

Maria José Magalhães 1, Yolanda Rodriguez Castro 2*, Ana Castro Forte 3

1Centre of Educational Investigation&Intervention, UNI. PORTO - FACULTY OF PSYCHOLOGY AND EDUCATIONAL, Porto, Portugal, 2Università Vigo, Vigo, Spain

Abstract: This paper aims to explore the femicide rates in Portugal and Spain and to reflect upon the social responses that are being given to gender violence victims in the European Westernmost countries.

In the last decade, Portugal and Spain are devoting themselves to stop violence against women throughout supporting advocacy movements, providing more social response devices to women victims and carrying out important changes in the national law. Even though both countries are given important steps to eradicate this problem, the femicide rates have been consistently high and have not decreased during this period (Rodriguez, 2010, 2011; Pais, 1998).

Taking this facts into account, it’s time for us to reflect why such important measures don’t seem to be effective to prevent femicide.

We’ll start by presenting a comparative analysis of female homicide in intimate relationships while addressing to some legal differences between both countries. After that we will reflect about the phenomena taking into account the cultural, the social, the legal and the health system framework in order to understand the social behaviours of perpetrators (Loinaz et al, 2010) in these countries and come up with some possible exploratory lines to understand the complex picture underlying femicide.

NEW CHALLENGES FOR ANTI-VIOLENCE ACTION IN MIGRATORY CONTEXTS

Francesca Alice Vianello 1, Giulia D’Odorico 1

1Department of Sociology, UNIVERSITY OF PADUA, Padua, Italy

Abstract: Italian women’s shelters and in general all social services deal with more and more women of different linguistic, religious and cultural backgrounds. In order to reduce the misunderstandings and mutual prejudices among social workers and new beneficiaries, we think that it is urgent to investigate and to try to comprehend different languages, social constructions and cultural meanings of gender-based violence.

The paper describes some results of a broad research on violence against women and migratory processes in Italy. The main research aim is to investigate the hypothesis that the differentiation among social definitions of gender-based violence depends on: a) simultaneous, multiple and interdependent patterns of domination that a woman lives on the basis of her culture and language (“race”), class and position in the social stratifications; b) different professional skills and styles of social workers; c) mutual biases in defining the sources of violence and the motivations of perpetrators.

In particular, the paper focuses on the results of four focus groups realized between 2009 and 2010 in two diverse Italian cities: Venice, in the rich Northeast of Italy, and Palermo, in the poor Italian South. In order to verify our hypothesis, two focus groups have been realized in each city: the first one involving first generation migrant women coming from several countries; the second with social workers employed in different typologies of public social and health services.

The paper presents an analysis of the discourses produced during the four focus groups. In particular, it examines: different interpretations of gender-based violence; consent and dissent borders within the patterns of violent relationships; problematic issues related to antiviolence practices.

FEMICIDE AMONG ETHIOPIAN JEWISH MIGRANT WOMEN IN ISRAEL

Shalva Weil 3

3Hebrew University, Jerusalem, Israel

Abstract: This paper will focus upon the most extreme form of violence against women, namely wife (or female partner)-murder known as femicide (or uxoricide). The phenomenon, which may be increasing as a result of increased media attention or as a result of migration, will be described in its Israeli context with special reference to Ethiopian Jewish migrants, who have come to Israel since the 1980’s and are continuing to immigrate to Israel today. Statistical data will also be provided on femicide among other Israeli ethnic groups.

The paper is based upon research carried out in Israel among Ethiopian Jews from 2005-2009 in which 30 full-scale interviews were carried out with murderers, survivors of murder attempts, family members, clergy, social workers and others. Data will be presented providing the social characteristics of the murdered women, and the social “profile” of the male murderer. Narratives will quote some of the interviewees. Information will be provided as to whether femicide generally takes place in the domestic arena, what murder weapon is most common and under what circumstances the murder takes place. In conclusion, a discussion will ask whether femicide is related to accelerated migration to the West, and globalization.

POLICE RESPONSES TO WOMEN’S TRAFFICKING IN LISBON AND LOS ANGELES
Ana Prata¹, Amy Denissen¹

¹Sociology, CALIFORNIA STATE UNIVERSITY NORTHRIDGE, Northridge, United States

Abstract: The trafficking of women for the purpose of sexual exploitation is a central social problem facing most societies. As a complex phenomenon, women’s trafficking has been researched in several ways: victimization; legal and policy frameworks (national, European, and international law); baseline statistics; recruitment and migration patterns (countries that are mostly importers, exporters, and both); and responses to trafficking by various agencies (NGO’s, police forces, women’s state agencies). Our paper focuses on law enforcement responses to women’s trafficking in two major cities: Lisbon and Los Angeles. While the trafficking in women is anchored in global migration and global economies, local and national state agencies are responsible to responding to trafficking. Informed by comparative and narrative approaches, this paper explains how the police force in these port-cities deals with victims and perpetrators of trafficking including, how they construct gendered meanings regarding victimization and criminalization, how they address human and citizenship rights, and how racial and gender inequality are embedded in the perception and treatment of those involved in trafficking. Our findings show that “migrant status”, “gender”, and “class” act jointly in determining responses to trafficking.
RN 34 Sociology of Religions

RELIGION AS A FORMATIVE PROCESS BASED ON SHARED EXPERIENCES – PRELIMINARY INTERPRETATIONS OF DIFFERENCES BETWEEN EUROPE AND CHINA TODAY.

Horst J. Helle¹

¹ Institut für Soziologie, UNIVERSITÄT MÜNCHEN, München, Germany

Abstract: Rather than looking at religion as a reflection of – and reaction to – a reality that is self-sustained and independent of religious phenomena, religion can be seen as a formative process based on shared experiences, in the course of which a specific reality is created. The paper is dealing with the religious construction of reality. From this point of departure it looks at recent phenomena in central Europe and in mainland China. The comparison is utilized to develop a concept of a specifically European condition of religion. Emotional reactions to fate may – or may not – be equipped with a religious “tone” or “color” depending on the inclination of the individual involved and the culture in the context of which fate is experienced. It is shown, what the conditions are that make it likely or unlikely for such a religious coloring of emotions to occur, and why at present that likelihood is larger in China than in Europe.

The whole endeavor suggested in this abstract depends on the definition of religion. A social relationship in which at least one of the interacting persons is believed to be immortal is here defined as religious. Given the ancient tradition of ancestor worship in China and the considerable importance of components of contemporary culture there, which can be interpreted as existing in the continuity of that tradition, countless interactions with “immortals” can be identified. In Europe by contrast, interaction with immortals is a rare occurrence.

Key words: social construction, interaction with immortals, China, Georg Simmel, Peter L. Berger

"ALL THINGS ARE POSSIBLE". TOWARDS A SOCIOLOGICAL EXPLANATION OF PENTECOSTAL MIRACLES AND HEALINGS

Jörg Stolz¹

¹ ISSRC-ORS, UNIL, Lausanne, Switzerland

Abstract: Pentecostal miracles and healings have often been described and interpreted but rarely explained in their sociological workings. As former research implies, actual biomedical effects of Pentecostal healings are possible (the so-called “placebo effect”), but quite limited. In Pentecostal healing services, however, very impressive miracles and healings are routinely produced: Paralytics arise from wheelchairs, cancerous ulcers disappear, legs grow, cavities are mysteriously filled, and the deaf suddenly hear. Drawing on a case study and qualitative interviews, this paper offers a sociological, mechanism-based, explanatory scheme for the observed phenomena. It is argued that a number of “social techniques” (e.g. suggestion, rhythm, music), context-factors (e.g. audience size and beliefs) and causal mechanisms (e.g. probability-, latency-, selection-, and editing-effects) are combined in an ingenious way in order to produce miracles and healings.

THE EMOTIONALIZATION OF RELIGION

Regine Herbrik¹

¹ Institut für Soziologie, TU BERLIN, Berlin, Germany

Abstract: Within the past few years, emotions have become an increasingly important research subject in the sociology of religion. This development is not just caused by a new research perspective; it rather reflects the empirically growing relevance of experiencing and expressing emotions in religious life. Newly founded, fast-growing churches with a pentecostal or evangelical orientation are, according to Hervieu-Léger and Champion, especially characterized by their emphasis on the emotional dimension of religion. Based on the results of an empirical study, the paper shows the performative, narrative and interactive elements of this new emotionalized religion, which is becoming more and more characteristic of contemporary forms of Christian life.

In the paper it will be first argued, that so-called “feeling rules” (as coined by Arlie Hochschild) play a vital role not only with regard to the dogmatic aspects of Christianity, like the two commandments of the New Testament, for example, which in fact are explicit feeling rules. They are also relevant concerning the exertion and expression of Christian belief. In the paper, it will be shown, how believers get socialized into theoretical and practical “emotional knowledge”. This includes asking the question: which emotions are socially desired and which are respectively unwanted within a certain parish, rite, type of situation, or even part of the liturgy?

Secondly, the paper demonstrates that religious procedures, rituals and narratives, like the liturgical order of a church service or the genre of conversion testimonials, are equipped with intriguing choreographies of consecutive emotional states, in addition to their widely known sacral characteristics.

Thirdly, as part of the paper, the relation between the claim for a “sensational religion” (as stated by Birgit Meyer), and, therefore, for almost a tangibility of the Holy Spirit, which can be observed especially in newer Christian congregations, and the thereby involved emotions will be addressed.

THE ROLE OF EMPATHY IN THE UNDERSTANDING OF RELIGIOUS PHENOMENON AND EXPERIENCE

Federico Antonio D’Agostino¹

¹ DEPARTEMENT OF CULTURAL AND EDUCATIONAL STUDIES, UNIVERSITY OF ROME III, ROMA, Italy

Abstract: The concept of empathy is at the crossroad of phenomenological analysis and symbolic interactionism as a theoretical perspective and a methodology to look into the religious experience understood as symbolic reality which we develop in facing not only the last condition of existence but also the most crucial rites of passage in the life cycle (C. Geertz, V. Turner, R. Bellah, Van Gennep). The symbolic perspective allows for the understanding of the liminal stage of religious experience which situates itself be-
between and betwixt unconscious and conscious dimensions. The empathic frame allows for the penetration into this phenomenon by overcoming the boundaries of otherness in order to look into the phenomenon from the point of view, the emotions, and the feelings of the actors, so that the object becomes subject fused into the intentionality and the meaning which is attributed to the gesture, the action, and the language. The concept and the method of empathy is highly used in the analysis of social diversity and the provinces of meanings which go beyond the ordinary life; also the religious phenomenon expresses some form of otherness into which to penetrate and to plunge into the play of ritual interaction and communication.

BOUNDARY LOSS. TRANSCENDENCE, RELIGIOUS SYMBOLS AND ADVERTISING

Carlo Nardella

1Department of Social and Political Studies, UNIVERSITY OF MILAN, Milan, Italy

Abstract: Alfred Schutz defined religious experiences as a shock which compels us to break through the limits of our world of everyday life and to shift the accent of reality to another finite province of meaning. These experiences depend on symbols socially constructed by means of a linguistic code considered to be in possession of the religious institutions. Although concentrated and maintained over time by the institutions as a deposit of meaning, these symbols are increasingly used for marketing purposes by subjects different from those traditionally installed within the religious field.

Through the analysis of a sample of advertisements gathered from Italian magazines from the period 1989-2009, the paper proposes a model interpreting the presence of religious symbolism in commercial advertising as the objectification of a knowledge system in which the transition from the paramount reality to the religious sphere tends to be lost.

SOCIAL RELATIONS AND SOCIAL ROLES IN ROMA HAMLETS IN SLOVAKIA AFTER RELIGIOUS CHANGE

Tatiana Podolinska

1Slovak Academy of Sciences, Institute of Ethnology, Bratislava, Slovakia

Abstract: The contribution inform about the SIRONA project that was conducted in year 2010 among the Roma in Slovakia. One of the goals of the project has been to comprehensively map out the locations of all churches, religious groups and movements which are having an impact among the Roma in Slovakia. In addition was searched the influence that spiritual conversions would have on social relations and social roles of Roma in Slovakia. Research was aimed also to learn the influence of religious missions for social change and potential for social inclusion of Roma (based on the set of uniform indicators of social inclusion).

The SIRONA research confirmed the basic hypothesis that the influence of religious mission leads to social changes and under certain conditions also to social inclusion (in all three target groups including the majority opinions of the independent, outside observers, we can state that all 14 of our research indicators showed a minimum of 80% success). The social change of the Roma in many cases was able to not only break the religious stereotypes but also the ethnic stereotypes. The contribution further pays attention to the issue of obstacles of social inclusion of Roma that occur in polarizing of various church groups dealing with Roma. The end is devoted to issue of religious participation of Roma as expansion of social network in Roma communities.

GENDER EQUALITY AND THE THEOLOGICAL KNOWLEDGE SYSTEM: CHANGING RELIGIOUS GENDER CONCEPTS IN EUROPEAN MODERNITY

Heidemarie Winkel

1Sociology/Gender Sociology, UNIVERSITY OF POTS DAM, Berlin, Germany

Abstract: Women’s ordination is often used as evaluation criterion for equality standards in the churches. This is not only the case for the Roman Catholic Church or Orthodoxy, but also for Protestantism, where church work is featuring a gender-based division of labour. Statistics about women’s ordination in Protestant churches are illustrating this until today. The segregation of women’s ordination is a relic of the longsome history about the quarrel concerning religion as women’s profession since the 1920s. Moreover, gender constraints are symbolically reinforced in everyday social practice of male and female pastors despite formal equalization; as a consequence, the ministry itself has nourished a particular gendered shape.

Contrariwise, Protestant Churches in Europe, like for example in Germany, defined guidelines for the realisation of gender justice in ministry already two decades ago. These principles are indicating a programmatic transformation on the theological level. This leads to the question, in how far a change in the understanding of women’s ministry has become reality in the theological reservoir of the religious knowledge system. From the perspective of institutional theory, the development can be characterized as de-institutionalisation of formal barriers in different European countries, cutting back legal limitations since the 1940s, 50s and 60s. To my opinion this was an important, but not a sufficient condition of change. I argue that the reflection and reformulation of religious knowledge structures like theological anthropology, was the primary precondition of transformation. The theological differentiation of gender concepts is the central key for the development of religious gender equality standards. It is the aim of the paper to show first, how the new paradigm based on gender justice came to light within the theological reservoir of knowledge. Second, I will discuss in how far the theological approach is affecting the institutionalised core of Christian religion in European modernity. This is based on the assumption that religious change is not simply enforced by social change, but needs religious legitimation.

Key Words: Gender - Knowledge - Theology - Ordination - Social Inequality

INTERNET AND THE SPREAD OF BELIEFS

Gerald Bronner

1sociologie, UNIVERSITÉ DE STRASBOURG, Strasbourg, France

Abstract: Our contemporary society is thus characterized by the rate of information which flows through it, and the huge development of the possibilities of access to this information. By using the metaphor of communicating vessels, one might think that this
A QUALITATIVE FIELDWORK ON THE PRACTICE OF RELIGION IN TWO DIFFERENT TURKISH CITIES

Kurtulus Cengiz

Department of Sociology, ABANT IZZET BAYSAL UNIVERSITY, Bolu, Turkey

Abstract: In parallel to the recent political polarization in Turkey between the "Islamist", "Republican" and "Kurdish" movements; some critical Turkish cities has been emerged as the symbols of this cleavage such as Izmir, Erzurum, Kayseri and Diyarbakır with their different socio-historical and geographical backgrounds. The overt difference in the electoral geography also implies the different tendencies in life-style choices and the uses and consumption of the urban spaces in the daily life. Indeed, the perceptions and practices of religion could be considered as one of the most outstanding aspects of this difference.

This paper discusses the preliminary findings of a research project called "Social Structure and Religion in Turkey" sponsored by The Scientific and Technological Research Council of Turkey. 48 in-depth interviews and participant observations were conducted in Izmir and Kayseri. The former has been historically stigmatized among the Turkish People as the “gavur” (non-Muslim) city at the Aegean Coast; while the later is a well known conservative and highly religious city in Central Anatolia with a dense concentration of industry and trade.

This paper will argue that religion is of critical importance in the private lives of the people in both cities; but, the way they live religion differs both in personal and social levels. While in Kayseri the religion is being lived and practiced in a communal and communitarian way which I will try to conceptualize with the concept of “familial sphere”; Izmir is giving a totally opposite picture by living and insisting to keep the religion in the individual/private sphere.

THE CHANGING ROLE OF RELIGION FROM THE PERSPECTIVE OF THE POLISH MUSLIMS. [KEY WORDS: ROLE OF RELIGION, IDENTITY, RELIGIOUS CONVERSION TO ISLAM, POLISH MUSLIMS]

Monika Ryszewska

1NICOLAUS COPERNICUS UNIVERSITY, Torun, Poland

Abstract: For years Poland has been functioning as an island on the contemporary map of Europe drew by sociologists of religion. The historical conditions as well as the intense transition process of the political system that took place at the end of the last century had a significant impact on the shape of the Polish society. Sociologists carry out numerous research projects in an attempt to define the directions of changes in the religiousness of Poles, but in most cases their target groups are limited to Catholics. It is therefore justified and interesting to broaden the scope of investigation and have a closer look at the Polish Muslims. I will attempt to analyse some of the processes taking place within the Polish society as well as the Muslim group itself. I will not constrain myself only to researching into the question of religiousness, I will try to depict it from a rather broad perspective. The growing immigration of confessors of Islam to Poland, the efforts aimed at the restoration of the Muslim identity of the Polish Tatars, the rising numbers of conversions to Islam, as well as the spreading debate on Islam in Europe are factors that led to a growing interest in this subject matter in Poland. And led me to ask myself the following question: how does it happen that the
Abstract and the political opportunity structure approach (modified so as to take into account also the religious context).

Thereby, this paper aims at contributing to our knowledge of a growing migrant community which has hardly been studied in a comparative perspective and to our theoretical understanding of the relation of immigrant religion and political mobilisation.

I'M ATTENDING CHURCH AND I LIKE IT. THE ROLE OF RELIGION ON THE INTERNET.

Marta Kolodziejskaa1

1Institute of Sociology, UNIVERSITY OF WARSAW, POLAND, Warszawa, Poland

Abstract: In the presented research three leading Polish websites connected with Catholicism (fronda.pl, apostol.pl, opoka.org) will be analysed in order to find out if their users create and sustain a virtual community and if so, on what basis. Both the content analysis and the discourse analysis will be used. The former is used to show what channels of communication are available on the aforementioned websites: chatrooms, comments, online support groups, etc. Discourse analysis is used to recreate the way non-religious media and popular culture are depicted and discussed on those websites. The aim of the discourse analysis is to show what are the perceived differences between the religious websites’ users and non-users and what effect does it have on virtual community building.

The initial findings speak in favour of the thesis of virtual community building, as it is based mainly on a shared religious worldview, values and morality, as well as the differentiation between “us” (religious websites users) and “them” (other users). The differentiation is made by expressing contempt for modern culture and its promotion of sex, violence and vanity on the aforementioned websites. The process of individualization is also present, as far as choosing to visit a religious website or not is concerned, however, it does not mean that we should perceive religious websites’ users as a set of independent individuals. To the contrary, reasons for visiting a religious website regularly, participating in discussions, chatrooms and online religious support groups can be viewed as an incentive to create a new type of religious community. How will they transform traditional community bonds remains to be seen.

THE END OF IRISH CATHOLICISM?

Gladys Ganiel1

1Irish School of Ecumenics, TRINITY COLLEGE DUBLIN AT BELFAST, Belfast, United Kingdom

Abstract: The paper explores the changing role and status of Catholicism in contemporary Irish society. With the publication of the Murphy Report on clerical sexual abuse in the Dublin Diocese in November 2009, confidence in the Irish Catholic Church seems to have reached an all-time low. Already reeling from previous revelations about sexual and physical abuse, the defensive reactions of the Vatican and high-ranking Irish clerics have been lampooned in the media. Disaffected Irish Catholics have expressed their dismay through actions such as a one-day mass boycott, a protest at Dublin’s Pro-Cathedral, and the development of the website countmeout.ie, which instructs people on how to exit the Catholic Church.

Polish and Muslim identities become compatible? Given that Polish identity is predominantly Catholic, this question strikes me as particularly interesting. The history of Islam in Poland is largely based on that of the Polish Tatars. It is the largest group of contemporary Muslims that currently lives in Poland. The second group in my research are Polish female converts to Islam. A modern Polish woman is becoming a woman who refuses the stereotypical role of a housewife and chooses to have a career instead. A question that results from this is whether a modern Polish Muslim woman rejects the above presented attitude towards life due to the set of values promoted by the Islam? I hope that a comparison of two groups: Polish female converts and Tatar women, will help me answer this question and give a picture of modern Polish Muslims. I would also like to stress the following: just as Prof Monika Wohlrab-Sahr I am not trying to create a sensation out of the conversion of European women to Islam per se. One of my aims is to analyse the phenomenon from the point of view of the sociology of religion, which approach has not been explored so far by Polish researchers.

MIGRANT RELIGIOUS NETWORKS AND POLITICAL MOBILIZATION: CHRISTIAN AND MUSLIM AFRICAN MIGRANTS IN TWO EUROPEAN CITIES.

Miriam Schader1,2*

1University of Goettingen, Goettingen, Germany, 2Sciences-Po Paris, Paris, France

Abstract: Despite the growing literature on the compatibility of migrant religions and democracy, on the governance of religious pluralism, and on political Islam, an important aspect of migrant religion has often been ignored in European research: religion as a resource for entering the democratic decision-making process.

This paper will argue, however, that religion may be a relevant basis for entering the political process. In order to do so, the religious and political engagement of migrants from Sub-Saharan Africa, resident in Berlin and Paris, will be analysed. The data comes from fieldwork accomplished in 2009 and 2010.

For Berlin, first results reveal a divide along religious lines: Whereas African Christians get involved politically as Christians, African Muslims are more or less invisible. African Christians are active at two levels: they mobilise for religious objectives, and also get involved for secular goals - explicitly doing so as Christians. At the same time, there are African Muslims who are politically active in African secular associations, but they do not get involved as a Muslim minority in Germany, nor as African Muslims defending the rights of the African minority.

In Paris, the picture is not as clear. The first preliminary results suggest that we may nonetheless observe some parallels between the two cities. Like in Berlin, some of the African churches in Paris are rather well organised and also get involved politically. Nevertheless, just like in Berlin, associations which are explicitly political in their outlook are more likely to be secular. African Muslims are much more present in Paris than in Berlin. However, once again, African Muslims do not seem to draw on their religion to get involved politically.

In order to account for the divergence between the religious groups as well as for the parallels and differences between the two cities, a model of religious networks as resources for immigrant political mobilisation will be developed, drawing on social network theory.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
But the Irish story is not one of a straightforward transition from ‘Holy Catholic Ireland’ to a secular, irreligious Republic. Drawing on in-depth case studies of laypeople who visit the Holy Cross Benedictine Monastery in Rostrevor, and Slí Eile, the Dublin-based Jesuit Centre for Young Adults, this paper explores how some ‘ordinary’ Irish Catholics are choosing to express their faith in the context of the challenges facing their institutional church. Using narrative analysis of the qualitative interviews with participants, it argues that ‘alternative religious institutions’ such as Holy Cross and Slí Eile provide Irish Catholics with a religious space that is perceived as ‘free’ from the corruptions of the institutional church, where they can experience healing and personal growth. Beyond that, these alternative religious institutions facilitate people’s exploration of issues, beliefs and spiritualities that they think have been neglected by the Irish Catholic Church, such as ecumenism, social justice and contemplative prayer.

The paper also aims to explore wider questions about the role that alternative religious institutions like Holy Cross and Slí Eile play both in reforming churches in light of scandal, and in developing people’s faith in a context of increasing secularisation. Accordingly, it contributes to wider European discussions about changing religious cultures, the changing public role of religion, and the dynamics and transformation of beliefs.

GOVERNING SACRALITY: MARIAN APPARITIONS IN PORTUGAL

Nora Ines Machado

Abstract: Throughout the world, certain places are sacred, like Mecca, and Jerusalem or the Mount Shasta in the Siskiyou County, California, or Mount Kailash in Western Tibet. These are places of worship, reverence and inspiration where pilgrims or spiritual searchers come to pray, to sacrifice and to heal. These are veritable shrines, natural or human made, enshrining sacred forces as for example, sacred labyrinths, sacred relics, site of holy events, or abodes of the gods. Also holy places concentrating telluric forces like those found in volcanic peaks, holy springs and ancient groves. This article focuses on the study of two places in Portugal, sites of Marian apparitions and centers of worship. The first, one of the largest catholic Marian apparition sites in the world, Fátima, a holy shrine that receives thousands of pilgrims and tourist every year. The other is the place of another Marian apparition, at Leira, also in Portugal, a site of “failed sacralization,” as defined by two important churches, the Catholic Church and the Christian Orthodox Church in Portugal (although a church was built at the place, there were followers and initial support from religious institutions.” The study focuses on the governance of sacred sites. How does the sacrality emerge or is collectively “recognized” as sacred? Typically, there is a “politics of sacralization.” How is it managed, regulated and “integrated” into societal realms and sacrality sustained?

MODERN ASCETICISM : CHANGING RELIGIOUS VIRTUOSITY

Isabelle Jonveaux

Abstract: According to Max Weber, monks are professional of asceticism, religious virtuosi. But asceticism in modern religious life is undergoing massive changes. Monks do not speak anymore about asceticism and it could be thought that it is disappearing. This exercise to reach a more perfect religious life is still present but its definition and its practice changed. Modern religious asceticism is no longer a performance in fasting or in enduring suffering which the monk imposes to his own body. Monks nowadays want to show to society that they are neither better nor stronger than the other, but the religious vocation was for them the best way to self-realization. In this case, how can be defined the religious virtuosity? Is there still an idea of religious perfection? Virtuosity can be defined so only if it is recognized as virtuosity by society. Does society think that monks are virtuosi? And what kind of virtuosi? This paper will seek to understand how the study of modern asceticism reveals the changing virtuosity of modern monks and to define the new kind of monastic virtuosity in the modern society. Thanks to inquiries in European monasteries (France, Austria, Italy), it will be possible to explore the lived asceticism in modern religious life and to understand which sense monks give to asceticism nowadays.

Richard Norrie

Abstract: This paper aims to establish what it is about religiosity that matters in explaining the link between religion and civil society, using a multilevel research design. At the micro level, it is tested whether or not belief and/or religiously derived social capital matter for participation. Simultaneously it is tested if one’s belonging to the dominant religion matters, as a revision to existing work on Protestant exceptionalism, which tends to ignore the underlying religious context in relation to the individual’s confession. Existing studies have also formulated at the macro level, hypotheses pertaining to the overall religious devoutness of countries and their religious traditions, but have failed to take into account the religious composition of the state. It is argued here that separation of church and state will increase civil society participation as if the state is closed to religion, then it will manifest itself in civil society. Finally, an interaction is hypothesised that with greater separation of church and state will come a greater effect of religious belief on participation, as disestablishment will foster less complacent, more vital public religions. Preliminary results have shown strong evidence for positive effects of both religious belief and social capital and that those belonging to the dominant tradition tend to participate more. Greater separation of church and state is associated with greater civil society but belief increases in efficacy only with regard to the political side of civil society. This analysis will be conducted using multilevel analysis of the latest wave of the European Values Survey (2008), supplemented with data from the Religion and State project. It will be framed in light of secularisation theory, showing that religion, both in terms of belief and social practice remain relevant for the organisation of public life, although this is constrained by the composition of the hosting state itself.

PLURALISM IN SWITZERLAND, FACTS AND FICTIONS OF A NEW REALITY

Christophe Monnot

Abstract: Using a multilevel research design. At the micro level, it is tested whether or not belief and/or religiously derived social capital matter for participation. Simultaneously it is tested if one’s belonging to the dominant religion matters, as a revision to existing work on Protestant exceptionalism, which tends to ignore the underlying religious context in relation to the individual’s confession. Existing studies have also formulated at the macro level, hypotheses pertaining to the overall religious devoutness of countries and their religious traditions, but have failed to take into account the religious composition of the state. It is argued here that separation of church and state will increase civil society participation as if the state is closed to religion, then it will manifest itself in civil society. Finally, an interaction is hypothesised that with greater separation of church and state will come a greater effect of religious belief on participation, as disestablishment will foster less complacent, more vital public religions. Preliminary results have shown strong evidence for positive effects of both religious belief and social capital and that those belonging to the dominant tradition tend to participate more. Greater separation of church and state is associated with greater civil society but belief increases in efficacy only with regard to the political side of civil society. This analysis will be conducted using multilevel analysis of the latest wave of the European Values Survey (2008), supplemented with data from the Religion and State project. It will be framed in light of secularisation theory, showing that religion, both in terms of belief and social practice remain relevant for the organisation of public life, although this is constrained by the composition of the hosting state itself.
Abstract: New data is available to understand the religious pluralism of Switzerland from the National Congregations Study of the Swiss National Research Program on religion (PNR 58). A comprehensive census of all religious communities contributes to determine the number and location of religious groups.

13% of religious congregations in Switzerland belong to non-Christian persuasions. Mainly established since 1975, this important proportion of groups should not obscure the other reality of internal pluralisation within Christianity. Surprisingly, despite their diversity, non-Christian groups share some common characteristics like urban communities with few members and financial weakness.

This paper will attempt to describe the pluralism from the congregation’s perspective and present the legal, social and religious variables constraining groups to adopt some forms to settle in Switzerland. It will also show that Switzerland has two faces. First: religious, rural and traditional; second: urban and pluralized. We aim to present, for the latter, new challenges (both legal and social), that stand with a new sharpness in Switzerland.

Keywords: Congregation - Pluralism - Switzerland – Non-Christian - legal constraints

RELIGION AND VOLUNTEERING ACROSS 116 COUNTRIES

Matthew Richard Bennett

Abstract: This paper provides a better cross-national understanding of aggregate rates of volunteering in a nationally representative sample of 116 countries contained in the Gallup World Poll – the most extensive country sample to date.

Seven explanations of national differences in voluntary association involvement are identified and tested at the country level: religious tradition, devoutness of, religious diversity, modernization, government welfare spending, level of democracy, and experience under communist rule.

Our OLS models suggest that voluntarism is higher in more devout societies, religiously heterogeneous societies, and societies that spend more on social welfare. Countries with a Protestant religious tradition also have higher substantive levels of volunteering. We were able to identify a suppressor effect: it appears that the positive effect of devoutness on voluntarism is suppressed by social welfare spending in our early models.

Countries with Orthodox religious traditions and other religious traditions have lower levels of voluntarism. Modernization is associated with a small decrease in volunteering, supporting claims that economic development may be associated with greater female labor force participation and use of technology (Putnam 2000). Level of democracy and experience under communist rule are not associated with volunteering.

MULTIPLE LOCATIONS OF RELIGION IN STATE INSTITUTIONS: EMPIRICAL INSIGHTS FROM SWITZERLAND

Irene Becci, claude bovay

Abstract: This paper is concerned with mediators that make religion possible. In this sense, it can be associated with a concept developed by Andreas Hepp et al called ‘Mediatization’. However, rather than a Zeitdiagnose that posits that once ‘pure’ immediate religious practices are now mediated ‘events’, I am going to go against the grain of historicism and depart from the assumption that all religious practices require mediators of some kind, and have always done so. Invoking an approach derived from Actor Network Theory, the research is primarily focused on the rituals of the Catholic Mass. The argument is that what in Catholicism is called ‘Real Presence’ is independent of any particular belief, because it is realized by a collective, an assemblage of mediators. The first task of this research project is to analyze the controversies around the issue of Real Presence, and the second is to establish the way in which these have been stabilized within the Catholic Church. Whereas these are often seen as theological debates, I hope to show that a sociological analysis can help to unravel the way in which associations have been forged between objects through distinctive patterns of imitation which can be referred to as ‘rituals’ but which are not empty gestures supported by the ‘social’ phenomenon of belief, but actualizations of ‘presence’ through which a distinctive religiosity becomes possible.

GODS BY DESIGN: FROM HUMANISTIC SPIRITUALITY TO TRANS-HUMANISTIC SPIRITUALITY

Stef Aupers

Abstract: Whereas Christian religion is eroding in most parts of Western Europe, New Age spirituality is becoming widespread (Houtman & Aupers, 2007, Heelas & Woodhead, 2005). In most academic work on New Age spirituality, it is held to convey a sacralization of nature and especially the ‘inner nature’ of the individual – doctrines that are rooted in romanticism, esotericism and the humanistic tradition (Campbell, 2007; Heelas, 1996; Lynch, 2007).
This paper argues that this academic consensus is informed by a romantic bias towards humanistic forms of (self)spirituality and a blind spot for "trans-human spirituality". Based on extensive fieldwork in Silicon Valley (about 35 in-depth interviews with programmers and computer-specialists) and various ICT-magazines, the discourse of this type of spirituality is analyzed and its ontologies and methods of salvation systematically compared with those of humanistic spirituality. Inspired by the work of Nietzsche and developments in the field of computer technology and biotechnology, trans-humanistic spirituality is not about "what we are by nature" but "what we can become"; it is not about re-embodiment but disembodiment; not about "finding" the sacred self but "designing" a sacred self whereas (privatized) technologies are not considered alienating but imagined as effective means towards spiritual salvation – as tools enhancing human potential and ultimately abolishing illness, suffering and death. It is concluded that Paul Heelas' humanistic lingua franca of "self-spirituality" should be complemented by a trans-humanistic type of self-spirituality. The implications of the findings are discussed in the broader sociological debate about secularization and a disenchantment of the world.

THE ADVANTAGES OF BEING A “RELIGION”. SHAMANISM IN THE POST-SOVIET RUSSIA

Ksenia Pimenova

Abstract: The end of Soviet times have triggered a renewal of the Shamanism amongst the autochthon populations of Siberia (Russia). As in the past, its content remains closer to magic than religion (in the sense given to these terms by Durkheim): the rites are still made for private customers and aimed at solving practical queries. Nevertheless, recent transformations have brought Shamanism closer to religion; three in particular will be analysed in this presentation.

The first concerns the definition of Shamanism as a religion. This definition is rooted in the history of the Soviet ethnography, which for ideological reasons qualified Shamanism as the “first form of religion”. During the 1990s this academic definition has started to be exploited by the actors involved in the renewal of Shamanisms, in order to promote their cause with public and foreign institutions.

The second entails the emergence of a public discourse on the nature of Shamanism. This has been forged by the local intellectuals and presents the Shamanism both as a local tradition and as an ancient universal religion. Amongst others benefits, this discourse confers to shamans a double status, which is both local and global, and provides them with the opportunity of being part of international networks (for example the Western neo-shamans).

The third takes place at the level of the social organisation of the ritual practice. Officially recognised during the 1990s as a “traditional religion” by the local laws, Shamanism has been granted certain benefits (fiscal exonerations, State aids, etc.). The shamans have then created several hierarchical religious organisations, which establish rules to select and affiliate their members, and wish to set standards for the ritual practice. These organisations present therefore certain features of the clerical organisations (which is a total break with the past social organisation of Shamanism).

As a result of these transformations, the current evolution of post-soviet Shamanism takes place between a ritual practice which is rather “magical” than “religious”, and a discourse and a social and institutional organisation which are rather “religious” than “magical”. The relative stability acquired by this unusual configuration provides therefore an example of the changing frontiers of religion in present times.

BEING DIFFERENT FROM RELIGION: DISTANCE FROM RELIGIOUS ORGANIZATIONS AND ITS ROLE FOR CZECH SPIRITUAL SEEKERS

Michaela Ondrašinová

1Department for the Study of Religions, MASARYK UNIVERSITY, Brno, Czech Republic

Abstract: The paper will be based on analysis of emic discourses about religion and religious organizations in periodicals available in Czech local “esoteric” shops or alternative health methods shops. This analysis aims to scrutinize a frequent supposition that spiritual seekers have a suspicious or reserved attitude to established religions or churches, the attitude resulting from their anti-dogmatism and anti-authoritarianism (Heelas 1996) or from significant differences between the worlds of the holistic milieu and of the congregational domain (Heelas,Woodhead 2005). It will be primarily concerned with a detailed analysis of the spiritual seekers’ expressions of self-distinction from religion, and of roles and functions these statements play within discourses of the analyzed periodicals.

Consequently, I will discuss following questions: Can we find a shared discourse about religion/religious organizations in the above mentioned periodicals? What role do the anti-religious statements play within this discourse (or discourses) and in what contexts and for what aims are they used as a meaningful language tool? Are they important for presentation of identity (identities) of spiritual seekers? What alternative conceptualizations of the relation between spiritual seeking and a membership of a religious organization can be found and in what ways are they justified?

Key words: spiritual seekers, attitude to religion, discourse analysis, media analysis, identity

Heinrich Wilhelm Schaefer 1

1Sociology and Theology, BIELEFELD UNIVERSITY, Bielefeld, Germany

Abstract: Beyond structural, functional and rational action theories, the general social theory of Pierre Bourdieu – not so much his writings on religion itself – conveys a great potential for understanding the specific dynamics of religious praxis, identities and strategies, within the context of functionally differentiated and power-divided societies. Particularly the theories of habitus and practical logic can be operationalized as to ‘understand’ (Weber) religion – in fact a task which Bourdieu himself left open. Furthermore, the subject areas of the interpretative, the performative, the iconic and the post-colonial turns in social sciences can easily be woven into the fabric of praxeological theory and method.

The present paper will outline this potential in three respects. First it will discuss some theoretical contributions of Bourdieu, mainly
the theory of logic of practice and practical logic – offering a ‘Wittgensteinian’ or pragmatist reading of praxeological theory and binding together ‘subjectivist’ and ‘objectivist’ traits of the theory. Second, the paper will sketch possibilities to operationalize praxeological theory for empirical research. For that purpose, we will briefly focus on Habitus-analysis in ‘triangulation’ with models of the religious field and the space of religious styles. Finally, the theoretical and methodological proposal is briefly checked for its capability to serve the interests expressed by the recent ‘turns’ in social sciences.

The paper is based upon 25 years of empirical research as well as methodological and theoretical advancement of the praxeological approach. It sketches lines of research followed at the Center for the Research on Religion and Society (CIRRU), Bielefeld University, by empirical studies on religious movements (mostly Pentecostals) in different Latin American countries as well as on religious peace-builders in Bosnia-Herzegovina.

THE ROLE OF CIVIL RELIGION IN FOUNDATION COLLECTIVE MEMORY
Salvatore Mattu1
1Social Theory and Methodology of Social Sciences, UNIVERSITAT DE BARCELONA, Barcelona, Spain

Abstract: Exploring the ethical and symbolic dimension of civic rituals, I try to recreate how a specific society shapes a common sense of belonging around cultural and historical reference to myth and symbols of a nation. Every society has its own sources and instruments of legitimacy and consensus, based on a collective memory and reinterpretation of historical events oriented to a common teleological aim.

The evolution of civil society in a specific historical context and culture, determines its own collective consciousness. Through the organic whole of symbolic references and emblematic historical events, the social forces shape the common heritage of a nation. Nowadays this heritage is condensed and amplified by media system and reverberate in individual psychological dimension like a citizen’s civic spirit, refurbish the link with political institutions, strengthen a collective identity and promote democracy.

In this context, the phenomena of civil religiosity referred to the politeia, is a religious factor, influencing the collective memory in a specific nation on behalf of regeneration and strength of a common’s social and political goals.

Also in secularized societies, civil religion continue to shaping and giving sense to social life, working as an instrument of integration and inclusion in national context as well as a conflict factor in political sphere.

RELIGIOUS TASTES AND STYLES: THE SOCIAL STRATIFICATION OF RELIGIOUS PRACTICE IN MODERN SOCIETIES
Jens Koehrsen 1,2*
1CIRRU, University Bielefeld, Bielefeld, Germany, 2CEIFR, Écoles des hautes études en sciences sociales, Paris, France

Abstract: Religious tastes and styles: The social stratification of religious practice in modern societies

How do individuals practice religion in modern societies? What factors shape the individual practice of religion in pluralized religious markets? This paper addresses these questions by applying the Bourdieuan concepts of “taste” and “habitus” to the field of religion. It is argued that individuals have religious tastes and habits and that these are crucial determinants of their religious practice. The religious habits and taste of an individual is, however, related to his biography and social background. The social context, particularly the class position and social milieu of an individual shape his religious habits and taste and thus the way in which he practices religion: his religious style. Therefore, the style of religious practice and the choice of a specific religious style depend on class related habits and tastes.

This theory was assessed for the case of Pentecostalism in Argentina. Here, I conducted a field study at different empirical levels (macro, meso and micro). The results showed that lower and middle class Pentecostals differ significantly in their religious tastes and styles. The practice of Pentecostalism is a matter of class-related taste. This raises the question if this is also the case in other religions and regions such as Western Europe.

In this paper I will present the theoretical approach of religious habits and tastes, the main results from my field research in Argentina and forward some hypotheses for the “European case”.

COMMEMORATION CULTURE AS POPULAR RELIGION?
Alejandro Baer1
1Sociology of Culture and Religion, BAYREUTH UNIVERSITY, Bayreuth, Germany

Abstract: The currently emerging ‘global’ commemoration culture is characterized by the confluence of paradoxical ascensions: On the one hand, it is drawing broadly on the abundant heritage of the most diverse religious forms, symbolizations and rituals; on the other, it is forced at the same time to mark a clear distance to any particular ties with determinate religious communities or national collectives. This is the case in Holocaust Remembrance Day, which has become integral part of a gestating »globalized memory«. Disseminated by public events and popular media formats, Holocaust Remembrance Day is part of an educational program tied to human rights promulgation with virtually global expansion and firmly embedded in efforts to propagate universalistic values and transnational identities. Studying contemporary commemoration culture can therefore be expected to illuminate the shape, role and consequences of particular ‘popularized’ religious forms. The paper draws on research from a socio-anthro-pological research project which aims to compare commemoration culture in Germany, Israel and Spain, focussing on Holocaust Remembrance Day. Contrasting these three highly diverse national memory cultures enables to contribute answers to the question of continuing differences or emerging convergences. Data includes detailed videographic reconstruction, analysis and interpretation of the central commemoration ceremonies and focussed ethnographic fieldwork in the respective ’fields of memory‘.

SECTS AND THE CITY. THE IMPACT OF URBANIZATION ON NRM’S AND SECTS’ RELIGIOUS DISCOURSE
Sebastian Nastuta
Faculty of Social Work and Sociology, "Petre Andrei" University of Iasi, Iasi, Romania

Abstract: More than being a huge agglomeration of people the urban environment means cultural diversity, perpetual acculturating and human interactions.

For a sociologist of religion the city it’s a space where the religious pluralism and the religious competition can be fully observed. New forms of spirituality, new religious or quasi-religious topics and new religious organizational structures perfectly adapted to urban life style and “urban mentality” are developed in the cities. These aspects allow us to observe not only the religious competition but to understand how these organizations attract more and more people by introducing in their official discourse subjects that attract people from urban areas (youth, students, highly qualified persons, migrants etc.).

Our paper tries to identify the influence of urbanization or metropolization processes on different religious groups’ official discourse and on their missionary/communication strategies. To do this, we’ll take into account movements like Mormons, Jehovah’s Witnesses or Pentecostals but also Hare Krishna or Scientology and we’ll try to identify how the urban topics became relevant in their religious discourse and useful for their purposes.

Research hypothesis: The competition between urban religious movements makes them to adapt their public discourses and religious offers to urban topics in order to be more attractive for individuals.

Empirical data: Content analysis of official website, reviews and promotional material.

LOCAL GOVERNMENT AND RELIGIOUS DIVERSITY IN CATALONIA

Gloria GARCÍA-ROMERAL, Maria del Mar GRIERA, Julia MARTÍNEZ, Maria FORTEZA
Department of Sociology, ISOR / UNIVERSITAT AUTÓNOMA DE BARCELONA, Cerdanyola del Vallès, Spain

Abstract: The management of religious diversity has, in recent years, become a crucial part of ensuring social cohesion and good governance in contemporary societies. The rise of migration has led to greater religious diversity and nowadays local governments have to deal with new and urgent challenges in this area. This paper analyzes how local governments face religious diversity issues in three Catalan municipalities, putting special emphasis on examining the institutionalization of new policy programs in this area. The management of religious diversity is conceptualized by considering its discursive/symbolic, normative and executive dimensions. The first dimension, discursive/symbolic, refers to the presence of religion in the political programmes, institutional events and the discourse of local politicians. The normative dimension is concerned with the existence of regulations, bylaws and other documents which deal with religious affairs. Finally, the executive dimension, takes into account the human resources involved in this management, the level of institutionalization of dialog with religious communities, and the branch of local government which is responsible for managing religious diversity as well as the manner in which they carry it out. The research combines quantitative data from a survey carried out in all Catalan municipalities by the Pi i Sunyer Foundation, with qualitative data obtained from in-depth interviews with political and religious spokesman from the three cities studied.

Key words: local government, religious diversity, public space, policy programs, Catalonia.

COMPARING FAITH BASED POLITICAL ACTIVISM AMONGST AFRICAN AND AFRICAN CARIBBEAN CHURCH COMMUNITIES

William Ackah
Social Policy and Education, BIRKBECK COLLEGE UNIVERSITY OF LONDON, London, United Kingdom

Abstract: Amongst the first community organisations established by migrants from the Caribbean to the United Kingdom after the Second World War were independent black churches. In more recent times primarily from the 1980s onwards these older black faith based organisations have been joined in the UK religious environment by churches comprised of and led by migrants from the African continent. This paper seeks to assess comparatively community and political engagement/kinship taking place within African and African Caribbean led church communities. Based on ongoing fieldwork in Bristol and London, with church leaders I seek to ascertain the extent to which notions of racialised/migrant minority identities shape the nature and forms of political and community engagement/kinship, and whether there are discernible differences in approach between African and African Caribbean led churches. The paper will also explore the influence of religious beliefs and practices on forms of engagement and non-engagement with the wider society and whether beliefs and practices are a more important variable than racialised/migrant identities in understanding African and African Caribbean church responses to community involvement and engagement.

"SUBDUE EARTH, BUT DON'T PLAY GOD!" CHRISTIAN RELIGION'S STAKE IN CONTEMPORARY TECHNOLOGY POLICY

Alexander Degelsegger
Centre for Social Innovation (ZSI), Institute of Political Science, University of Vienna, Vienna, Austria

Abstract: Advocates and critics of secularisation theory have been engaged in a decades-long debate on the question of the decline or permanence of religion and religiosity. Nowadays, there seems to be virtual agreement on few basic empirical observations, one of them being that the ecclesiastic organisations and elites in Europe play a smaller role in the social fabric than they did before.

The example of political decision-making on controversial technologies like embryonic stem cell research, pre-implantation genetic diagnosis or synthetic biology seems to simply reconfirm this conclusion. Experts from different disciplinary backgrounds discuss technological developments in bioethics commissions. They engage with the public and offer formalised secular ethical expertise. We observe a rationalisation and differentiation of the technology policy decision-making process. At the same time, traditional players like Christian denominations seem to have lost power of interpretation.
However, having a look at the communication and public relation activity of the Catholic Church in Europe, we argue that there is more to it than meets the eye, namely a double movement:

First, institutionalised religion is, in this empirical case, not continuing to withdraw from the public sphere. Based on the patterns of mobilisation developed in the anti-abortion movement, it addresses and enters more and other discourses from which it had long been excluded. Compared to the abortion debate, current issues of concern are scientifically and technologically more elaborate. Ecclesiastic structures aim to participate in specialised scientific or secular-ethical debate. In order to do so, they transform accordingly, as exemplified by the case of the Pontifical Academy for Life.

Secondly, an increased number of individuals and societal actors engage in defining what is to be held sacred and, thus, protected from mundane access. This setting apart is negotiated in ethics committees or public debate. The rituals of setting apart, connected with a set of rules, once performed mostly by priests, have shifted from the altar to the lab, to some extent, for instance when scientists deal with the in-vitro fertilised embryo.

Both movements invite sociology of religion to revisit technology and suggest interesting implications regarding the role of religion in society.

‘CORPORATE’ WORSHIP: CONSUMER CULTURE AND MUSICAL IDENTITY MANAGEMENT IN AN EVANGELICAL NETWORK CHURCH

Thomas Wagner

ROYAL HOLLOWAY - UNIVERSITY OF LONDON, London, United Kingdom

Abstract: Community and society are central, if contested, concepts in sociology. They are also important discourses that help shape religious groups. Since Ferdinand Tonnie posited his concepts of Gemeinschaft (community) and Gesellschaft (society) in 1887, innovations in mobility and communication technology have broadened our understandings of these concepts. ‘Community’ is increasingly thought of as a common understanding of shared identity that exists separate from place. ‘Society’ is seen as closely linked to market capitalism and its concomitant practices: modern marketing, consumer culture and mass-mediation.

While consumer culture facilitates the rapid expansion of Evangelical network churches, it also presents challenges to the sense of community that is vital to their success. As a collection of integrated ‘sub-communities’, a network church must balance ‘local’ and ‘global’ sensibilities in managing its ‘corporate’ identity. One way of doing this is to engage in a specific set of discourses that are simultaneously identifiable at different levels of ‘locality’.

This paper investigates the ways in which the Australian network church Hillsong discursively manages its corporate identity through musical practice. Famous for using innovative technology and compelling rock music in its worship, Hillsong presents its message in ways that many young Evangelicals perceive as ‘authentic’ through the media of consumer culture.

‘Consumer culture’ is posited to be a broad culture to which Hillsong’s members are ‘indigenous’; it is where Hillsong’s corporate community is situated and from which it derives its practices. Thus, Hillsong worships in an ‘indigenous’ – which is to say ‘authentic’ – style. Hillsong discursively shapes its musical worship in ways that are recognizably Evangelical and specific to both the Hillsong Network and the local church. In doing so, it provides the aesthetic material, structure and opportunity for producing and integrating personal and corporate identity narratives.

ORTHODOXY AND ETHNICITY IN TRANSITIONAL SERBIA

Danijela Gavrilović, Miloš Jovanović

Sociology, FACULTY OF PHILOSOPHY/UNIVERSITY OF NiŠ, Niš, Serbia

Abstract: The revitalization of religion, a process which has been diagnosed by sociologist in the modern world, has also been very much present in Serbia during the transitional and post-conflict period. Religion plays an important role in the social life of the inhabitants of Serbia and performs very important functions as the identifier of ethnic identity. Religious institutions also have an important place in the public arena of contemporary Serbia, presenting the symbols of ethnic affiliation.

Our paper “Orthodoxy and Ethnicity in Transitional Serbia” is based on the comparative analysis of the findings of the research conducted in 2007 “Culture of Peace, Identities and Inter-ethnic Relations in Serbia and the Balkans in the Process of Euro integration”, the European Value Survey for Serbia in 2008, and the survey research, interviews and focus groups implemented in the course of the project “Social and Cultural Capital in Serbia” from 2010. It is our intention to show the dynamics of Orthodox confessionality and religiosity in Serbia, where religion is in a specific relation with the ethnic distinguishing, while confessional affiliation is used as the indicator of belonging to an ethnic community, which does not have to denote the religiosity of the subjects. The form of “belonging without believing” is indeed present, yet it is not the only one. Our paper will show the complex set of relations of presence and levels of religiosity, confessionality, and ethnic affiliation in contemporary Serbia.

Key Words: Orthodoxy, Ethnicity, Religiosity, Serbia

EURO-INTEGRATION AND ORTHODOX CHRISTIANITY IN SERBIA: ATTITUDES TOWARD THE EU INTEGRATION AMONG SERBIAN ORTHODOX BELIEVERS

Marija Krstić

Department of Ethnology and Anthropology, University of Belgrade, Belgrade, Serbia

Abstract: After the democratic changes in 2000, the official goal of the Republic of Serbia’s foreign policy is to enter the European Union. In 2005, National Assembly accepted the Resolution on joining European Union and at the end of 2009 Serbia submitted its candidacy for the EU membership. While, the EU is secular organization, it is usually claimed that it is founded on a Christian, and more specifically, Roman-Catholic roots. In this respect, one of the key features of the EU’s ‘unity in diversity’ politics is Christianity as a core of Europe. While Christianity is seen as one of the key elements of integral European values, this research draws attention on “Orthodox European Serbia” and questions is it possible to exist? With other Orthodox countries in the EU, like Greece, Bulgaria and Romania, religion became visible part of the EU public sphere. I use opinions of the representatives of the Serbian Orthodox Church as
an outline of their perception where is the place of Orthodox Serbia in Europe. Furthermore, by examining small-scale interview sample of Serbian Orthodox Christian believers, I present, discuss and explain the most frequent possible attitudes toward the EU integration: the EU will not influence Orthodox Christianity an its believers; the EU will have negative influence, and the EU will have positive influence on Orthodox Church and its believers in Serbia.

Key words: euro-integration, Orthodox Christianity, Serbia

IMMIGRANT ISLAM: POLITICS OF REPRESENTATION AND THE CHALLENGE OF SEEING COLLECTIVE IDENTITY IN GLOBAL CITIES

Timothy Shortell1, Jerome Krase1
1Sociology, CUNY Brooklyn College, Brooklyn NY, United States

Abstract: Representations of Islam are common in the US and EU; these are generally negative and often derogatory, as a quick Google image search reveals. Local political talk about Islam in the US and EU tends to be critical and often panicked. Nativist politics are on the rise throughout the West and the central point of contention seems to be visibility. The ‘burqa controversy’ in France and the conflict over a Muslim community center in lower Manhattan (the so-called ‘WTC mosque’) are recent examples of the disputes over urban public space involving representations of collective identity. Public space becomes the locus of the public sphere, where visibility conflicts—who is seen in public space—become disputes about who ought to be included in the national ‘public.’ Because of globalization, ‘cultural strangers’ share urban neighborhoods. As a result, politics and policy get caught up in these intergroup competitions, with their resulting expansions of the ‘civitas’ and periodic backlashes. At present, examination of the visual semiotics of difference is especially important as American and European cultures interact with Islamic cultures. Using a spatial semiotic analysis, we investigate how the presence of expressive, conative and phatic signs of recent Muslim inhabitants change the meaning of vernacular neighborhoods in global cities. Visual data from urban neighborhoods in the US and Europe will be presented as examples of different functions of semiotic markers, and exemplars of the data we collect using a neighborhood photographic survey technique. We discuss how these different functions interact with local policy to create interpretive landscapes which can lead to dramatically different outcomes in terms of social conflict.

MOSQUE CONFLICTS IN AUSTRIA FROM THE PERSPECTIVE OF SPACE SOCIOLOGY

Ernst Fürlinger1
1Institute of Religious Studies, UNIVERSITY OF VIENNA, Vienna, Austria

Abstract: Like in other Western European societies, there are increasing conflicts over the construction of mosques and Islamic centers in Austria. The public debates on a national level started with the minaret construction in Telfs (Tyrol) in 2005. It continued with the demonstration against an Islamic centre in Vienna in 2007 and the conflicts over the building of new mosques in Bad Vöslau (starting in 2006) and in Bludenz in 2008. Already in three federal states there are new building regulations with the open intention to avert the construction of representative mosques with minarets.

In a first step, the paper will present a systematic overview about these developments and its stages, based on a research project ("The Mosque Conflict in Bad Vöslau") which is funded by the national research council (FWF, 2009-2012), based on methods of qualitative research on religion and conducted by the author.

Social conflicts over mosque constructions and Islamic centers do not happen in an empty container, rather, within the nationalized space of power, within the institutional architecture and symbolic space of the national state. In a second step, the paper will apply perspectives of the sociology of space, to touch deeper levels of these conflicts. In doing so, it will focus on the theory of "social space" (P. Sorokin, P. Bourdieu) and postcolonial space theory (E. Said, H. Bhaba, W. Mignonne). These perspectives should contribute to a fresh, innovative view of current social conflicts in regard to the institutionalization of Islam in Austria.

THE SOCIOLOGY OF PUBLIC SPHERE COLLATED TO THE VISIBILITY OF ISLAM

Alexandre Piettre1
1CSPRP, UNIVERSITE DE PARIS 7, Paris, France

Abstract: The sociology of the public sphere, possibly with Isaac Joseph or Daniel Cefai, is firmly linked to the interactionist paradigm. Indeed, this paradigm allows us to understand in what extent the public can’t be reduce to politics. However, this sociology understands the more often the public sphere as a frame for the interactions, frame which permits the people to avoid troubles through rituals, but doesn’t allow us to understand how this frame is produced through these troubles. Therefore, this sociology seems to be haunted by community, by conflicts which have the community as a support for its, the frame. The interactions allows the political conflict to be submitted to the public use of the reason, as Habermas understand the public sphere, and links the possibility of citizenship to a normative civility.

But what is disrupted in the interactions, what is calling into question the boundaries of the public sphere, should show us the way to challenge the links between public and politics when, when habitus which are disrupted, are engaged into interactions. Indeed, such a conflict is also not directly political, because the challenge of the boundaries of the public sphere, and finally the emergence of new social movements and new forms of political mobilization, is originally linked to a withdrawal of politics.

As the disruptive visibility of Islam can show it, what is bring into question the boundaries of the public sphere can be understood as cultural interpenetration, when several cultures share a same public sphere. Thus, this conflictual process of valuation is not linked to a political engagement, but is impolitical, as Dewey and Esposito allow us to understand it. That’s I propose to demonstrate with a participant observation during more than a year of a political mobilization called “Kollectif” in a great social housing area, in the city of Bondy in the Parisian suburbs at the beginning of this century. In peculiar through the religious conflicts between Muslims of the first generation of immigration and young Islamic actors, we can understand how this political mobilization had the Islamic renewal as stand and cultural support, as agency, but no as ideological and political issue.

RELIGION: A CLEAVAGE IN POLITICS, AN ACTOR IN WELFARE PROVISIONING
Abstract: Is it religion back to the public and political arenas or is it the attention of different publics back on religion? This paper aims to given an answer to this question by focusing on the phenomenon of faith-based organizations (FBOs). The paper undertakes a historical and interdisciplinary analysis of the concept of FBOs by comparing it to concepts such as religious charity and philanthropy. After a brief overview of the developments in Europe, the paper focuses on the case of Turkey as an extreme example due to its special position on the margins of European integration, as a country with a predominantly Muslim population with a modern laicist tradition, which has been undergoing a phase of serious reformation in the last decades.

The last decade experienced a proliferation of FBOs in the welfare realm in Turkey. Its specific history of secularization renders Turkey a highly interesting object of analysis. Religion has always been a contested phenomenon with the potential to be politically exploited in Turkey. Therefore, the proliferation of these associations can only be understood in relation to this particular historical background of state-religion relations. This article presents the findings of in-depth qualitative research conducted with twenty-seven FBOs in three cities in Turkey. The main aim of the article is to demonstrate how the identities of single FBOs are contingent on their different positions within the constituency of political Islam in Turkey and in the international Islamic movement.

ADAPTATION AND ENTRENCHMENT OF NON-INSTITUTIONALIZED RELIGIOUS COMMUNITIES IN PUBLIC SPHERE

Jan Vane

Abstract: The object of the conference paper is to demonstrate the research in religious, non-institutionalized communities – with prevalent orientation to the Czech Roman Catholic confession. The project examines and analyzes the reason of their occurrence and of transformation of their life, as well as of their incorporation into social system, which is conditioned by requirements and expectations of economical and political nature. The research examines not only the forms and ways of the legitimating reasoning of the existence of these communities, whose formation is one of the ways to “oppose” the raising level of privatizing and de-traditionalizing of religious forms, but also transformation of the original suppositions and expectations of the new communities. A complementary part is a study of reactions of the official structures of the Czech Catholic Church to the activities of these communities and their acceptance by the “denizens” of the given region where the communities have found their home and where they act.

RELIGIOUS NGOS AND CIVIL SOCIETY PARTICIPATION: THE EXAMPLE OF THE RNGOS ACTIVITIES AT THE HUMAN RIGHTS COUNCIL AT THE UN IN GENEVA

Sophie-Helene Trigueaud

DIMENSIONS OF BELIEVING AND ANALYSIS OF CONFLICTS AND RADICALIZATION

Anne-Sophie Lamine

Abstract: Believing is considered with a definition including both content and attitude: giving meaning to assertions, to values, to experiences and symbols, as well as validity claims about them. In this perspective, believing has four dimensions: cognitive, ethical, emotional and symbolic, which may be subject to combinations (with more or less weight of each dimension), passing and oscillations. The working hypothesis is that conflict (or recognition of otherness) between persons or groups can be analysed by using these four dimensions of belief. Just as moving towards radicalization which appears when one eliminates (or at least tries to eliminate) these oscillations in these four angles. The argument will also be based on empirical findings both religious and not religious.

A PERMANENT SOURCE OF CONFLICT FOR THE EASTERN EUROPEAN RELIGIOUS SPACE: ETHNICITY, RELIGIOUS AFFILIATION AND THE ETHNIC PRINCIPLE OF THE ORTHODOX CHURCHES

Nicolae Dinu

Abstract: The fall of communist regime marked the affirmation in the East-European space of democratic regimes and European values, but for Orthodox Churches from Eastern Europe it meant the resumption of the confrontation with un-totalitarian stance of modernity and the dispute on the space and the faithful being under their jurisdiction. The ecclesiastical emancipation in modernity, according to ethnic criteria and only partially territorial of local
Orthodoxies, led to the extinction of universal consciousness that should define the Church.

The Romanian Orthodox Church is considered to be the core identity of the Romanian state and Orthodox Christianity, an essential component of the Romanian nation. Canonical independence or autocephalous Orthodox Church in Romania (1885) was conceived by ecclesiastical hierarchy and the political class as a mandatory element of political independence. The direct relationship between the Orthodox Church and national identity led to the identification of ethnicity with religion (ethnicity / religion). In other words, To be Romanian necessary means to be Orthodox.

This study aims to examine the practical controversial aspects and potential conflicts that entail the ethnicisation phenomenon of the Orthodoxy in European space. An important point of analysis will be the pre-conditioning issue of ethnic affiliation, the Orthodox condition involving the birth or adoption of a circumscribed linguistic, cultural and territorial identity. Using data from European Social Survey (ESS, 2006), World Values Survey (WVS, 2005), Romanian Institute for Assessment and Strategy (IRES, 2010, 2011) and the latest reports of the Romanian Orthodox Church, this paper will explore the issue of religiosity and ethnicity in Romania, from the perspective of the Church ethnic principle. Results indicate that Romanians appear to be amongst the most religious people in Europe but with a strong sense of ethnicity. The key question of this study is: can the Orthodox Church provide a model of evangelical unity as a model of Europeanisation, overcoming ethnic criteria? The paper will also discuss the current situation in religion in Romania, the serious implications for the consistent application of the ethnic principle and possible strategies for an Orthodox integrative model.

FROM DURKHEIM TO BOURDIEU: EVOLUTION OF THE SACRED-PROFANE DISTINCTION ILLUSTRATED BY THE CASE OF THE LDS CHURCH.

Pierre Vendassi

1Centre Emile-Durkheim, UNIVERSITÉ DE BORDEAUX, BORDEAUX SEGALEN, Bordeaux, France

Abstract: According to Durheim’s theory, religion consists in a distinction between two categories of things spaces and experiences: the sacred and the profane. Actors religious experience then consists of entering the sacred sphere trough rituals, and then going back to profane, and repeating this experience according to religious prescriptions.

However, in a modern and increasingly fragmented society, in which actors are affiliated to multiple social groups, another kind of sacred/profane distinction appears: a distinction between individual actors and the society they are in. Becoming religious, actors are becoming sacred, symbolically set apart from society. the constant seeking of divine inspiration, charismatic and miraculous experience on a daily basis and the emergence of a spiritual life at least partly independent from religious institutions are expressions of this new kind of distinction.

And yet, this new distinction sacred/profane, this individual sanctification doesn’t mean a total rejection of society. In fact, we see that the new sacred/profane distinction resembles the distinction theorised by Bourdieu in la distinction, critique sociale du judgment (1979) : sacred becomes a capital that an actor can use to create a distinction between him and others, to obtain better integration as well as higher position in social fields.

The present communication aims to illustrate the two kinds of distinction briefly described before, by analysing the definition and experience of the sacred in the Mormon-LDS church. (after observation of materials as well as congregations in France)

THE BUDDHIST SOCIAL FIELD IN WESTERN SOCIETIES

Liliana Arroyo

1Sociology of analysis and Organizations, University of Barcelona, Barcelona, Spain

Abstract: In recent decades Buddhism has moved beyond asian boundaries encountering new contexts, new meanings and new social functions. Reaching and surviving in new environments necessarily means adaptation (in its wide sense) to other visions of the world.

In this paper we aim at understanding to what extent this adaptation processes are a chance to develop different and new models of believing, practicing and living Buddhism. Depending on the definitions and roles of Buddhism as well as the audiences to whom it is directed, we will find emphasis in different aspects and traditions along with different approaches to adapt, modernize and/or transform this ancient wisdom. We want to see the relation between the meaning and the practice structures and how it shapes the social field.

We use the data from an on-going study of Buddhist centers and organizations in Spain, covering many topics such as origins, values, goals, organizational forms, products, and relationships and social networks among themselves and with their social, cultural and political environment.

SPIRITUALITY AND MODERNITY: YOGA IN AN AREA OF CONFLICT?

Clemens W. Eisenmann

1Graduate School for History and Sociology, Bielefeld University, Bielefeld, Germany

Abstract: Keywords: Yoga, Spirituality, Modernity, Religion

Recent decades have witnessed a major shift in the field of religion with spirituality playing an increasingly important role within established religions, and beyond. The more fluid field of deinstitutionalised spirituality – often framed as holistic, alternative and reflexive – is spotlighted in controversial discussions. For instance: the ‘boom’ of alternative practices like Yoga, Tai Chi, Zen and Magic is seen by some as indicator of a societal spiritual revolution, while others do not include those phenomena within the field of religion or deny their empirical significance. Part of this divergence is due to different conceptualisations of spirituality and religion, as well as due to a lack of good empirical research of alternative practices.

Firstly, I like to discuss that a central key in understanding the controversy – as well as understanding the phenomena – lies in the conceptualisation of the relationship of spirituality and modernity (and contemporary society). This can be shown in (1) the ongoing debate about secularisation, (2) the question of individualistic transformation of religion, as well as in (3) the discourse on spiritual
compensation and ‘counter-cultural’ movements. To highlight just one of the arguments: The conception that there is a growing need for spirituality at turbulent times of capitalist economic downturn seems to be in line with central themes of the secularisation thesis, which in turn are criticised at the same time.

I will, secondly, show the relevance of the relationship of spirituality and modernity at the example of Yoga. Contemporary ‘Modern Yoga’ emerged in the end of the 19th century, and has since situated itself in the area of conflict between tradition and modernity, religion and secularity, as well as orient and occident. In this perspective the processes of adaption, legitimisation and authentification of Yoga in relation to modern societal developments come into focus. Further I propose an area of conflict reaching from functional adaption to an alternative countercultural movement, which encapsulates several challenges for the conceptualisation of spirituality as well as modernity itself.

SECRETIONS AND REVELATIONS: TENSIONS AND NEGOTIATIONS IN A SECRETHE NUSAYRI COMMUNITY

Muharrem Erdem

Abstract: In this paper, I intend to contribute to a more adequate understanding of the process of revelation of “social secrecy” and deprivatisation of secret rituals in a secretive Nusayri community in Turkey. Secrecy is theorized as a technique for the construction of social boundaries (Simmel 1906; Johnson 2002; Urban 2001a); it is a boundary without specific content marking reclusion from the public sphere. The Nusayris have tried to keep their inner teaching and rituals secret, somewhat like the Masons or Mormons. Although secret teachings and rituals are a part of the Nusayri belief, some of the members of the community want to be more open for their religious or ethnic identity.

The secrets are shared and transferred only mens, they do not share them with non-Nusayris and Nusayri women. As far as I see, I can calm, that the Nusayri like Brazilian Candomblé as a secret religion becomes public since 1990s; its indicators can be seen in oral to written; as books by religious leaders (Şeyh or Hoca) or published information about Nusayri beliefs, television broadcasts, film representations, and sites devoted to Nusayri belief on the Web. The paper is based on data collected my field research in the Karaduvar district of Mersin, Turkey. As an insider to secrets of the community, I experience a related set of tensions: between concealing and revealing and between pressings upon others what is no secret at all. Although the most secret ritual of the Nusayri community is Garîr Humm, performed in the streets of the district. The public space of the street represents a site of danger, but also a site of public display in which the religion’s national and public importance is expressed and, as a political claim, pressed (Johnson).

Research findings show that although the intentional concealing of Nusayri religious knowledge and ritual practices have historically played an important role in the survival of the Nusayri community and belief, partial revelation of secrets are becoming more common and acceptable. Both the internal dynamics of the Nusayri community and the socio-political context in Turkey have contributed to this process. The disclosure of secrecy is particularly supported by younger generations, university graduates, Nusayri intelligentsia, and those Nusayris who live outside of their hometown.

THE INDIVIDUAL AND THE COLLECTIVE IN HOLISTIC SPIRITUALITY: THERAPEUTIC PRACTICES, CORPOREALITY AND SOCIALITY

Hana Doležalova

1Graduate School “Human Behaviour in Social and Economic Change”, FRIEDRICH-SCHILLER-UNIVERSITÄT JENA, Germany, Jena

Abstract: This paper is based on a qualitative enquiry into the beliefs and practices found in Holistic (New Age) spirituality. I deal with the question of how New Age practitioners relate to their own selves, their bodies and to others, examining the role of individualism and collectivism in New Age’s holistic spiritual milieu. Holistic spirituality is often described in sociological literature as an individualized, privatized or even narcissistic form of religiosity. Opposing accounts suggest that relating to others plays an important role in a holistic milieu, but how this sociability is manifested in everyday life has not been described in detail. This study aims to fill in this gap and suggests how the “paradox” of emphasizing one’s self while demonstrating solidarity with others is possible in reality. While it is true that New Age practitioners pay great attention to their own selves, it is important how the self is conceived. Embodiment is taken into account, while bodywork plays a crucial role in New Age body and is an important means of enabling social interaction. I relate the findings of the study to a more general topic: transformation of the forms of sociality in contemporary individualized society. This ethnographic research took place within New Age centers in the Czech Republic and Germany. It used semi-structured interviews with long-term visitors of the centers and therapists and participatory observation was used to study spiritual practices in a holistic milieu.

ECUMENISM AND NEO-ECUMENISM WITHIN BALKANS – MYTH OR REALITY?

Zoran Matevski

1sociology, ŠS. CYRIL AND METHODIUS UNIVERSITY IN SKOPJE, Skopje, Macedonia, The Former Yugoslav Republic Of

Abstract: Balkans has a geopolitical location where even in the period of the so called “East disruption”, in 11th century, over here passed the borders of the Byzantium-Eastern church and Roman-Western church. Even in that period the relations between the Orthodox and Christian churches moved from an open antagonism to an aspiration for cooperation and religious reconciliation. The situation changed essentially and became even more complex in the 15th century when the ably Ottoman Empire adjoint itself the Balkan territories. By then, until the modern times these three religions are followed by three models of culture and three types of civilisations. From historical point of view, even today the Balkan area on which independent states have been established is weighted with authoritative political culture. It reflects to all political and religious events and relations. After the socialism crash, people living in this area started living their lives in a period of conflict between authoritative political culture, on one side and democratic political culture, on the other side. How the relations in the sphere of religious processes will develop depends on the outcome of this epoch conflict. Here arises the crucial question: are the national interests on the Balkan stronger than the ecumenical conscience? Balkan countries in their bases are laden with their own history and past. That is the destiny of all small countries that want...
to be big, at least in the history. Therein there are three heavenly kingdoms (Orthodoxy, Catholicism and Islam), which meet and interface each other. Also, this is the clash point of three great cultures and civilizations. This paper is an attempt to answer the question if on this piece of territory we can expect conflict of civilizations or maybe in the future multiculturalism, multi religion and the value of differences will be good pre-conditions for realization neo-ecumenism. The best base for establishing religious and ethnic tolerance is the civil society. That is sub-national society, where the main norm is the citizenship. Within a society like this there is generalization of the human values.

Key words: ecumenism; religious reconciliation; civilizations; multiculturalism

RELIGION AND STRATIFICATION IN THE CZECH REPUBLIC

Daniel Topinka 1, Dušan Lužný2

1DEP. OF SOCIOLOGY AND ANDRAGOGY, PALACKY UNIVERSITY, Olomouc, Czech Republic

Abstract: This report tries to explain reasons and forms of the secularization process in the Czech Republic. It describes the current state of “religiosity” and asks a question if there is a relationship between denomination of the Czech Republic’s citizens and a social structure. This report uses data of two surveys – DIN (Detraditionalisation and Individualisation, 2006) and EVS (European Value Survey, 2009) – and searches for the relationship of stratification and religiosity. It asks a question how much the religiosity is reproduced within the Czech society in which non-believers and non-church forms of religiosity are highly represented. The report deals with the religiosity’s participation in the social stratification and in the set-out of religiosity within the social strata.

The Velvet Revolution in 1989 meant an important turning point in all areas of life of the Czech society. The key topic of the Velvet Revolution was the human right issues and achievement of such standards of the human rights. Main change in religious life after 1989 is plurality of religious life, related to the revival of religious freedom and democratization of the society.

In the Czech Republic the relationship between religiosity and social structure is rather complicated. Religiosity is projected to social structure only partially. It likely is because of the erosion of social structure after the WW II. resulting from the socialist regime and its secularisation. Religion disappeared from the educational system and so we can currently see attitudes towards religion evenly spread over the social classes. It shows how much the secularisation impacted on all social strata. Social transformation after 1989 played also its part. The relationship between socio-economic status and religiosity is the most remarkable. A whole range of expressions of the Czech religiosity, which is typical by its distrust in church forms of religiosity, rich images of transcendence, inclination to alternative forms of religiosity and cultural conception of religiosity, can be seen in the relationship. It was revealed the traditional religiosity is kept in low income households. Religiosity is most reproduced within the process of primal socialisation – it is generally influenced by the religiosity patterns kept in families.

THE ISLAMIC IMMIGRANT ORGANISING PROCESS IN SWITZERLAND AND ITALY: NEW WELFARE ACTORS FOR NEW RELIGIOUS RESIDENTS?

Elisa Banti1,2*

1Resop, 2SES, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: National political systems enable differently the immigrant Islamic associations to get involved in social policies and play a part in reforming welfare structures. This paper focuses on the political opportunity structures impacting the Islamic immigrant organising process by means of a comparative approach. Firstly, we describe how Islamic organisations collaborate with public institutions in providing welfare services to residents and immigrants, Muslims and non-Muslims. Secondly, we analyse whether political features foster or hamper the attempts of Islamic organisations towards welfare fields. Our data describe Islamic associations variously involved in social policies in four municipalities in Switzerland and Italy (Zürich, Geneva, Milan and Rome). In addition to factors rooted in the welfare environment, this study takes in consideration how the decentralization of powers and the state-religion relationship affect activities, aims and networks of Islamic organisations. Welfare privatization alters the balance between religious actors and states, for it encourages public institutions to allocate resources along religious identities and local patterns. Therefore Muslim organisations increasingly interact with other private actors interested in providing social services to immigrants, such as churches, syndicates and pro minorities associations. In fact, we may observe that Islamic actors increase their influence as public institutions restructure social policies and reintroduce communitarian criteria for redistributing public resources. As the centralisation multiplies patterns of cooperation between private and public actors, political opportunity structures differently incorporate Islamic organisations in welfare activities at the local level. In fact, states decentralise public powers by privatising social policies and at the same time they shape indirectly the Islamic immigrant organising process at different levels. Italy and Switzerland are two interesting cases that allow a fruitful comparison.

WHO IS THE POLISH (BUT NOT ONLY) NONBELIEVER?

Radoslaw Tyrala1

1Department of Sociology and Social Anthropology, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: In my paper I would like to classify studies over disbelief as a part of sociology of religion. It makes sense for some reasons. First one is that in country with such high level of religiousness like Poland, nonbelievers – even if they don’t want to – live and function in religious context (family, friends, public sphere). The second reason is that Polish nonbelievers usually were believers in the past. Most of them are Catholics converted to disbelief.

I am interested in socio-demographic profile of nonbelievers. Members of this community we may potentially meet in Poland in each social class, in every type of dwelling place, in every range of age, income or education. However, some research experience suggests that nonbelievers are more likely to be characterized by: male gender, higher education, higher income, living in a big city.

Also discussed would be the issues of heterogeneity of that population and associated with it matter of auto-designations. “Nonbeliever” is a term, choose by me because of its semantic capacity.

---

718 Abstract Book

 Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
is worth to consider how it correspond to the similar term “none”, used often in American research. There are lot of terms used by nonbelievers to describing their attitudes to religion (emic perspective): atheist, agnostic, skeptic, rationalist, humanist, freethinker, bright. We may distinguish two groups of such auto-designations. First one consists of those emphasizing the (negative) reference to religion: a-theist, a-gnostic, non-believer. Second one is the group without such references: rationalist, humanist, bright. Using auto-designations the second kind contemporary social movements unite nonbelievers are tried to create a positive and constructive message about themselves. I am interested in potential consequences (especially in dimension of identity) of choosing such auto-designations of disbelief.

In my paper I would like to refer to results of my research Nonbelievers in contemporary Poland as a cultural minority. Some of them would be compared to results of research conducted in other countries, especially in United States of America.

„RELIGION“ IN A SOCIOLOGICAL CONTEXT: GROUNDING THE SEPARATION

Milan Fujda

Abstract: Significant part of Sociology of Religion deals with the issue of the destiny of religion in modern society through controversies over secularization and what is after. This endeavour is based on two presumptions: 1) that non-modern societies were in some reasonable sense ...religious“ while the modern might not be so; 2) that sociology has tools to distinguish ...religious“ and ...non-religious“.

These presumptions are questionable: 1) religion is a modern construct and its application outside modern context needs extraordinary caution; 2) existing etc concepts of religion are either not able to consistently detach ...religious“ from the broader field of the social, or interchange the concept of ...religion“ with the concept of church as an organization.

This has important implications: either the concept in use is not under theoretical control and thus - in actual use - incorporates pre-reflexive notions, ideological or theological agendas into analysis (including mixing church organization with religion), or ...religion“ is used as an empty signifier only seemingly explaining something.

In my presentation I will demonstrate these problems on an analysis of the use of category ...religion“ in particular sociological texts and show that: 1) debate over secularisation is not misleading because secularisation does not occur, but because the whole question is not posed in a productive way; 2) more reasonable sociological way to study processes which sociologists of religion would like to study, would be possible if the concept of religion was dropped completely and the study would concern for more particular aspects of human action (i.e. communication, interaction, mobilisation though shared symbolic resources etc.). It would make it possible to see interconnections and relationships which, at present, are hidden by the use of a priori discriminating tool which groups together things which may not have anything in common (such as wearing hijab and speaking tongues) and distinguishes things which might be significantly connected (such as mobilising against Babri mosque and publicaly negotiating the meaning of the Dresden bomb attacks at the end of WV II). This way classical heritage and its depth of analysis could be allowed to enter the superficial and theoretically insignificant contemporary Sociology of Religion.

LOOKING FOR LITURGY IN CONTEMPORARY THEATRE

Kees De Groot

Abstract: Contemporary theatre sometimes uses religious language, symbols and poses, including elements derived from the Christian tradition. The question is what these references mean: how serious is the courtship with religion? I have selected five productions with unmistakable religious elements. I used the tools of the anthropological informed study of liturgy to test whether these could help to produce an account of the liturgical quality of these shows and performances. Two conclusions could be drawn. Firstly, in some instances the boundary between performers and audience is made fluid. This induces a development towards an event. Secondly, in some cases the show includes the (collective) performance of rituals, but within the context of theatre. This approach, constrained by the limitations inherent to professional (secular) theatre, facilitates a liturgical function of contemporary theatre. Apparently, it is possible to make analytical distinctions with respect to the liturgical quality of the productions, although the subjective element is never absent.

ITALIAN PROTESTANT CHURCHES BETWEEN PAST AND FUTURE. AN ANALYSIS OF THE CHANGING OCCURRING WITHIN MINORITY CHURCHES DUE TO MIGRATION

Alessia Passarelli

Abstract: In this paper I analyse the situation of Protestant Churches in Italy and their responses to migration and the increased number of newcomers in their congregations. According to Jenkins (2002) the movement of people from the South to the North of the world will result in an increase of Christianity in Western countries. However as he points out the most successful types of Christianity in the global South ‘have been very different from what many Europeans and North Americans consider mainstream’. (Jenkins, 2002:123) These models ‘have been far more enthusiastic, much more centrally concerned with the immediate workings of the supernatural, through prophecy, visions, ecstatic, utterances, and healing’ (Jenkins, 2002: 123). Jenkins’ analysis can be also applied to the situation faced in Italy by mainstream Protestant Churches. Here I argue that migration is also increasing the visibility and the numbers of minority religious communities including the Protestant ones. In this paper I investigate how Protestant Churches balance their vocation to solidarity and their fear to lose their identity – a very crucial point especially in relation to their minority status. Finally, from the preliminary findings it emerges that migrants can be seen as both a resource and a treat for the church as they challenge the ecclesiology, the theological understandings and worshipping styles of mainstream Protestant Churches.

Data has been collected over the past two years using semi-structured interviews with church leaders – both migrants and in-
INTERRELIGIOUS DIALOGUE BASED ON VALIDITY CLAIMS BREAKS UNDEMOCRATIC AND UNSCIENTIFIC PROCESS

Lena De Botton, Ana Burgués, Oriol Rios

Abstract: The religious fact is a dimension that can not be ignored in the social relationships and the structure of a society. The group of interreligious dialogue belonging to CREA in the University of Barcelona, departs from the recognition of this fact in order to favour the scientific identification of actions towards inclusion. The group arose in 2004 with the goal of going deeper into the identitarian aspect of religion given the fact that it is an element which is present in the managing of the public space, in the interactions and which has the potential of guiding the social commitments as well. This general goal of the group is stated, among others, in the possibility of conciliating the religious identity with the scientific production – just as the best universities in the world prove-, as well as in being able to contributing to the democratisation of societies. Both deepen into the rationalisation process which is common to modernisation. In spite of this, the development of the modernity in Europe was associated, among other questions, to the secularisation making of reason the enemy of religion. History, however offers us many examples among the scientific community where the religious experience does not hinder the development of knowledge. One of these is Hipatia from Alexandria. She was scientist well known for her intense search of the truth above any imposition and she did it in a constant dialogue with intellectuals from diverse cultures and religions. She also had a strong commitment with freedom and therefore against interpretations or social models that placed women in a position of subordination. We can also find examples of this nowadays. The recent events in different countries with Muslim majority, an important process of democratisation is happening thanks to the ICT use. This fact does not imply a rejection of the religion fact present in the daily lives of many people, as shown with the large prayer in Egypt’s Tahrir square. This is the same square where the weeks long concentration took place to reject both dictatorship and religious fundamentalism.

CREATION AND TRANSMISSION OF NEW ISLAMIC NORMS AND PRACTICES. THE CASE OF WOMEN WHO CONVERTED TO ISLAM

Amélie Puzenat

Abstract: This paper or poster aims at presenting some of the findings from the research conducted as part of my thesis in relation to the path followed by individuals who choose to convert to Islam, and in particular, those of French women living in the outer suburbs of Paris. It includes unravelling the social causes and consequences of their conversion in order to better understand how they redefine their identity and those of their children, as well as how they rationalize the new gender order they produce. After a brief presentation of the families I have met with and of the type of Islam they practice and live daily, the different stages of conversion will be articulated to ethnic and gender factors. Through the examples of marriage, socialisation and schooling of children, we will insist on the production of new family related norms and practices, and also on the redefinition of the borders between public and private lives.

Key words: Conversion; Islam; Gender; Ethnicity; Transmission

BETWEEN EXCULTURATION AND POPULARIZATION: RELIGIOUS KNOWLEDGE AMONG FRENCH AND GERMAN TEENAGERS

Bruno Michon

Abstract: Religious knowledge is mostly correlated with Religious Education in school. In this paper I aim to understand the process of the construction of religious knowledge in teenagers. Is school really the only place that allows teenagers to construct a stock of knowledge (Schütz)? By examining a comparison between France and Germany we will see that two social phenomena are implied in the transformation of religious knowledge. The first, featured in Daniel Hervieu Léger’s book Christianisme la fin d’un monde, is the process of Exculturation. The second, explored in Hubert Knoblauch’s book Popular Religion, centers around the notion of the Popularisation of Religion. With these concepts in mind we will question the classical distinctions between France and Germany in matters of Religion. Traditionally, religious institutions in Germany assume a greater importance in the public sphere than in France. Indeed, the fundamental notion of laïcité in France is often interpreted as a rigid separation between States and Church. I aim at questioning the impact of this national difference on the religious knowledge of teenagers. To the end I will insist on the effect of the previously mentioned social phenomena on the stock of knowledge. I will focus my analysis on the question of the difference or the homogenisation of religious knowledge among French and German teenagers.

CONSTRUCTING RELIGIOUS IDENTITIES: HOW YOUNG PAKISTANI MUSLIMS IN DUBLIN AND BOSTON ARE NEGOTIATING THEIR ISLAMIC IDENTITY

Craig Considine

Abstract: This seminar will discuss the experience of young Pakistani Muslims in Dublin and Boston (US) as far as their religiosity and identity is concerned. It seeks to explore how various expressions of Islam have contributed to the construction of young Pakistani Muslims’ ‘sense-of-self’. Indeed, Western societies, although latently, inevitably create categories and classifications of how identity should be defined in the face of ‘the other’.

In reaction, young Pakistanis are participating in an era of Islamic renewalism and revivalism. In both cases in Dublin and Boston, there is often an unspoken request for the ‘imagined communities’ of Muslims to mimic the majority population. It is in this dynamic that we can explore the notion of Muslim ‘hybrid identities’.
THE RELIGIOUS PATTERNS OF EMERGING ADULTS IN POLAND: HOW TWENTY- AND THIRTY-SOMETHINGS LIVE AND LOSE THEIR RELIGION IN TODAY’S POLAND

Maria Rogaczewska¹

¹Institute of Sociology, WARSAW UNIVERSITY, Warsaw, Poland

Abstract: The growing tensions permeating the religious life of the Polish society on the eve of XXI century can be best shown on the case of teenagers and emerging adults. These groups are still a special target of the Catholic Church in Poland. The Church is very much focused on their religious education in public schools, extensive preparation to Christian marriage and family life and moral life. At the same time, the emerging adults are trapped between the embodied religious tradition and multiple modern challenges and they tend to seek for alternative ways to cope with these challenges. The religiosity of their parents and grand-parents cannot be taken for granted any more as it has basically been a form of life: a sum of habits, rituals and bodily practices rather than epistemology. This unique Catholic form of life still persists but seems to be inadequate in the youth’s own experience.

In this very dynamic situation of bottom-up change of life-styles and moral habits, the agency of the hegemonic religious institution becomes a critical factor. In my paper I am going to describe the results of my qualitative research on unexpected effects of the Catholic Church educational policy and its impact on the religiosity of young Poles. A very strong political position of the Catholic Church in Poland made it possible to enforce religious instruction on massive scale in all Polish public schools after 1989. The religious instruction in all public schools leads to the situation in which Catholic religion becomes just another set of beliefs that have to compete with many other sets of beliefs in pluralist society. This fact results in a massive epistemological crisis of young adults when they leave public schools. Still, they are trying to find their own way of balancing traditional, embodied and family-centered faith with the conditions of modern life. There are also very interesting gender differences in how the emerging adults in Poland come to terms with their religious heritage, because women seem to be more flexible and open to re-configuration and innovation within their belief-system then men.

PIOUS OR MODEST? COLLECTIVE SELF-DESCRIPTIONS OF TURKISH-GERMAN TEENAGERS IN BERLIN.

Yasemin Soytremel²

²Sociology, UNIVERSITY KONSTANZ, Konstanz, Germany

Abstract: The proposed paper presents some results of my PhD-research about the idols and heroes of Turkish-German teenagers in Berlin. My research is directing the focus on the previously neglected narratives of belonging and self-description among the third generation of Turkish-German teenagers. As we were interested in their interpretative negotiations of idols, we conducted several group discussions with Turkish-German pupils at different schools in Berlin.

Surprisingly, the interviewed teenagers named role models like Mother Theresa, Oskar Schindler or Atatürk. However, these idols are not used by the teenagers to identify themselves neither with Germany nor Turkey or the Turkish-German community. Moreover, they contest the existence of a consistent Turkish-German identity and besides, dismiss this as category of self-description. In contrast to the disclaiming of national categories of belonging stands the veritable “sacralization” of family – the most important point of reference among abstract categories. Hence, the question arises: Is the idealization of family a mere default notion in the absence of alternative possibilities of identification?

I am arguing that for the Turkish-German teenagers family stands for loyalty towards the Turkish-German community. By referring to Family they emphasize a codex of modesty, respectability and virtue, by which they are committed to themselves. This codex enables them to dissociate themselves from “Germans” as well from “Turkey-Turks”. Irritatingly, in contrast to family and modesty, religion is sparingly addressed in the group discussions, although the teenagers frequent the mosque weekly and abide the Ramadan. If the teenagers prefer a conservative or traditional lifestyle, why has religion not that important explicit function for their self-descriptions? Goal of this paper is to discuss the relation between “family”, “modesty” and “religion” in the group discussions.

Keywords: Collective identity, narratives, idols, turkish-german, diaspora

CHURCH AND STATE RELATIONS IN LATVIA: RELIGION AND RELIGIOUS ISSUES AS A POLITICAL WEAPON IN ELECTORAL CAMPAIGNS

Simona Gurbo³

³Department of Political Science, RIGA STRADINS UNIVERSITY, Riga, Latvia

Abstract: The role of religion in Latvia, if calculated according to statistics and the number of people belonging to churches, seems to be in decline as in so many other Western countries. Churches in Latvia face the same problems – an ever declining numbers of members, lack of commitment by those who still are listed in church records, in short, people wish to believe without belonging. And yet churches in Latvia, though attended regularly by approximately 5% of people, have one of the highest levels of trust in the society.

For years, Latvia has been encountering many of the problems associated with new democracies – corruption, economic instability, etc., which has led to a general distrust in politicians and political institutions. Only 5% of people in Latvia trust in political parties (one of the lowest levels of trust in the EU) and less than 12% trust in the Parliament, however the Church continues to have very high indicators of trust in the society. Studies in 1995 showed that 68% of people in Latvia trusted the Church and in 2003, the level of trust grew to 75%, which was the highest point; today it stands at approximately 65%. People show general trust in the Church because it seems distant from politics and therefore it is easy to understand why throughout the pre-election period churches become a battleground for various politicians and their political parties in a race for votes. There has hardly been a political party that has not tried to reach voters within the churches.

Analysing conducted interviews with church leaders and clergy, as well as newspaper articles on the many cases of political canvassing in one form or another, it becomes clear that even though churches have their own agendas with regard to politicians on such issues as legalisation of abortions, euthanasia, and homosexual rights, etc., it is actually the politicians who are more interested in collaborating with the clergy throughout the pre-election period using religion and various religious issues as a weapon to appeal to the Christian
voter and receive more votes at the voting booth. The line that separates the state from the church has been stretched very thin in Latvia, but apparently parties are the ones that are feeding on the positive image the churches have and are building their electoral campaigns on this, which proves that religion still matters in the public sphere in Latvia if only for the sole reason to help get more votes.

THE MYTHS ABOUT THE ROLE OF RELIGION IN RUSSIAN SOCIETY: TO THE ISSUE ON HOW TO MEASURE RELIGIOSITY
Irina Kargina

Sociology, MGIMO (UNIVERSITY), Moscow, Russian Federation

Abstract: One of the myths concerning modern Russia in a religion context is the seemingly high level of religious self-identification of Russians. This myth is based on the results of polls, according to which about 60 % of respondents in Russia say they are religious. But the paradox is that whilst 60% of Russians consider themselves religious - about 80% say that they are Orthodox Christians. Furthermore, the number of adherents regularly visiting Churches is no more than 7 % of the population. Mass polls of the population do not find any Protestant believers in Russia, whereas the analysis of the quantity of religious organizations and the research carried out within these organizations show that Protestants in Russia comprise about 2.5 % of the population. A certain fetish of figures concerning the definition of the importance of each religion is hence predominant in the public opinion. This "magic of figures" (named so by Russian researchers of religion R.Lunkin and S.Filatov) supports myths about a condition of religiousness and a social role of religion in Russian society, defines a vector of fashionable behavior in a religious context.

The myth about the increased influence of the Orthodox religion on social life in Russia is also supported by the aspiration of the government to publicly show their religiousness and loyalty to religion by means of participation in religious ceremonies and another matters of the Orthodox Church. Within the last decade, in the modern Russian society it became fashionable to celebrate religious holidays, which possibly testifies to the revival of the religious culture of Russia.

This survey tries to answer the following issues: distinguishing the myth from reality concerning what role religion plays in the modern Russian society, and also what quality stands behind the figures derived from mass population polls and whether it is still adequate to apply the traditional quantitative methods to researches concerning religiousness in the modern, dynamically changing society, which is constantly becoming more and more complex.

RELIGION IN HOSPITAL: BETWEEN CONFLICTS AND ADJUSTMENTS
Sophie Geistel

Université de Strasbourg, Strasbourg, France

Abstract: New conflicts, which have cultural, ethnic or religious dimensions, have emerged in France, where religious visibility is considered with suspicion. A number of social and political sciences’ investigations, about the secularism issue at school, were published, but, what about the situation at hospital? As a place where different religions coexist, hospital is a good field to analyze the emergence of new forms of identities enunciations (individual and collective) in which religion is one of the references. According to the French law separating Church and State, public hospital has to ensure the neutrality of collective spaces. But this law also enforces closed environments (prisons, army or hospitals), to ensure the free exercise of religion and therefore to facilitate chaplaincies functioning. Tackling both with neutrality and freedom of religion, how do hospital actors deal with various demands?

Recent years have witnessed the emergence of new religious demands which sometimes lead to conflicts between institution and patients, such as blood transfusion refuses or demand for same sex doctor. I investigate the emergence and the management of such demands and analyze the different types of conflicts resolution modes: negotiation, adjustment, avoidance.

In contrast to other public spaces, it appears that the hospital institution is a better place for accommodations.
RN 35 Sociology of Migration

GLOBAL GOVERNANCE OF MIGRATION AND THE GLOBAL MIGRANT RIGHTS MOVEMENT
Nicola Piper

Abstract: The past few years have seen the ascendancy of international (economic) migration on the global policy agenda. Much in contrast to other issue areas which are subject to global regulation such as trade (WTO), finance (IMF, WB), health (WHO) and intellectual property (WIPO), the movement of people is not governed by one formal international regime (except for refugees). Recently, however, there has been an increased level of activity surrounding the governance of economic migration at the global level: many intergovernmental organizations are now actively involved in migration from their respective areas of expertise or interests, several international commissions and state-led initiatives have placed migration governance on the global policy agenda, and a number of institutions for inter-state dialogue and cooperation have been established at the regional and global levels. This has led to an emerging system of migration governance which is to date, however, highly fragmented and incoherent.

The general aim of this paper is to examine the obstacles and opportunities provided by the emerging, yet fragmented, migration governance system, and specific IOs within it, for the rallying around of non-state actors in one form or another in order to assess their level of influence over shaping the direction and content of policy making at the global level. Of specific interest in this paper are the strategies employed by those non-state actors which are advocating for migrants’ human rights, referred to as “civic organizations”.

In this context, this paper probes into the kind of strategies civil society actors are using to promote migrant rights and to influence policy making at the global level. It is argued that these strategies are mainly of two kinds: 1. normative (i.e. the discursive level, to achieve a certain, and possibly new, understanding of what migrant rights are all about) and 2. agential (that is, the meso level of political activism via collective organizations which aim to gain access to global institutions and influence on processes of policy making). To probe deeper into the nature of these strategies, an analytical framework is developed on the basis of two overlapping strands of theory: constructivist international relations and social movement theory.

NEW MIGRATION CHALLENGES IN EUROPE: A CASE OF CIRCULAR MIGRATION
Oksana Shmulyar Gréen

Abstract: In recent years, international migration has become one of the major issues, an interest to which is no longer limited to a narrow group of analysts. Within the framework of the European Union migration has reached the top of the EU’s policy agenda and the state policies of the countries involved. The growing significance of this issue can also be observed in the public discourse in most of European countries. One of the key questions debated now is how migration can contribute to development? The policymakers at the EU and international levels seem to converge in their belief that the best available option to achieve development it to promote circular migration. This paper aims to analyse the phenomenon of circular migration both in theory and in practice, drawing on the Swedish experience. Focusing on the evaluation of circular migration policies in Sweden, as one of the EU member states, this study seeks to explore the circular migration - development nexus, in order to identify the circumstances (political, economic and social) in which the 'win-win' potential of policies encouraging circular migration can be realised. The paper is designed as a qualitative study with the aim to highlight the importance of the context, namely the circumstances surrounding the circular migration, for unfolding its developmental potential. The main argument is that there is a clear discrepancy in the ways how policymakers and migrants themselves, as well the countries of their origin and destinations, prefer to handle circular migration and its dynamics. It is this particular discrepancy that informs a broader research question of this paper, namely to what extent the 'win-win' scenario manifested in the circular migration policies is real or imaginable.

THE AGE OF MIGRATION POLITICS? A SOCIO-HISTORICAL ANALYSIS OF THE EVOLUTION OF MIGRATION MANAGEMENT IN AUSTRIA 1920-2010
Kenneth Patrick Horvath

Abstract: The propagated global management of migration has so far mainly resulted in the further development of national migration regimes, specifically in the global North and West. Using the example of Austria 1920-2010, the proposed paper puts these recent migration policy initiatives in a historical perspective. The aim of the paper is to analyse how the logic of migration management is applied in a Western European nation-state and how the resultant policies are connected to its long-term development. The primary empirical data-source is an extensive corpus of material from the Austrian parliament dealing with migration issues, spanning the period from 1920 to 2010. In a first step, these documents are analysed interpretatively and quantitatively to trace the development of the political rationality informing migration policies over time and the concomitant evolution of political technologies. The main finding is that while the basic logic informing migration politics remains surprisingly stable, there is an interesting and complex pattern regarding the development of political terminologies and administrative technologies. Over the years, specific terminological capabilities develop – terms, distinctions, categories, and classifications that go hand in hand with legal, political, and social differentiation and discrimination. Without these capabilities, sophisticated forms of governing mobility and inequality, such as point-based systems and temporary migrant workers programmes, would not be conceivable. In a second step, the patterns identified in the corpus are contextualised in order to discuss how they are linked to social and political events and embedded in specific economic, political, and social constellations. Most importantly, they are read...
against the background of changing industrial relations, labour market structures, and welfare regimes. On this basis, the paper concludes that recent migration management initiatives can be conceptualised as the latest step in the long-term development of Western migration regimes, with the notion of migration management, developed and propagated by supra-national initiatives, serving as a legitimating discourse. Consequently, global social inequalities are rather reproduced than overcome.

THE IMPACT OF INTERNATIONAL MIGRATION IN THE POPULATION AGE STRUCTURE: THE PARTICULAR CASE OF THE SOUTHERN EUROPEAN COUNTRIES

Andreia Barroso Maciel 1, Maria Filomena Mendes 1

1Sociology/CIDEHUS, ÉVORA UNIVERSITY, Évora, Portugal

Abstract: The fertility decline and the subsequent ageing population has thrown light on the importance of migratory movements, nationally and internationally, turning in an outstanding way the population structure of both, countries of origin and host countries. While some authors such as Giddens (2003) refers to a possible cosmopolitanism in global terms, others, like David Coleman (2006) perspective the occurrence of a Third Demographic Transition, with substantial weight reduction of native populations to the detriment of the increased weight of the population of immigrant origin (and mixed), if the immigration trend shows increasing continuously. Coleman (2005) considers immigration - particularly of people from the underdeveloped countries, whose age structure tends to be young and its fertility rate higher than that of the destination countries, although these distortions are transient - the driving force of population growth, including greater demographic power than fertility. Our goal is to understand the importance of the process of international migration in Southern European countries and its influence in the population age structure of these countries, which currently are characterized by one of the lowest fertility level in Europe. The fertility behaviour of immigrant women is crucial for the future of European populations, particularly the ageing populations of Southern European Countries. At the methodological level, we will use a statistical approach, integrating specific calculation of demographic indicators. Following the analysis of the demographic situation, we will try to understand the consequences of current economic and financial crisis in attractiveness of international immigrants, especially in the particular case of women. As in many of the "providers" the fertility is declining, in some cases very quickly, what will be the possible impact of this phenomenon on destination countries? If the immigration movement has been operating in the poorest countries with overcrowded labor markets to richer countries, recent economic crisis and increasing rates of unemployment in Southern Europe, will not turn those countries into no longer attractive for immigration? Finally, given the recent crisis, we question whether in the vast majority of immigrants persists a desire to remain in those host countries.

DOES WESTWARD MIGRATION LEAD TO BETTER WORKING AND LIVING CONDITIONS IN THE EAST? THE IMPACT OF TRANSNATIONAL LABOUR MIGRATION ON ROMANIAN ECONOMY AND SOCIETY

Roland Erne 1, Sabina Stan 2

1UNIVERSITY COLLEGE DUBLIN, 2Dublin City University, Dublin, Ireland

Abstract: The controversial rulings of the European Court of Justice in the Laval, Viking, Rüffert and Luxembourg cases led to a broad consensus in industrial and labour relations literature: The enlargement of the single market to Central and Eastern Europe is putting wages and working conditions in Western Europe under pressure. By contrast, the socio-economic effects of westward migration on Central and Eastern European labour markets have not caught so much attention.

In this paper, we are proposing an analysis of the impact of Romanian workers’ westward migration on Romanian economy and society. The paper builds on the assessment of Romanian labour market data, documentary analysis, expert interviews, and economic, sociological and ethnographic literature on Romanian migration. It assesses whether the Romanian case confirms the thesis according to which the massive vote of Easters workers with their feet triggers an improvement of worker’s living and working conditions in their home countries (Meadri 2010). The paper will look at the impact migration has on Romanian wages, working and living conditions in Romania, as well as on the larger economic development of the country.

DUBLIN II FROM A CHILDREN’S RIGHTS PERSPECTIVE.

Anna Lunderberg 1, Emma Kristina Söderman 1

1Global Political Studies, Malmö UNIVERSITY, Malmö, Sweden

Abstract: The aim of this article is two folded. First it is to describe the vulnerabilities of unaccompanied adolescents seeking refuge in Europe. The focus is Malta, a country of the EU external border having received 6000 migrants by the sea since 2002. The article presents unaccompanied children’s strategies to handle everyday life in Malta, to where they have been deported from Sweden in accordance with the Dublin II Regulation. The second aim of the article is to analyse and assess the harmonization of European migration politics from a bottom up and human rights perspective. Listening to children’s voices is a fundamental idea of children’s rights (Convention on the Rights of the Child article 12). An underlying ambition is consequently to give voice to children in a subordinated position.

It is well known that children’s experiences as well as other migrants’ stories, with few exceptions, are neglected in migration research. Refugee children are generally conceived as vulnerable victims unable to act in an exposed situation. Thus, the scientific community has overlooked the political dimension of refugee’s everyday life. Our ambition is to contribute to the academic discussion on vulnerable children’s rights by addressing the tension between children as vulnerable object on the one hand and children as active subjects on the other.

Methodologically the study set out from critical ethnography. It has an inter-active action oriented ambition. This means we see knowledge as created by the children in collaboration with us. Each child were for example given a disposable camera that they used to document their everyday life. A field study was conducted in a refugee camp during three weeks, from the 28th of April until the 18th of May 2010. Five boys were included in the study. They were interviewed three to eight times and we also followed them in their everyday life.
The study shows that the image of refugee children merely as victims needs to be nuanced. This since the children, even in an extremely vulnerable situation, possess a great strength demonstrated through the strategies to handle everyday life hardships. Our study further reveals that the harmonization European refugee politics leads to a denial of the rights of the children. This calls for a stronger advocacy to make the voices of the children heard and to take their experiences into consideration in discussions on the European refugee policy.

INTERCULTURAL INTEGRATION OF THE "NEW GENERATION" OF IMMIGRANTS: THE RESULTS OF AN EMPIRICAL RESEARCH CARRIED IN THE ABRUZZO REGION (ITALY)

Rina Manuela Contini

INTRODUCTION

In the study integration processes of the "new generations" of immigrant origin and the possibilities of intercultural integration in Southern European Societies, that are undergoing deep transformation because of the growth of their multiethnic and multicultural character, are analysed. Particularly, integration processes are investigated taking into consideration the ways of selective acculturation (Portes, Rumbaut, 2001; Portes, 2004; Ruben, Rumbaut, 2004), that is to say in reference to a recent explicative model.

Such a question is dealt with considering an empirical research carried out - on a sample of 1314 Italian and foreign preadolescents - in Abruzzo, a region in central Italy, that is to say in a context that in the last decade has had a growth of foreign presence, and also a transformation in the migration flux from temporary immigrations to a populating immigration.

Through the presentation of the results of the empiric research, we suggest to:

- Cast a look on preadolescents’ identification formation processes with larger groups (formation of multiple belonging) (De Wende, 2008; Commission of European Communities, 2008);
- Investigate the construction of intercultural relations, that imply on one hand the ability to understand and respect cultural diversity, and on the other the research of social cohesion, in a new vision of citizenship suitable to current pluralism in which particular focus is set on building the convergence towards common values (Kymlicka, 1995; Dubet, Martuccelli, 1996; Council of Europe, 2008);
- Understand how these young immigrants articulate the complex relation between their family and cultural origins, the perception of diversity with which they are identified, the larger social context with which they enter in relation (Portes, Hao, 2002; Portes, Rumbaut, 2005; Nesse Network 2008; Ambrosini, 2008);
- Observe how particular cultural and social practises - as language or religion, listening to music or following the country of origin’s traditions - are taken into possession and repurposed, become a binding social and distinctive element, favour aggregation and distancing (Hakuta, 1986; Portes, Zhou, 1993; Hirschman, 2004; Chen, 2006; Levitt, 2007).

LIBERAL RESTRICTIONISM IN IMMIGRATION AND INTEGRATION POLICIES

Gerard Boucher

1Sociology, UNIVERSITY OF THE WEST OF SCOTLAND, Greenock, United Kingdom

ABSTRACT: One apparent paradox of neoliberal globalisation is that liberalisation of international markets for capital and trade has not been accompanied by a similar liberalisation of people flows as immigrants. This paper draws on a concept of liberal restrictionism to provide a common framework to compare global flows, and liberal restrictive policy mixes in each flow. It contrasts these flows by focusing on the specific characteristics of each category. For immigration, the main feature is that the flow is of people, who, as individuals and in social groups, carry their skills, credentials, networks, capital and cultures within and between them to their host countries.

Liberal democratic states have devised a common set of national immigration and integration policies with a distinctive mixture of liberal and restrictive features. In terms of restrictionism, external borders have been fortified, increasing restrictions have been placed on asylum-seekers, ‘illegal’ immigrants and ‘unwanted’ immigrants with lower levels of skills, education and capital, and civic integration policies have been introduced for new immigrants. Yet, policies have become more liberal with regards to ‘wanted’ immigrants, particularly those with higher levels of skills, education and capital, who are granted greater access to citizenship rights. These differences in the treatment of the respective types of immigrants are usually justified in nationalist terms.

The liberal elements in this specific mix are justified by reference to neoliberalism and the restrictive parts by nationalism. This resolves the apparent paradox between the different rates of liberalisation. People as immigrants are deemed as potential social problems, justifying the deviation from neoliberal ideology and nationalist restrictions on ‘unwanted’ types of immigrants. Yet, the liberal treatment of ‘wanted’ types of migrants shows that these countries remain ‘liberal’ towards immigrants. This also justifies deviating from neoliberalism when it is deemed to suit the national interest. Arguably, the current mix of liberal restrictive policies serve to legitimize states to their citizenry by showing that they are willing to deviate from global neoliberalism to protect their people from foreigners when it suits the national interest. It is expected that this policy mix, and its use for legitimation, will increase during the current period of crisis.

MIGRATION IN ‘TURBULENT TIMES’: IS ALBANIA A KIND OF SOCIAL LABORATORY FOR STUDYING THE MIGRATORY PHENOMENON IN NEW EUROPE AND GLOBAL WORLD?

Lekë Sokoli1, Edlira Lloha1

1Department of Sociology, MARIN BARLETI UNIVERSITY ALBANA, Tirana, Albania

ABSTRACT: Massive migration from Albania, during two decades of post-communist transition, is one of the most impressive ones globally on the bases of both its size and economic impact. The phenomenon of migration has been at the core of economic and social changes of the country. At least one third of Albanians have immigrated, since 1991. Most of them have located in Greece, in
Italy and in other twenty EU Countries, in the USA, Canada etc. Recently, Albanians have immigrated also to Australia, Malaysia, South Arabia, New Zealand, South Africa etc. Albania is transformed from a “hermetic country” (during the communist time) into a typical country based on migration. No other Center or East European Country has been affected to such extent by migration, in such a short period of time.

The authors of this paper try to provide an answer to some basic questions, such as: why the case of Albania is different in comparison to Bosnia-Herzegovina, Kosovo and other Balkan countries, in spite of the fact that in Albania there hasn’t been armed conflicts, genocide, persecution, ethnic problems, political repression, human rights violation and so on; what specific “push” and “pull” factors have influenced such a massive (even biblical) exodus of Albanians; is Albania a kind of laboratory for studying the migration phenomenon in new Europe and global world; how Albania has optimized the positive aspects of immigration, while minimizing negative ones; which is the impact of migration (of this size) for the sustainable development of the country and why Albania itself is far from being a fully democratic or economically developed country; What are the effects triggered by Visa liberalization and is a new wave of migration in sight, due to this fact? To answer to the above questions a national survey data set (of December 2010 - January 2011) is used by the author/s. The paper concludes with some specific suggestions concerning the migratory policy-making in Albania and wider.

Key words: Albania * migration * social laboratory * push and pull factors * remittances * visa liberalization * poetical exodus *

REMOTE CONTROL AND THE ENHANCED SELECTIVITY OF BORDERS
Lena Laube 1

1Sociology, University of Bremen, Bremen, Germany

Abstract: Controls on persons to regulate the access of foreign citizens have classically been located at the border of the sovereign nation state. On the background of increased global mobility as well as the emergence of the European governance of borders, this location has been shifted to many different places inside and outside the territory. The trend to conduct controls extrateritorrarily has been labelled “remote control” (Zolberg 2003).

We can observe spatially relocated border controls for example with regard to visa procedures, the stationing of airline liaison officers abroad as well as with regard to interceptions of refugees on the High Seas. These instruments are able to treat specific groups of travellers and migrants differently. While some “wanted” persons may cross borders easily, others are frequently controlled or kept from even starting their journey in the countries of origin. Furthermore, extraterritorial control policies may avoid the legal responsibility for refugees (Guiraudon 2000). In the current European attempt to keep off refugees from Northern Africa, these processes became quite obvious.

I will argue that these control practices of Western immigration countries have enhanced the selectivity of borders. “Mobility rights” (Urry 2000) are distributed unequally mainly depending on the country of origin and the assumed individual motivation to migrate. A country comparison of relocated border control instruments in liberal Western societies (USA, AT and FI) is provided on the basis of qualitative document analyses as well as expert interviews. It will be demonstrated that control practices have converged not just across Europe but also in North America during the last two decades. This standardization of the governance of migration entails the danger to immobilize parts of the world population. In fact, we are facing a global approach to regulate mobility which will foster the social stratification of individual life chances.

ROMA MIGRATION: CHALLENGING GOVERNANCE, PROVING SOCIAL INEQUALITIES
Teresa Sordé Marti 1, Olga Serradell 1, Rosalina Alcalde 1, Ariadna Munte 2

1Sociology, UNIVERSITAT AUTONOMA DE BARCELONA, Bellaterra, 2Social Work, Universitat de Barcelona, Barcelona, Spain

Abstract: Recent European episodes related to Roma migration into Western European countries (France, Italy) have highlighted existing challenges in governing global migratory flows, especially regarding the compliance of freedom of movement rights and Anti-discrimination protection. Along these lines, this paper will present some of the findings obtained from the ongoing Spanish Ministry of Science and Innovation funded RTD project “DROM-IN: Romani immigration in Spain: challenges for social inclusion and coexistence” and other previous research endeavors on the field of Roma migration to Spain. The project covers a review of the scientific literature, policy analysis, and qualitative fieldwork with Romani immigrants and Spanish Romani organizations. Despite of its broad nature, it should be kept on mind that the situation of Romani immigrants in Spain is complex, involving a myriad of factors and circumstances that vary greatly from one area to another.

The immigration of Roma to Spain must be understood in the context of other major population movements. It fits into the broad pattern of international westward migration flows, but that circumstances specific to the Roma that is the global social inequalities make this group especially likely to migrate. Romani migration from Eastern Europe to Spain extends back to the early 1990s and peaked between 2002 and 2007. Romani migration is clearly a family-based strategy, with many children among those migrating; this study also analyzes the role that women play within the migratory project and in the process of adjusting to life in the host country. The results will be presented using the dimensions we refer to as exclusionary and transformative. Differentiating between the two makes it possible to identify the main barriers in the migration governance that prevent Romani immigrants from being included within the host society, as well as elements that contribute to their inclusion. It will conclude with some recommendations and reflections arisen from the analysis conducted.

THE GOVERNMENT OF MIGRATORY FLOWS IN ITALY: ACCESS AND BARRIERS FOR IMMIGRANTS TO LOCAL SERVICES
Anna Maria Zaccaria 1, Fabio CORBISIERO 1

1Sociology, UNIVERSITY OF NAPLES, napoli, Italy

Abstract: Immigration has been integral to developing Europe’s identity as well as its economy, policies and society. In Italy, immi-
igration has become a driver for economic and population growth, especially in the large urban northern areas. The reflection and the elaboration about the size and the topics of immigration and inter-cultural (Portes and Rumbaut, 1996; Harris, 2000; Ambrosini, 2007), produced in the latest years a series of administrative and legislative initiatives that have resulted in specific initiatives which have found space in the national laws, regional and trial practice. In Italy, the information contained in the “Immigration Act 40 of 1998” (Testo Unico per l’Immmigrazione l.n. 40/98) provided for the enactment of a series of legislative measures that have a regional center to the implementation of policies aimed at the “government of migratory flows” and promote strategies for the integration of the immigrant population. After 13 years of its implementation, not all the Italian Regions have taken steps to enact laws in line with the provisions in the Immigration Act 40/98. Our communication proposes a survey study about the access of immigrant to the local services, after implementation of Immigration Act 40/98. The aim of the survey has been to capture insights about real spillover effects induced by national and local laws on the immigrant population, and to focus the analysis tools and channels of access for immigrants to local services. In this study we give an overview of experiences in 4 different Italian areas (Abruzzo, Friuli, Liguria, Emilia Romagna) analyzed in order to assess the evolution of integration strategies promoted locally to promote the full inclusion of immigrants in according with Immigration Act 40/98. The survey involved 400 immigrants living in the selected areas: the sampling plan provides for the administration of 100 questionnaires for each region surveyed. The data analysis shows each Italian region has a unique and singular configuration of demands as well as resources. Thus, changes not occur in a uniform manner, despite Immigration Act 40 of 1998. Local governments must determine how best to meet the immediate needs of their own communities and to balance immigrants needs.

A LONGLITUDINAL PEER RESEARCH STUDY OF THE ATTITUDES OF MEMBERS OF THE IRISH PROFESSIONAL SOCIAL CLASS TOWARDS IMMIGRANTS BEFORE, AND DURING, THE CURRENT ECONOMIC RECESSION

Martina Byrne1

1sociology, TRINITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: This paper draws on data from a qualitative study which explores indepth for the first time the attitudes of Irish professionals towards immigrants. The turbulent socio-economic changes in Ireland since the 1990s, specifically economic growth and inward migration followed by recession and outward migration, provide a unique context and opportunity to contribute to sociological theories on migration. Throughout Europe the intersection of the indigenous professional social class and migrants is under-researched with no in-depth qualitative attitudinal studies in Ireland until now. In 2008 as Ireland continued to enjoy the Celtic Tiger economy I interviewed Irish professionals, peers from a former career, on their attitudes towards migration. By year-end the Irish economy had experienced a contraction large by historic and international comparison. In 2009, I re-interviewed those same professionals to establish if the recession had any impact on their attitudes.

This paper draws on this unique longitudinal data and contributes to theories on resource competition specifically in relation to members of this social class in the context of a period of rapid socio-economic change. Following the argument that resource competition is not confined to economic resources and can include competition for social, cultural, and political advantage, this paper will explicate if/how access to these advantages are manifest in the way this indigenous social class think about inward migrants.

The methodological framework is constructivist grounded theory. Undertaking peer research reduced the generic information and moved the interviews towards the personal for both interviewee and interviewer. The rich data gathered demonstrates the efficacy and challenges of the methodology.

This work is positioned within the theoretical framework of the intersection of class and race/ethnicity/national identity and Hall (1980), Gilroy (1987) and Anthias and Yuval-Davis et al (1992) who posit the existence of a mutual relation with ‘an agonistic as to which is primary’. This paper argues that in the current turbulent socio-economic context, for members of this social class, perceptions of class are pre-dominant in categorising individuals as immigrants and informing attitudes about immigrants which, in turn, affect social relations in the professional and private sphere.

FACTORS EXPLAINING ATTITUDES TOWARD IMMIGRANTS IN SWEDEN

Orlando Mella1, Kristina Bromark2

1Sociology, UPPSALA UNIVERSITY, Uppsala, Sweden

Abstract: Different studies conducted in Europe show that Sweden is one of the countries with the most generous attitude towards immigrants and ethnic diversity. By examining cohort data from 1969 to 2005, the trend is confirmed. For each measurement made the attitudes are broadly more positive than the previous year. The Swedish population accepts cultural and ethnical diversity to a greater extent than before. Education, gender, cultural distance and contacts with immigrants are factors that statistically influence attitudes toward immigrants and immigration. Highly educated individuals show more positive attitudes towards immigrants than unskilled individuals and women are more positive than men. Cultural distance is a strong influencing factor with higher cultural distance giving more negative attitudes and in the opposite, low distance gives more positive attitudes. Social interactions with immigrants more often contributes to positive attitudes than when interaction takes place to a lesser extent. The structural, the cultural and the interaction factors improve attitudes and reduce the resistance to immigration and immigrants, but together, these findings indicate that culture and interaction are more significant than structural factors.

FROM BOOM TO BUST? EVOLUTION AND DETERMINANTS OF ATTITUDES REGARDING IMMIGRATION IN ANDALUSIA (SPAIN)

Sebastian Rinken1,2, Saúl Velasco1,2

1Institute for Advanced Social Studies (IESA), Spanish National Research Council (CSIC), Córdoba, 2Permanent Migration Observatory of Andalusia (OPAM), Ministry of Employment, Regional Government of Andalusia (Junta de Andalucía), Seville, Spain

Abstract: When inquiring into the trends and factors regarding the European public’s perception of international migration, the Spanish case is particularly telling. Until mid-2007, Spain experienced a
sustained economic and demographic boom; millions of foreign workers were incorporated swiftly (albeit imperfectly) into an expanding labour market. Despite misgivings on some counts, public opinion accompanied this extraordinary immigration flow with comparative composure; arguably, this was due chiefly to the perceived usefulness of migrant labour, destined mainly to unskilled, dangerous and/or poorly paid jobs in sectors such as agriculture, construction and domestic services.

Just like the boom that preceded it, the current period of economic downturn and stagnation is of historic proportions, in Spain even more so than in other European countries. To which extent, and in which ways, is this change of macro (and micro-) economic context affecting the Spanish population’s mindset regarding immigration, its effects on the receiving society, and the policies best suited to manage it?

These questions are addressed, in this paper, on the basis of ample empirical data collected in Andalusia, the largest and most populous of Spain’s regions and one of the most severely affected by the economic downturn, with an unemployment rate of currently about 28%. Specifically, the paper is based on data collected in 2005, 2008, 2010 and 2011 respectively by the so-called OPIA study, a vast longitudinal research project conducted by Andalusia’s Permanent Migration Observatory (OPAM). Qualitative (focus groups) and quantitative (survey) data are combined to analyze the degree to which the economic crisis has affected opinions regarding migration in a variety of thematic domains, including the impact of migration on the receiving society, the regulation of migration flows, and migrants’ access to social and political rights. Subsequently, advanced statistical analyses are used to establish a typology of attitudes regarding migration, as well as their determining factors and evolution over time.

The OPAM pertains to the migration policy department of Andalusia’s Ministry of Employment; the Observatory is co-funded by the European Social Fund and managed by the Institute for Advanced Social Research, a unit of Spain’s Council for Scientific Research.

WHY ARE THEY AFRAID OF IMMIGRANTS? GENDER ANALYSIS OF PERCEPTION OF IMMIGRANTS IN LUXEMBOURG

Marie Valentova 1, Aigul Alieva1

1CEPS/INSTEAD, Differdange, Luxembourg

Abstract: Luxembourg is one of the European countries with the largest proportion of immigrants in the population and with a relatively long immigration history. According to the latest official statistics, in 2009 the immigrants represented 44 % of the Luxembourg population. In this context, the issues of integration and perception of immigrants are high on the political and research agenda.

The literature reveals several main groups of predictors of anti-immigrant sentiments among the native population: macro level factors related to overall economic conditions and the size of the immigrant population in the recipient country; factors related to the socio-economic, ethno-cultural profile of immigrants; and individual characteristics of the native population. A great deal of the literature on attitudes toward immigrants deals with the effect of threats against both individuals and groups on the perception of immigrants. However, what has been substantially missing in the empirical results is a more detailed analysis of the impact of gender differences in perceptions toward immigrants and explanations for gender’s effect. No studies explicitly focus on analyses of how men and women differ with respect to the main determinants that drive anti-immigrant sentiments. There is no empirical evidence related to how different kinds of immigration-related threats moderate anti-immigrant feelings among men and women.

The main aim of the present paper is to fill in this gap in the literature and examine gender differences in the perceptions of immigrants in Luxembourg where the number of immigrants reaches almost 50 % of the total population. The paper examines how the perception of different specific immigration-related threats (job competition, cultural intimidation, criminality, concerns about rising welfare dependency and out-group’s size) affects general anti-immigrant sentiments among men and women. In other words, we analyze which immigration-related factors are the most important determinants of anti-immigration sentiments among men and women. In the analyses, we account for the migratory backgrounds of residents meaning that we distinguish between natives and inhabitants with a migrant history.

ATTITUDES TOWARDS IMMIGRATION IN UKRAINE: THE COUNTRY’S SPECIFICITY IN EUROPEAN CONTEXT

Oleksii Shestakovskyi1

1INSTITUTE OF ECONOMICS AND FORECASTING, Kyiv, Ukraine

Abstract: Here the prevalence and dynamics of anti-immigration and perceived immigration threat attitudes in Ukraine are considered. Three waves of European Social Survey (2005–2009) serve as an empirical basis. Ethnic competition and social identification approaches are tested as explanatory models for the perception of immigration in Ukrainian society.

The findings are compared with the results for other European countries. At the same time, the data of Ukrainian studies of ethnic distance and intolerance are used.

All in all, there is demonstrated that attitudes towards immigration in Ukraine as well as factors that affect them, are in the course of pan-European tendencies. However a number of revealed peculiarities should be taken into account in further researches.

LABOR-MARKET PATHWAYS OF MIGRANT HEALTH WORKERS: DIFFERENT SCENARIOS FOR COMMON SITUATIONS. UK-SPAIN COMPARISON

Mariona Lozano Riera 1, Guglielmo Meardi 2, Antonio Martín Artiles 1

1Centre of Studies QUIT, Department of Sociology, UNIVERSITAT AUTÓNOMA DE BARCELONA, Bellaterra, Spain; 2Warwick Business School, The University of Warwick, Coventry, United Kingdom

Abstract: The article explores migrant workers careers in the health sector, comparing the Spanish case and the British case. International migration has become an important feature of globalization labor markets in health care. Recently, concerns over the need of ensuring staff and skill shortages in the health system are becoming a common issue in many European countries. Following this, the paper is focused on career uncertainty for migrant workers, qualification recognition processes, and policy issues on the training of nurses and doctors, in both countries selected as contrasting cases. The study provides an overview of migration of health workers,
regarding social and labor issues. We consider trends in migration, the working conditions of migrants, migration policies and recruitment practices.

By using a qualitative approach, the paper demonstrates that governments and employers have a key role in the migrations of health workers. In both countries, labor-market pathways of migrant health workers are uncertain compared to their native counterparts. This raises two issues: first, while immigrants fare well after a period of adjustment, migration generally reduces the returns to high-level education. Second, men and women experience differences in regards to the degree of uncertainty, that can be explained by their role in balancing life and working time. In addition, in the UK trade unions play an important role in showing support for foreign nurse’s demands for a better recognition, especially those who are employed in the care sector but have medical knowledge and perform medical activities. In Spain, Unions tend to protect native’s requests as immigration is a relatively recent phenomenon compared to the UK.

MIGRATION & ILLEGALITY / IRREGULARITY: WHICH TERM TO CHOOSE WHEN WE THINK ABOUT MIGRANTS’ RIGHTS IN PORTUGAL

Maria João Guia,1, Vera Silva1

1UNIVERSITY OF COIMBRA, CENTRO DE ESTUDOS SOCIAIS, Coimbra, Portugal

Abstract: In the last 10 years, Portugal has witnessed a rise in the number and diversity of origins of immigrants, at the same time as a large number of Portuguese were still leaving the country, looking for better living conditions. The integration of Portugal in the European Union and the Schengen space has committed Portuguese legislation to follow some common directives and readapt Portuguese national laws where the rights and duties of immigrants have been laid down.

In fact, the Portuguese Constitution sets out several rights for all citizens, mainly those related to the dignity of the human being on which the Portuguese Republic is based. According to its 15th principle (principle of equity), the rule is that all citizens, including foreigners and stateless immigrants, have the same rights as Portuguese citizens (the right of access to health, education, work and justice, with some specifications that regulate these laws). In this way, irregular immigrants have the right to access the national health care system, their children have the right to access free basic education and they have the right to juridical protection in conditions of reciprocity.

But even though Portugal is ranked in second place out of 31 countries for having the best immigrant integration measures (MIPEX III), there is still a considerable way to go in terms of standardising procedures on access to Law and public services, mainly for illegal/irregular immigrants.

The choice of one of these terms contains in itself an option that must be made. On the one hand, “illegality” evokes a state problem that must be solved by reinforcing the control upon borders, and so enhancing the sovereignty of the country and the national security, on the other hand, “irregularity”, preferred by the academic, proves to be a term that allows a more neutral stance to be taken.

In this paper we try to debate the national legislation for foreigners and attempt to identify what tools non-legal immigrants are able to use to gain access to Law and Justice in situations of inequity, exploitation, inequality and victimization.

We also intend to consider what assistance immigrants may call upon when they need help to exercise their rights, bearing in mind that they contribute to the demography and to the financial sustainability of the European countries, which are aging and greatly in need of an active population.

POLITICS OF BELONGING IN LAY, POLICY AND MEDIA DISCOURSES ABOUT MIGRATION IN GREECE

Maria Xenitidou1

1Sociology, UNIVERSITY OF SURREY, Guildford, United Kingdom

Abstract: Since 1989 Greece appears as a destination country for immigrant populations from Eastern Europe, the former Soviet Republics, North Africa, South Asia and the Middle East. In this context a negotiation of identities is observed. The aim of the present paper is to discuss the ways in which identity and otherness are constructed by Greek lay social actors in the context of immigration, and in relation to policy and media discourse on identity and immigration.

The paper draws from a focus-group based study conducted in Greece in 2004-8, with people who identified as Greek citizens of Greek ethnic origin. The focus groups were recorded and the recordings were transcribed. The transcriptions were discourse analysed focusing on themes, lines of argument and their function and on how these might interact with discursive patterns in policy and media discourse.

Identity and otherness are constructed by Greek lay social actors by resort to (national) categorization discourse and subsequent negotiations of boundaries of belonging, negotiating in this case the boundaries of Greekness and access to it by ‘others’. This (i) reflects trends in media and policy discourse, (ii) situates discussions about immigration at the juncture of (national) identity and tolerance, (iii) manifests the ‘politics of belonging’ in Greece as being expressed in terms of assimilation and (iv) reveals that discussions about immigration are imbued with (ideological) dilemmas.

Keywords: Greekness, immigration, discourse analysis, ideological dilemmas

INSTITUTIONAL SORTING OF ASYLUM-SEEKERS IN FRANCE AND GERMANY. HOW BUREAUCRATS ACCOMPANY THE TASK OF MAKING DECISIONS ON ASYLUM-CLAIMS

Johanna Probst1

1LIDSE / Zentrum für Konfliktforschung, UNIVERSITÉ DE STRASBOURG/UNIVERSITAT MARBURG, Strasbourg, France

Abstract: As Michel Agier (2002) writes, refugees are the symptom of an epoch’s evils. Paraphrasing Agier, one could say that they refugees express and highlight our world’s geopolitical (as well as economic and ecologic) turbulences. European countries have a legal commitment to receive asylum-seekers and to consider their claims. This challenging and politically sensitive task regularly causes sociopolitical turbulences on the national, and more recently also on the European level.
In this talk, I propose to question the internal operating mode of the German and the French asylum-system. The analysis is based on the results of comparative and qualitative research (conducted in 2010/2011) of two national institutions responsible for adjudicating asylum-claims. Despite the EU’s efforts to harmonize its member-states asylum procedures, the empirical study shows that big discrepancies remain, especially on the level of inner-institutional arrangements. By contrasting the German and the French case, we will try to disclose the mechanisms of administrative sorting of the applicants. Thereby, we will focus on the question of how political, bureaucratic, and moral concerns emerge in the national asylum-procedures, how these different aspects shape the social relations between the institutional staff-members and the asylum-seekers, and how they impact the final decision on the individual application-files.

I mainly refer to sociological literature concerned with: a) institutions and administration in general (V. Dubois, N. Luhmann); b) the political treatment of foreigners and asylum-seekers (A. Spire, G. Noiriel, S. Laacher); c) the theory of international migration, justice and conflict (U. Beck, N. Fraser, F. Nuschler, C. Butterwegge).

SUSTENANCE STRATEGIES AND SOCIAL ORGANIZATIONAL FORMS UTILIZED BY UNDOCUMENTED IMMIGRANTS IN SWEDEN

Markus Hansson

Abstract: This paper raises some preliminary findings from an ongoing research project about undocumented immigrants in Sweden. The undocumented existence requires alternative means of sustenance, since the opportunity structures utilized by citizens, and others that are being granted access to them, are generally inaccessible to this category of immigrants. These opportunity structures, i.e. the formal labour market, the formal housing market, adult education, most subsidized health care, public welfare and so on, have then to be replaced or complemented by other means. The research findings thus far suggest that there are a few life strategies or organizational forms of sustenance being used by these groups. These forms are sometimes complementary, but the material suggests that the utilization of these different strategies, and the ways in how they are being organized, are usually being conditioned, or preconditioned, by the immigrants’ life history, country of origin and preexisting social networks in Sweden. The two main opportunity structures being available to the undocumented immigrants are ethnic networks and voluntary organizations. The strategy of utilizing ethnic networks for life necessities such as housing, work opportunities and information are oftentimes used by undocumented labour migrants and with rejected asylum seekers with preexisting social networks within the immigrant society. The strategy of gaining support from voluntary organizations is more often used by rejected asylum seekers without these preexisting ties to any segment of the Swedish society. These strategies offer different sets of benefits to the immigrant. The ethnic networks are effective in supplying job opportunities; they are also able to provide housing, information and money among other things. The voluntary organizations are basically able to cover most of the range of services of the welfare society, such as healthcare, housing, education, but are generally ineffective in offering work opportunities. Drawbacks of each system are increased risks for exploitation and excessive social control in the case of the ethnic networks and feelings of isolation and lack of purpose among those largely dependent on voluntary organizations. The life histories and backgrounds of the undocumented immigrants are also determining factors of how they navigate in each sustenance system, mainly depending on the level of fear of being deported.

WHAT NEW COUNTRIES OF IMMIGRATION HAVE EMERGED IN EUROPE? IMMIGRANT INTEGRATION POLICIES IN ROMANIA BEFORE ENTERING THE EUROPEAN UNION AND AFTER

Astrid Hamberger

Abstract: The Central and Eastern Europe countries have started receiving refugees and transform themselves from refugee producing countries to refugee destination countries once with the fall of the Iron Curtain and the dissolution of the Soviet Bloc in 1989. In this respect, Romania ratified the 1951 United Nations Convention Relating to the Status of Refugees on the 7th of August 1991[1]. Prior to 1990 the asylum institution, based on the 1951 Convention, did not exist in this region.

Between 1991 and 2010 Romania recognized approximately 3000 refugees under the 1951 UN Convention Relating to the Status of Refugees. Nowadays, only around 1200 still live in Romania. Before year 2004 the refugees in Romania faced serious problems in their integration. This was due to the lack of an integration policy and the lack of a coherent legislation regarding the management, rights and duties of the recognized refugees in Romania.

Thus, in terms of the timing of their arrival and the context of reception[2], in Romania there can be identified two waves (or arriving decades) of recognized refugees: refugees arrived before year 2004 (the first wave or decade), and refugees who arrived after year 2004 (the second wave or decade). The first decade is characterized by the lack of a coherent legislation regarding asylum seekers and refugees and the lack of a policy/program regarding their integration. The second decade is characterized by the restructure of the asylum and refugee legislation which began in year 2004. These changes have brought along the beginning of a new system in managing refugees in Romania. These two distinctive decades characterized by different legislation in the refugee field have brooded different patterns of integration among the settled refugees in Romania.

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
WHO IS A POLITICAL SUBJECT? THE CASE OF SOMALI ASYLUM SEEKERS INTO SWEDEN
Hanna Wikström 1, Åsa Wettergren 2*, Thomas Johansson 3

1) social work, 2) sociology, 3) Education, Communication and Learning, UNIVERSITY OF GOTHENBURG, Gothenburg, Sweden

Abstract: What makes an asylum applicant a political subject in the assessments of the Swedish Migration Authorities? In Sweden accepted asylum seekers generally get a permanent residence permit. The average accept rate (between 5-25%) is also high if compared to other Nordic countries. However, the overwhelming majority of residence permits are granted on the basis of subsidiary protection, while the status of refugee – i.e. in accordance with the 1951 Geneva Convention – is very rarely used. The classification matters, because it is accompanied by both concrete and symbolic rights such as travelling documents and social status/esteem accorded by members of the receiving society.

Analyzing documents from 34 case files on Somali applicants, we problematise the frequent use of the residual category of subsidiary protection. We argue that the systematic reluctance to apply the category of refugee is corollary to a general ambivalence and uncertainty inherent to the application process. The applicant has a responsibility to make his or her story credible and trustworthy, both by hard facts (documents etc), by cooperation and comport; that is both by internal and external credibility. But while the process strives for a certainty that hardly ever can be accomplished, the actual agency and strict claims of the applicants instead are submitted to “common-to-all” categories thus blurring the ends that do not meet. In this move, they both ‘brand’ the applicant’s credibility as doubtful, and deny him/her recognition and agency as a political subject.

Key words: asylum seekers, assessment, political subject, refugee, categorization

CITIZENSHIP, RELIGION AND TRANSNATIONAL IDENTITIES IN A JEWISH DEMOCRATIC STATE: THE DUALITY OF STRUCTURE
Ruth Amir 1

1) Department of Multi-Disciplinary Studies, THE MAX STERN ACADEMIC COLLEGE OF EMEK YEZREEL, Haifa, Israel

Abstract: Israel provides an extraordinary laboratory for examining the agent/structure divide with regard to citizenship due to its rigidity of structure and ethnonationalism. This paper assumes the duality of structure and analyzes it in terms of policies and mechanisms of inclusion and exclusion, opportunity and exploitation and the variable capacity of transnational migrants to modify the fabric of society. I examine the duality of structure with regard to the four recent groups of migrants: immigrants from the former Soviet Union, Ethiopians, migrant workers and asylum seekers.

I argue that Israel seems to be light years away from Habermas’ vision of the post-national state. Israel has yet to balance the three somewhat conflicting commitments that constitute the hard core of its political and social order: colonialism, ethno-nationalism and democracy. While Israel’s collective identity is based largely on religion and blood kinship, it needs to be further reconstructed in order to facilitate incorporation as first class citizens – first and foremost the indigenous Palestinian citizens and the large transnational communities of Russians and work migrants that migrated to Israel and constitute a growing minority group of non-Jews non-Palestinians. Each of these agents have somewhat modified structure, in various explicit or implicit ways.

This paper holds four parts. The first part deals with the three citizenship discourses in Israel; namely, the liberal, republican and the ethno-nationalist. The second part lays out Israeli legislation that provides the framework for the policies which are used for the inclusion or exclusion of each of these groups (and their sub-groups) into society. In the third part I examine the differential allocation of civil, political and social rights, which is legitimized and sustained through a particular conception of citizenship. The final part discusses the manner in which the incorporation of these groups affects Israel’s particularistic commitment to being both democratic and Jewish. While this commitment is quite unique, the Israeli case offers the most overt form of such tensions, which characterize many liberal democracies today.

DIVERSITY AND ITS CONSEQUENCES FOR SOCIAL INTERACTIONS IN URBAN NEIGHBOURHOODS
Sören Petermann 1, Karen Schönwälder 1, Dietlind Stolle 2, Thomas Schmitt 1

1) MAX PLANCK INSTITUTE STUDY OF DIVERSITY (MMG), Göttingen, Germany; 2) Political Science, MCGILL UNIVERSITY, Montreal, Canada

Abstract: The paper presents selected results from a large-scale empirical study in German cities entitled “Diversity and Contact”. In the past few years, the consequences of the increasing migration-related diversity in the cities of Europe and North America have been the subject of controversial debates. While some assume disintegrative effects on social relations others expect that bridging contacts will develop and help counteract negative responses to diversity in the social environment.

A study currently conducted at the Max Planck Institute for the Study of Religious and Ethnic Diversity in Göttingen investigates the relation between contextual diversity and interaction between migrants and non-migrants as well as their impact on selected attitudes that measure trust and efficacy. The study uses a longitudinal (three-wave) survey with 2500 participants as well as qualitative methods. The unique stratified random sampling design which selects individuals from 50 neighbourhoods (ca. 7500 inhabitants) located in 16 cities enables us to represent “urban normality” in Germany rather than the exceptional situation of neighbourhoods with very high shares of immigrants.

The paper presents results from the first wave of the survey. It focuses on links between contextual diversity, interactions across group boundaries and indicators of social and political integration. The data reflect different modes of interaction (from strong ties to everyday casual encounters) and their sites. Our assumption so far is that the relatively strong negative effects of contextual diversity in the United States might not be reflected to the same degree in the European context. If this is correct, our paper will also consider why such differences exist, e.g. character and scale of the existing
diversity, welfare state differences and other aspects of civil society.

SOCIOMETRY DEPARTMENT, ADAM MICKIEWICZ UNIVERSITY, POZNAŃ, POLAND. MIGRATION FROM EAST TO WEST (WITHIN THE EU) AS A SAFETY VALVE: THE SOCIOECONOMIC REPERCUSSIONS OF RECENT SYSTEMS TRANSFORMATION PROCESSES IN POLAND.

Marek Nowak

1Institut of Sociology, Adam Mickiewicz University, Poznań, Poland

Abstract: Following the accession of Poland to the European Union (2004), the number of migrants from Poland increased significantly. Researchers, both sociologists and demographers, estimate this phenomenon as involving more than 1 million members of the labor force. The case of Polish migration can be profitably discussed because of its specificity and its evolution from the 90s to the first decade of 2000s.

It could be mentioned as an important result how this outflow has impacted the Polish labor market, but the changes reached much further than just decreasing the unemployment level. Both the structure of the migrating employees and the period of time when the migration occurred may have contributed to this. A significant fraction of these people were relatively young, relatively well educated people high school and universities without significant work experience, and manual workers (including the stereotypical Polish plumbers, builders, drivers, etc.), who did not come from the main urbanized cities.

The stabilizing of social relationships and the political reorientation which resulted from the parliamentary elections of 2007 may be somewhat surprising consequences of a decrease in social tension, and of the absence of potentially the most radical voters. The main idea of the text is to describe the socioeconomic consequences of mass migration, for society in general, for the labor market, and for local communities, and to answer the questions of migration as a safety valve, which on one hand changes social relationships (through deradicalization), and on the other preserves the status quo for a relatively long time.

The text works with official Polish statistics, data from public opinion research institutions, EUROSTAT, and materials from a workshop which took place in Poznan in 2009 (Social Inequalities and Migration in Post-Communist Societies: Searching for Positive Identity of Central and Eastern European Sociology. Central and Eastern European Sociology Workshop, Poznań, Poland, 21–22 September 2009).

DOING ETHNICITY. THE POLITICAL IN CARINTHIAN SLOVENE TEENAGERS’ ETHNIC BELONGING

Jonas Kölb

1Department of Sociology, UNIVERSITY OF ABERDEEN, Aberdeen, United Kingdom

Abstract: Belonging to an ethnic group is generally defined as an essential aspect of ethnicity and linked to cultural, historical, religious and linguistic aspects. Some scholars discuss ethnic belonging as a stable and steady group characteristic which is determined by structural aspects, others as an alterable notion challenged by ethnic organizations or media and still others as a fluid and volatile product of subjects’ human agency. However, those different points of view agree in most instances that ethnic belonging is socially produced and theoretically permeable in whatever degree.

Contrary to that, the question whether processes of negotiating and renegotiating ethnic belonging have to be classified as political issues constitutes the subject of controversial scientific discussions.

Based on ethnographic participant observations, empathetic interviews, analyses of artifacts and group discussions with Carinthian Slovene teenager cliques, the paper aims at analysing processes of negotiating ethnic belonging and distinguishing different meanings of the political in those sequences. Applying a praxeological perspective, the research is able to consider different scientific points of view on ethnic belonging by taking structuralist determinations as well as definatory power of ethnic organizations and subjects’ human agency into account. The paper focuses on three issues: (1) Are there different notions of ethnic belonging among the teenagers regarding different fields of activity, conditions of socialisation and involvement in organisational ethnic contexts? (2) What are the different levels and meanings of the political in the processes of negotiating ethnic belonging? (3) What role does autochthony play in negotiating Carinthian Slovene ethnic belonging?

EASTERN SLAVIC DIASPORA ONLINE: THE IMPLICATIONS OF ‘IMAGINED COMMUNITY’

Ivan Kozachenko

1Department of Sociology, UNIVERSITY OF ABERDEEN, Aberdeen, United Kingdom

Abstract: A growing numbers of studies on diasporas are applying the concept as an analytical tool rather, than its classical meanings. This populosity is caused by the applicability of the concept to the exploration of a range of factors shaping migrant communities abroad; varying from social cohesion to cultural contents and community experiences (Brazier 2008). Moreover, recent developments in information and communication technologies (ICT) have revived the ideas of Benedict Anderson (Anderson, 1999) on ‘imagined community’ and ‘long distance nationalism’. It is argued that ICTs are revitalizing the sense of belonging and community affiliation of diasporic subjects (Brazier, 2008). While the implications of the social change caused by the rapid development of ICT have been explored extensively for African, Asian and Polish diasporas in the UK (Moorti, 2005; Ryan, Sales, Tilki, & Siara, 2008), the social consequences of ICT usage within migrant communities constituted by people from the former Soviet Union are still poorly studied.

In my paper I investigate the interplay between online and ‘imagined’ dimensions of the diasporic community formed in the UK by migrants from the three Eastern Slavic (Russia, Belarus and Ukraine) countries. As the demise of the USSR facilitated the discourses on national identities within these three countries, the sense of national belonging for Eastern Slavic people is put within a continuum between ‘nationalist’ (nationalist) and ‘universalist’ (Pan-Eastern Slavic) identity options. In my research on virtual diasporic community I primarily test the hypothesis that virtual communities are polarized in terms of ‘universalist’ or ‘nationalist’ national belonging. I do so by examining the content of the articulated national identities in cyberspace. I argue that diasporic virtual communities offer a pool of instrumental identities referencing to the ‘re-invented’ (Smith, 1991) traditions and national myths of the national majority of the sending societies. In this, ‘nationalist’ national identity defines Russia
ONE HOUSE HERE, ANOTHER THERE, AND HOME-DOING IN THE IN-BETWEEN: CHANGING DOMESTIC SPACES AND THE NEGOTIATION OF BELONGING IN AN ETHNOGRAPHY ON ECUADORIAN MIGRANTS IN ITALY

Paolo Boccagni

Abstract: Migrants’ constructions of their domestic spaces, and the ways to “personalize” and make them meaningful to themselves and the significant others, are a still understudied topic, whereby a major effect of “social transnationalization” can be appreciated: the lack of overlapping between territorial and social spaces, hence between the geographical and the social boundaries which delimit one’s social interactions. Approaching migration as a matter (also) of home-doing, in this perspective, holds a good potential for making sense of migrants’ belonging as an open-ended, multi-faceted process.

This paper explores the social effects of migrants’ home-doing (and indeed, “house-doing”) practices, both in the contexts of settlement and of origin, building on a multi-sited ethnography on Ecuadorian migration to Italy. Migrants’ ways of coping with the “housing issue” in Italy, and their aspirations to build new or better houses in Ecuador, will be critically appreciated, in order to shed light on the shifting meanings and locations of “home” – hence of the boundaries of their social belonging –, being negotiated in their day-to-day lives. My analysis will generate fresh insights, first, on the processes that shape the transnational field of migrants’ identifications, ethnicity and belonging; secondly, on the grassroots forms of cultural diffusion, and of life-style hybridisation, enabled by migration in host and home societies.

What can be inferred from the ways in which migrants select, adorn and inhabit their houses abroad – and often simultaneously, acquire or renew their houses back home –, as to their sense of belonging to either society, and about the socially relevant markers they are ascribed? What do their housing-related practices indicate, ultimately, as to their processes of attachment and identification, against the pressures they have to negotiate “here”, but often also “there”? Drawing from my fieldwork notes, mostly related to the transnational family life of a few dozen Ecuadorian migrants, I will show that the ways they inhabit their houses here (possibly making them more similar to “homes”), while typically investing in better housing arrangements there, are critical for understanding (i.) the fuzzy boundaries and references of their belonging, as well as (ii.) the dilemmas and social factors that affect their processes of boundary making vis-à-vis the host society, and the significant others left behind.

WILL THE HONEYMOON BE OVER... NARRATIVES OF IDENTITY OF ROMANIANS IN IRELAND DURING THE CELTIC TIGER AND RECESSION

Gloria Macri

Abstract: Focusing on identity as a dynamic process, this paper looks at the way members of Romanian community in Ireland narrate and perform their ethnic identities in the virtual space. While the concept of ‘identity’ has been strongly criticised for being marked by essentialist connotations, this paper embarks on a study of identification, as an on-going process of understanding themselves and being defined by others, a study of the continuously flowing boundaries between Us and the Others. It is at the boundaries that symbolic space is negotiated and identities are fiercely debated, constructed and reconstructed.

Romanian diaspora in Ireland tend to use a multitude of references to ‘Other’ groups in their identity discourses. This paper will focus on one of the key aspects which emerged from the research findings, namely how Romanians in Ireland construct their diasporic identity in relation to the host society. It is argued that the views Romanians have on how they are perceived in the society as well as their understanding of ‘successful integration’ (and how it may be achieved) are extremely relevant aspects in the process of construction of their diasporic identities (making them feel more Irish than Romanian or, on the contrary, feeling a permanent foreigner in a strange land).

The dynamic character of identity will also be highlighted in this paper by analysing the identity discourses and feelings of belonging developed by Romanians in Ireland in two very different contexts: during the Celtic Tiger when Ireland was experiencing a ‘time of plenty’ and also during the recession.

Media (considered both as ‘circulated content’ but also as ‘technologies’) are often attributed key roles in shaping, maintaining, reflecting and performing identities. This study places an emphasis on the role of media (as an integral part of the public sphere) in the process of identity construction.

This ethnographic study focuses on the Online Discussion Forum of the Romanian Community (Ireland): www.romaniancommunity.net. The forum was chosen mainly because it constitutes a lively debate arena; it is the pulsating heart that keeps the community alive. The study presents an analysis of data collected over a six-year period (2004-2010) in the forum archives. Having access to such a valuable resource allowed a visualisation of the shifts in community’s identification patterns over time, thus illustrating the dynamic character of diasporic identity.

IDENTIFICATION AND BELONGING AMONG DESCENDANTS OF IMMIGRANTS IN EUROPE

Rossalina Latcheva, Barbara Herzog-Punzenberger

1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland
2Federal Institute of Research in Education, Innovation and Development of the Austrian Schoolsystem, Salzburg, Austria

Abstract: Within migration and integration research, a lot of controversy exists regarding the role of identification and belonging in the process of integration. According to some scholars, identification with the society of immigration is considered to be the litmus test or final aim of the integration process. Others stress the relational and situational character of identification and focus on its context dependency. Yet, analysis of identification and belonging with regard to descendants of immigrants cannot be done using the
same analytical framework as applied for the analysis of their parents or grandparents. 2nd generation migrants are born in their parents’ “countries of immigration”, their feelings of belonging might pattern differently and their identifications might have different effects on other life domains as compared to their parents. Many young adults nowadays are multi-lingual and cities in Europe are becoming more and more diverse.

This paper draws upon results from the TIES survey (The Integration of the European Second Generation) and explores patterns of identification and belonging among descendants of immigrants from Turkey, Morocco and Ex-Yugoslavia aged 18 to 35 living in different cities in eight European countries. A comparison group without migration background living in the immediate neighbourhood of the 2nd generation respondents has been also surveyed and integrated into the analyses. We have analyzed feelings of belonging in three different ways. Firstly, we were looking at the different socio-spatial levels of neighbourhood, city, country and parents’ ethnic groups found remarkable differences for each individual and group depending on the city. Secondly, we were comparing descendants of parents from Turkey across cities and found significant differences. As this is also true for their neighbours without migration background we thirdly, looked at differences between both groups in each of the cities analyzing the different patterns which emerged taking socio-economic and other background variables into account. This data therefore gives us the possibility to learn about the societal impact on feelings of belonging and identification while controlling for individual characteristics deemed relevant for explanations of patterns of belonging.

RESEARCH ON THE STATUS OF THE SENSE OF BELONGING TO THE CITY OF THE NEW GENERATION OF CHINESE MIGRANT WORKERS
Ge Hai Ting 1
1 Research and Communication Center on Social Issues, China Association for the advancement of International Friendship, BEIJING, China

Abstract: The new generation of Chinese migrant workers is growing in its number and has become the main force of migrant workers. To understand the status of the sense of belonging to the city of the new generation of migrant workers and to study on how to cultivate and increase their sense of belonging to the city are of great significance. This study on one hand relates to the vital interests of migrant workers and can improve their living standards and promote their integration into the city as soon as possible, on the other hand can keep orderly flow of the society, speed up the urbanization process and maintain sustainable and stable social development.

Enlightened by the previous researches on the strong sense of belonging to the city of migrant workers and the weak sense of belonging to the city of urban residents, this thesis holds that compared with the older generation of migrant workers, the will of belonging to the city of new generation of migrant workers is much stronger, the gap between the will of belonging and the actual sense of belonging is much larger, and the contradiction is much more fierce.

Under this assumption, we design the questionnaire, collect and analyze the data by means of questionnaires and interviews. Through the quantitative and qualitative analysis, we understand the status of the sense of belonging to the city of the new generation of migrant workers, explore the way the strong will of belonging and low sense of belonging bring about and the reason of these two contradict with each other, and analyze the differences and their reasons of the sense of belonging to the city of the new generation of migrant workers and that of the older generation of migrant workers in terms of age, educational level, marital status, occupation and so on. Last but not least, this thesis puts forward several suggestions on how to cultivate and increase the sense of belonging to the city of the new generation of migrant workers.

SHIFTING BOUNDARIES OF BELONGING AMONG SECOND GENERATION PALESTINIANS IN GERMANY: FROM THE REFUGEE CAMP IN LEBANON TO THE HOMETOWN IN PALESTINE
Barbara Obelé 1
1 Graduate School of Social Sciences, GOETTINGEN UNIVERSITY, Goettingen, Germany

Abstract: The ongoing statelessness and the inability for Diaspora Palestinians to return to a place they call their “home” has forced them to find a replacement that serves as an anchor of belonging for those spread all over the world.

During the initial years after migration, the main anchor of belonging for Palestinians in Germany (particularly the first generation) seemed to be the refugee camp they had inhabited in Lebanon and the flight experience.

In recent years, however, a stronger orientation towards the place of origin in Palestine can be observed, i.e. the village or town where the family used to live prior to 1948. In particular, members of the second generation of Palestinians often re-construct a connection to their hometown and foster a sense of belonging to this “home”, which, under current circumstances, is little more than the idea of a home.

Nevertheless, many young Palestinians strongly emphasize the importance of the place for their Palestinian identity. They claim a sense of togetherness with others from the same village or region, both as far as personal contacts are concerned as well as with Palestinians from the area that now live in other countries. In addition, they organize community events for young people “from the region” in order to foster their sense of belonging and educate them in the history of their “home”. Hometown organizations and virtual social networks hereby serve as important platforms for the creation and development of these groups.

My paper will analyse why the sense of belonging to the hometown of their grandparents is strong particularly among the second generation. Furthermore, I will illustrate how this virtual return to the hometown can be seen as an expression of a wider trend among the second generation away from the refugee identity towards settling in Germany, while simultaneously preserving ties to the anchor in Palestine.

In addition, I will provide an explanatory model for the shift of boundaries of belonging from the refugee camp in Lebanon to the hometown in Palestine and show that this shift is more than a simple generational change.

Finally, I will describe examples of how this shift is reflected in the daily lives of second generation Palestinians in Germany and give an
outlook of future trends that can be observed in the third genera-
tion.

DILEMMAS OF INTERGRATION OF THE UKRAINIAN LABOUR MIGRANTS INTO THE ITALIAN INFORMAL ECONOMY

Natalka Patsiurko

Sociology, UNIVERSITY OF ABERDEEN, Aberdeen, United Kingdom

Abstract: This paper will consider the dilemmas of integration of the informal labour migrants from Eastern Europe in Southern European economies and societies, in particular focusing on the case of recent Ukrainian migration to Italy, which has produced a 500,000-strong community in the country. The paper argues that this migration was enabled by the interaction between the informal economies of the sending and receiving countries. The informal economy of the sending country fostered an entrepreneurial attitude and inclination to circumvent the state, effectively used in implementing migration. In turn, the informal economy of the receiving country provided mechanisms for the efficient insertion of migrant workers into the receiving labour market. The paper demonstrates the mechanisms through which the informal economies successfully matched supply and demand for immigrant work, while the policies of the involved states desperately lagged behind in recognition of real labour migration flows. It argues that despite providing fast access to the receiving economy, informal insertion led to significant disadvantages in short-term economic incorporation of immigrants: in pay, legal status, and segregation in very few economic sectors. Immigrants were effectively sorted into the secondary labour market with very limited opportunities for professional advancement in the future. The paper is based on the original research conducted with Ukrainian migrants in mid-2000s.

DO INTEGRATION POLICIES MATTER? A STUDY OF THE EFFECT OF INTEGRATION POLICIES ON LABOR MARKET DYNAMICS OF IMMIGRANTS IN BELGIUM.

Vincent Corluy, 1, Ivé Marx, 1, Gerlinde Verbiest 1

Centre for Social Policy, University of Antwerp, Antwerp, Belgium

Abstract: This paper investigates the impact of integration policies on employment outcomes of immigrants in Belgium. Belgium is often praised for its efforts to integrate immigrants. From a theoretical point of view, this type of policies should have a favourable effect on immigrants’ employment outcomes and trajectories. Yet, paradoxically, Belgium still has one of the highest employment gaps between natives and immigrants in Europe. We seek to test the hypothesis of a positive impact from integration policies on employment dynamics of immigrants. The Belgian case is particularly interesting in this respect, not only for the scope and nature of its integration measures, but also, and particularly, for the extent of regional policy variation in this respect. Integration policies exist at the federal level; the relatively easy access to Belgian citizenship being an important one. Then there are measures at the regional level, with considerable differences in both integration policy efforts and labour market policies. We use Belgian Labor Force Survey data, and more specifically the ad hoc module of 2008 which includes additional data on migration motives and history, citizenship acquisition, participation in language courses, etc. We will seek to identify the determinants of employment and unemployment dynamics of immigrants compared to natives and we focus on the following questions. Do naturalised immigrants have better labour market entry chances than immigrants who have not acquired Belgian nationality? Is there a significant difference between labour market trajectories of immigrants in the three regions that can be attributed to differences in regional policies (either integration programs or labor market policies)?

REFUGEES AS A OBJECT OF POLICY

Karin Scherschel

Institute of Sociology, FRIEDRICH SCHILLER UNIVERSITY, Jena, Germany

Abstract: Labeling someone as a refugee is a powerful process by which agendas are established and people are conceived of as objects of policy (Roger Zetter 1991, 2007). A sociology of forced migration must systematically raise the question; who is perceived as the “desired refugee.” Globalized processes and patterns of forced migration have shaped a fundamental change of the refugee regime over the last years. A restrictive immigration policy has strictly reduced the chances of being granted asylum. These increasingly restrictive measures to control migratory processes have been put into place all over Europe. Driven by the need to manage migration, new labels such as “asylum seekers” were created. Furthermore, most European countries developed bureaucratic labels for “temporary protection.”

The contribution examines the refugee policies in Europe, and exemplifies the process of differentiating the label in Germany. In recent years, German policy makers have responded to the problem of successive temporary permits to remain in Germany (known as Kettenduldungen) by adopting provisions governing the right to stay (so-called Bleiberechtsregelungen) and establishing hardship review committees. Those provisions may award the right of permanent residence under certain conditions, usually “successful integration.” The contribution raises the question, whether the new provisions replace human rights principles with the introduction of economic, cultural and educational criteria in asylum policy.

SOCIAL COHESION AND INTEGRATION REGIMES: REDIRECTING OUR ATTENTION TO IMMIGRANT- NATIVE BORN GAPS

Marc Helbling

Wissenschaftszentrum Berlin für Sozialforschung, Berlin, Germany

Abstract: The consequences of ethnic and racial diversity are at the center of attention of a wide variety of empirical studies in political science. An entire research agenda was pushed forward when political scientist Robert Putnam first announced that Americans, who live in diverse neighborhoods, are least likely to engage in society and social interactions. Based on the results of the Social Capital Community Benchmark Survey, Putnam argues that at least in the short run ethnic and racial diversity is likely to reduce social solidarity, social capital and particularly social trust between citizens. Various studies have been undertaken to test and counter these results in a cross-national context. So far the consensus is that the
negative effects hold out side of the US in Canada, but are admit-
tedly weaker within and across European countries.

Within this debate, a new critique has emerged which focuses on
how integration and immigration policy regimes might help to
overcome these negative effects of diversity. Integration regimes
are assumed to display symbolic messages about the inclusiveness
of society which help to increase generalized trust and other as-
pects of social cohesion. However, while most of these accounts
focus on the overall population’s generalized trust as the best
measure of social cohesion following Putnam’s example, they fail to
take into account the gaps between immigrants and native-borns
on various dimensions of social capital or civic engagement. Obvi-
ously societies that manage to create lower immigrant-native born
gaps on various measures such as trust, democratic values, political
participation and engagement are prone to exhibit higher levels of
social cohesion than societies where these gaps are insurmountably
high.

This paper then classifies Western societies according to their social
capital and engagement immigrant-native born gaps and attempts
to understand which integration regimes are best suited to close
them. The authors use the collapsed data set of the European Social
Survey (four waves from 2002-2008) in order to measure these
gaps. Statistical measures of integration regimes are taken from the
Migrant Integration Policy Index (MIPEX).

CITIZENSHIP REGIMES, LABOUR MARKET
PARTICIPATION AND IMMIGRANTS’ POLITICAL
INTEGRATION ACROSS EUROPEAN CITIES

Katia Pilati

1Institute de sociologie, GERME, UNIVERSITÉ LIBRE DE BRUXELLES,
bruxelles, Belgium

Abstract: Ongoing research on immigrants’ political integration
across European cities shows that “close” political contexts charac-
terized by ethnic conceptions of citizenship, like Switzerland, Italy
or Hungary, are characterized by significant cleavages between
natives and immigrants as regards access into the political sphere.
Such political differences seem to be mediated by several segregat-
ing structures, an important one, being the immigrant labour mar-
ket structure. In fact, in close political contexts, most immigrants
are segregated in secondary sectors of the labour market structure
where immigrants tend to have low-paid and low-status jobs while
in the more open political context, like the UK, the natives’ labor
market structure resembles more the immigrants’ one. In close
political context, ethnic cleavages prevail as immigrants-natives
asymmetries characterize the labour market structure and are re-
produced in the political sphere. In contrast, in more open political
contexts, other forms of social and political differentiation charac-
terize the participatory structure, and cleavages such as the class
one are significant in affecting access to the political sphere.

Drawing on such preliminary findings, in the paper we aim to ana-
lyze the role of the national political contexts, in particular, the
citizenship regimes, on immigrants’ labour market and political
participation. The empirical analysis will make use of micro data
from a population survey carried out in 2007 in 8 European cities
(Barcelona, Budapest, Geneva, London, Lyon, Madrid, Milan, Zurich)
on their three major immigrant groups and a control group of
autochthonous origin in each city.

EUROPEAN INSTITUTIONS AND ITS ‘TRUE EUROPEAN
MINORITY’/ ONE-SIZE-FITS-ALL-BUT-ROMA

Marek Szilvasi

1Department of Sociology/Centre for Citizenship, Civil Society and
Rule of Law (CISRUL), UNIVERSITY OF ABERDEEN, Aberdeen, United
Kingdom

Abstract: The aim of the paper is to address the relevant dilemmas
and inconsistencies linked with the introduction of the institution
of a European (Roma) minority. The recent European call for a specific
Roma targeted policy and the establishment of specific Roma fo-
cused departments within the European Union (EU), Organisation
for Security and Cooperation in Europe (OSCE) and Organisation
of Europe (CoE) is neither challenging responsibilities of national
governments nor effectively fighting the gap between Roma and their
European co-citizens.

Initially, after the collapse of the Cold War European division, the
European treaty-based organizations such as the EU, CoE and OSCE
classified the Roma issue entirely as a security concern (crime pre-
vention, population regulation, assimilation) mostly in a reference
to the Roma migration from east to west. In the late 1990s, these
collusions were reformulated into human rights politics and extend-
ed to the post-communist countries. Thus, principles of minority
rights, non-discrimination and addressing socio-economic inequalities
were appropriated by new eastern democracies as a part of
human rights politics since they became a criterion for the mem-
bership in the international organizations such as the EU, CoE and
OSCE. Through the promotion of reputable memberships, western
security concerns relating to the Roma were redressed to the top-
down European Roma rights advocacy.

The underlying reasoning of the European organizations is united in
seeing the Roma people as fitting neither to the category of comp-
act national minorities (produced by previous forced nation-state
incorporation), nor that of immigrants. The Roma have been recog-
nized as “a true European minority” (Decision No. 1203/1993,
Council of Europe) and as a “nation without a state” (Declaration
of Nation, the Fifth World Romani Congress, July 2000, Prague). Due
to these perceived misfits, when it seems that classical liberal and
multicultural strategies on inclusion do not work, these European
organizations launched a call for a particular Roma recognition and
inclusion on a transnational level. Accordingly, the key puzzles this
paper will address is how the Europeanisation of Roma (Ver-
meersch 2010) challenges the dominant socio-political theories of
liberal pluralism, and whether it effectively fights the severe Roma
discrimination.

WHAT INTEGRATION FOR ROMA FAMILIES IN
SHANTY-TOWNS? COMPREHENSIVE EVALUATION
RESEARCH ON THE PROGRAM LAUNCHED BY LE
SYNDICAT D’AGGLOMÉRATION NOUVELLE DE SÉNART
(2002-2005, FRANCE)

Katia Lurbe-Puerto

1IRIS, EHESS, INSERM, CNRS, Université Paris XIII, Paris, France

Abstract: The presence of Roma in Europe and their relationships
with State is now receiving media coverage, even if it has for long
been a sensitive political issue. Research on Roma focuses on pov-
erty and the ‘nomad style of life’; few studies approach the con-
tributive factors of their social integration. Focusing on the integration program for 34 Roma families who lived in a shantytown in Le Syndicat d’Agglomération Nouvelle de Sénart (2002-2005), we identified the representations of “integration” underpinning it & analysed the constraints/opportunities structure configuring its implementation.

Methods: Comprehensive evaluation research based on data triangulation from Program archives & Legal framework documentary analysis, in-depth interviews to involved professionals, sociobiographical interviews to the families & ethnohistory with 2 families with distinct social integration trajectories.

Results: The Program specification was elaborated, consensually and as it went along, by the Program Executive Team (PET), as to help families to access to: empowering civil rights, school for the kids, vocational training to be employable for “regular jobs” (with a women specific track), “proper housing” and become “normal” users of social protection and healthcare services. By analyzing their activities, we traced back how the PET created codes defining ethical practice and regulated their “professional conduct” in doing their mission. As performance indicator, 30 families obtained a social housing, 2 returned to Romania, 2 accepted in another program. The program involved a State-local authorities-professionals-NGO’s joint force. Its success mainly relied on a) exceptions made to the Migration Law to break a major obstacle for these families’ integration: the residence permit - access to regular work/housing everlasting circle, b) the resources allocated to provide specific social education and accompaniment, c) the chances opened by the urban policy for dormitory-cities development.

Discussion: Competing notions of “citizenship” held by the PET, the families and the other involved actors (Préfecture, local authorities, health practitioners, school directors and neighbors) rose throught the Program implementation, shaping it. PET’s capability to apply a socio-culturally sensitive and responsive to families’ needs approach was confronted to the value dilemmas and conflicts encountered in interpersonal and professional contexts.

FROM NATIONALS ABROAD TO “Diaspora”. THE RISE AND PROGRESS OF EXTRA-TERRITORIAL AND OF OVERSTATE NATIONS
Stéphane Dufoix1

1Sociology, UNIVERSITY OF PARIS OUEST NANTERRE, Saint Leu la Forêt, France

Abstract: In recent decades, the use of the word “diaspora” has undergone significant changes. Among these, the latest evolution is the rise of the term as a political-administrative category mobilized by more and more states to describe either their nationals living abroad or a body of people that are connected to the homeland through nationality or only descent. Most of the time, these descriptions go hand in hand with the elaboration and implementation of policies towards these populations (voting rights, political representation, online registration, Diaspora-Homeland meetings...). These policies can be analyzed in relationship to the rise of two rather new visions of the nation, one being the extra-territorial nation (with inclusion of nationals abroad as complete citizens), the other being the over-state nation (with inclusion of people who are not-nationals but connected through descent to the homeland). Since the early twenty-first century, some multilateral agencies or organizations have become active in including these policies into the "best practices" they offer states to set up, under the name of "diaspora engagement" or "diaspora policy". The definition of diaspora involved in this new lexicon is interestingly distant from the original definition of it but also from most academic conceptualizations.

MIGRANTS’ SOCIO-POLITICAL PARTICIPATION IN A LOCAL CONTEXT: DYNAMICS OF BELONGING IN A TRANSNATIONAL PERSPECTIVE.
Petra Mezzetti1, 2

1CESPI, 2Dept of sociology and social research, Università Milano Bicocca, Milano, Italy

Abstract: In my study on migrants’ socio-political participation in a local Italian context, I addressed the following research question: which factors explain migrants’ participation in the country of residence and at home? The aim of the work is to investigate the specific topic of migrants’ social and political participation and to contribute to rethinking theories of participation to include migrants as political actors together with their specific forms of mobilisation.

Recent ethnical mobilisation studies have been dominated by approaches attributing major explanatory power to the notion of “political opportunity structure” (POS), whereby the sum of external factors shape migrants’ organisational field, behaviours and the formation of social movements. So far, migrants’ political participation has been studied mostly within institutional theories, looking at institutions in agency political behaviours and policy outcomes, and mostly within the contexts of integration. Criticism within this approach has asserted that: a) by privileging the influence of the context, the characteristics of migrant associations/communities, and social ties established within such groups have been disregard ed, thus taking away “agency” from those directly concerned; b) the POS notion is incapable of accounting for change, too standardised and static.

In line with these criticisms, I have assessed empirical field work through a contentious politics framework, complementing it with transnational lenses, in order to include migrants’ multi-stranded social relations that link their cultures of origin and settlement together, looking at dynamics and mechanisms that allow to expand, destroy, shift or build new boundaries of belonging through the migration process.

Field work has been conducted in the city of Milan, on the Eritrean and the Senegalese communities. In a second phase it was extended to include Somalis in Milan as well as in other local contexts.

A transnational contentious politics framework by emphasising a relational analysis, looking at ties, relationships, mechanisms and processes of interaction between groups and institutions here in the country of residence and there, in the country of origin, helps building the theory for studying migrants’ political participation, illuminating previous approaches.

ORGANIZING MUSLIMS AND INTEGRATING ISLAM — AN ORGANIZATIONAL SOCIOLOGICAL STUDY OF MUSLIM UMBRELLA ORGANIZATIONS IN GERMANY
Kerstin Rosenow1

1Institute for International Law of Peace and Armed, RUHR-UNIVERSITY BOCHUM, Bochum, Germany
Abstract: Since 9/11, Muslim organizations have been expected to function as integration facilitators, as 24-hour contact partners for politics and media, and as counter-terrorism activists. How does this affect their organizations? And what are their claims in this context? In contrast to existing studies, this research closely examines the perspective of Muslim umbrella organizations vis-à-vis their changing political and institutional environment. The research aims at opening the ‘black box’ of their often disputed organizational behavior from an innovative organizational sociological research perspective, which shall be detailed in this paper along with the main empirical results. With the aim to understand organizational behavior of Muslim umbrella organizations in the context of a period of political transition the research asks: How and why do Muslim umbrella organizations interact with their organizational field? The proposed analytical framework can explain a) forms of organizational (re)actions upon the changes in their institutional environment (ranging from adaptation to decoupling and protest towards external expectations), b) behavioral differences between organizations, as well as c) organizational influences upon the actors within their issue specific organizational field. Through a comparative analysis of three major Muslim umbrella organizations in Germany, distinct patterns of organizational behavior are examined. While politicians wish for organizational adaptation towards their expectations, the study also reveals potentials for decoupling and protest behavior due to conflicting members’ interests and a perceived lack of external resource opportunities. Organizational protest is mainly directed at the securitization and islamification of integration debates, and the often rather symbolic politics of cooperation. At the same time, legitimacy and efficiency considerations can explain why Muslim organizations attempt to overcome such internal disputes trying to satisfy political expectations. The case studies include the Turkish Islamic Union of the Directorate for Religious Affairs e.V. (DITIB), and the Turkish organization Islamic Community Millî Görüş e.V. (IGMG), as well as one multinational Muslim umbrella organization: the Central Council of Muslims in Germany (ZMD).

SPACES OF BELONGING: TRANSNATIONAL NETWORKS OF THE SPANISH SECOND GENERATION IN SWITZERLAND

Marina Richter, Michael Nollert

Abstract: Shifting boundaries of social belonging do not constitute a new phenomenon. If we think back to Georg Simmel and his theory of the crossing of social circles (Kreuzung sozialer Kreise) or to Fernando Ortiz’ concept of “transculturalism”, blurred boundaries between groups and forms of multiple belonging constitute an important element of modernity. Migration adds even more “circles” to an already complex society and in particular adds a dimension of geographical distance to the dimensions of social difference. Transnational migration has complicated the picture further as several geographical references such as places or countries remain equally important in migrants’ lives.

Scholars of transnational migration studies agree broadly that transnationalism and integration into the society where migrants are living do not contradict each other. The question is rather, whether migrants’ transnational lives also lead to transnational forms of belonging as has been suggested by various studies (e.g. Leitner and Ehrkamp 2006; Westwood and Phizacklea 2000). These issues have presently been discussed mainly for first generation migrants. The Second Generation has only recently entered the debate (e.g. Åkesson 2011; Levitt and Waters 2002).

Based on findings from a project on transnational social spaces we present transnational networks of Second Generation Spaniards in Switzerland. These networks connect people, places and memories between Switzerland and Spain and exemplify how the Second Generation builds various forms of belonging. We discuss in our presentation these networks and propose a typology of Second Generation transnational networks. These typologies will help us to approach the question whether transnational networks also lead to transnational forms of belonging.

“I AM NOT WHO I AM SUPPOSED TO BE”: STORIES FROM 20-SOMETHINGS IN MANCHESTER’S ‘MIGRANT’ NEIGHBOURHOODS

Bethan Harries

Abstract: “I am not who I am supposed to be”: stories from 20-somethings in Manchester’s ‘migrant’ neighbourhoods

Migration settlement patterns in the UK have resulted in neighbourhoods often associated with one particular racial or ethnic group. These spaces become signifiers of racialisation processes, but also act as locations of other local processes of identification including those related to class, gender and urban culture. Young adults aged 20-30 years old, living and working in these neighbourhoods are the second (+) generation to be affected by these rudimentary processes of representation. Using auto-photography, participant observation and semi-structured interviews, my PhD research has elicited young adult narratives about everyday life in three neighbourhoods in Manchester. These are racialised (crudely as ‘Asian’, ‘Black’ and ‘White’) and imbued with negative stereotypes that commonly centre around immigrant culture, working class and ‘chav’ culture, high crime, drugs and gang culture. Stories about place permit grounded accounts of how the problem of race is articulated and experienced in everyday life. Against the backdrop of the dominant story of the ‘ethnic neighbourhood’, 20-somethings talk about how they must negotiate their identities in relation to the spaces they occupy, often in conflict with pervasive stereotypes. Their ability to do so has implications for how well they can ‘fit’ in certain spaces and how ‘authentic’ they are deemed to be.
"I KNOW A LOT OF PEOPLE EVERYWHERE" - TRANSNATIONAL BUSINESS NETWORKS OF BLACK HAIR SALOON OWNERS IN FRANKFURT AM MAIN, GERMANY

Caroline Schmitt

1Research Center of Social and Cultural Studies, JOHANNES GUTENBERG UNIVERSITY MAINZ, Mainz, Germany

Abstract: African migrants in Germany often experience discrimination and devaluation in the German labor market. While African women are often familiar with the art of African hair styles, which they have formally or informally learned in their home countries, the opening of a Black Hair Saloon in Germany is an important alternative to an engagement for both women and men.

The potential of African migrants businesses in Germany gets meanwhile overlooked, since African migrants are often classified as low-skilled and their businesses as low-class-enterprises.

In my lecture I would like to give an insight into the transnational business networks of Black Hair Saloon owners in the Rhine-Main area to show up a counterpart to this view. I intend to demonstrate how saloon owners build up and sustain their enterprises with the help of transnational networks. Since the black hair and product industry is only rudimentary established in Germany, saloon owners keep in contact with firms and single persons in “black booming centers” as in the United States, London, Paris and in the countries of origin where they can buy products and equipment to fill this gap. To be economically successful with a Black Hair Saloon in Frankfurt am Main, it seems to be necessary to have transnational networks which can manifest an economic power of action (agency) in this urban area. The economic power of action also seems to amplify an improvement of the social situation in Germany.

The concept of agency (see Homfeldt/Schröer/Schwepppe 2006; Barnes 2000; Holland 1998) serves as an analytical approach in my work and focuses on the interrelation between actor and structure. It raises up the question whether structures encourage and/or impede power of action and how the actors thmmselves relate to the structures and influence it.

In summary, I would like to discuss the following questions: How do actors thmselves develop and secure social and economic sustain-ability in a partly disclaiming society of residence through their transnational business networks? Which effects do these transnational networks have on people’s power of action (agency) on a global as well as on a local level?

The material is based on the ethnographic research in the context of my dissertation project, on which I work at the Research Center of Social and Cultural Studies (SOCUM) at the Johannes Gutenberg University in Mainz, Germany.

BATTLESPACE DIASPORA: BELONGING TIES OF KURDS IN LONDON

Ipek Demir

1sociology, UNIVERSITY OF LEICESTER, leicester, United Kingdom

Abstract: Since the late-1980s there has been a significant migration of Kurds from Turkey to the various countries in Western Europe. In this period in London, as also happened in Berlin, many self-identified ‘Turks’ became self-identified ‘Kurds’, not self-identified ‘British’ or ‘self-identified German’ (Leggewie 1996). However, even though Kurds from Turkey make up a significant proportion of London’s ethnic minority population, they constitute an ‘invisible’ diasporic community, both in terms of the current debates surrounding ethnicity and the Muslim minority in the UK, and in diaspora & migration studies. In my conference paper I will examine how the Kurds and the leaders of Kurdish organisations in London interact with, and relate to, their country of origin by highlighting their resistance to, and struggle with, Turkey (as defined by their displacement and suppression of cultural and linguistic rights) as well as the close and, at times, intimate ties Kurds continue to maintain with Turks and Turkey. Whilst the first is conceptualised as ‘battling with Turkey’, the latter is conceptualised within the framework of ‘memleket’ (homeland) ties. In particular, I aim to explore the contingencies of belonging and battling for Kurds of London. Through an examination of how the Kurdish diaspora encodes its orientation towards, as well as its resistance to, Turkey, the paper will attempt to make visible the belonging ties of this largely ignored and understudied, yet politically very active, diasporic formation in London.

MIGRATION, GENDER AND BELONGING. ON THE MULTIPLE WAYS OF THINKING AND LIVING THE URBAN PUBLIC SPACE IN POBLE SEC (BARCELONA)

Claudia Pedone 1, Sandra Gil-Araujo 2, Lucía Solavagione 1, Belén Agrela 3

1CIIMU-Institut d’Infància y Món Urbà, Barcelona, Spain, 2Gino Germani Institute, CONICET, Buenos Aires, Argentina, 3University of Jaén, Jaén, Spain

Abstract: Our proposal is based on the European Research GEMIC. The goals of the research were to investigate: a) the migrants’ use of the urban spaces and the changes in the city, b) the formal and informal practices in local communities and neighbourhoods in which intercultural interactions take place, c) migrants’ citizenship practices in their local and transnational lives.

The research was based on a qualitative methodological perspective from a gender approach. Our fieldwork took place in Poble Sec, Barcelona, a working-class neighbourhood which, in January 2008, registered an immigrant population of 28%.

We consider public spaces privileged places of interaction and participation, which are crucial to the formation of the identification processes and to the construction of citizenship. The urban public space, especially in big cities, has always been subject to tensions and conflicts between different functions and actors that have diverse uses and interests. We propose the idea of citizenship as a social practice that migrants engage in on many scales and within many public spheres across national boundaries. From this point of view, urban spaces are a privileged place to understand migrant citizenship practices. One of our main interests was to pay attention to the meaning and value assigned by the migrant population to local belonging, their ways of appropriating the spaces where they live and their imaginations around the idea of citizenship.

In our fieldwork we could identify a feeling of belonging to Poble Sec, where migrants carry on their daily life practices and successful business enterprises. This local territorial identification is not in contradiction with the claim for citizenship rights and with the exercise of transnational family, social, economic and political practices. All these testimonies question the simplistic conception that
understands migration as leaving one place and arriving and settling at another.

The findings of our study confirm that citizenship practices led by the migrant population are produced on multiple scales and involve multiple public spheres that cross national borders and renegotiate relations between their homes in origin and in destination. This suggests that citizenship practices exceed the limits and jurisdictions of the nation-state.

NEGOTIATING ASSIMILATION, EXOTICISM AND INDIAN MODERNITY - TRANSLOCAL SUBJECTIVITIES OF SECOND GENERATION INDIANS GROWN UP IN SWITZERLAND

Rohit Jain

1Department of Social and Cultural Anthropology, UNIVERSITY OF ZURICH, Zürich, Switzerland

Abstract: Second generation Indians, socialized in Switzerland, are inserted in multiple cultural codes, they move in translocal networks and they are connected to global media-escapes. They negotiate and translate plenty – and often contradictory – sets of identities and alterities concerning race, ethnicity, class, gender, sexuality and religion. In the Swiss public sphere they are both disciplined and exoticized within a dominant regime of assimilation and a recent urban consumer culture. Also, they face cultural and social norms of their parents and the local diasporic community to maintain specific idioms and practices of “Indianness” concerning education, career and family values. Furthermore, in global communication networks with relatives and friends in India and other diasporic places, and also during holidays and professional stays in India they negotiate their role as PIO’s (“persons of Indian origin”) and narratives of the “global Indian modernity”.

The paper draws on biographic, multi-sited ethnographic and discourse-analytical methods and shows the strategies of second generation Indians to translate the manifold idioms of “Indianness”, of cultural normativities and of the good life into their own translocal biographies. Doing so, they develop individual ways of “lived cosmopolitanisms”. These negotiations take place against the historical backdrop of the increasing and changing representation of “India” in the Swiss consumer culture through the orientalizing semantics of Bollywood and Yoga, the targeting of India as emerging market by Swiss companies and the state, the neoliberal and nationalist assertions of post-liberalization urban middle class and Indian diaspora policies fostering the “global Indian family”.

The paper, thus, explores the changing modes of constructing, re-constructing and de-construting of ethnicity in the context of cultural globalisation, global capitalism and flexible citizenship.

GENDERING PROCESSES IN OCCUPATIONAL BIOGRAPHIES OF MIGRANT WOMEN

Ingrid Jungwirth

1Institute for Social Sciences, HUMBOLDT-UNIVERSITAET ZU BERLIN, Berlin, Germany

Abstract: The paper presents findings of a research project on the labour market integration of highly skilled migrant women from postsocialist states qualified in the natural sciences and technology. The research is being carried through from 2009 to 2011 at Humboldt-Universität zu Berlin and is sponsored by the Federal Ministry of Education and Research and the European Social Fund. Since the 1990s migrants from postsocialist states have formed an important share of migrants in Germany. From their perspective, the transformations in the postsocialist states meant “turbulent times” and changes in basic conditions which also included their occupations and professional possibilities. Since new migration paths were opened “after the wall”, migration was also pursued in order to actively change one’s professional as well as the personal and family situation.

Taking up the life course perspective, professional careers of highly skilled migrant women are reconstructed, pointing out hindrances and exclusionary mechanisms relating to gender. The analysis shows that migration became a major cut in the occupational biographies of many women which needs to be analysed with reference to gender. The findings of the research project indicate that highly skilled migrant women have considerable difficulties in integrating into the labour market in Germany generally, and particularly in jobs which accord to their qualification or in other highly skilled jobs. They experience long periods of unemployment, as our analysis of data of the GSOEP (German Socioeconomic Panel) shows. They work predominantly as associate professionals in jobs in which women are typically employed, i. e. in business services, administrations, finance, sales as well as social work associate professionals. The qualitative interviews reveal that highly qualified women in the natural sciences and technology are often confronted with gender stereotypes, combined with a general dequalification of skills of migrants. Apart from that, life course analysis is taken up to systematically analyse the influence of reproduction work as well as the influence of the family on the work cycle and employment status.

POLISH WOMEN IN ICELAND AND THEIR WORKING CAREERS

Anna Wojtynska, Joanna Napierala

1Faculty of Social and Human Sciences, UNIVERSITY OF ICELAND, Reykjavik, Iceland, 2Centre of Migration Research, Warsaw University, Warsaw, Poland

Abstract: Women had important role in development of migration flows from Poland to Iceland and for the long time outnumber men in the entire Polish population in Iceland. Majority of them was finding job in the fish processing plants placed around the country. The period of the economic boom brought significant changes in the migration patterns from Poland. Expansion in the building industry attracted large groups of Polish construction workers that were coming meanly to the capital region. Consequently, in 2007 men made 73% of total Polish population in Iceland. Again, the financial crisis marked a new period in the migration history from Poland. Until 2008 unemployment rate among Polish migrants was on minimal level (for most years below 2%), but after the crisis it rose up to 20%. It seems that the crisis had different impact respectively on men and women. For example, at first men clearly predominated among unemployed Polish citizens (75% by the end of 2008), however with time the number of unemployed Polish women was increasing. In our presentation we would like to trace employment histories of Polish women in Iceland and discuss how their employment careers were influenced by recent financial crisis. For the purpose of our analysis we will use the results of the survey that was conducted among Polish migrants living in the Reykjavik area between May and August 2010.
REMITTANCES AND GENDER: THEORETICAL CONSIDERATIONS AND EMPIRICAL EVIDENCE FROM GERMANY

Andrea Schaefer 1, Mechthild Schrooten 2, Elke Holst 3
1Gender Policy in the Welfare State, ZES/UNIVERSITY OF BREMEN, 2University of Applied Sciences Bremen, Bremen, 3SOEP, DIW Berlin, Berlin, Germany

Abstract: In this presentation, we focus on gender-specific determinants of remittances from Germany for the years 2001 to 2006. The main questions are: Are there gendered patterns of transnational activities, such as remittances? What are the factors explaining gendered patterns of remittances?

Theoretical framework: The paper introduces a basic formal concept for analysis of remittances. It is argued that the explanatory power of the classical theories is limited, since they do not consider gender relations at the societal level and within the transnational network. So their use can lead to misinterpretation of remittances patterns. Instead the paper introduces an approach taking into account aspects of the transnational network and formal integration from a gender point of view from which hypotheses are derived.

Methodological approach: We explain differences in level of remittances by sex, taking into account human capital indicators, mediated by the transnational family and friend network in the home as well as destination country and the formal citizenship in the destination country. For our empirical investigation, we use data from the German Socio-Economic Panel Study (SOEP) and perform Tobit estimations to deal with non-remitters and to account for the censored nature of the dependent variable.

Results and discussion: Our findings show, first, the fact that migrant women with foreign citizenship remit less money than their male counterpart can be explained by the underlying transnational network contract. Second, remittances sent by immigrants with foreign citizenship and with German citizenship have at least partly different determinants. Acquiring German citizenship increases the probability of family reunification in the destination country and decreases remittances. Third, the structure of the existing network in Germany and the family and friend network structure in the home country both play important roles in explaining remittances.

THE NEED FOR AN INTERSECTIONAL UNDERSTANDING OF DISCRIMINATION AMONG DOCTORS WITH IMMIGRANT BACKGROUND IN SWEDEN.

Lisa Maria Salmonsson1
1DEPARTMENT OF SOCIOLOGY, Uppsala, Sweden

Abstract: Doctors with immigrant background are often reporting work related discrimination on the basis of ethnic background in Sweden. In 2009, 6051 (6.2 percent) of all doctors working in Sweden were educated in another country according to The Swedish national Board of Health and Welfare. This paper presents and discusses findings from a quantitative study that was conducted at Uppsala University 2009 among 124 doctors with mixed backgrounds where the aim was to find differences in discriminatory experiences when it comes to country of birth, education country, gender, and employer. The result of this is an intersectional explanatory model that might be useful in order to understand discriminatory dimensions in a doctors carrier.

“CARERS’ TRANSNATIONAL LINKS: THE AMBIVALENCE OF IMMIGRANT REMITTANCES”

Mara Tognetti 1, Annalisa Ornaghi 2, Simona Olivadoti 3*
1Department of Sociology and Social Research, UNIVERSITY OF MILANO BICOCCA, Milano, 2Faculty of Sociology, University of Trento (Italy) and University Paris – Sorbonne (France), Trento, 3University of Milan-Bicocca, Milan, Italy

Abstract: Recent studies on international migration have paid special attention to the transnational perspective; this new branch of the sociology of migration studies the process through which migrants build social fields that link the countries of origin and destination. The economic transnationalism connected to the great phenomenon of remittances - financial, material or immaterial - is one relevant aspect of this field of study. Remittances are ambivalent, because they can be interpreted either as a medium of consolidation of Transnational ties or as a bond linking migrant women to the country of origin.

Our target is, in fact, those migrant women who carry out in Italy a particular work of care: the badanti, or informal caregivers. As such, they constitute an important resource of the Italian welfare system, characterized as it is by an important family component.

Any migratory phenomenon is, by nature, complex and dynamic, with different historical, economic and social characteristics; moreover it operates changes at many levels. The caring work done by badanti as well as the transnational links represented by cross-border remittances take place and must be read within this broader dynamics.

The research question for this paper is precisely whether remittances are mainly bonds or mainly ties for badanti, relative to other migrant workers employed in the care sector.

We use qualitative and quantitative data from the Prin 2005 research project concerning nationality, gender and class in new house holding work in Italy.

After describing this phenomenon and its peculiarities, we shall analyze the mechanisms that originate it and, establish correlations with the surrounding context.

ANALYZING CARE WORKERS’ GEOGRAPHIC MOBILITY BETWEEN UKRAINE AND ITALY

Anna Amelia1
1Faculty of Sociology, BIELEFELD UNIVERSITY, Bielefeld, Germany

Abstract: The paper presents results of author’s current research on geographic mobility of care workers between the Ukraine and Italy. The initial question is about multiple categorical mechanisms of
inequality formation, such as gender, ethnicity and class within the transnational field of care.

First, the paper questions the idea of “care drain”, which predominantly focuses on migrant care workers’ exploitation in the households of the receiving country. Second, it relates to the concept of transnational circulation of care, which indicates inequality effects of care workers’ migration in both the sending and the receiving countries. Third, it points to the advantages of the transnational field approach, which disconnects the research of care workers’ geographic mobility from the framework of a nation state. According to it, the paper suggests to study the social stratification by focusing on care workers’ simultaneous memberships in the households of both the sending and the receiving countries. Therefore, it exemplifies, how the complex intersections of ethnic, gender and class categorizations influence access to financial and emotional resources within the transnational field of care.

GENDER EQUALITY AND HIGHLY QUALIFIED IMMIGRATION IN EU: INTERACTIONS AND PERSPECTIVES

Ana Claudia Beduschi

IDEDH, UNIVERSITY OF MONTPELLIER I, Montpellier, France

Abstract: The Council Directive 2009/50 of 25 May 2009 made highly qualified immigration an important subject to the EU legal migration policy. This directive doesn’t distinguish between female and male third-country nationals immigrants. Once legally entry at the EU territory, the female workers should benefit from a battery of legal tools in the field of interdiction of discrimination between female and male workers. Nevertheless, directive 2009/50 allows a large number of derogations and permits also a great scope for making decisions to the member States. In this way, it’s probably that migration control imperatives will be favored to the expense of gender equality protection. In consequence, it’s interesting to analyze directive 2009/50 in the light of the gender equality principle, enunciated by the Charter of Fundamental Rights of European Union, and also recognized as an EU objective by the Lisbon Treaty. An interactive scrutiny of both of these areas can offer a new perspective to the female highly qualified immigration at EU.

GENDER, MIGRATION AND LABOUR MARKET: THE TRANSONATIONAL REDISTRIBUTION OF DOMESTIC WORK IN SPAIN

Paloma Moré-Corral

Social Structure, Complutense University of Madrid, Madrid, Spain

Abstract: The object of this proposal is to analyze the complex interrelation between the specific situation of discrimination of women in the labour market, the increasing demand for domestic services, and female migration into Spain.

Subordinate position of Spanish women in the occupational structure reflects the fact that they are still carrying the whole weight of domestic work. Public services for childhood and dependent care are not enough to meet the increasing demand of this kind of services, as shows the high proportion of part-time women workers. In these circumstances, the reproductive work externalization toward migrant women from the poorest countries becomes the lowest cost and the most flexible strategy for Spanish women to get rid of domestic work.

This situation has consequences for the foreign women who want to begin a professional carrier in Spain. According to gender discrimination and the segmentation of the occupational structure, their opportunities to find a job are more restricted than for migrant men.

In relative terms, Spain is one of the European countries with more percentage of domestic workers. The rise of household services demand in the last decade was stimulated for the migration policies. The laborer profile is characterized by the high feminized rates, which are more than 90% as well as by the rise of foreign workers, who represents almost the 60% of declared domestic workers.

Moreover, this sector is characterized by traditional and servility features like the tolerance to undeclared work, the high proportion of live-in domestic workers or the absence of written agreements. In addition, domestic workers rights and basic welfare benefits are inferior to those of other categories of wage-earners workers. This proposal wants to explore the way in which the crisis is affecting this sector and domestic workers.

LABOUR MIGRATION AND WORK CAREER OF RECENT CZECH MIGRANTS. ANALYSIS INVOLVING GENDER DIMENSION.

Alena Parizkova

Department of Sociology, UNIVERSITY OF WEST BOHEMIA, Plzen, Czech Republic

Abstract: Biographies of labour migrants are influenced through the exiting gender order. Migrants enter the migration process with certain gendered notions and stereotypes which are then challenged, or, on the other hand, affirmed within it. Gender is only one of the constitutive elements of the migrants’ career paths. The status of an immigrant proves itself to be also an important interactive factor of the issues of occupation segmentation. Labour migrants are directed especially into the secondary segment of the labour market. Their non/legal status, however, greatly influences their possible strategies and the paths of their further orientation within the labour market. The goal of the paper is to analyse how gender identities, stereotypes of the migrants and the gender structure of the labour market influence the work experience in migration process. The paper is based on a qualitative research among Czech migrants carried out in 2008 and 2009 in the United Kingdom. The research focuses on those who, as ‘novice’ migrants, apply for occupations of low qualification requirements, often characterized as so-called immigrant jobs. The research showed that especially in the beginning of the migration process, migrants follow the gendered paths. Women and men found their occupation in position defined as typical for their gender. On the other hand, opening the borders of the host country and the opportunity of documented employment and residence unifies the migrants’ strategies in terms of gender and the only gender-specific strategy stays the au-pair position. This position is perceived as a simple, beginners’ position of a low status. The research also problematizes the image of female migrants directed towards the sector of care provision where they consequently become trapped. Advancing from a typically female immigrant position to a better (still prevailing ‘female’) one is a difficult, but feasible process. Many of inter-
viewees targeted better occupations as they were aware that they have certain advancement potential.

**DIVERSITY OF EXPERIENCE: THE CONSTRUCTION OF TRANSNATIONAL SOCIAL SPACES AMONG TURKISH-CYPRIOT, KURDISH AND TURKISH YOUTH IN LONDON**

Dogus Simsek¹

¹Sociology, CITY UNIVERSITY LONDON, LONDON, United Kingdom

**Abstract:** This dissertation addresses debates on transnational migration, second generation and identity, developing the proposition that Turkish, Kurdish and Turkish-Cypriot youth living in London experience multidimensional positioning in the society. Rather than focusing on the limited perspective of identity and belonging, the concept of transnational experience offers wider understanding of multidimensional positioning of these young people. Especially in the case of young people who live in between more than one cultural space, identity and belonging are not enough to explain their complex experiences. This study argues that young people who practise transnationalism have multidimensional positioning in the societies they interact and they negotiate their identity positioning. By doing this, this research focuses on two main concepts are identity and a transnational social space. In order to analyse identity formation of youth in the context of a transnational social space, this study first looks at the social relations of individuals with community, family, neighbourhoods and people in the country of origin. Secondly, it studies the dynamic of institutional factors (transnational media, community organisations, school) in process of identity formation of CKT youth. Finally, it explains the perceptions of the self to identity positioning and the function of transnational social space in order to understand multidimensional positioning of young people in society. Transnational social space is used as an analytical tool to analyse identity formation of young people in relation to their experiences in both societies which could offer theorising forms of identifications are not based on shared common ethnic identities. It could give a richer picture to understand the experiences of mobility which constitute aspects of creativity. Empirical data shows that there are diverse experiences among CKT youth within a transnational social space; thereby their identity positioning is negotiated through social relations with themselves and institutional factors. Their experiences challenge assumptions about practices of identity.

**MIGRANT MOTHERS AS COSMOPOLITANS?**

Umut Erel¹

¹CCIG/ Sociology, OPEN UNIVERSITY, Milton Keynes, United Kingdom

**Abstract:** Migrant women as mothers play an important role in constructing belonging for themselves and their children. Their mothering practices engage with politics of belonging on several levels: the locality, the nation-state of residence and origin. These levels in themselves articulate complex relationships between ethnic majority and minority groups in the country of residence and transnationally. Migrant mothers are charged with transmitting cultural and social values to their children which enable them to participate in society. These demands are often formulated in dichotomous ways, juxtaposing belonging to an ethnic minority community on one hand to loyalty to the country of residence on the other. While research often conceptualises migrant women’s mothering practices as either based on repetition of cultural tradition or on openness to innovation and cross-ethnic identification, I suggest that migrant mothers engage with both.

Drawing on a qualitative study of migrant mothers of diverse ethnic backgrounds in London, the paper explores how mothering practices contribute to ‘Diasporic Cosmopolitanisms’. The interviews with migrant mothers reveal that all migrant women’s mothering practices negotiate ethnic difference and sameness. Yet, migrant mothers’ social location (class, ethnicity, citizenship status) allows them differential access to laying claim to cosmopolitan identities. The paper explores the significance of ‘Europeanness’ as a category that enables recognition of mothering practices as cosmopolitan. It argues that vernacular cosmopolitanism is a status of refuge. Mothering practices are easily overlooked, while for some migrant women, identification as ‘European’ constitutes a form of recognition of their claims to non-national, cross-ethnic mothering practices.

**SEX/GENDER REPOSITIONINGS: DISPLACEMENTS AND RE-ENCARNATIONS ON TRANSNATIONAL PRACTICES OF MIGRANT PEOPLE FROM SENEGAL AND ECUADOR IN MADRID.**

Carmen Romero Bachiller¹, Antonio Agustín García García¹

¹Dpto. Sociología V (Teoría Sociológica), UNIVERSIDAD COMPLUTENSE DE MADRID, Madrid, Spain

**Abstract:** In this paper we offer a preliminar field-work analysis – interviews, life stories and focus groups- of a current research we participate in entitled “Sex/gender and homes repositioning in transnational projects: towards an integrated framework” (SGO2008-04838). Drawing on this results, along with some others from previous researchs (Romero Bachiller, 2006; García García y Oñate, 2009), we analyse sex/gender practices of migrant people from Equador and Senegal settled in Madrid. We focus, concretely in sex/gender practices in the course of migrant experience, by considering encarnation processes and relationship types emerging in it. We highlight displacements, ambivalences and resistences appearing in the narratives of the narratives informants offer on their gender identities, their sexual practices and their affective and familiar relationships. In this framework, tensions and conflicts arise. Some appeals for the diasporic collective identity maintenance are made, so that, occasionally a gender conflict is portrayed as a conflict about loosing or keeping collective identity. Yet, these appeals yuxtapose to practices that talk about displacements and rearticulations. Practices that then to erode and question the appealed hegemonies. In this paper we seek to analyse displacements and reincarnations, resistences and ambivalences emerging in transnational practices by comparing discourses of people in gender and sexual “hegemonic” positions – people identified as heterosexual men and women-, with those whose with non normative gender and sexual practices (LGBT[1]).

**References:**

[1] The acronym LGTB is used to summarize, but without trying to identify the multiplicity of non normative practices, identity formations, sexualities and gender positions of people coming from Equador and Senegal with the Western identity model.

**INCLUSION AND EXCLUSION OF YOUNG ADULT MIGRANTS IN EUROPE - PRESENTATION OF A CROSS-NATIONAL QUALITATIVE STUDY**

Katrine Fangen

1DEPARTMENT OF SOCIOLOGY AND HUMAN GEOGRAPHY, UNIVERSITY OF OSLO, Oslo, Norway

Abstract: Social exclusion is a term which was introduced in the social sciences in the early 1990s in order to extend the focus beyond poverty by focusing on the relation between the individual and the society. During later years, it has been common to speak of a new social exclusion perspective, which is better fit to analyze the moreheterogeneous, multicultural and complex society (Body-Gendrot, 2002). In this paper, I will focus on social exclusion in different arenas, thus underlining the multi-dimensional aspect of social exclusion. The underlying question is: ‘What is it that contributes to social exclusion of young adult immigrants in different social settings?’ and ‘How do young adult immigrants with different backgrounds experience social exclusion in different social arenas?’ I will distinguish between social educational exclusion, labour market exclusion, spatial exclusion, relational exclusion and finally, socio-political exclusion.

The combination of information from macro-oriented quantitative research and its focus on structural explanations and micro-oriented qualitative research and its focus on agency together make a holistic picture of social exclusion which underlines its dynamic, complex and multi-dimensional character.

**INTERETHNIC RELATIONS AMONG STUDENTS FROM DISADVANTAGED URBAN HIGH SCHOOLS IN FRANCE. EXPERIENCES OF STIGMATISATION AND THE INVERSION OF DOMINANT HIERARCHIES IN THE MULTIETHNIC PEER GROUP SOCIETY.**

Claire Schiff

1Sociology department, UNIVERSITY VICTOR SEGALEN, BORDEAUX 2, Bordeaux, France

Abstract: The paper will present some of the results of a three-year research project entitled “Ethnic differences in education and diverging prospects for urban youth in an enlarged Europe” (EDUMIGROM FP7 European Commission) involving nine countries from old and new members states. Using the material derived from interviews, group discussions and in class observation with teachers and students from low prestige multiethnic urban high schools, the leader of the French research team will focus on the issues of inter-ethnic relations, peer-group socialisation, and victimisation as they are experienced in contexts in which young people of African origin make up either the majority or a significant minority of the school population. We will discuss how the manifestation or downplay of ethnic differences among French teenagers of various ethnic origins are intricately linked to processes of educational, social and residential segregation. We shall describe how students recreate and subvert the dominant discourse through the use of satire and bantering about each other’s origins, in a national and institutional context in which ethnic distinctions are regarded as a taboo subject. By analysing representations and instances of victimization we will show the ambivalent position of both majority and minority youth and the manner in which peer-group relations in the more disadvantaged urban schools often invert dominant hierarchies.

**IS DISCRIMINATION AN ISSUE? YOUNG ADULTS WITH IMMIGRATION BACKGROUND AT THE LABOUR MARKET IN NORWAY**

Erlend Paasche 1, Katrine Fangen 2

1Migration team, PEACE RESEARCH INSTITUTE OSLO (PRIO), 2Institute of Sociology and Human Geography, University of Oslo, Oslo, Norway

Abstract: How do young adults with immigration background experience discrimination at the workplace? How do they react when it occurs? This study analyzes the experiences that these immigrants and descendants have of inclusion and exclusion at the labor market. The empirical basis for this study is 25 qualitative semi-structured interviews, conducted within the EUMARGINS research project on processes of inclusion and exclusion, with young adult immigrants and descendants, aged 17-26, in Norway. In the analysis of these interview data we use a two-fold typology of labor market discrimination, discrimination by employers and discrimination by customers, clients, patients, etc. We find that whereas several interviewees voiced concerns about possible discrimination by employers during job interviews, they rarely complain about discrimination by employers or superiors once they have a job. Following entry at the labour market, it seems as if there are more experiences of discrimination at the hands of customers, clients and patients. Such a finding suggests that labor market participation is no silver bullet, and that researchers studying the sociology of work should problematize the use of labor market participation as an indicator of structural and sociocultural integration.

**LIVING ON THE EDGE. YOUNG ADULT IMMIGRANTS STRATEGIES TO HANDLE LABOUR EXCLUSION**

Nils Hammarén 1, Thomas Johansson 2

1Social work, 2GOTHENBURG UNIVERSITY, Gothenburg, Sweden

Abstract: Living on the Edge - Young adult immigrants strategies to handle labour exclusion.

**SECOND GENERATION OF IMMIGRANTS AND THE STRUGGLE FOR CITIZENSHIP: THE CATANIA CASE**

Laura Siligato

1Dipartimento dei processi formativi, UNIVERSITÀ DI CATANIA, catania, Italy

Abstract: Despite the fact that there is a rich debate in the European intellectual panorama about the second generation issue, this element reflects a deeply-rooted attention to this kind of phenomena. In Italy this reality is still perceived as an in progress phenome-
The second generations, the young Italian born immigrants, are not immigrants in the strict sense: even if they are considered immigrants from a social and legal point of view. Instead of this second generation is shaping itself as a precise social category. These young people consider Italy as the homeland, the place where they were born, in which they live and, probably where they will live. The upbringing process of their own identity, an identity between two cultures. In many cases it is often characterized by a labeling processes originated by their diversity: the somatic and racial elements are the typical clues of this process. The citizenship is the status conferred to whom is an officially recognized member of a community, and indicates the relation between the individual and the State, the rights and the duties that such relation involves for the individual. In spite of this assumed principle, the Italian law, differently from many European legal systems, is rooted upon the acquisition of the right of citizenship through the jus sanguinis and not by the jus soli. The reported case study, based upon a fieldwork conducted in the city of Catania, heart of the Mediterranean, represents a laboratory of experiences a continuous contamination between native society and immigrant society. This is demonstrated from several in-depth interviews to young people of second generation. Such interviews focus on the citizenship issue that is considered like a great problem between the interviewees, in particular for those that have been born and live in Italy. The provisional results of this research wants to pose a research-based question about the interactive constructs of the belonging sense of the young second generation immigrants. In the asking for a satisfactory social collocation in the future, there is a growing demand about the possibility to obtain the citizenship from the country considered as The Country: Italy. In this sense this struggle for recognition is a very problematic area that involves both institutional and social actors showing all the contradictions in this renewed relationship between the State and all the inhabitants.

YOUTHS IN NO MAN’S LAND. THE PROCESS OF DISAFFILIATION OF YOUNG IMMIGRANTS IN A SUBURBAN AREA IN MADRID

Cecilia Eseverri Mayer

Sociology IV Department, UNIVERSIDAD COMPLUTENSE DE MADRID, MADRID, Spain

Abstract: The suburbs of large cities in Europe have become genuine social laboratories. In Madrid, the neighbourhood of San Cristobal de las Ángeles is the third poorest district of the city, the first in percentage of immigrants (43% of the population are foreigners who arrived in Madrid between 1998 and 2008) and with nearly 50% average of school drop outs among youth under the age of sixteen. However, this inner city possesses a very strong social network composed of associations and civil societies that strengthens it in comparison with other districts in Madrid.

I spent twenty four months (in 2005 to 2008 periode) in this urban area studying the situation of youths who dropped out from school and do not find ways to integrate in the labor market, by applying qualitative research methods (observation, individual and focus group) and a survey to 447 students registered in high school. The target group was Morroccans, Dominicans, Ecuatorians and Spanish youths. Within this ethnic diversity, I drew a comparison between families and educational experiences and I also studied the different circumstances of the children that do not attend school and their conduct (for instance street life, informal or parallel education and/or social programs). In other words, I researched different trajectories of young people who were stagned in a sort of intermediate space (a “No man’s land”) and I compared this disaffiliation (Castel, 1995) experiences with other successful stories (or ascendant assimilation (Portes and Rumbaut, 2001) stories and superseding trajectories in order to answer the question why some were negatively influenced by the segregation context and others were not.

The results of the research considers several combinations of individual factors (family structure, migration path, human capital of the parents, community and social networks and participation in association and intermediate structure), and questioned the place of cultural elements (family’s and community’s habits and norms) to explain the deviation of the social path and also to identify the mechanisms and resources (located in the neighbourhood and local area) that young people can used to fight against the exclusion and change their destiny.

MIGRATION, SOCIAL INCLUSION AND URBAN TRANSFORMATION : THE CASE OF CYPRUS

Savvas Katsikides 1, Papadopoulou Manto 1*, Iasonas Lamprianou1

1Social And Political Sciences, UNIVERSITY OF CYPRUS, NICOSIA, Cyprus, 2Sciences Humaines et Sociales, UNIVERSITE AIX-MARSEILLE, AIX EN PROVENCE, France

Abstract: Recent data about migration by the Statistical Service of the Ministry of Finance show that migration is one of the most important factors behind the increase of the population in Cyprus. More specifically, at the end of 2009, foreign citizens in Cyprus represented 15% of the total population. Migration is a very important issue in Cyprus and the political establishment of the island is in the process of devising a new migration strategy.

The paper is based on an on-going empirical sociological research exploring patterns of immigration in Cyprus. Via an ethnographic method, focusing on two neighborhoods each in a different city and with a different immigrant population, the authors will examine the implementation strategies of young adults in the particular context of the Cypriot society and the interactions resulted from their co-habitation with the locals. Quantitative data are being collected regarding the attitudes and the views of people in the neighborhoods (and comparisons are being made with the views of the wider population in the area).

The paper will analyse ethnostratification process and intra-group dialogue taking place along the neighborhood’s everyday life as determined by the “closure of relationship” mechanism (Weber) as well as by the ethno-racial ideologies elaborated by the historical and political background of the host society. Examination of empirical data (observations, interviews, local documents) will evoke the young immigrants’ experiences and perceptions of exclusion when settling into motion for a better future.

OUT OF PLACE IN THE ALPS? INVESTIGATING IMMIGRANTS’ INTEGRATION IN ALPINE COMMUNITIES

Natalia Magnani1

1Department of Sociology and Social Research, UNIVERSITY OF TRENTO, Trento, Italy
Abstract: Recently there has been a growing interest in the integration of international immigrants in European rural areas. Indeed while the majority of migrants in the past have settled in major urban centers, recently the proportion settling in non-metropolitan areas has increased. In many of these areas, and especially in mountain regions, the impact of ageing and fertility decline has been exacerbated by outmigration of the young generations. The communities who live in these areas have thus often experienced a process of territorial marginalization, revealed by indicators such as high emigration rate, low levels of economic activity, low levels of social and cultural capital and bad connections to urban centers.

On the one hand young immigrants, with their work and families, represent a potential resource to ensure the social and economic sustainability and viability of these areas. On the other hand, while immigration in these areas is much smaller if compared to urban centers, its impact can be magnified because of smaller and culturally homogeneous local populations.

On these premises the main aim of the paper is to analyze the way in which the marginality of rural communities (in economic, demographic and social terms) influence the process of integration of new immigrants on three key levels, namely systemic integration (economic, administrative and political dynamics), habitat integration (environmental and habitat dynamics) and social integration (social and cultural dynamics).

I will to do that by focusing on the case study of an alpine valley in the North-East of Italy located at the margins of a mass tourism area. Through the analysis of official data and through a number of qualitative interviews to representatives of local institutions, local associations and migrants, in my paper I will show how in contrast with a stereotyped image of the Alps as a natural, peaceful and white space, small communities in Italian Alps in the last 10/15 years have been facing with a growing immigrant population, mostly made of young immigrant workers with families coming from Northern Africa as well as from the countries of the former Yugoslavia. The dynamics of inclusion and exclusion that this new population is experiencing in Alpine communities is investigated and assessed.

THE ROLE OF SOCIAL CAPITAL IN YOUNG IMMIGRANTS SOCIAL INTEGRATION IN SPAIN

Roger Campdepapros

Abstract: In communication I will show the different implication of familiar network and ethnic community as predictor variables of the social integration of young immigrants, aged 16 to 35 years, in Spain. The work is part of the research performed under the R+D project “Social Networks as Social Support Providers” (PSI2008-01937), and it will use a subsample data of 7241 people, from the 2007 National Survey of Immigrants, the larger immigration survey to date in Spain. Social networks use to constitute a basic social support for immigrants, with them they can enjoy more probabilities of having a successful first stage at their arrival in the host country. Relatives and friends can provide housing, cultural translation, counseling, working access or moral support. Several authors as Portes and Rumbaut (2006) have studied how ethnic enclaves can provide easy access to jobs or to ethnic labor niches, some labor market subsectors where an ethnic origin is a majority. But often, these are low qualified jobs, and they don’t easily provide an upward social mobility. So the tested hypothesis of this work is that of segmented assimilation theory (Portes & Zhou, 1993), that is for high occupational levels upward mobility and social integration rely on small familiar networks and far from their own ethnic community, while for low occupational levels larger familiar networks provide more upward mobility and social integration than smaller ones. With a hierarchical analysis this work will show this relation controlling both for individual variables (as educational level, sex, network size and kind of ties) and contextual variables (as province and region of origin).

UNDOCUMENTED SENEGALESE MEN BETWEEN DEPORTABILITY AND EXPULSION.

Giovanna Cavatorta

Abstract: The aim of this proposal is to explore practices, tactics (De Certeau, 1984) and sojourn strategies (Engbersen, 1999) of Senegalese undocumented migrants who are living or have been living in Italy.

Data have been collected through a multi-situated ethnography between Northern Italy and Senegal: these two locations of this research allow us to consider both expelled and “clandestini” and so to take into account different positioning with respect to the European system of governance of migration.

Through the experiences of the already repatriated and the ones who risk to, we would like to grasp which kind of agencies can be constructed and which kinds of solidarity links, moral economies, gender representations are involved.

VULNERABLE CHILDREN, STRATEGIC TEENS AND CALCULATING ADULTS

Live Stremo

Abstract: The study presented is part of a broader PhD project where policies directed unaccompanied minors in Sweden and Norway during 2000 until the 2010 are compared and analysed.

According to the principles stated in the Children’s bill of rights any person under the age of 18 is to be considered a child and is hence entitled to a “softer” asylum scheme and a quicker asylum procedure. As a rule of thumb unaccompanied and asylum seeking children are normally not refused of entry nor deported out of the country when and if their asylum claims become rejected. At the same time other principles such as the intention to retain a restrictive asylum scheme can come on a colliding course with the best interest of the child. In order to make these two rather irconcileable aims smoothly cooperating the distinction between adults i.e. asylum seekers over the age of 18 and children i.e. any asylum seeking person under the age of 18 becomes important.

In this paper my main aim is to analyse the concept of “age” and how it becomes constructed in relation to gender and ethnicity and concepts such as children versus teenagers and adults in Swedish and Norwegian policy directed at unaccompanied children. Central to this analysis is also to highlight some of the practical consequences and implication of such representations. As a child the
asylum-seeker is constructed vulnerable and dependent and in need of care and protection and as an adult he/she is considered independent and agent, capable of autonomy and strategic thinking and excluded from the extra benefits and support directed unaccompanied children. As a teenager the asylum-seeker is constructed as being in a fluid space between the child and the adult. The teenager becomes an ambivalent and undesirable other: considered as more mature and more competent than the child, yet not as advanced as the adult. Inherent ideas of gender and tales of ethnic belonging also colour off on the construction of the teenage asylum-seeker.

Keywords: Unaccompanied minors, age determination, discourse analysis, comparative policy studies

BETWEEN HOME AND GLOBAL MARKET – RESEARCHING POLISH MIGRANT WOMEN PERSPECTIVE OF MIGRATION AND FAMILY ROLES

Marta Moskal1
1UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: The proposed paper focuses on the experiences of women and their family roles in the case of intra-European Polish migrant workers. It refers to the qualitative research with 65 members of Polish families (including children) living in Scotland. The paper will discuss empirical results linking migration associated with family processes (changing family forms and new living arrangements). The study finds an evidence of growing diversity of Polish migratory strategies following EU enlargement as the proportion of migrant’s women and children increases. While my research indicates a good proportion of a family reunion, it indicates also an increasing number of women being the breadwinners for their families and the changing employment opportunities different for women and for men. The paper looks at migration as an active force challenging gender relations in migrants’ families and social networks. Polish respondents in the project maintained close relationships with relatives in Poland. With reference specifically to transnational networks from Poland to Scotland, it is important to learn that respondents benefited from the emotional support and advice of relatives back in Poland. In fact, the emotional and psychological need for social ties can also be satisfied in the form of transnational connections, as continued involvement in social life ‘back home’ is well possible. Women more often remain closely connected with other family members in both the sending and receiving country, and are more likely to take continuing responsibility for care of family members in a variety of ways.

CONSTRUCTING BOUNDARIES OF DIFFERENCE: REFLECTIONS ON THE RACIALISATION OF MIGRANT WOMEN IN ‘HUMANITARIAN’ SETTINGS

Isabel Crowhurst1
1University of London, BIRKBECK, London, United Kingdom

Abstract: This paper is based on the analysis of a selection of everyday ‘incidents’ of racism and racialisation that I witnessed in the course of ethnographic fieldwork with a number of NGOs providing support to migrant women victims of sex trafficking in Italy. I explore in particular the everyday discourses and practices that contribute to the production and reproduction of sexualized and racialized representations of migrant prostitutes, commonly referred to, in Italy, as ‘foreign prostitutes’.

I adopt the notion of ‘everyday’ here with a specific reference to the work of Philomena Essed on everyday racism (1990; 1991). A focus on the ‘everyday’ –defined as the socialized meanings that make “practices immediately definable and uncontested so that, in principle, these practices can be managed according to (sub)cultural norms and expectations” (Essed 1991: 48) – enables to look at practices and their meanings in the familiar settings where they are routinely performed. And it is precisely at the level of everyday situations that, in the context I explored, migrant women are racialized on the basis of assumptions built on essentialist notions of cultural inferiority and biological determinism. Such processes are sustained and reinforced through the construction of a divisive boundary of difference, whereby the Italian/western cultural model is uncritically constructed as the “norm and positive standard” (Essed 1991: 14) and the ‘Others’ culture is viewed as disadvantaged, inferior, hence incapable of belonging within the ‘norm’. I conclude by reflecting on the ways in which these notions and processes of ‘race making’ (Knowles 2003) reinforce paternalistic claims for altruism that serve to justify often dubious ‘humanitarian’ forms of intervention.

TITLE: FORCED MARRIAGE IN FRANCE: A MIGRATION-RELATED PROBLEM?

Nisrin Abu Amara1
1International Migration and minorities, INED, Paris, France

Abstract: The recent debate on forced marriage in France and other European countries has two paradoxical aspects: on one hand, it is linked to the wish to control immigration and on the other hand, it represents genuine concerns relating to gender issues. Therefore, the debate raises important questions on gender and multiculturalism. The consequences are contradictory: while the issue draws public attention to gender-based violence, it is directly mostly toward immigrant women, thus possibly resulting in racism, stigmatization and marginalisation of minorities. Notably, European legal systems tend to paraphrase forced marriage with “simulated” or “sham marriages” (Rude Antoine, 2005), this has pushed them to adopt measures to limit immigration and to control marriage on grounds of “interest”. This presentation builds upon a qualitative research based on 44 interviews with women and men, immigrants, descendants of immigrants, who reported being pressured or forced to marry by their families or their spouses. The population includes immigrants and descendants from southern-Europe (Portugal, Italy), northern and sub-Saharan Africa and a minority of Asian women (Srilanka, Vietnam). The research followed a quantitative survey named “trajectories et origins”, on the lives of 22,000 French immigrants and descendants of immigrants, and discriminations they may have encountered in various domains (research by INED and INSEE, France, 2009). One of the qualitative research guiding questions was: how are consent and constraint to marriage linked to immigration? The research results show that a variety of situations exist, in which native French, as well as immigrant women and the descendant generation might experience pressures influencing their marital decisions, and leading, in the long term, to different forms of control and spousal violence. Moreover, one of the most striking results shows that among the diverse reasons mentioned for these imposed unions, the wish to obtain legal residency or French citizenship was rarely mentioned. This study, therefore, encourages a revisiting of definitions on forced and ar-
ranged marriages, and considers “forced marriage” as both a continuum and a form of gender-based violence, instead of an “immigration problem”.

WHEN MEN BECOME VICTIMS. CHANGING PATTERNS OF TRAFFICKING IN HUMAN BEINGS IN POLAND.

Anna Ratecka

Abstract: Trafficking in human beings is on the agenda of national states, international bodies and NGOs since for over 15 years. Although this notion is problematic for many social scientists and activists, it has made a “career” in the international politics, and is now in the centre of interests of EU, national politicians, state and international agencies, NGO’s supporting trafficked persons and the media.

In the Central and Eastern Europe the topic started to be discussed in the mid 1990s with the political and economical changes in the region. From the very start of the debate around trafficking, it was presented as a strictly gender issue concerning women and especially young women. The debates around trafficking focused mainly on the problem of women trafficked for the purpose of commercial sexual exploitation, i.e. forced prostitution. The programs aimed at fighting trafficking as well as supporting trafficked persons were designed for women. NGOs dealing with the issue were mainly women’s organizations dedicated to trafficked women (like the main NGO in the region dealing with trafficking – La Strada network).

After 2004, when first CEE countries joined EU the character of trafficking changed. The nationality of trafficked persons changed (citizens of new EU member states could find legal jobs and were less prone to being trafficked) but also the gender of trafficked persons changed. Both state agencies and NGOs started identifying more trafficked men from Asia or Romain men. Unlike women, they have been usually exploited in forced labour or forced to begging.

In my presentation I will elaborate on the new trend in trafficking, i.e. a growing presence of men and the consequences it has on the politics of trafficking in Poland. I will show how it changed the public debate concerning trafficking and the various ways cases of trafficked woman and trafficked men are presented in the media and during conferences concerning trafficking. Secondly I will show how NGOs supporting trafficked persons deal with this change. I will focus on the La Strada Foundation, which was established as a woman’s NGO in the mid 1990s and which is the main and only executor of governmental program for trafficked persons in Poland. Thirdly, I will discuss the government reaction to this shift and the impact it had on the policy concerning trafficking.

AMBIGUOUS EMPOWERMENT THROUGH MOBILITY – UKRAINIAN WOMEN’S MIGRATION TO ITALY

Lena Näre

Abstract: One of the representative figures of contemporary globalisation is the migrant worker working as a domestic or care worker. Women now account up to half of world’s migrants and women’s migration has become a common means to survive and cope with the effects of economic crises around the globe. In the existing research literature migrant women working as domestic workers are often portrayed as victims at the mercy of their employers, local labour markets and the globalising economic restructurings. However, as women become main breadwinners in their families patriarchal gender orders are being transformed and for many women mobility can be a means to leave unsatisfactory marriages and search for a more fulfilling life. For many female migrants mobility means hence more than mere survival (cf. Sassen 2003), it can be about empowerment. This paper explores the case Ukrainian female migration to Italy in the mid 2000s from this perspective. It argues that Ukrainian women resorted to mobility to empower themselves from unhappy marital and family situations but this came with the cost of social downgrading and de-skilling. Through mobility women hence needed to re-negotiate their subjectivities as professionals working in low-skilled jobs, mothers, single women and as (stigmatised) migrant workers. Drawing on participant observation and twenty-four in-depth interviews of Ukrainian women working as domestic and care workers in Naples, in South Italy, the paper examines Ukrainian women’s mobility strategies and subjectivity negotiations.

“I LIVED UNDER CEAUSESCU’S DICTATORSHIP AND NOW I LIVE IN ITALY”. THE MORAL CAREER OF ROMANIAN WOMEN

Cristina Calvi

Abstract: This paper presents the results of a research project realized in Piedmont (a region in the north-west of Italy) with Romanian women between 40 and 50 years old.

The research aim was the reconstruction of moral careers of Romanian women who lived under Ceausescu’s dictatorship and now live in Italy.

Moral career is the sum of the changes in the self and self-image experienced by an individual (Goffman 1961) when particular events happen. In literature, the theme of the impact of the events (life events) is analyzed by the interactionist perspective of the life course (Elder 1985; Riley 1998; Olagnero, Saraceno 1993). The re-definition of self, linked to significant changes on the moral career, is associated with the occurrence of significant events.

In this research the biographical perspective is adopted in order to reconstruct moral careers of women with particular attention to two moments of transition: the fall of the Ceausescu’s dictatorship, and the migration in Italy. In fact, by identifying those events that mark the biography of all respondents it becomes possible to distinguish three distinct stages in their moral career: the stage of “dictatorship”, which includes women’s life under the dictatorship; the stage of Ceausescu’s fall, which includes women’s life from dictator’s fall to the departure from Romania; and the stage of life in Italy. The identification of these stages is important because in each one we can observe one or more redefinitions of self. In the first stage, the dictatorship shaped an ideology of gender which gave to woman a dual role: worker and mother. Has this model changed after the Ceausescu’s fall? What kind of relationship exist between the “socialist gender model” and the social construction of immigrant woman in Italy?
Thirty interviews with women are realized and then analyzed in order to identify a typology of moral careers, carrying out a reconstruction and a categorization of coping strategies implemented by the respondents, depending on the events that have been faced with.

**THE ADULT-YOUNG. NOTES FOR A NEW PROFILE OF IMMIGRANT GIRLS IN ITALY**
Gaia Peruzzi

Abstract: Children of immigration, that is young immigrants and second generations, are one of the emergent social categories today in Italy, announcing an irreversible demographic and cultural mix, like it already occurred in other neighbor countries. The integration of these girls and boys is an important challenge for the social cohesion and stability of the country. However, the features, expectations and problems related to these children are still unknown to us, because the phenomenon is recent and the research stands always one step behind social changes. The first important researches conducted to this day in Italy followed mainly the issues of integration in schools. More recently scholars are studying consumptions. As they are at the intersections between personal tastes and fashion tendencies, and between freedom of action and actual purchasing power, the consumptions are important windows on the private sphere and subjectivity of these people.

This paper draws inspiration from the project *Media, mode e amori dei figli dell’immigrazione*. As the title suggests, the research identifies leisure and cultural consumptions as pretexts to explore the quality of life and the most inner expressive needs of the interviewees, and the choices concerning clothing as the signs of cultural belongings. In particular the proposed article refers to the results of the first action of the project mentioned above, conducted in the second half of 2010, aimed at testing the waters for the realization of in-depth interviews. In this phase we interviewed 20 migrant girls or migrants’ daughters, between 15 and 25 years old, all resident in the region of Lazio, in Rome or in some provincial towns. Despite the explorative nature and the limited dimensions of the sample of this first phase, the empirical evidences and mainly the recurrences emerged in the analysis of collected materials allows us to sketch a profile for this young women, whose many features seem to contrast the main characteristics of native young people. Moreover, overturning an expression frequently used to indicate accidental young people, we propose to name the women of our sample *adult-young*, because they are young in the official age, but already adults in the life-styles. This paper will illustrate in a more detailed way the features of this new sociological figure (also by considering the elements emerging in the phases of the research currently in progress).

**TWO CRISSES AND THE ONE MIGRATION**
Galina Denisova, Ekaterina Bagreeva, German Mendzheritskiy

Abstract: For the vast majority of the population of Russia and CIS countries, the 1990’s collapse of the Soviet Union was experienced as a deep political, social and economic crisis. The disintegration of societal values and loss of confidence in existing social institutions, tended to liberate individuals from their attachments to territory and country. Taken together, these factors lead to dissatisfaction, changed the quality of life of citizens, who consequently tried to influence this. Thus, such long-term crisis situations provoke active migration processes. Negative changes caused by crises usually first affect the traditionally less secure gender group - women, who demonstrate different reactions to the circumstances. When looking at our report, special attention will be drawn to the study of the role and significance of gender differences in decision-making processes for migrants from the CIS countries, and its implementation and adaptation for Russian-speaking migrants in Russia, and to Germany and Norway.

The social conditions surrounding the crisis in the early XXI century was the background for the pilot study of social attitudes of former Russian-speaking immigrants in these 3 countries. One of the tasks in this study was to identify the degree of success for immigration strategies aimed at maintaining or improving the migrants quality of life.

The effectiveness of the adaptation of immigrants was measured by a set of indicators that characterize their economic activity, the degree of mastery of the state language, the intensity of communication with their neighbors, the intensity of relations with immigrant communities, as well as to what extent the migrants remain in contact with the countries of origin. Ethnocultural and civic identity of the immigrants also serve as important indicators of adaptation. The respondents were asked direct questions related to their evaluation of their migration as a positive move, their vision for the future of their children, as well as the degree of satisfaction with their lives and achieved level of comfort. The results for all three countries, especially in the female segment of the respondents, show a generally high positive assessment. On this basis, migration can be seen as one way to control the quality of lives in crisis situations.

**FROM MIGRATION TO MOBILITY: POLISH NATIONALS IN THE IRISH LABOUR MARKET**
Elaine Moriarty, James Wickham, Justyna Salamonska, Alicja Bobek, Torben Krings

Abstract: This paper argues that intra-European movement from the New Member States of the EU challenges conventional academic understandings of immigration. Using a study of Polish migrants working in Dublin during the 2000s we show how a new set of motivations for movement is better conceptualised as mobility. We use the concept of ‘worklife pathways’ to understand how, especially for the younger and more educated of these migrants, employment often involved lifestyle choices and jobs were sometimes only instruments in a broader aspiration for self-development.

European worklife pathways were enabled by new forms of social networks and technologies of physical and virtual mobility. Migration research has often highlighted the role of social networks in facilitating migrants’ access to work and accommodation. In Ireland Polish migrants rapidly built such networks where – unlike the UK –
there was no established Polish community. However, these networks were not only created rapidly, they were also very loose, transient and often very instrumental and sometimes interwoven with market-based relationships.

Migrants could keep in touch with home because of transport technologies: first there were long-distance coaches between Warsaw and Dublin, and then the dramatic expansion of budget airlines with new routes and low fares. Migrants could return ‘home’ to visit parents, go to the dentist and even to the hairdresser. For this generation, keeping in touch also meant electronic communication (email, skype, social networking sites) and the mobile phone. Using our respondents’ own accounts of their mobile phone use and their recent plane journeys, we show how these technologies partially collapsed distance. Both physical and virtual travel meant that contacts could be maintained, but equally crucially, such contacts were selected and new contacts created.

Physical travel was not just back to Poland. Once arrived in Ireland, most migrants began to travel far more than they had done before from Poland. Ireland became a jumping off point for travel elsewhere for holidays, for long distance working breaks and even for looking for a new job. Above all, once respondents had improved their English, Ireland was seen as giving access not to Europe but to the Anglosphere.

**INTER-ETHNIC COMPETITION: EXPLAINING NETWORK DRIVEN MIGRATION AND SEGREGATION**

Christofer Edling 1, Rickard Sandell 2

1 SHSS, Jacobs University, Bremen, Germany, 2 IMDEA, Madrid, Spain

Abstract: Based on theories of ethnic conflict and competition we apply the idea that ethnic competition constitutes a destination specific phenomenon that alter conditions for network driven migration. Our concern is not the competitive relation between migrants and the native population. Instead, we explore situations of inter-ethnic competition.

We argue that when members of different ethnic groups occupy the same socio-economic niche the presence of one immigrant group reduces the opportunities of the other. Hence, ethnic competition is an intervening factor that can weaken the positive effect of the social capital feedback loop between past and potential immigrants. Furthermore, if inter-ethnic competition influences the settlement process in network driven international migration, it becomes a causal component in explanation of ethnic segregation processes. Hence, a second objective is to study how variation in inter-ethnic competition over time influences the degree of ethnic segregation. We call into question explanations of segregation based on individual preferences about neighborhood composition.

We use data from the Spanish local population register for the period 1999 to 2009. We analyze 4.6 million international immigration events and 10.1 million internal migration events, of which 2.6 million events are internal migration events involving the foreign born population. The data spans a total of 198 different immigrant collectives and includes information on both legally documented and undocumented migrants’ movements.

We show that inter-ethnic competition change the intensity and the quality content of immigrant social capital transfers. The expansion of other foreign born groups (increased competition) impedes the expansion of a particular collective, and the contraction of members of other collectives (decreased competition) benefit a particular collective’s capacity for expansion. Moreover, we find evidence that high levels of inter-ethnic competition in a location reduce exodus of the native population and hence the degree of segregation.

**SLOWLY CHANGING FOR THE BETTER? LABOUR MARKET MOBILITY OF CENTRAL EASTERN EUROPEAN MIGRANTS IN BRITAIN**

Zinovijus Cipuþius 1, Robert MacKenzie 1, Chris Forde 1

1 work and employment relations division, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: The post 2004 labour migration from Central Eastern Europe to Britain presents a pertinent example of emergent intra-European mobility. Newly gained freedom of movement in the EU has a generally positive impact on spatial mobility of Central Eastern Europeans (CEE); however it is an imperative for social researchers to understand labour market and workplace experiences of the EU citizens in order to draw a comprehensive picture of new mobility. Although there has been a wide number of evidence suggesting that the employment of Central Eastern Europeans have concentrated in secondary labour market and that they often faced downward social mobility (Thompson et al, 2010), some researchers argued that EU citizenship might help them to move away from low-paid, precarious jobs (Anderson, 2010). A number of studies (Trevena, 2009), focused exclusively on young graduates in such cosmopolitan urban centres as London, suggested that moving towards better jobs is a possible trajectory for some mobile CEEs in Britain. Building on existing scholarship, this paper looks at the experiences of CEE migrants from diverse range of social backgrounds in three localities in Northern England. The biographical interviews and focus groups with mobile CEEs (mostly Polish citizens but also with migrants from Slovakia, Estonia and Latvia) have been conducted in 2009-2011, after most of the migrants have spent at least four years in the UK. Additional data originates from non-participant observations in community and trade union groups. The data provides an insight on the changing trajectory of migrants’ employment and its impact on social lives of mobile CEEs. The emerging picture is complex: it’s neither of a linear progression from secondary labour market, nor the one of labour market immobility. In contrast, the data suggests that through daily hardships and struggles CEE workers can achieve a better working and living conditions for themselves; however their ability to improve their employment status is constrained by the structure of local labour markets. On the other hand, mobile CEEs resort to diverse labour market strategies (self-employment, informal employment) to seek more fulfilling working lives. The interviews also reveal a variety of ways mobile CEEs have established their lives in Britain (employment and beyond) and their aspirations for the future.

**SOCIAL STRATIFICATION, WELFARE STATE AND EMIGRATION INTENTIONS**

Alexi Gugushvili 1

1 Political and Social Sciences, EUROPEAN UNIVERSITY INSTITUTE, Florence, Italy

Abstract: The difficulties in finding adequate data to study the characteristics of migrants have led to the growing interest in the indirect analysis of migration behaviour based on migration inten-
IMMIGRANTS IN PORTUGAL: ALL DIFFERENT, ALL EQUAL?

Maria Filomena Mendes 1, Maria Conceição Rego 2, José Rebelo Santos 3, Maria Graça Magalhães 1, Maria Manuela Oliveira 4
1sociology, 2economics, EVORA UNIVERSITY, Évora, 3Escola Superior de Ciências Sociais, Instituto Politécnico de Setúbal, Setúbal, 4mathematics, EVORA UNIVERSITY, Évora, Portugal

Abstract: Portugal, a country traditionally characterized by relevant emigration processes, has become, since the eighties of the twentieth century, a territory with significant flows of immigrants. Currently, “foreign citizens with legal resident status” in Portugal exceeds 4% of the total population.

The phenomenon of immigration in Portugal, while important in terms of social dynamics and population, is relatively recent: in the last 20 years, the foreign population in Portugal more than quadrupled. Among the nations seeking to Portugal as a destination of residence include, besides the Portuguese-speaking countries - Brazil and African countries, particularly in Cape Verde, Angola, Guinea Bissau and Mozambique in less volume and Sao Tome and Principe - the countries of Central and Eastern Europe, including Ukraine, Romania and Moldova, in addition to those belonging to the European Union. We concluded based on recent research studies, that immigrants from Central and Eastern Europe have different characteristics from their counterparts in Africa and Latin America. While the former are mostly men, aged between 29 and 49, in the second group, women are more numerous and more important is the age group between 25 and 44 years and are distributed all over the country (areas of Lisbon, Setúbal, Algarve and Porto).

In this study we have identified, through methods of statistical and data coming from the European Social Survey (ESS), to what extent is that immigrants from European countries, particularly in Central and Eastern Europe, seeking to Portugal, have profiles similar or dissimilar between them in terms of values and expectations. Moreover, this analysis tried to identify differences and similarities between European countries emitting emigrants to Portugal, in terms of demographic, social and economic, that may explain not only the options in terms of, the Portuguese regions of destination for those individuals but also of capacity of integration and the setting for long periods.

EDUCATION MARKET SORTING AND MIGRANT YOUTH IN RUSSIA

Daniel Alexandrov 1, Valeria Ivaniushina 1
1HIGHER SCHOOL OF ECONOMICS, St. Petersburg, Russian Federation

Abstract: The proposed paper is focused on Russian school system as a sorting mechanism for incoming migrant youth. The emergence of independent states and economic disparity resulted in large flows of migration to Russia from Southern Caucasus and Central Asia, with almost 40% coming to Moscow and St.Petersburg. Russian urban schools are regulated by supply and demand rather than by considerations of social policy. Students and parents are free to select schools, and though schools formally have small ‘catchment areas’ they are also able to select students. According to recently introduced scheme government school funds are allocated on per capita basis which increases competitiveness with highly unequal opportunities.

Our research is based on mixed-method design: original surveys in St. Petersburg (104 schools, 7300 students) and Moscow region (50 schools, 3800 students) with the data on complete networks of
class friendships, plus interviews with teachers, administrators, and migrant families. Our results demonstrate that urban school market is highly differentiated, mainly in terms of socio-economic status, even in the absence of pronounced spatial pattern of ethnic or socio-economic segregation in urban areas. Concentration of migrant children in disadvantaged schools follows the pattern of socio-economic school differentiation.

Sorting between schools has two effects on migrants. One the one hand, within-school situation for migrant children is favorable, and in a short run it seems to result in a better integration of migrants. In disadvantaged schools migrant students demonstrate higher motivation and lower level in anti-school culture than ‘local’ majority students. Teachers appreciate their willingness to learn and their parents’ attention to school, especially in comparison with local urban population. Our network analysis of school friendships shows that majority children in their friendship choices do not discriminate against migrants. On the other hand, disparity between schools facilitates growing inequality within migrant population and strengthens social class boundaries no less and maybe even more than ethnic boundaries.

FROM COMPLEMENTARITY TO EXCLUSION? FOREIGN WORKERS IN THE SPANISH LABOUR MARKET, 2000-2010

Fernando Gil-Alonso 1, Andreu DOMINGO 2

1Human Geography Department, University of Barcelona, 2Centre d’Estudis Demografics, Barcelona, Spain

Abstract: From the beginning of the 21st century to the upsurge of current global crisis, foreign population living in Spain—mainly arriving for labour reasons—has significantly increased. As Spanish workforce has also been growing, particularly female one, we would not be before a case of “replacement migration”. Authors argue that this “migration boom” is partly due to the educational, labour and social promotion of the autochthonous workforce. In turn, this upwards mobility attracts foreign workers who, in a segmented or dual labour market, fill the vacant posts which national workers do not want, or are no longer able, to cover. Even though this situation is not new, the Spanish case is particularly interesting due to its speed and numbers involved. In a context of female education level improvement, these trends would be partly related to the increasing local female labour market participation and the extension of two salary households. As household reproductive tasks (domestic work, including child and elderly care and housework) are still unequally distributed by sex and the Spanish welfare system is weak, they have been externalised into the market and internationalised. Thus, authors argue that the arrival of foreign immigrants and nationals’ educational, labour and social promotion are “complementary”. However, it should not be forgotten that it is a clearly uneven “complementarity” as foreigners mainly find jobs in sectors requiring a low skilled workforce, which are also the hardest, worst paid, and more unstable posts. The paper will—which using EPA (Spanish labour force) survey data—firstly analyse this labour market complementarity during the economic growth phase (2000-2007), focusing on the differences between foreigners and Spaniards’ participation by activity sectors, as there are sectors where the foreign population has partly substituted the autochthonous one, others where the two populations have competed, and finally others which have nearly become exclusive niches for Spaniards. In a second phase, the impact of the economic crisis will be analysed (2007-2010), in order to check our two hypothesis: 1) foreigners have been more affected by crisis than national workers, and 2) foreigners working in sectors where they compete with Spaniards have been more affected by unemployment than those employed in sectors characterised by substitution.

INTERNATIONAL RECRUITMENT OF URUGUAYAN DOCTORS TO PORTUGAL: BENEFITS AND CHALLENGES

Erika Masanet 1, Eva Espinar-Ruiz 2

1Centre for Research and Studies in Sociology, UNIVERSITY INSTITUTE OF LISBON, Lisbon, Portugal, 2Sociology II, University of Alicante, Alicante, Spain

Abstract: The international mobility of health professionals has increased in recent decades due to the global health workforce crisis. In the context of this global crisis, bilateral agreements between countries or institutions for the recruitment of foreign health professionals are tools for more ethical and equitable management of this migration.

In the past two decades, there has been a significant increase in the arrival of foreign health professionals in Portugal due mainly to its structural shortage of health personnel. One solution to reduce this deficit has been the formalization of a bilateral agreement between the Ministries of Health of Portugal and Uruguay in 2008 for the recruitment of Uruguayan doctors in emergency services of Portuguese hospitals for three years.

The present paper examines the development and the conditions under which migration of Uruguayan physicians to Portugal occurs through this bilateral agreement, with emphasis on the process of professional integration and working conditions of these migrants in the Portuguese National Health System.

The research uses a combination of techniques and information sources to study this issue. On the one hand, it is based on qualitative analysis of the following secondary data: document of the bilateral agreement between Portugal and Uruguay (“Memorandum of Understanding on health”), taking as reference the recent “WHO Global Code of Practice on the International Recruitment of Health Personnel”, and a selection of news from Portuguese newspapers about the arrival of these Uruguayan doctors. On the other hand, we analyze the qualitative primary data obtained from key informant interviews and in-depth interviews with Uruguayan doctors.

The research results show some facilities in the process of professional integration of these doctors in the Portuguese National Health System. Despite this institutional support, the study also indicates an inequality in the working conditions between these foreign physicians and Portuguese doctors and processes of discrimination in the workplace by their superiors and colleagues.

LINKS BETWEEN IMMIGRATION AND EDUCATION: A COMPARISON AMONG SELECTED EUROPEAN COUNTRIES

Steffen Hillmert 1

1Department of Sociology, UNIVERSITY OF TUEBINGEN, Tuebingen, Germany

Abstract: Comparative assessment studies indicate that immigrant students are often disadvantaged in the educational system, but also that the international variation in their relative situation is
remarkable. However, relatively little is known about the processes that lead to these international differences. The main assumption of this paper is that the relative performance of migrants in education can be attributed not only to their individual characteristics, but also to specific macro-level conditions in societies. In particular, we explore the role of institutions in determining the situation of migrants in education. Such an impact can be expected for the structures of educational systems and the availability of group-specific support; however, this also applies to regulations of immigration and integration, and as such, can be linked to the social composition of the migrant population and to typical incentive structures in educational investments. Applying a multi-level conceptual framework, we reconstruct relationships between immigration, immigrant and educational policies; recent patterns of migration; and finally the performance of migrants within the education systems. Our study covers five European countries that show considerable variation in the major explanatory variables. A theoretical survey of country-specific policies and institutional features is supplemented by a selection of relevant quantitative indicators of institutional differences and immigration patterns. Regarding the empirical consequences for educational performance, we draw upon comparative micro-level data from the large-scale student assessment studies PIRLS and PISA. These allow conducting multivariate comparisons while controlling for differences in group-level composition. Moreover, by combining the two datasets in a systematic way we can interpret the results in a quasi-longitudinal way. Preliminary results indicate that social selectivity and effects of individual and family characteristics vary considerably in their relevance among the selected countries. Given the assumed institutional basis of many of these effects, our results corroborate the idea of close links between the regulation of immigration and group-specific educational performance.

Second, legal statuses upon arrival and status-specific immigrant policies constitute varying contexts of reception. Extending Alejandro Portes’ et al. concept of inclusive, neutral, and negative modes of incorporation, my theoretical model distinguishes between their direct and indirect effects. For instance, while access to schools might be guaranteed to any child independent of his or her (il)legal status, economic and social rights denied to the child’s parents undermine the economic situation needed for a productive learning environment in the family.

In the German case, while economic selection is of minor importance, the politically privileged immigration of ethnic Germans (Aussiedler) involved linguistic selection criteria which provided them with a modestly advantageous position at the beginning of their lives in Germany. The governmental reception of ethnic German immigrants is a prime example of an inclusive mode of incorporation – in contrast to the exclusive reception of e.g. refugees. Yet, despite their accumulation of supportive immigrant policies, even the politically favoured ethnic Germans are confronted by more general institutional hurdles affecting immigrants and/or lower social-status groups more generally. In effect, inclusive group-specific institutional arrangements function as a cushion against education failure but do not overrule major mechanisms of social stratification.

THE NEW GERMAN ELITE? PEOPLE WITH A MIGRATION BACKGROUND IN LEADERSHIP POSITIONS
Sarah-Elisa Nees¹
¹BIGSSS, UNIVERSITÄT BREMEN, Bremen, Germany

Abstract: In Germany, over 18% of the population has a migration background. Studies on their integration into German society so far mainly focus on the lower strata of society. Contrary, this qualitative research identifies those people with a migration background who reached the top-tiers of politics and the economy. The central question being: how those with a migration background made it to the top? Specifically, this paper, which is part of my dissertation, concentrates on the educational and work trajectories of the top-achievers. For this, 40 problem-centered interviews with politicians, managers, entrepreneurs and labour unionists from Germany were conducted. All interviewees are or were in leadership positions and fulfill the criteria of the German Federal Statistical Office Migrationsbericht’s definition ‘person with a migration background’, i.e. they are first generation immigrants or have at least one parent who is or was non-German at the time of birth. Based on the trajectories, various model routes to success are identified, which reflect the diversity of the sample in terms of socio-economic and generational differences. Further, this paper critically assesses the concept ‘person with a migration background’ as the research has shown that this definition is providing a very heterogeneous sample.

THE WHITENING OF EAST EUROPEAN MIGRANT LABOURERS IN THE UK
Jon Fox¹
¹Sociology, Politics, and International Studies, UNIVERSITY OF BRISTOL, Bristol, United Kingdom

Abstract: In 2004, the UK opened its doors to migrants from the EU’s eight new member states from East Europe. In 2007, migrants from Romania and Bulgaria, the EU’s next members, were granted
more limited entry to the UK. In many respects, these migrants looked like past migrants to the UK: they left poorer parts of the world in search of work and the better life in the UK. But in other respects, they looked different: they were white. The link between racism and migration is well-documented. But what happens when migrant and host are supposedly the same ‘race’? Whilst there has been increasing recognition of the ways in which the migrants have been targets of racialisation, there has been less attention focussed on how these same migrants are also the perpetrators of racialisation. The purpose of this paper is to explain how ‘race’ is wielded by different segments of the East European migrants to assert and defend the relatively privileged position their ‘whiteness’ affords them in the UK’s racialised labour market hierarchies. Our study of Hungarians (representing the larger and unregulated wave of 2004 migrants) and Romanians (representing the smaller and more regulated wave of 2007 migrants) considers not only differences in sending context but, more importantly, differences in the local labour market context of the UK in explaining variation in the quality and intensity of racialisation. We argue that different regimes of immigration control lead not only to different labour market positions but also to different possibilities (and expectations) for mobility. These differences and the frustrations they engender in turn conspire to place Hungarians and Romanians at respectively higher and lower positions of Britain’s racialised hierarchies, positions which the migrants reinforce through the processes of racialisation in which they engage. East European migrants in the UK have demonstrated adroitness and dexterity in adopting their sending country variants of ‘race’ and racism to assert and defend their position in the UK labour market. This case illustrates that putatively shared whiteness is best understood not as a determinant of labour market segmentation but rather as its contingent outcome. It is the language invoked and evoked by migrant workers to describe and ultimately constitute difference in the labour market, even when migrant and host nominally share the same ‘race’.

'DOING RIGHTS': DISABLED YOUNG PEOPLE AND EMBODIED CITIZENSHIP

Phillippa Robertson-Rieck

School of Social and Political Sciences, UNIVERSITY OF GLASGOW, Glasgow, United Kingdom

Abstract: We do not usually associate the body with rights or citizenship yet for disabled people the body is both the site of discrimination and the site of agency and it is through their bodies that disabled people are active in establishing their rights and their citizenship. If we are to understand what it is like to be a disabled person we must do so from an embodied perspective. The experience of disabled people and of living with 'unusual' bodies renders the concept of embodiment particularly salient for the study of the relationship between bodies and rights and the notion that citizenship is embodied. Disabled people as they navigate mainstream spaces 'do' their rights every day and it is through an analysis of this process of 'doing' that we can come to understand embodied agency. This paper is drawn from an ongoing PhD based on interviews with disabled young people. These young people have grown up in a very different world to that of older disabled people. For them legislation such as the Disability Discrimination Act along with the growing mainstreaming of services has meant that they have grown up in a society where the right to inclusion is, on the whole, accepted. In this paper I draw on data that examines how young people live their everyday lives and explore their accounts of being a disabled young person. The data documents how the body acts as the medium through which relationships are enacted and experienced - relationships between bodies and the state, relationships between bodies and rights and relationships between bodies and other bodies - in relation to disability. It explores the concept of embodiment as the site of citizenship and rights in our everyday lives and by engaging with disabled young people the research has sought to explore how bodies are active in realising rights and participating in citizenship in a society where young people occupy mainstream spaces on a daily basis. By exploring corporeal experiences of inclusion, exclusion and participation in everyday life we confirm that our rights and citizenship are embodied.

EMOTIONS AND DISABILITY: PITY, FEAR AND DISGUST

Bill Hughes

School of Social and Political Sciences, GLASGOW CALEDONIAN UNIVERSITY, Glasgow, United Kingdom

Abstract: In the phenomenological tradition emotions are the means by which consciousness apprehends objects and attaches value (or disvalue) to them. They are a source of judgement, and with respect to the basic aversive emotions (Kolnai 2004) – like fear and disgust –, there would seem to be little ambiguity about the value associated with objects that inspire and arouse aversion. In this paper, I will argue that his line of reasoning has value for Critical Disability Studies in that it helps to problematise the non-disabled imaginary. I will examine the relationship between the affective turn and disability studies arguing in particular, that while – from the perspective of the social model of disability - pity has played the most significant part in non-disabled actors relationship with disabled people, the emotional parameters of ableism suggest that the impact of fear and disgust cannot be underestimated.

THE PSYCHO-EMOTIONAL IMPACT OF IMPAIRMENT EFFECTS: WHERE CHRONIC ILLNESS MEETS DISABILITY STUDIES

Joanna Ferrie, Nick Watson

School of Social and Political Sciences, UNIVERSITY OF GLASGOW, Glasgow, United Kingdom

Abstract: Where impairment ends and chronic illness begins has been a major issue for disability studies and disability theorists. Explorations of chronic illness have been mostly confined to medical sociology whilst for disability studies impairment has been the major identifier. Medical sociology has been criticised within disability studies for its failure to engage with and explore how social structures impact on the experience of chronic illness whilst disability studies has been criticised for its neglect of an analysis of living with a chronic condition. In an attempt to rectify this Carol Thomas has suggested the use of impairment effects and psycho-emotional disableism. The former are the restrictions or limitations imposed upon a body relating to an impairment which are distinct from the social relational barriers whilst the latter refers to the social processes and practices which place limits on the psycho-emotional well-being of people with impairments. Impairment effects and disabilities are inter-related so that the whole person can not be subjected to a dualist approach where each symptom and barrier faced can be situated in one category over the other. In this paper we employ data drawn from interviews with adults who have motor neurone disease (MND) and focus groups of family members who have supported someone with motor neurone disease (MND) to explore how living with a terminal, chronic condition can be explored from a disability studies perspective. The data suggest people facing chronic and life-limiting illnesses may be less aware of disabling barriers as they are faced simultaneously with impairment effects that grow in number and severity. The psycho-emotional consequences of living with a condition that will end one’s life, on average within 18 months, and with particular symptoms will be discussed. Particular attention will be given to the loss of verbal communication ability, fear of asphyxiation, a lack of medical awareness among front line medical professionals and the need to accept an identity of disability in order to access particular resources and benefits.

CHRONIC ILLNESSES - PROCESSES OF OBJECTIFICATION

Ulrike Manz

Sociology, GOETHE-UNIVERSITÄT FRANKFURT AM MAIN, Frankfurt am Main, Germany

Abstract: In the course of chronic illness, the weakened body increasingly becomes the object of professional action. Doctors, physical therapists, and speech therapists all treat the body of the ill person based on acquired expert knowledge. The presentation discusses the interaction between these professional objectifications and subjective modes of dealing with the situation. Drawing on interviews from an ongoing research project on body concepts
of the chronically ill, three areas of objectification will be presented: First, chronically ill persons are increasingly forced to organize everyday life along the lines of time patterns defined by professional actors. Second, based on expert (i.e. medical) knowledge, they are required to make decisions about interventions into the body. Third, a process of objectification takes place by "interpellating" (Althusser) a specific identity as an "ill or disabled person." The empirical data shows that those affected respond to such objectifications by resorting to incorporated body knowledge; they do so by referring to the body as the bearer of knowledge. Following Hirschauer’s distinction between various forms of body knowledge (Hirschauer 2008), this process is viewed as the transfer of knowledge present “within the body,” which, in coming to terms with processes of objectification, becomes verbalized knowledge and takes on the status of knowledge “of the body.” This transfer, thus the final conclusion, can be interpreted as an empowerment strategy of the chronically ill in dealing with their increasing physical frailty.

SUBJECT AND DISABILITY: HUMAN BODY AS A CATEGORY CONSTRUCTING “DIS/ABLED” IDENTITIES (A TRIAL OF CRITICAL DISCOURSE ANALYSIS)

Jolanta Rzeznicka-Krupa

Faculty of Social Sciences, UNIVERSITY OF GDANSK, Gdansk, Poland

Abstract: The main idea of the proposal is an analysis, interpretation and re-construction of meanings, based on the socio-cultural perspectives and creating some concepts connected with the disability phenomenon (e.g. norm and what is abnormal, body and its impairments, the difference, otherness, pathology, ...) as well as the same category of disability. Biological determinants, which are linked with some impairments of body or/and mind founding the basic element of a disability definition structure [ICIDH-2, see T.B. Ustun, 1999], are also connected with certain body discourses and within their frames – with some corporeal constructs. We can say that they constitute, by analogy to the symbolic capital of P. Bourdieu theory, a specific kind the individual’s "biological capital".

The context of analysis is based on the subjectivity and identity categories which let to conceptualize in certain theoretical frameworks reflection concerning the ways and processes of establishing the individuals as subjects and positioning (situating?) them in the social network and it’s structures. The main problem of the research, according to de-centred, constructivist identity concept understood as a liquid construct having only temporary stabilization in the space of discourse (language) closing the meanings and filling them up the sense [S. Hall 1992, see also the theory of discourse by E. Laclau], concentrates on the question referring to senses, meanings, discourses and practices creating the subjects which are described to be disabled. This perspective show us the discursive nature of a basic category which create our thinking about disability – body category which “unworthiness” becomes the origin attribute defining the subjects (e.g. P. Bourdieu thesis on the cultural arbitraries transformation into natural phenomena).

The discourse analysis, understood as a trial of re-reading and de-construction of signifying practices (signs and trajectories of identity) and the categories creating various texts and narrations in which individual and social disability discourses are tied up was used. Especially the assumptions and works of critical discourse analysis as a way of researching the discursive aspects of subject seems to be the most suitable strategy within the cultural study area [N. Fairclough. R. Wodak, 1998; T. A. van Dijk, 2001; N. Fairclough, A. Duszak, 2008].

THE SOCIAL CONSTRUCTION OF “INTELLECTUAL DISABILITY” AND THE SEXUAL NORMS

Lucie Nayak 1,2

1Sociology, UNIVERSITY OF GENEVA, Geneva, Switzerland, 2Sociology, UNIVERSITE PARIS OUEST NANTERRE, Paris, France

Abstract: According to the recent concept of « sexual health » (WHO 1975, 2002) defining it as a component of individual welfare and health, sexuality tends from now on to be considered as a « need » to which « able » or « disable » individuals must have a « right » to answer. It is in this context that sexual assistance services recently started to be offered in many European countries. They consist in hetero- or homosexual services meant for persons of both sexes considered as « disable » against payment. They are proposed by a same proportion of specially trained men and women, who are presently working for their activity to be recognized as contributing to the opening out and health of « disable » people. Having to face these new injunctions to sexual health, the various categories of social actors involved in the emotional and sexual life of persons referred to as « disable » are led to adopt a definite position regarding the numerous questions which proceed from it.

This paper proposal is based on a qualitative survey through 85 interviews held in Switzerland and in France, with people considered as « intellectually disable », their parents, professionals of education, as well as sexual assistants.

Its purpose is first to describe the representations and practices of the professionals (of educational action and of sexual assistance) and of the non professionals (the « intellectually disable » and their parents), as well as the stakes put down to them on the ground of the affective and sexual life of the persons labelled as « intellectually disable ». Then, we will show how, by taking into account the question of the sexuality of the « intellectually disable » and considering the conflicts of representations and interests opposing them, these various categories of actors build up the « intellectual disability » social object, while contributing to the production of a new sexual normativity inspired by the « sexual health » concept.

SOCIAL-PSYCHOLOGICAL CHARACTERISTICS OF FAMILY EDUCATION OF CHILDREN HAVING HEARING IMPAIRMENT

Galina Mongush

1Psychology, TUVAN STATE UNIVERSITY, Kyzyl, Russian Federation

Abstract: Currently, hearing impairment is one of the most common and difficult to treat defects, seriously complicating the normal social and psychological adaptation in society. Hearing impairment both congenital and acquired creates a peculiar problem in the family, child or adolescent peer groups, school admissions, employment, and finally into adulthood. From an early age the closest social environment of a person is his family. It is the policy of the family influences the correctness of the development of any child, especially a disabled child. E. Leonhardt notes that there are two ways of upbringing and education of deaf and hearing-impaired children. Firstly - to educate their children in institutions starting from 2 or 3 years of age. Secondly, teaching children at home by a
special technique. Children who are educated at home with proper remedial work become socially rehabilitated to preschool age. The special pre-school educational institutions have lower positive results because of early separation of children from families, lack of normal speech environment, and isolation from communication.

**DISABILITY AND SUPPORTED EMPLOYMENT IN GERMANY IN THE PERSPECTIVE OF DISABLED EMPLOYEES**

Norbert Petzold

UNIVERSITY OF BREMEN (UNIVERSITÄT BREMEN), Bremen, Germany

Abstract: Against the background of implementing new tools for the social integration of disabled people in Germany this paper presents key dimensions of labour market inclusion in the perspective of disabled employees and summarizes them into two empirically grounded types. In the course of ratifying the Disability Convention of the UN in 2008 and of enacting the Social Code IX ‘Rehabilitation and Participation of People with Disabilities’ in 2001 German disability welfare policy shifted to a new strategy of social inclusion, which promotes a social perspective on disability and a flexible normalisation of the environment. Supported Employment (Unterstützte Beschäftigung) as its mechanism of labour market inclusion should lead to work in an adapted, barrier-free working context, reduce disability, and encourage self-determination and individual responsibility of the supported employees.

The qualitative-explorative study introduced here investigated disabled participants in supported employment. It studied, on the one hand, experiences and meanings of the support activities and of disability in the working environment of the first labour market. On the other hand, it analyzed the biographical meanings of supported employment among people with learning difficulties that worked in regular companies and were supported by an integration service (Integrationsfachdienst - IFD). The focus of the analysis was the development of relevant categories and dimensions (i.e. “Everyday theory of disability”, “Reality of employment”, “Strategy to inclusion”, “Meaning of labour”), which are summed up in two empirically grounded types (i.e. “Self-Empowerment” and “Status consolidation”). The findings point to subjective (respectively subjectified) struggles between new chances for inclusion and further risks for disability and exclusion.

**DISABILITY POLICIES IN TURKEY: A CONTRADICTORY CASE IN TERMS OF POSITIVE DISCRIMINATION IN THE LABOUR MARKET**

Mine Ersoy Özcan

Sociology, MIDDLE EAST TECHNICAL UNIVERSITY, Ankara, Turkey

Abstract: The lives of people with disabilities are limited by physical and social barriers. Over the years, disability policy has been developed. After the 2nd World War, a growing awareness involved and the concepts of integration and normalization appeared. For the disabled, integration means to participate into all aspects of social, economic and cultural life. Employment is the most important mechanism for them to integrate into economic life. Governmental policies tend to emphasize establishing national regulations aimed at integrating disabled people into the labor market. However, implementation remains a stumbling block and people with disabilities continue to be underrepresented in training and employment opportunities. They are generally excluded from the labour market.

In Turkey, the 12.29% of the total population is disabled and 78.29% of it is excluded from the labor market (Turkey Disability Research, 2002). For the disabled, the low level of access and their disadvantaged position in the labour market are mainly related with the existing policies in Turkey. As the citizenship is mostly defined in terms of participating into the labor force, the unemployed disabled will not have the chance to use their social rights.

Turkey is an underdeveloped country waiting to enter to the European Union and in this sense; it regulates a disability policy to correspond the integration expectancy of the Union. The employment of disabled people and the methods used for their participation into the labor are closely related with national economy and workforce market. The logic of capitalism depends on maximizing the profit and the employers’ main aim is to accumulate their capital. There is a sharp contradiction between the needs of the state aiming to integrate with the EU and the capitalist market. The disability policy in the law level encourages the disabled to access into the labor market; however the practices build barriers to integrate. This study examines the relation of contradicting disability policy depending on positive discrimination and the practices depending on market needs in terms of social rights in Turkey.

**DISCOVERING THE RE-COVERED - THE INEVITABLY INCLUSION OF THE EXCLUDED BY MAKING THE OTHER INTO THE SAME**

Caroline Vandekinderen 1, Griet Roets 2, Michel Vandenbroeck 2

1 Centre of Inclusive Education & Disability Studies, 2 Department of Social Welfare Studies, GHENT UNIVERSITY, Ghent, Belgium

Abstract: In the context of a current PhD research project, we reflect from a critical disability studies perspective on the recovery paradigm as it gets established in mental health care. At first glance, the recovery discourse is very seductive, as it explains recovery in terms of a journey of hope: a lifelong, individual process with ups and downs in which the individual (re)integrates in the social world. Moreover, the ‘patient’ is assigned ownership of his/her life and illness and is renamed as the ‘expert’, in short, an ode to empowerment and agency. However, we interpret recovery against the framework of the neoliberal welfare state, in which individuals are respected as citizens and supported by the welfare state as long as they can participate in the game as self-governing entrepreneurs. As we will argue, this socially constructed norm of the competent and autonomous citizen is persistently at work in the recovery story, in which deviant bodies and minds are disciplined and normalized according to the norm of the managed autonomy of the individual, which is expected to deliver a demonstrable effort to integrate socially and economically in the various domains of society. To put clear, our intent is in no sense to dump the personal growth model or to denounce integration, but to expose the dynamics of the inevitably inclusion of the excluded in society through the translation of recovery in terms of making the other into the same. In fact, we want to challenge the structural processes of marginalisation which are consolidated by institutional arrangements and practices and create a residual fraction of quasi non-recycle-able people who do not fit into the recovery trail. In this article, we will discover the re-covered process of othering through the explicit and agentic positioning of Jimmy Sax, a 49
years old man labeled as a (core)psychopath, outside the dominant recovery discourse.

**SYSTEM(AT)IC EXCLUSION & INCLUSION OF DISABLED PEOPLE – VOCATIONAL REHABILITATION IN THE LIGHT OF THE SYSTEM THEORY**

Nancy Titze ¹, Stefan Zapfel ¹, Stefan Gruber ²

¹Research Department Joblessness & Social Inclusion, INSTITUTE FOR EMPLOYMENT RESEARCH, Nürnberg, Germany

Abstract: The participation of people with disabilities in society is one of the central interests of social policy. One of the most important aspects of social inclusion is the integration into the labour market since the participation on the labour market goes far beyond the sustaining of the living standard. Besides that, employment contributes to the maintenance of social networks, guarantees a constant time structure and the pursuit of conjoint goals, and brings about social appreciation and prestige.

The vocational rehabilitation aims at the integration of people with disabilities into the labour market. Concerning vocational rehabilitation there is no systematic research on exclusion and inclusion mechanisms within the different fields of society. Since there is no theoretical discussion in Germany regarding this topic, we want to push on with this.

We use the theoretical concept of System Theory established by Niklas Luhmann to identify the subsystems of society that are important for the understanding of the exclusion and inclusion mechanisms regarding vocational rehabilitation.

To understand vocational rehabilitation as a whole three levels should be taken into account. On the macro level, we argue that the economic system tends to exclude people with disabilities from some subsystems of society. As a response the political system uses the vocational rehabilitation as an instrument to compensate the exclusion from the economic system. Thus, an effective legal basis is a prerequisite for the inclusion into the labour market. Additionally on the meso level, the institutions should guarantee the implementation of statutory provisions. And finally on the micro level, the successful integration might fail due to the negative signal attached to the status "rehabili.

**HANDICAPPED STUDENTS IN AUSTRIA - MECHANISMS OF INCLUSION AND EXCLUSION AT INSTITUTIONAL AND INDIVIDUAL LEVEL**

Angela Wroblewski ³

³Sociology, INSTITUTE FOR ADVANCED STUDIES VIENNA (IHS), Vien,
na, Austria

Abstract: The situation of handicapped students at Austrian universities became a topic of political discussion after the turn of the century. This was mainly due to an increasing effort to attract interest by the representatives of handicapped students. A student survey in 2002 revealed for the first time how many students are affected and which kind of impairment they have. Furthermore it was asked which measures handicapped students would need to facilitate their every day student life. In the following several measures have been implemented to support handicapped students (e.g. concerning exam conditions, students’ assistance, and exemption of student fees). These measures are implemented at an institutional level (university) and guarantee specific rights to handicapped students. A more detailed analysis of how these measures are put into practice show that specific forms of exclusion or discrimination go hand in hand with them.

In the paper presented we will give a description of specific inclusive and exclusive effects of these regulations. Therefore we refer to two studies conducted in 2006 and 2009. The first one is based on qualitative interviews with handicapped students, the second one on an analysis of strategic documents of selected universities and interviews with members of university management and representatives of handicapped students. On the one hand we will describe the different strategies universities adopt to support handicapped students. On the other hand we will discuss – intended and unintended – effects of these measures. The analysis depicts a gap between the treatment at institutional level and the implementation in everyday practices. The practice reveals new forms of discrimination and exclusion for specific groups of handicapped students, especially students with non visible forms of impairment or students with mental health problems. It becomes evident that inclusion is only achieved in cases where measures at the institutional level are combined with measures to raise awareness among university staff in order to change the practice of applying these regulations.

**AGEING WITH A LIFELONG IMPAIRMENT: THE GREYING OF CEREBRAL PALSY**

Kevin Paterson ¹, Nick Watson ²

²Strathclyde Centre for Disability Research, UNIVERSITY OF GLASGOW, Glasgow, United Kingdom

Abstract: The Global North is gripped by a “collective angst” about the demographic “time bomb” and what will happen to us when we grow old. Such deliberations inevitably make reference to older disabled people. However, the older disabled people being referred to are predominately individuals who have acquired impairments as part of the ageing process. There is a ‘new’ and growing cohort of older disabled people: those with a lifelong impairment. They have sought to live much of their lives in the community and now find, as they age, that their existence has not been anticipated. Older people with a lifelong impairment are at risk of becoming a marginalised group of an already marginalised population - a situation exacerbated by the whirlwind of public expenditure cuts that is currently felling support structures.

The phenomenon of ageing with a lifelong impairment highlights the lack of engagement between disability studies and gerontology, and the consequential limited understanding of how the experience of a lifelong condition mediates the experience of ageing and vice versa. This paper considers this phenomenon by drawing on our research into the experiences of older people with Cerebral Palsy (CP) in Scotland. CP is viewed as a childhood and adolescent issue and adults with the condition are now demanding more analysis. This paper will present older people with CP’s perspectives on the personal, familial and social factors of ageing in order to understand how the lived experience of ageing and disability intersect, and to identify the processes that promote or hinder their social inclusion.

**DISABILITY IN TURBULENT TIMES: BETWEEN PRIVATIZATION AND POLITICIZATION OF CARE**
Céline Borelle

PACTE, Grenoble, France

Abstract: The proposal is based on a research on the trajectories of autistic children, in terms of care arrangements and problem qualification. This research consists in an ethnography of the autistic field on a local scale in France. It aims at articulating the different logics of actions in various arenas (medical, administrative, associative, school and family) that determine the child’s trajectory. This paper focuses on an issue that emerged during the research concerning the schooling of disabled children in ordinary schools. In July 2010, the local authorities realized that all the funds for 2010 dedicated to employing people helping disabled children in classes had been used up and they decided to stop renewing expired contracts. For a lot of children, it meant being sent back home. This paper shows how a political context characterized by a lack of financial resources has impacted on the decision-making arenas by questioning or revealing their logics of action and judgement. A pragmatist approach of that crisis permits to understand that it becomes the parents’ responsibility, individually or collectively, to make sure their children access their right (since 2005) to be schooled in ordinary institutions. This process of parents’ being made responsible for their child’s future results in paradoxical trends according the level of analysis. From a case analysis, we may argue that making parents responsible as individuals is notably conveyed in the medical arena and raises a major issue: the sharpening of social inequalities between children. Parents don’t have the same capacity to claim their rights, the same resources to get their child back to school or to compensate for the lack of public aid by privatizing the production of care. From the individuals’ point of view, that crisis reveals the tendency to privatize a public problem, and the changing equilibrium between State and family in social arrangements of care. But, if we consider parents as collectively organized in associations, this crisis has given place to a repoliticization of the schooling problem. It has been an opportunity to denounce the problem of lack of funds, by using media coverage and lobbying. This process found an echo in the administrative arena, as far as the experts analyzing the cases and allocating resources redefined the logic of their action in political terms: to make local authorities conscious of existing needs.

THE ACQUISITION OF A DISABILITY BY ONE OF THE SPOUSES: PROBATION PERIOD AND REDEFINITION OF MARITAL AUTONOMY.

Aurélien Berthou

cerlis, UNIVERSITY PARIS DESCARTES, Paris, France

Abstract: The objective of our contribution is to provide some answers to the consequences on marital life following the acquisition of a disability by one of the spouses. More precisely, we will question to what extent the physical disability acquired at the adulthood by one of the spouses redefines the question of the autonomy of each spouse. To answer this question little studied up to now, we will base our research on a qualitative sociological research in progress, carried out through interviews with disabled spouses, in centers of French rehabilitation as elsewhere. We will deal with two important components of autonomy which will bring into question several dimensions related to the disability (the body, intimate and conjugal life, emotion, etc.).

Firstly, we will show that the question of autonomy of partners within the couple evolves according to the stage of the trajectory of the disabled spouse vis-à-vis the experiment of disability. From the hospital to the center, then from the center with the first returns to the household to the final return, spouses are confronted each time to a redefinition of their autonomy and “good distance” in relation to the partner.

Secondly, we will show how the disabled spouse, but also the spouse who is not, has room to manoeuvre to preserve the autonomy of each one, to avoid transforming the conjugal tie into a relationship only turned toward physical assistance, and to preserve personal times and spaces.

To conclude, we will question the fact that the lack of autonomy of one of the partners is not inevitably in contradiction with the modern conjugal models and that the arrival of the disability can be a new positive impulse in the construction of the couple.

‘DISABLED NATION’ AND ‘STATES OF EXCEPTION’: DISABILITY RIGHTS IN TURBULENT TIMES

Rachel Gorman

Graduate Program in Critical Disability Studies, YORK UNIVERSITY, Toronto, Canada

Abstract: Democratic resistance unfolding across the Middle East presents us with an opportunity to examine ways in which disability rights, which have historically been articulated as charity, are rearticulated through the state in a context of World-Bank-enforced austerity. This paper is drawn from an ongoing comparative study of: US, World Bank, Cuban, and local responses to disability and disaster in Haiti; and Palestinian articulations of health and war trauma organized through UNRWA and NGOs in the West Bank and Beirut. I argue that internationalist and national liberation articulations of disability and rights exist within ‘states of exception’ (Razack, 2008) which are excluded from the rule of international law, and which are therefore not conceptualized as being under the auspices of the UNCRPD. Rather than looking to UN Conventions as rights instruments which are ineffective because there is no power to enforce them, we must look to the way they are implemented in capitalist relations of ruling. In the case of Haiti, disability appears as ‘exclusion,’ which is addressed by mobilizing poor rural women ‘caregivers’ of the disabled to perform the ‘high intensity’ and under-waged labour of salvaging land for appropriation by large-scale private agricultural and tourism interests.

Drawing on Jasbir Puar’s notion of homonationalism and Achille Mbembe’s theorization of necropolitics, Robert McRuer has called for an awareness in Disability Studies of “disabled subjects who in certain times and places are ‘targeted for life’ even as others are disabled in different ways... or targeted for death” (171). In Palestine, political struggles for material well-being, democracy, and equality include the attempts of civil society to draw attention to a population under siege—the duress of checkpoints; the psychological effects of torture; the impact of daily bombardment on children; the cutting of electricity to hospitals and essential services; the blockade of construction materials to rebuild bombed roads and buildings; and the blockade of medical supplies. Although these noted violations are about disabled people, rights claims are made in the context of the Geneva Convention, not the UNCRPD. In ‘states of exception’ created through global capitalist relations, the denial of universal human rights results in widespread disability;
and, conversely, the rights of disabled people hinge on the honouring of universal human rights.

BEYOND THE OLD/ NEW SOCIAL MOVEMENT DEBATE: REFLECTIONS ABOUT THE PORTUGUESE DISABLED PEOPLE’S MOVEMENT

Fernando Fontes¹

¹Centre for Disability Studies, School of Sociology and Social Policy, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: Until the 1960s, social movements were comprised mainly of workers’ movements, focused on class and economic issues, highly organised in trade unions and political parties and using strikes and demonstrations as their main action tactic. The 1960s and 1970s witnessed, however, an increased variety of social conflicts beyond the workforce, particularly in Europe and North America, and the subsequent emergence of numerous social movements around new ‘post-material’ issues. The emergence of these new social movements (NSMs) did not only push for a multitude of issues based on identity, but also the investment on civil society as its key location, organised in non-hierarchical structures and networks and embracing direct action and protest.

As with other social groups, the failing of disabled persons by the welfare-state made them especially active since the 1960s. This was especially true of the UK and USA, where disabled people struggled “for equality and participation on an equal footing with other citizens” (Driedger, 1989: 1). This action was made possible by the creation of the Disabled People’s Movement composed of diverse organizations of disabled people. Most current debates on the Disabled People’s Movement included the discussion of whether this is a new or an old social movement. Some authors have been arguing in favour of the former, highlighting its internationalisation, its critical evaluation of society and framing its material concerns within the struggle for an improved quality of life of disabled people, regarded as a ‘post-materialist’ value. Other authors have questioned the applicability of the label NSM to the Disabled People’s Movement due to problems of identity formation and the newness of its repertoires of political action and representation, and have suggested an additional category of social movements.

Drawing on my PhD research about social citizenship and the Disabled People’s Movement in Portugal, this paper explores the commonalities and differences evidenced by the Portuguese case in relation to other international counterparts and investigates the ways in which this case study may contribute to the theoretical dispute between old and new social movements.

INDEPENDENT LIVING POLICIES IN THE NEWS: MEDIA REPRESENTATIONS OF THE “LAW ON DEPENDENCY” IN SPAIN

Israel Rodríguez-Giralta ¹, Daniel López ², Agnès Vayreda ³, Sergi Fàbregues ⁴

¹Sociology, Goldsmiths College, UL, London, United Kingdom, ²LSTS, Vrije Universiteit, Brussels, Belgium, ³Humanities, ⁴Psychology, UOC, Barcelona, Spain

Abstract: Over the recent years, taking care of dependent people has become a central issue in the development of social policies in Western aged societies. In the case of Spain, the Spanish Government set up the so-called “Law on Dependency”, Law on the Promotion of Personal Autonomy and Treatment of Dependent Persons (Law 39/2006), as a way to cope with an increasing demand of long-term care. The aim of the law is to support the caregiving role of the families (still the main caregivers) and provide a more personalised and flexible services, such as telecare or seniors’ day-care, that enhance the autonomy of the users and the relatives. Even though the Dependency Law was one of the most popularly acclaimed initiatives of the Government in 2006, it has turned into a huge controversy with social, economic and ethical implications. The main aim of the paper is to describe which are the issues and actors that configure the public perception of the Dependency Law in the Spanish media. Is it only a struggle among the political parties? What is the role of experts and civil organisations? Are the main issues concerned with funding the domestic carework, with developing new technologies and services or with administrative disputes? What is the target of the Law? In order to answer these questions we are going to present the preliminary results of an inductive thematic analysis of arandom sample of 326 articles published by the four main Spanish newspapers covering the period 2005-2010.

STRUCTURES OF EXCLUSION: SPECIAL UNITS IN MAINSTREAM SCHOOLS IN CYPRUS

Myria Pieridou¹

¹Sociology, UNIVERSITY OF CYPRUS, Nicosia, Cyprus

Abstract: The era of inclusive education in Cyprus began through the passing of the 113(I)/99 Law, according to which disabled children are integrated in mainstream settings. One of the main provisions of the law refers to the establishment of special units (known as resource rooms) in mainstream primary schools. Designated disabled children receive education both in the special unit and the mainstream class and the rationale behind this settlement is to receive more individual tutoring and support from special teachers rather than from mainstream school teachers. Even though special units in mainstream educational settings are a common practice for educating disabled children, it shows how inclusive education is associated with the development and expansion of special classes and resource units in ordinary schools (Zoniou-Sideri and Vlachou, 2006: 390). Moreover, it demonstrates how inclusive education policies can inscribe exclusive provisions (Allan and Slee, 2001), which enable the mainstream school to remain unaltered in terms of culture and pedagogy.

Within the framework of a study entitled “The social and educational inclusion of disabled children in mainstream schools: The case of Cyprus”, non-participant observation and semi-structured interviews revealed fundamental issues regarding the functioning of the special unit. This paper aims to demonstrate the way special units operate within mainstream settings and to reveal differences amongst stakeholders’ views regarding its role and functioning. The analysis of the research findings revealed differences amongst stakeholders’ attitudes with regards to the autonomous operation of the special unit, the absence of a specific curriculum and evaluation criteria and the implementation of children’s timetable. Furthermore, the observation suggested that the spatial shifting of disabled children from the mainstream classroom into the special units had serious implications in relation to their educational and social development.

References:
Abstract:
The experience of traumatic spinal cord injury presents multifarious challenges to a previously non-disabled identity, demanding a reconstruction of the self. This often lengthy process of identity reconstruction implies several dimensions including physical, psychosocial and cultural aspects.

Socio-anthropological literature about the life course of people with spinal cord injury suggests that their experience tends to be codified by the discourse of bio-medicine which determines the construction of the new self. In addition to this theoretical assumption, periods of ongoing health complications relocate the individual in his/her role as patient, conferring a circular character to the process of self-identity reconstruction. Moreover, the sudden character of traumatic spinal cord injury adds an aspect of vulnerability that reinforces the power of biomedical structures, particularly rehabilitation services.

Vulnerability to the biomedical power is reinforced by the absence of a strongly politicized disabled people’s collective identity that could offer alternative discourses and resources to identity formation. In this context, the reconstruction of identity becomes captured by the complex network of institutions and biomedical powers which inhabit individual journeys and that fail to acknowledge the disabling role of mainstream society.

Based on the analysis of biographical accounts collected in Portugal, in this paper we will discuss the intersection of an absent politicization of disability issues with the hegemony of the biomedical discourse, as well as the effects of such junction on personal and collective processes of identity reconstruction after a traumatic spinal cord injury.

Anchored in the social model of disability, this work draws on an ongoing research project – “From spinal cord injury to social inclusion: disability as a personal and socio-political challenge” – based at the Centre for Social Studies, University of Coimbra, Portugal, and funded by the Portuguese Foundation for Science and Technology.

DISABLED VETERANS AND THE PORTUGUESE COLONIAL WAR: LIVES SCARRED BY HISTORY

Bruno Sena Martins 1, Boaventura de Sousa Santos 1, Coimbra Natércia 2

1CENTRE FOR SOCIAL STUDIES - UNIVERSITY OF COIMBRA, CENTRE FOR SOCIAL STUDIES - UNIVERSITY OF COIMBRA, 2Centro de Documentação 25 de Abril, Universidade de Coimbra, Coimbra, Portugal

Abstract: The Portuguese Colonial was fought between Portugal’s military and the nationalist movements in Portugal’s African colonies between 1961 and 1974. In spite of its length and social impact, the Colonial War has never been given a space of commemoration in the process of the democratic and post-imperial reconstruction of Portuguese society after 1974. That is why this silence about the war may be described as a constituting element of this process. From various points of view, the disabled war veterans represented the vivid expression of a collective trauma which the democratic social order has wished to forget. The silencing and marginalization which the “Disabled of the Armed Forces” have been subjected to make them privileged witnesses, by means of their accounts, for the salvation of important historical dimensions necessary for the understanding of contemporary Portugal, and by consequence, for the valorization of the Colonial War as a historical moment which has left long-lasting marks on Portuguese society.

There is a contradiction between the war veterans’ “excess of memory” (in the sense that the Colonial War has scarred their lives, minds and bodies) and the manifest silence of Portuguese society as regards such a significant conflict. Our presentation shows how the lives interrupted by the Colonial War and scarred by disability contain significant elements of marginalization and distancing in relation to Portuguese society, as a result of the dramatic encounter of these factors of disruption. From this position of “exteriority” arise two exclusion vectors which have been granted very little importance in the context of the social analysis of inequality and the mechanisms of exclusion in Portuguese society. The first vector relates to the exclusion the disabled in general and the relation of war veterans amidst the social movement of disabled people in Portugal. This perspective will nourish the idea that the compensation for the war veterans inevitably requires the creation of inclusion factors, which are also necessary for all other disabled people. The second vector, concerns the soldiers’ personal histories through social neglect suffered by upon their return to Portugal, i.e. the neglect of their accounts and about their fight for social inclusion.

TECHNOLOGICALLY MEDIATED (DIS)ABILITY

Hilje Vanderhorst Van Der Horst 1, Maartje Hoogstyns 1

1Sociology of Consumers and Households, WAGENINGEN UNIVERSITY, Wageningen, Netherlands

Abstract: Technical aids, such as walkers and prostheses, are designed to solve practical problems. Using these technologies, people are expected to overcome obstacles and try to participate as much as possible in ‘normal life’. However, the impact of such technologies is not limited to their function. These aids interfere in many complex ways in people’s daily life. They, for example, are part of the way people experience their own bodies, influence the way people deal with their social and material environment, or the way that people are looked at by others. Technical aids play a part in the construction of disabled and abled as two separate social categories and in the related mechanisms of inclusion and exclusion.

In this research we will conduct 40 biographic interviews with users of four categories of technical aids: walkers, arm prostheses, hearing devices and incontinence products. In these biographic interviews, moments of incorporation, change and abandonment of technical
aids will be focal points. In this paper we present several case studies that deepen the understanding of the complex, and often contradictory roles of technical aids in the daily lives of their users. We will, in particular, focus on the ways these technologies contribute to mechanisms of in- and exclusion and the related concept of (dis)ability.
RS 02 Dynamics and Complexity of Minority Statuses in Plural Societies

EXPANDING ACCESS TO HIGHER EDUCATION - CULTURAL BACKGROUND AND OBJECTIVE OBSTACLES OF ARAB STUDENTS IN TWO PUBLIC COLLEGES IN ISRAEL

Nitza Davidvitch 1, Dan Soen 2, Michal Kolan 3

1 Academic Development and Assessment Unit, 2 ARI'EL UNIVERSITY CENTRE, Ariel, 3 Academic Administration, Ra'ananana College, Ra'ananana, Israel

Abstract: Recent official data reveal that between 1990 and 2001 there was a 220% growth in the enrollment of Arab students in institutions of higher education in Israel. As it is, it far exceeded the total growth rate of the students' population, which stood at a mere 125%. Moreover, data also reveal that the tendency to continue studies after graduation from high school is gaining force in the Arab sector to a much larger extent than in the Jewish sector. Thus, the rate of Jewish high school graduates who enrolled in higher education institutions grew by 9.4% in real terms between 2001 and 2004, whereas the rate of the Arab graduates grew by 20.5%!

And yet, the Arab students face grave problems as they enter the higher education system. The four main problems mentioned in this respect are: First, wide and detrimental gaps between the Jewish and Arab high school system, the latter being inferior to the first. Second, serious accommodation problems faced by Arab students due to linguistic, cultural and economic problems. Third, a dire lack of support systems needed to help the Arab students in their difficulties. Fourth, Employment difficulties facing the Arab graduates.

The main research question posed and tackled by the research team in the article is what are the actual difficulties encountered by the Arab students in the two colleges studied in the research - The Academic College of Judea & Samaria (ACJS) and The Western Galilee College (WGC), and to what extent do they manage to face them successfully? The article also tries to determine whether the colleges have offered Arab students options that are unavailable to them in the country’s universities. In other words, the article focuses on the question of equal opportunities and bridging the gap between Arab students and their Jewish counterparts.

INCLUDED AND EXCLUDED. POLISH MIGRANTS IN ICELAND ENTANGLED IN THE NETWORK OF TRANSTNATIONAL INTERGENERATIONAL COMMITMENTS

Łukasz Krzyzowski 1

1 Sociology and Social Anthropology, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: Poland is a country characterized by the fact that there are still many people leaving it for some reasons (despite the increasing number of immigrants) and where the process of social ageing is undergoing intensification, like almost everywhere else in the world. Both processes are altering the form of intergenerational relations.

The aim of the following paper is to present the results of the field work (participant observation, focus interviews, Internet survey) conducted in Iceland in three months. I strive to deal with the issues pertaining to how intergenerational relations change due to crossing of nation state borders. I am interested in the specific group of migrants that while being ‘excluded’ in recipient society (Iceland) simultaneously occupy high position in their sending society (Poland).

The main conclusion of the research is that the differences in perceiving migrants mainly result from quite distinct ‘care giving cultures’ pertaining to the categories of dependants (mainly children and the elderly) in Poland and Iceland. This ‘disaccord’ of migrants, the fact that they are perceived as socially excluded in Iceland, is among others the outcome of not being acquainted with migration strategies of Polish migrants. The main goal of these strategies is to fulfill family commitments and ensure proper level of living to one’s wards (‘the young’ and ‘the elderly’), even at the expense of one’s quality of life. There is certain ambivalence, consisting in simultaneous inclusive (pertaining to society of origin) and exclusive (pertaining to recipient society) character of transnational family commitments, present in the mechanisms of fulfilling socially constructed expectations and intergenerational commitments.

THE ASYLUM-SEEKING AND REFUGEE CHILDREN IN POLAND AND THEIR STATUS IN THE POLISH SOCIETY

Katarzyna Nagorny 1

1 European Studies, SILESIAN SCHOOL OF MANAGEMENT, Katowice, Poland

Abstract: Many reasons for migration might be found, however, it seems to me that migration of children is always forced. Nobody asks their child “do you want to move to another country? another place?” There is, of course, nothing striking in that situation, as it is usually a parent who decides what is proper for the minor. But when it comes to the state of asylum-seekers, the situation of granting asylum to a child, when the children’s rights are involved, the whole case becomes much more complicated. Some researchers claim that “children can have their own reasons for being granted asylum” [U. Bjornberg].

The researchers from EU countries [e.g. K. Vitus, H. Lidén, C. Gine, M.L. Seeberg] prove that the discourse about the status of minor asylum-seekers and refugees is mostly the discourse “between” two policy frameworks: asylum policy on the one hand and children’s rights and protection on the other. There are two linked issues in the case: the status of a child and the status of an asylum-seeker/ refugee in a particular culture. The society (culture?) decides how “the strange” child should be positioned.

The paper presented will draw on my research as a PhD candidate [sociological analysis, ethnography, official documents and references [literature]. In the paper I will present the preliminary find-
ings and try to outline some aspects of the status of asylum-seeking and refugee children[1] in Poland.

[1]In Poland a foreigner may be granted a protection by means of granting refugee status, granting political asylum, granting a permit for tolerated stay or granting temporary protection. I am aware of the difference between the above mentioned statuses. My PhD research concerns the children living in refugee camps placed in Poland and all kinds of statuses may be granted to children who stay in refugee camps.

A QUESTION OF IDENTITY: ON THE ISRAELI IDENTITY OF ARAB AND JEWISH STUDENTS ON TWO CAMPUSES

Dan Soen 1, Nitza Davidovitch 2, Michal Kolan 3
1Dual Major Dept. & Dept. of Sociology & Anthropolo, 2Academic Development and Assessment Unit, ARI’EL UNIVERSITY CENTRE, Ariel, 3Academic Administration, Ra’anana College, Ra’anana, Israel

Abstract: Israelis a bi-national society (with a 76% Jewish majority and a 20% Arab minority) immersed in a conflict. The Arab-Jewish conflict termed “an intractable conflict” by some researchers evolved from what were grasped as mutually exclusive national conflicts. The conflict is grounded in a political and social power struggle over self-determination. It has been ostensibly accompanied by a psychological process, which defined the dispute as a zero-sum situation. All in all, this concept enhanced the construction of societal emotions, perceptions and attitudes towards the self as well as the “other” that warranted coping with the situation through the use of radical measures. Othering, marginalizing, excluding and stigmatizing are typical of the majority-minority group relations. Enhancing real pluralism, inclusion and a real sense of common citizenship is recognized as a complex problem.

The paper (based on field research) tries to examine whether any difference exists in the sense of Israelianness of Arab and Jewish students on two campuses of higher education in Israel. The main focus of the paper is the Arab students. The point of departure of the research team was that the Israeli Arab citizens feel divided between their (Arab) nation and (Israeli) State. Analysis of the participants’ responses to the questions posed to them points to a series of interesting findings. Of foremost importance is the fact that the Israeli identity component in the overall aggregate identity of the Arab students is significantly smaller than that of their Jewish colleagues. Yet, this sense of Israeliness is nevertheless deeper than the one revealed formerly in similar studies on other campuses. A favourable surprise is to be seen in the fact that differences in the Israeli identity between Arab and Jewish students do exist, however, they are not dramatic.

Two other findings of the study are important. First, the level of Israeli identity among Jewish students was found to be significantly lower than that indicated forty years ago among Jewish high school students in Tel-Aviv. Second, a significant minority among the Jewish students states that the term “Israel” is altogether inappropriate to describe their sense of identity. Which raises a very interesting question.

REFUGEES’ IDENTITY CONSTRUCTION PROCESSES: AMBIGUITIES AND PARADOXES

Marie Schneider 1, Helmut Willems 1

Abstract: As the numbers of refugees around the globe rise, most western countries have developed a multitude of regulations and policy strategies dealing with the legal and illegal inflows of people (Schengen agreement, The Hague Programme). When refugees arrive in their host societies they do not instantly become part of these. They have to go through legal asylum procedures where, by the presentation of their displacement and persecution, they have to earn the right to stay. For most refugees the asylum procedures can last years and do not end satisfactory as most claims get rejected.

Therefore refugees do not only have to cope with the loss of their former life, but also with the fact that they have to live in and develop future perspectives in host societies who create a sense of distrust and disbelief. In this regard identity construction processes are always interrelated with the development and conversion of integration strategies. These two dimensions will be placed in the center of your presentation.

Its national context is the Grand-Duchy of Luxembourg. More than 45% of its inhabitants do not have the Luxembourgish nationality; more than 50% have a migration background. Among the immigrant population refugees represent the smallest number but have to deal with very high personal consequences if they fail to get asylum.

In our presentation we first set the theoretical frame by presenting relevant sociological and social psychological identity concepts. With these we will point out important dimensions of interest for the empirical capturing of refugees’ identity construction processes. Next we present the results of a qualitative empirical study carried out with refugees living in Luxembourg. The study focused the interconnections between identity construction processes and the development integration strategies. At last we will summarize important starting points for further empirical investigations concerning refugees’ identity construction processes and integration strategies.

THE IDENTITY DISCOURSES ABOUT THE NATION AMONG HUNGARIAN MINORITY FROM ROMANIA

Valer Veres 1

1Sociology, BABES-BOLYAI UNIVERSITY, Cluj-Napoca, Romania

Abstract: The present paper analyzes the identification patterns and ideological discourses about the majority and minority national community from Romania among the Transylvanian Hungarians from Romania. The first aim is to identify how it reflect the mobilization’s (ambivalent) policy coming from Hungary in relation with the “unity” of the Hungarian ethnocultural nation. Secondly, we also aim to understand how citizenship and the relationship towards the Romanian state is framed and reflected in the ethnonational identity discourses of Hungarian minority community members from Romania. Also we are interested if this is affecting majority–minority relations and patterns. According to our hypothesis it can be noticed a kind of de-territorialization of national culture: to be Hungarian is disconnected from the affectual ties with Hungary.

The empirical data sources are: (1) sociological survey (Karpat Panel), realised on an aleatory sample with 900 cases, selected from the Hungarian speaking population from Romania, (2) focus group
interviews (12) selected from the same population like the survey, according to age, sex and educational level.

According to the survey results members of the Hungarian minority community in Romania, mostly share the representation about the existence and symbolical membership of the Hungarian ethnocultural nation in transborder sense. A significant part of the respondents also identify themselves with the Romanian civic nation, even if the formulation and the criteria of the notion of civic nation are not clear and coherent in Romania.

Based on the focus group answers, two marked national discourses may be formed about the representations of Hungarians from Transylvania regarding the nation and national belonging.

The two main discourses: essentialist-radical, quasi-primordial, moderate. Conceptually, discourses follow the typology of Geertz’s (1973) national ideological discourse, but this may only be done partly, because Geertz’s primordialist discourse follows mainly the characteristics of the civic nation ideology, while in our case we can talk about a quasi-primordialist discourse which is also based on cultural nation, but it has a civic nation extension towards Romanians. That is why we call it quasi-primordialist, in other words ...moderate°".

JUSTICES COMMUNAUTAIRES, JUSTICE ÉTATIQUE ET TRIBULATIONS IDENTITAIRES AU LIBAN

Samer Ghamroun¹

¹ISP, ENS Cachan, Paris, France

Abstract: Le droit et la justice de la famille au Liban aujourd’hui constituent un ensemble hétérogène d’institutions, d’acteurs et de pratiques en grande partie hérité de l’Empire ottoman, et consolidé sous le mandat français (1920-1943) et l’État libanais indépendant (1943-aujourd’hui). Les communautés religieuses libanaises, qui cohabitent dans le cadre d’un système politique consociatif pluriconnunautaire, bénéficient ainsi d’une autonomie juridique et juridictionnelle par rapport à l’État dans toutes les questions relevant du «statut personnel». Chacune des dix-huit communautés reconnues par l’État produit et applique ses propres normes juridiques dans le cadre de ses propres tribunaux, dans les affaires de mariage, de filiation, de succession (avec certaines exceptions) etc., et chaque citoyen libanais est soumis dès sa naissance à l’un de ces systèmes juridiques en fonction de son appartenance communautaire, indépendamment de ses croyances effectives.

LE STATUT DES MINORITÉS TAMOULE, RODRIGUAISE ET CHAGOSIENNE À MAURICE : USAGES SOCIAUX DU MULTICULTURALISME ET DISCRIMINATION

Jean-Luc Alber¹

¹HEVS, UNIVERSITY OF APPLIED SCIENCES WESTERN SWITZERLAND, Sion, Switzerland

La minorité ethnique tamoule, qui compte moins de 70 000 membres, est l’une d’entre elles. Chevauchant la frontière de l’hindouisme et du christianisme, fixée émblématiquement à une langue ancestrale parlée par un nombre infime de personnes qui l’appris comme langue étrangère, elle affirme avec force son identité dans l’espace public mauricien.

Le statut de la minorité tamoule est-il mal assuré ? Les avertissements réitérés des militants ethnoculturels tamouls brandissent à l’envi deux « dangers » : 1) Le risque d’être absorbés dans une entité indo-mauricienne indifférenciée suite à une perte des spécificités culturelles qui les distinguent des descendants des immigrants venus du Nord de l’Inde, de loin plus nombreux. 2) Leur disparition, via la conversion, au sein de la population chrétienne. Ils réclament de la sorte plus de moyens de la part de l’État qu’ils accusent de les défavoriser.

L’État mauricien veille à garantir une répartition des ressources qui assurent la cohésion nationale. Cette logique distributive peut donner lieu à des pratiques de nature discriminatoire à l’égard des Tamouls comme à l’encontre des membres des autres minorités. Nous verrons que les Tamouls ne sont pas les plus mal lotis en comparaison des Rodriguais et des Chagossiens, citoyens mauriciens certainement les plus victimes de discrimination, qui ne disposent pas de moyens équivalents pour tirer parti du mauricianisme pluri-culturel.

PUTTING PORTUGAL BACK ON THE MAP. THIRD WAY OR DEPOLITISATION OF DIFFERENCE?

Nuno Castro Oliveira¹
1CIES, ISCTE-IUL, Lisbon, Portugal

Abstract: Recently the thesis of the two models of national incorporation of migrants and ethnic minorities has undergone some serious revision. According to this thesis, in the European space, England and France represented two contrasting models for dealing with migrants and minorities. Whilst the former was supposedly more multicultural taking ethnic minorities diversity into account in public policies, the latter was civic republican with the focus on the individual and shying away from group representation in the public sphere. It has been argued that this distinction – between a multicultural and an assimilationist model - is no longer tenable and that both countries present more complex features than what this duality makes apparent. It might be said that such fuzziness ensued in part from a radical critic of multiculturalism that mounted significantly after the terrorist attacks, but in a reverse movement, in the case of France, the unaltering republican model has undergone some adjustments towards the recognition of ethnic minorities and migrants. Complexity seems to makes its way into this duality when we try to classify countries like Portugal or Spain. Neither sit well with this opposition. In the case of Portugal, public and political discourses have offered a new version for models of migrant incorporation, one that is often called a “Third Way”. I raise the question whether we are dealing with an actual “Third way” or with a piecemeal refashioning of some of the features of the two old models. In order to do that I offer an overview of institutional building, public policies and the emergence of interculturalism as a state sponsored ideology for the cosmopolitan imaginary of the city and its cultural heterogeneity.
RS 03 East and West in Europe: Two Decades of Transformations

BALTIC CAPITALISM(S) IN INTERNATIONAL COMPARISON

Zenonas Norkus

Abstract: The paper will focus on the question what kind of capitalism was in making in the Baltic states during the two decades of post-communist transformation? In pursuit of answers, the architecture of their economic institutions will be compared with that of advanced Western countries and other countries of post-communist world. While ideal types of liberal market capitalism and strategically coordinated capitalism from VoC can be usefully applied to part of post-communist world, they must be supplemented with the ideas of world systemic analysis to get the picture where Baltic states are and where they are moving. Among all post-communist countries, Baltic states most closely approximate the ideal type of liberal market capitalism, and Estonia is its most clear-cut case. As Baltic states still not are on the technological frontier, where sole source of economic growth is genuine innovation, they still do not belong to capitalist core. However, differences in institutional framework or its coherence may matter for varying absorption capacity in technology transfer and the use of the ‘advantages of underdevelopment’. Although Baltic countries by the end of Soviet time were on the same social–economic level, Estonia’s joining European Monetary Union in 2011 marked the emergence of a gap between Northern (Estonia) and Southern (Latvia and Lithuania) Baltic that was in making during post-communist decades. While Estonia seems to represent semi-core world systemic variety of liberal capitalism, Latvia and Lithuania stand for its semi-peripheric kin. The typological analysis Baltic capitalism is closed by the inquiry about the causes of the inter-Baltic differences, taking into account both background conditions and agency-related factors.

EUROPEAN EAST AND WEST: CORE AND PERIPHERY 20 YEARS LATER

Borut Roncevic

Abstract: One of the key questions, emerging in the context of recent enlargements of the EU with a number of post-socialist East European countries is whether it is realistic to expect that the new EU member states – or at least some of them – will be able to become part of developmental core, i.e. the group of the most developed European countries. In trying to answer we test two hypotheses. First, we can identify a set of socio-cultural factors, which are necessary and sufficient conditions of developmental performance. Secondly, these socio-cultural factors and causal relations have a very stable structure. Hence, any policy aiming to enhance developmental performance has to fulfill two criteria. Firstly, it has to aim at changing these basic socio-cultural conditions. Secondly, it has to employ long-term orientation. Unlike most economic approaches, based on extrapolation of past and current trends, we are trying to identify the existence of necessary and sufficient conditions of developmental performance and test their causal structure by applying fuzzy-set analysis. Our analysis is based on a vast set of qualitative and quantitative data from years 2000 and 2010.

PERCEPTION OF EUROPEAN INTEGRATION IN CENTRAL AND EAST EUROPEAN COUNTRIES

Borbala Goncz

Abstract: The perception of the European integration process has been researched since the 1970s – several studies have been conducted focusing on the logics behind the attitudes towards the integration process. The European Union is an abstract and distant bureaucratic construct about which people lack information and interest. In order to form an opinion about it people often turn to proxies. An obvious proxy can be the domestic political/ economic arena.

In general, countries of Central and Eastern Europe lag behind their Western counterparts not only in terms of economic development and the level of social spending, but also in terms of satisfaction with their country’s economic and political performance, institutional trust and political activity. On the other hand, average support for the European integration process is often higher in these countries[1]. Is this higher level of support explained by a wish for a more integrated society or is it driven by a mere utilitarian attitude focusing on economic development only? Or is the question of European integration so distant and meaningless, that attitudes in this matter is a mere reproduction of attitudes towards current domestic political and economic situation?

Departing from the theories on social and system integration (e.g. David Lockwood) I suppose that the level of integration of a society determines how people perceive the European integration project. As measures of social and system integration I take into account institutional trust, satisfaction with the political and economic performance of the country together with macro measures of economic performance. As both individual and country level factors are taken into account multilevel regression is used. The analysis is carried out on European Social Survey (ESS) data collected in 2008 including nine EU member states of Central and Eastern Europe with comparison to West-European countries at some points[2].

[1] Based on the following question: “Now thinking about the European Union, some say European unification should go further. Others say it has already gone too far. Using this card, what number on the scale best describes your position?”

[2] The countries included are: Bulgaria (BG), Czech Republic (CZ), Estonia (EE), Hungary (HU), Latvia (LV), Poland (PL), Romania (RO), Slovenia (SI), Slovakia (SK).
POST-CRISIS EUROPEAN LANDSCAPE: IS THE EAST-WEST DIVISION BECOMING IRRELEVANT?

Marju Lauristin¹, Peeter Vihelemm¹

¹Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

Abstract: In the presentation we at first analyse new divisions among the EU member states, which are emerging in the post-crisis situation. When before the crisis it was taken for granted that the new EU members represent weaker economies and the forecasts about their coping with economic recession had been rather grim, the post-crisis landscape of Europe looks different from those forecasts. In the second half of our presentation we will present sociological reflection on the reasons why the post-communist part of Europe could manage with the crisis better that it was expected. Our special attention is related to the post-transition mentality, and to the relations between society and nation state. For the analysis we use data from Eurostat and Eurobarometer, also from national surveys.

Tatjana Sekulic¹

¹DEPARTMENT OF SOCIOLOGY AND SOCIAL RESEARCH, UNIVERSITY OF MILAN-BICOCCA, Milan, Italy

Abstract: The topic of the paper regards the European integration process and its present and possible future patterns and consequences, that sometimes appear unexpected and controversial. Particular attention is dedicated to the institutional process of the EU enlargement, especially over the “iron curtain”, to the post-communist states, that are still facing the difficulties of transition and democratic consolidation. The aim of the paper is to present the first results of the research on the enlargement of the EU to the ‘Western Balkans’ countries: candidates (Croatia, FYROM; Montenegro) and potential candidates for the membership (Albania, Bosnia Herzegovina, Kosovo, Serbia). It is focused on two aspects of this process: first on institutional framework and barriers to the accession, and second, on the analysis of how different actors from both sides, committed directly into the negotiations, perceive dynamics and difficulties of the process itself. The former is concerned with the analysis of the EU policies regarding prerequisites and conditions of the accession, indispensable to enter the procedure of the acquisition of the full EU citizenship and also, not less important, with the inner dynamics of every single state that was taken in exam, where the positive or negative support to the EU integration has become a strong constitutive element of different political orientations. The latter was approached by the in-depth interviews with a number of ‘privileged testimonies’ from different social parts (representatives of the European Commission Office for the Integration in Brussels; representatives of the European Commission Delegation in each Western Balkan country; representatives of other international organisations committed in the integration process; official members of the negotiation teams on local level; members of the WB State Missions in Brussels; relevant intellectuals and representatives of the NGO sector in all involved countries), made in the period from October 2009 to February 2011.

*This study is a part of the interdisciplinary research project “Political imagination of the West. European Union as an area of opportunities or as a fortress?”, financed by the Italian Ministry of Education, Research and University (PRIN 2007)

IS THE BRIDGE COLLAPSING? TURKEY’S RECENT EXAMINATION OF ITS RELATIONSHIP TO THE WESTERN WORLD

Kayhan Delibas¹

¹SOCIOMETRO, ADNAN MENDERES UNIVERSITESI, Aydin, Turkey

Abstract: Turkey, as it is often acknowledged, is a ‘bridge’ between East and West. Due to its geographical position and membership of NATO, Turkey did play a significant role during the Cold War years, especially in the military sphere. This strategic role has dramatically increased with the tragic events of 11/9. In this sense Turkey’s standing in world politics perceived as much more critical for the survival of democracy, peace and security in the world’s most troubled regions. For many Turkey has the potential of becoming a role model for the rest of the Muslim world. But recently that role, hoped for by many in the west, has increasingly been considered as “problematic” by many within Turkey itself. Turkey’s historic strong ties and emotions toward the West have been undergoing major changes.

There are various explanations and theories for Turkey’s recent re-examination of its attitudes toward the western world. For some observers Turkey is turning its back to western world to lead the East. For others the ruling AK Party is returning to its Islamic roots and using the incidences like Mavi Marmara, Gaza war, or blockade as a political leverage to re-Islamise the country. There are various other explanations or theories too. This paper aims to analyse the current political crisis and seismic shifts Turkey experiencing since 2002 from a socio-cultural and political perspective. Various explanations and concerns will be examined. It can be said that no of these major political changes can be justified or explained on the bases of external factors or international developments. All these changes must be reflecting one way to another, wider socio-political and cultural concerns or shifts in Turkish society. This paper will draw upon the author’s fieldwork on the recent anxieties about Turkey’s shifting foreign policies, citizen’s attitudes, perceptions and expectations in relation with the EU and US in Aydin-Turkey.

POLITICAL CULTURE-RELATED EFFECTS OF UNCERTAINTY IN A RISK SOCIETY: ATTITUDES TOWARDS EU MEMBERSHIP IN BULGARIA

Manuel Roblizo¹

¹Area of Sociology, UNIVERSIDAD DE CASTILLA-LA MANCHA, Albacete, Spain

Abstract: Basically, the sense of this paper lies in analyzing Bulgarian population’s perceptions about their country’s integration in European Union. Bulgarian case will be approached as a highly significant instance of the effects of never-ending social uncertainty in population attitudes. The analysis is based on the conceptual foundation provided by risk society analyses, primarily carried out by Ulrich Beck and, in a complementary manner –though basically coinciding in their main lines-, by Bulgarian sociologist Nikolai Genov, Phil Macnaghten and John Urry; as an additional significant
aspect, the paper will turn to Bulgarian citizens’ political culture – forged through country contemporary history- as an explanatory ingredient of prevalent values. In the general context of expectations and perceptions of those countries that have joined UE in the last years –mainly post communist societies from Eastern Europe-, living conditions and, subsequently, economic factor, have a particular relevance. We can notice how factors influencing public opinion show in Bulgaria some particularly marked traits, with a particularly low level of trust on country’s institutions and, at the same time, particularly high on EU ones. All of this is the result of the peculiarities that have characterized the development of this people in recent times, and they remit always to the aforesaid theoretical proposals. Both correlation and regression analyses will be offered as a means to check the interrelation existing among relevant aspects of Bulgarian public opinion, and the causation that some of them exert on basic attitudes –particular in relation to political institutions.

AN ‘OSSI’ BY NAME? – GIVEN NAMES IN DIVIDED GERMANY AND 20 YEARS AFTER REUNIFICATION
Anja Bruhn1, Denis Huschka1,2,3, Gert G. Wagner2,4,5,6
1German Data Forum, 2SOEP, DIW Berlin, Berlin, Germany, 3ISER, Rhodes University, Grahamstown, South Africa, 4Economics, Berlin University of Technology (TUB), 5Max Planck Institute for Human Development (MPIB), 6DIW Graduate Center and Max Planck Research School LIFE, Berlin, Germany

Abstract: This study employs given names as indicators of regional and social origin with a focus on the developments in naming after German reunification. Do the differences in naming, which Huschka, Gerhards and Wagner (2009) demonstrated between the two German states, persist in former Eastern and Western Germany even 20 years after reunification (the so-called “Wende”)?

While the statistical concentration of names in both German states was similar until 1990, significant differences in the parents’ taste arose over time. The given names did not differ significantly, but certain names reached quite different levels of popularity in the two German states. We aim at delivering valid empirical evidence of naming practice in Germany and interprete changes in naming as indicators for social change. In contrast, obvious differences in naming within one country along the border of former seperation are regarded as signs of intergenerational heredity. Therefore, names in terms of “nomen est omen” are an area of importance when analyzing East-West relations, especially in regard to the effects of social backgrounds.

The given names will be systematically analysed by origin in both former parts of Germany. As a result, it will be shown that naming has not been properly taken into account as an aspect of everyday practices in the sociological research on East-West relations in the course of transformation.

The database is the German socio-economic panel study (SOEP), a representative dataset of more than 50,000 persons, which contains given names as well as detailed information on socio-economic backgrounds and the parents.

Basic keywords of the Abstract: given names, social change, everyday Life changes, Germany, East-West relation, social consequences of transformations

THE FRACTAL NATURE OF THE EUROPEAN EAST AS A CHALLENGE FOR CRITICAL THEORY
Tomasz Zarycki1
1Institute for Social Studies, University of Warsaw, Warszawa, Poland

Abstract: The paper will present selected results of my current research on the role of regional elites in the production of discourses on identity in regions of Eastern Poland. These elite strategies on regional level will be compared to elite strategies on the national level in Poland. In particular I will focus on affinities in nature of elite discourses, in particular those directed towards “Western” audiences, on regional and national level. In these discourses ways of dealing with elites’ own “Eastness” will be interpreted with special emphasis on the strategy of using local and external significant others as underdogs. As I will argue, these discourse may be seen as demonizing lower status groups. Such attempts may be interpreted as overt or unconscious attempt at passing down the Eastern stigma on others. Thus the lower status inhabitants of the “East” of different scales may be seen as being accused more or less reflectively of such “sins” as dangerous populism, radical nationalism, extreme religious traditionalism and other fundamentalisms. The elite discourses often frame the lower status inhabitants of East in psychological language, with mentality, in particular the post-Soviet mentality as their key traits. Consequently other questions could be asked in this context, in particular to what extent these discursive strategies serve the local elites’ interests by legitimizing their privileged status. Additionally, one can ask if they may be also seen as unintended tools of naturalization of economic inequalities. These questions will serve as a point of departure for a wider reflection on challenges of application of the critical social theory in reference to Eastern Europe and its regions. In such context I will offer my reflection on such questions as to what extent critical interpretations of social relations in these regions can be based solely on local elite discourses and without taking into account of the wider context of international symbolic, political and economic power relations between East/s and West/s. I will also ask whether notions and ideals of the Western critical theory may appear in some contexts as tools of legitimization elite’s interests. However, as I will elaborate in the paper, we may also ask if the local and regional elites can be seen as victims, although not only of the processes and groups they point out themselves as their main opponents and source of all kinds of threats.

THE POST-COMMUNIST MAKING OF THE COMMUNIST: POST-COMMUNIST SOCIAL ORDER AND POWER RELATIONS IN THE NARRATIVES OF THOSE LABELLED AS COMMUNISTS
Vaida Obelene1
1UPPSALA CENTRE FOR RUSSIAN AND EURASIAN STUDIES, UPPSALA UNIVERSITY, Uppsala, Sweden

Abstract: The paper explores the meanings of the label of ‘Communist (functionary)’ within biographical interviews with former communist functionaries and supposed bearers of the very label in the two post-Soviet contexts of Lithuania and Belarus. Social labels conveying negative association and stereotypes are basic mechanisms of power and social order. The notion of ‘Communist (functionary)’ is such a label that continues to evolve conceptually in the post-Communist context of social interaction and institutional or-
der. The questions under discussion are: how is this label a metaphor of variety and complexity of social arrangements and social change; and how does it convey the multitude of relations that people pursue in society?

In a first step the paper characterizes being a (former) communist as a deviant condition during both perestroika and post-communism. It then describes how the experience of being labelled a ‘communist’ is recounted, and in particular, how the dilemma represented in having been a communist functionary in the past is managed. The paper explores what kind of complex yet functional structure of social relations the label ‘communist’ conveys, and how beliefs, values and power relationships are nested in it. In this context it reconstructs how those people labelled as communists understand the concept, what meanings they attribute to the label, and what contrasts between the conceptions of the labelled and the labellers are presented, and how. Finally, the paper explicates how the label assumes convergent and contrasting meanings in the narratives of the labelled, and how the interviews from these two post-Soviet societies - one of them may be characterized in terms of anti-communist, and the other in terms of pro-communist beliefs - help to unveil the complexity inherent in post-communist social change.

THE REUNIFICATION AND THE BACKSTAGE OF THE CONSTRUCTION OF OTHERNESS IN BERLIN

Marie Luce Hocquet

Abstract: This presentation aims at investigating the outlines of social relations which are taking shape in Berlin 20 years after the fall of the Wall. The process of reunification has implied the assimilation of the GDR by the FRG, namely the disappearance of a State and of its political, economical, social and cultural structures. In this context, ex-citizens of GDR are supposed to adopt the ways of thinking and the ways of doing inherent to capitalism. This conversion is sometimes expressed in terms of change of mentality and hardly leaves place to the recognition of an East German identity.

By basing us on an ethnographical research led in the German capital between 2006 and 2009, we propose to deal with the question of the production of the otherness as a consecutive process to the reunification of a city and a population having been separated for about forty years. Starting from the point of view of our informants, we will analyse the confrontation between communist and capitalist value systems, the formation of stereotypes which stigmatize the East Germans, but also the West Germans, by fixing mentalities and behaviour perceived as a natural resultant of the socialization under a communist or liberal regime. We shall see to what extent these stereotypes are interiorized and which resource they constitute for the East and West Berliner in terms of “resistance” or “leverage”. At the same time, we will try to find what remains of the main master narratives of both Germany within the autobiographical narratives that have been collected. Finally, we will examine closely speeches related to the identity in order to determine how a common feeling of “us”, including the East and West Berliners (and beyond, East and West Germans), could be established at the heart of the Republic of Berlin.

ETHNIC IDENTITIES IN SOCIETAL TRANSFORMATIONS: RUSSIANS INTERPRETING THEIR ETHNICITY IN ESTONIA, RUSSIA AND KAZAKHSTAN

Trin Vihelemm, Cynthia Kaplan

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia, 2Dept. of Political Science, University of California, Santa Barbara, United States

Abstract: The paper focuses on questions of ethnic collective identity among Russians living in their homeland and in neighbouring nation states both in the East and West, which have (re)gained their sovereignty with the dissolution of Soviet Union. The analysis is based on rich qualitative data collected from Estonia, Kazakhstan and from different places in the Russian Federation - cities of Moscow and Penza and Tatarstan Republic. Variations and similarities in the representation of ethnicity will be explored, especially the role of religion, language and collective memory (important historic events). Russians living in Estonia have experienced quick political and economic transformation plus have had to cope with the state’s linguistic requirements and liberal integration ideology. Russians living in Kazakhstan and Tatarstan have also experienced the “national awakening” of titular groups, but without language requirements. The religious differentiation between Christian and Muslim also is likely to influence the identity construction of Russians living in Kazakhstan and Tatarstan. The analysis will also focus on similar constructions shared among Russians from different locations and their local ethnic counter-parts as a reflection of Soviet experience.

POLITICAL DISCOURSE OF CIVILIZATIONAL IDENTITY IN CONTEMPORARY RUSSIA

Yulia Prozorova

1SOCIOLOGICAL INSTITUTE OF RAS, St. Petersburg, Russian Federation

Abstract: The paper focuses on the analysis of the concept of Russia’s CI and its representations in the political discourse of post-Soviet Russia. Historically, the West and the East, Europe and Asia have always constituted the system of coordinates in which Russia have searched for its civilizational identity (CI). Discourses of CI have always been relational ones: from the assertion of integration into the orbit of the Western civilization (Westernism), the assertion of the hybrid nature of the Russian civilization (Eurasianism) to the proclamation of its original essence and the opposition to the West and the East (Slavophiles). The USSR, considered as a specific civilizational project, determined itself through the aggressive opposition to the Western world. After its collapse, the concept of civilization and CI enjoyed a renaissance in Russia. The pro-western civilizational discourse was revitalized, the West was now considered as an avant-garde of progress and civilization and the universalistic view of civilization began to dominate. However, with the changes in the political environment the discourse invoked the idea of Russia’s civilizational originality with its own historical path while opposing the idea of the Western civilization’s universality and its monopolist claims for the export of civilization. The concept of CI is used to indicate borders of affiliation, to evaluate and differentiate actors and actions (J.O’Hagan) and to define one’s position against the others. The representations of CI correspond to political intentions. Discourse, particularly the political discourse, plays an immense role in the construction of CI. The article focuses on the con-
structivist approach to CI, within which the singular-universalist and plural-particularistic civilizational dimensions can be found. These dimensions are represented in the conceptions of Westernists, Slavophiles and Eurasianists. Westernism is associated with the singular-universalist approach (the West-Europe sets the civilizational standards) and the discourse in terms of “civilization vs. barbarianism”. The pluralistic and particularistic approaches are represented in Slavophilia, Pan-Slavism and Eurasianism. These frames constitute the basic repertoire of Russian CI representations with its references to the West/Europe and the East/Asia which have been actualized in different periods.

RELIGIOSITY IN POST-COMMUNIST COUNTRIES – THE POLISH CASE

Mirosława Grabowska¹

¹The Institute of Sociology, UNIVERSITY OF WARSAW, Warszawa, Poland

Abstract: Religiosity is a very complex phenomenon, conditioned by a whole structure of factors, and has far reaching consequences. The paper addresses three questions concerning religiosity:

1. Historical conditions, i.e. long lasting factors and the impact of the communist system.
3. The impact of civilizational and cultural factors of late modernity on religiosity.

In post-communist countries the historical conditions were highly differentiated, but the influences of the communist system were rather uniform. But in these countries the effectiveness of destructive power of the communist system differed – it depended on the local historical and social conditions: it was much easier to confine further the catholic Church in the already secular Czechoslovakia than in the traditional catholic Poland.

After 1989 post-communist countries developed church-state relations under a complicated set of conditions: traditions and the strength of religious commitments in a given country, the institutional power of churches (which was in part a result of their attitudes under communism) and particular political trends. All that resulted in a whole set of institutional patterns, which in turn begin to exert an influence on societies. Of course, established institutional patterns were and still are the object of critique and change over time.

In addition, one has to include factors characteristic of late modernity. At least two such factors have to be named: tendency to metaphorise religion (D. Hervieu-Léger’s conception) and the systematic weakening of the consequential dimension of religiosity (this observation is rooted in secularization theories and widely accepted).

The above will serve as a framework for the analysis of Polish religiosity at the beginning of XXI century including a comparison with selected post-communist countries.

THE CHANGE OF SOCIAL IDENTIFICATIONS 1998-2010. THE MODERNIZATION OF POLAND REFLECTED IN PEOPLES’ SELF-CATEGORIZATIONS.

Krzysztof Kosela¹

¹INSTITUTE OF SOCIOLOGY, UNIVERSITY OF WARSAW, WARSAW, Poland

Abstract: The special quantitative procedure has been used in four-year intervals to measure the social identifications of adult Poland’s inhabitants. Social self-identifications were to be chosen as valid for respondents and sorted in standardized way to ascertain their prevalence for a person. The aim was to try out whether the unquestionable modernization of Polish economy is accompanied with some revision of loyalties to various groups and communities. The questionnaire studies replicated in 1996, 2002, 2006 and 2010 have revealed considerable extent of stability of commitment, however some trends are also detectable pertaining to familial, civic, national and religious self-identifications. Peoples’ identities seem to catch up with transformation of economy and other areas of social life. The pattern of identities alteration will be reaveal. One possibility is that many age group transform their allegiances in some extent, the other option is that youngest age groups bring in their new selfcategorizations and group loyalties. The later state of affairs will inflame generation conflicts. Some wider comparisons with the Polish case are possible, because the procedure of quantitative measurent of self-identifications has been applied in Russia and Germany as well.

INTERACTIONS BETWEEN INFORMAL AND FORMAL SOCIAL CAPITAL IN ROMANIA. EMPIRICAL ANALYSES

Laura Nistor¹, Petru Iliut²*, Cristina Tirhas³

¹Social Science, SAPIENTIA UNIVERSITY, ²Sociology, Babes-Bolyai University, ³Social and Political Sciences, Avram Iancu University, Cluj-Napoca, Romania

Abstract: The aim of our analysis was to elaborate an integrative view on the existing linkages between informal and formal social capital in Romania. For this purpose, we structurally separated between solidarity, interpersonal trust, participation in informal networks (understood as informal social capital) and trust and participation in institutions and civic activities (as formal social capital).

Our approach followed that of the regimes of social capital, according to which, at societal levels, different combinations between formal and informal social capital may occur. According to this macro-level approach, regimes of social capital can vary form complementarities, in situations where both types of social capital are present and intense (e.g. Nordic countries) to substitutions, when one of the two types of social capital, most frequently informal social capital, compensates the lack of the other type of social capital (e.g. Southern and Eastern Europe). We presupposed that these regimes of formal and informal social capital do not necessary exclude each other and envisaged that, for example, in the case of substitution-type regimes may exist certain complementarities as well. Based on empirical data delivered from the 2008 wave of the European Social Survey and with the help of several regression models, we verified the hypothesis according to which some sub-regimes of complementarities are possible in the case of Romania as well and specific formal social capital can be positively linked to some other, specific forms of informal social capital. Among other findings, our results suggested that trust in national political institutions is positively associated with interpersonal trust, while political activism is positively associated with participation in informal networks. Thus, seems that two decades after the regime change, informal and formal social capital are not mutually exclusive and positive effects of informal social capital are transposed on the level of formal social capital, at least in situations when the two forms of
social capital are considered at the same level of specificity. Results based on qualitative methodology (intensive interviews) supported this finding and provided further nuances.

**TRANSNATIONAL BABUSHKAS: GRANDMOTHERS’ CHANGING LIVES ACROSS RUSSIAN-FINNISH BORDER**

Tatiana Tiaynen

1School of Humanities & Social Sciences, University of Tampere, Tampere, Finland

Abstract: How have the significant processes of social transformation in post-Soviet Karelia and subsequent increased migration in the Russian Karelian-Finnish borderland affected the way family is imagined and lived? The Russian-Finnish borderland, which for centuries has been an area of conflicts and peaceful relations, has now become a space of intensified cross-border family ties due to migration, particularly of Ingrian Finns under the Finnish repatriation program. In my social anthropological research I explore changing family lives, both imagined and practical, from the perspective of grandmothers, or babushkas. Soviet grandmothers used to play an important role in child upbringing, often substituting for “ever-working” parents and filling in the shortages of the Soviet public child care system. My study discusses changes in grandmothers’ everyday lives, identities and subjectivities in a transnational space between post-Soviet Russian Karelia and Finland. I argue that transnational grandmothers (babushkas) have become important actors in maintaining “transnational families”, whereas transnational grandmothering has become a pivotal social phenomenon of post-Soviet social realities in this transnational context. Empirically, my study relies on multi-sited ethnographic fieldwork, which I carried out on both sides of the Russian-Finnish border and during real-time border crossing. I apply the concepts of “transnational families” and “transnational subjectivity” in a methodology of social history to trace changes in grandmothers’ family lives and subjectivities against socio-economic and political changes in post-Soviet Karelia and Russian-Finnish transnational mobility. I suggest that along with difficulties and challenges brought about by the odds of separation, “transnational grandmothering” has also become a source of empowerment for many women in times of social turbulence of post-socialist transformation and migration.

**TURNING TO PARENT OR FRIEND? USING PARENTAL AND PEER MEDIATION OF CHILDREN’S INTERNET USE IN COMPARATIVE ANALYSIS OF 25 EUROPEAN COUNTRIES**

Veronika Kalmus

1Institute of Journalism and Communication, UNIVERSITY OF TARTU, Tartu, Estonia

Abstract: Alongside with the rapid growth of Internet use among the young generation and rising public concern about opportunities and risks children and young people may face online, we witness an increasing research interest in help and guidance that socialising agents (parents, teachers and peers) provide to youngsters to support their online endeavours. Together with rules and restrictions, set mostly by parents, these practices are termed as ‘mediation of Internet use’.

Given that the current generation of children and parents across countries is in similar situation in working out strategies to cope with online risks, the existing cross-national data on mediation of Internet use provide valuable opportunities for interpreting cross-cultural variation in the patterns of mediation as indicative of differences in socialisation cultures and the underlying institutional and cultural factors.

Previous research, by concentrating on mediation by parents, has provided classifications of countries based on predominant parental strategies. For instance, in earlier analyses of Flash Eurobarometer 248 data (2008), we have shown that systematic correlation patterns exist between the types of welfare arrangement and predominant parental styles of mediating children’s Internet use. Post-socialist countries, with a few exceptions, fall in the same group, distinguished by the highest proportion of passive parents.

This paper will focus on two generational groups – parents and peers – as agents of mediation of children’s Internet use, assuming that a generation gap may be more remarkable in the countries undergoing rapid social transformations. Based on data collected from 9-16 year-old Internet users (N=25,142) and their parents in 25 European countries in summer 2010 by European research network EU Kids Online, the analysis will, firstly, classify children according to the levels of parental and peer mediation they receive, and secondly, draw a typology of the 25 countries based on predominant types of children in each country.

**“HEALTH OF NATIONS”: THE NATURE AND CAUSES OF TRANSFORMATION OUTCOMES WITH RESPECT TO PHYSICAL, SOCIAL AND MENTAL ASPECTS OF HUMAN DEVELOPMENT**

Gordey Yastrebov

1Economics Department, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The major transformations of the late 20th century have led to a radical system change in post-socialist Europe. However, there is still much debate as to whether this large-scale institutional building has brought about the desired outcomes for the economic prosperity and general well-being. We argue that the emerging divergence of development paths in post-socialist Europe still requires a critical analysis of the basic theoretical and methodological approaches to its explanation.

In particular, we suggest that this divergence appears to have been caused by reformers’ poor (and, perhaps, intentionally wrong) understanding of the certain cultural and historical contexts of these countries’ development. Such understanding tended to focus on institutional building per se rather than setting the milestones for development and achieving certain goals in terms of society’s well-being as a whole. By following this (rather unorthodox) line of analysis we suggest to set back the dominant economocentric (i.e. focus on economic achievements) and economically determinist (i.e. primacy of economic structures in social development) approaches to evaluation of transformation outcomes and focus rather on distinguishing certain vectors of human development with respect to physical, social and metal aspects of society’s well-being. Precisely, we suggest to extend the widely accepted UNDP’s notion of human development to a notion of ‘societal health’ (by analogy with WHO’s definition) to determine the society’s ability to resist certain pathologies: social (e.g. anonymity and social disintegration accompanied by crime and certain forms of deviant behaviour); physical...
(e.g. poor health and low life expectancy); and mental (e.g. various apathies accompanied by self-destructive behaviour).

Using this model we conduct a thorough empirical analysis based on comparative data from WHO, UNDP, World Bank, etc. to test some of our theoretical assumptions, which explain the nature and causes of the divergent paths of post-socialist development in contemporary Europe. Generally according to these assumptions, the extent and quality of human development is related to society’s certain social, economic and political organization, which could be either appropriate (like in some CEE countries), or inappropriate (Russia and some CIS countries) to dominant attitudes, values, and patterns of behaviour of the population.

CONSORTIALISM IN EAST CENTRAL EUROPE: A SOCIOLOGICAL ANALYSIS RS 03
Grazyna B Skapska1
1Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: In East Central Europe the process of political and legal reconstruction presents an effort of postcommunist societies to consolidate around some fundamental values, principles an concepts that would help them to integrate and form a new political architecture. This would entail a new institutional design as well as conceptual framework for a new social contract after the collapse of the former regime compatible with the challenges of the modern world. The presentation aism at this new contract formation - a formation of postcommunist constitutionalism in East Central Europe. The fundamental question follows whether the formation of values and principles is based on some clear conceptual foundations compatible with the specific legacy of the communist system on one hand, and requirements of the European unification on the other. In another words, it is a question about the complexities and ambivalencies of postcommunist constitutionalism and the structuring effect of “Europe”.

SUPPORT FOR DEMOCRACY IN EAST CENTRAL EUROPE: STABILITY OR FRAGILITY?
Matej Makarovič2
2SCHOOL OF ADVANCED SOCIAL STUDIES, Nova Gorica, Slovenia

Abstract: While democratic institutions have clearly been consolidated in most of European new democracies, the support for democracy seems to be less stable. The evidence from comparative international as well as some national social surveys indicates that support for democracy in many East-Central European countries resides at the level of the thin (instead of thick) values. Moreover, democracy is often understood in an instrumentalist way, namely as a means of achieving better live, especially in materialist terms, not as a value in itself. Consequently, support for democracy tends to decrease during the times of crisis as we have witnessed particularly after 2008. This may be demonstrated by some social surveys, e.g. by significant levels of support for the rule of experts or the rule of a strong leader instead of democratically elected politicians. Convergence of new European democracies with the old ones is thus rather questionable in the field of democratic values, since undemocratic alternatives continue to be more unanimously rejected by the respondents in western and northern European democracies. This does not mean, however, either that one can truly expect the rise of authoritarian alternatives in East-Central Europe or that authoritarian alternatives are generally supported in ECE countries. Instead, as demonstrated by the case of Slovenia, we are dealing with a complex mixture of democratic, authoritarian and nostalgic sentiments as indicated by factor analysis of the survey data. This case is also be placed in a comparative perspective.

CHANGE OF BASIC HUMAN VALUES IN TWO DECADES OF TRANSFORMATION IN THE BALTIC COUNTRIES
Indrek Tart3
3Centre for Contemporary Cultural Studies, TALLINN UNIVERSITY, ESTONIAN HUMANITARIAN INSTITUTE, Tallinn, Estonia

Abstract: Return to the Western Europe’s main economic, political and cultural patterns after 1989 has been the key motivation for the Baltic nations. Political results include memberships in NATO and European Union, Estonia becoming a part of the euro-zone. But do the change in the institutional fields brought with changed mind-sets, new personal value-worlds? Two decades of transformation are long enough to see stabilization of basic values into new
constellation. Soviet occupation left in the Baltic mixture of different
cultural communities – indigenous Estonians, Latvians and Lithuanians as well as predominantly Russian-speaking migrants from the ex-Soviet Union. We are taking into account that specifics also.

Data sources are coming from four different value survey types: Schwartz Value Survey (1990-1997) for Estonians and Latvians, extended Rokeach (terminal) Value Survey (Balticom 1991-1995, Me. The World. The Media 2002, 2005 and 2008), Portrait Value Questionnaire (European Social Survey 2004, 2006 and 2008) and European Value Study (1990, 1999, 2008) for all subgroups. To catch main trends of the value change we will use principal component and cluster analysis, multidimensional scaling and social network analysis methods for 2-mode data sets to examine the value stability and change also in the whole Baltic Sea region during recent decades. Preliminary investigations show a watershed between Estonians and other Baltic cultural communities of the region. In the crude Schwartz’ bipolar axes (openness to change vs. conservatism, self-transcendence vs. self-enhancement) scale Estonians gather together with Nordic countries while Russian speakers in Estonia and respondents from Latvia and Lithuania are closer in both axes to basic value constellations of Russia and Poland. There is also expected to find explanation why the Baltic countries on the Inglehart-Welzel world values map are not giving much hope for postmodernist, self-expression centred change that has been taken to be the key cultural change – from survival to self-expression values. It seems that institutional change (on the opposite axis toward secular-rational values) in the Baltic has been seemingly more visible, resource requiring and self-centred than essential personal development.

MEASURING SOCIAL TRANSFORMATION IN POST-SOCIALIST COUNTRIES THROUGH AGE DIFFERENCES IN BASIC HUMAN VALUES

Vladimir Magun1, Maksim Rudnev2

1Institute of Sociology SAS, Higher School of Economics, 2Higher School of Economics, Institute of Sociology SAS, Moscow, Russian Federation

Abstract: Our goal in this paper is to tackle the changes in value socialization through measuring value differences between age groups in the European post-socialist countries. The data came from the ESS Human Values Scale developed by Sh. Schwartz (national samples from 11 post-socialist and 12 Western European countries, Round 3, the year 2006)

The respondent’s age is responsible for a big share of internal value diversity of each country. And the age differences in values may be partly attributed to differences in value socialization of the correspondent birth cohorts.

The analysis was based on the index (“delta”) calculated as a difference between average value score of the age category in a given post-socialist country and the average score of the same age category in the Western European countries. Assuming that biological effects of age are approximately the same in different countries this index is interpreted as reflecting the comparative socialization effects on values in a given post-socialist country versus average Western European country.

To measure the shift in socialization effects in a given country from socialist to post-socialist times we compare the delta-indices for the younger (15-23 years) and elder (62 years and older) age groups.

Two exemplary results revealed through this analysis are mentioned below:

1. The comparative socialization effects on Self-direction value became stronger in all the post-socialist countries in the period of post-communist transformation. It is in line with the most salient and most universal message of the 1989-1991 revolutions which advocated personal freedom.

2. Three post-socialist countries with “hard” version of socialism in their past demonstrate the most remarkable change in comparative socialization effects: in Russia, Bulgaria and Czech Republic the younger and elder age groups differ significantly by all the 7 delta-indices. (Russia outraces its former socialist allies and shows the largest difference between age groups.) On the contrary, Slovenia and Hungary with their “soft” socialist past show just minor changes and provide only two or three statistically significant differences between delta-indices of younger and elder age groups.

NEW VALUES IN THE RELATIONSHIPS BETWEEN THE STATE AND NONPROFIT ORGANIZATIONS IN ROMANIA

Maria Roxana Atesoaie

1FACULTY OF SOCIAL WORK AND SOCIOLOGY, PETRE ANDREI UNIVERSITY, IASI, Romania

Abstract: The author study in the article the interface between the State and the nonprofit sector in Romania by identifying the evolution of the relationship between the two sectors in Romania since 1989 till present based on the change of the impact of values as participation, trust and solidarity.

We’ll compare the situation of the nonprofit sector in Romania with other CEE countries and will identify the main characteristics of the contracting and third party government relationships based on the level of development of the communities involved.

After twenty years of democracy, the tertiary sector is called on to join the State in a new type of relationship called “partnership”. This new relationship can take several shapes and shades. In some cases, it may be influenced by the nongovernmental sector’s strong dependency on the State, while in others we may notice a more egalitarian relationship of partnership.

VALUE CONVERGENCE AND ENTROPY IN EASTERN EUROPE: SEARCHING FOR EXPLANATIONS.

Horatiu Mihai Rusu1, Mircea Ioan Comsa2

1SOCIOLGY, LUCIAN BLAGA UNIVERSITY OF SIBIU, Sibiu, 2Sociology, BABES-BOLYAI UNIVERSITY CLUJ NAPOCA, Cluj Napoca, Romania

Abstract: There are not many comparative studies dedicated to value change in Eastern European countries. In our paper, we employ both longitudinal and cross- national analyses to describe and explore whether and, if so, how and why Eastern European countries have changed their values on the conservatism-openness to change axis. We considered the support for religiosity, traditional family type, instrumental qualities of work (work ethos) and authority, as value orientations of a conservative/normative type. Sexual permissiveness, tolerance, orientations against a non-democratic political system (democratic orientations) were regarded as open-
ness to change values. We are using the available EVS/WVS 1990-
2009 data sets from Albania, Belarus, Bosnia-Herzegovina, Bulgaria, 
Czech Republic, Estonia, East Germany, Hungary, Latvia, Lithuania, 
Moldavia, Montenegro, Poland, Romania, Russian Federation, Ser-
bia, Slovakia, Slovenia and Ukraine. The main method employed is 
multi-group confirmatory factor analysis (MGCF); we are testing 
for measurement invariance (configural, metric and scalar) and 
then compare the means of the latent variables (values). First, we 
explore whether we can find overall value convergence of countries 
or increasing entropy. We expect to find processes of partial value 
convergence (i.e. convergence with respect to some of the values) 
in varying clusters of countries. Second, we are searching for expla-
nations of these processes considering the different cultural herit-
geages and economic developments of these countries.

EXPLORING SOCIAL STRATIFICATION IN WEST- AND 
EAST-EUROPEAN STATES: THE CASES OF 
MERITOCRACY AND MEDIOCRACY

Gordey Yastrebov 1, Osey Shkaratan 1

1Economics Department, HIGHER SCHOOL OF ECONOMICS, Mos-
cow, Russian Federation

Abstract: There is still much debate over the extent to which demo-
cratic and market institutions bring about the economic success in 
developed and transforming societies. The most widespread as-
sumption behind this is that these institutions support the merito-
cratic rule of advancing individuals to their social positions, and, 
thus, enhance better use of their social, economic and human re-
sources. Meritocracy is, on the other hand, opposed by mediocrity, 
i.e. a principle, in which people advance regardless of their personal 
achievements (e.g. loyalism). Yet however obvious it may seem that 
in Western developed countries meritocracy is most likely to ap-
pear, we argue that such regularity in social stratification has little 
to do with ’modern’ institutions per se, since in some societies me-
diocracy may persist as an attribute, which is rooted in particular 
cultural and historical context of their development.

In this research we attempt to grasp these differences in social 
stratification empirically using data from European Social Survey 
(rounds 3, 4). For this purpose corresponding modes of stratifica-
tion are operationalized in terms of multidimensional systems 
composed of such axes of inequality as occupation, education and 
economic rewards. We further develop a certain relative measure 
of distribution randomness (entropy) to distinguish between meri-
tocracy (regular distribution) and mediocrity (random distribution).

Our results indeed show that there is a far stronger degree of 
matching between individual occupation, education and income 
in better developed European countries than is observed among some 
of the post-socialist states. Yet this pattern is irregular and cannot 
be strongly tied to extents of democratic and market development. 
Among the most particular cases in this respect are Spain and Por-
tugal (in Western Europe), and Russia (in Eastern Europe). To em-
phasize this finding we also look at the differences in patterns of 
tergenerational mobility, which also correlate with relative measures of meritocracy/mediocrity.

INDIVIDUALIZATION IN THE CONTEXT OF POST-
SOCIALIST TRANSFORMATIONS: WHAT IS MEANT BY 
BEING A WINNER OF REFORMS?

Elena Danilova 2

1Department for studies of social transformations, INSTITUTE OF 
SOCIOLOGY, RUSSIAN ACADEMY OF SCIENCES, Moscow, Russian 
Federation

Abstract: Individualization is widely viewed as a process which has 
been observed as a one of the key processes coming alongside with 
globalization. The paper argues that in post-socialist countries the 
individualization has been accelerated during the last two decades. 
The similar globalizing factors notwithstanding, some specific push-
ing forces of individualization in these countries seem to be differ-
ent from those in the Western European and North American socie-
ties. These forces are involved in the dramatic post-socialist social 
transformations. The development of Russian society is a telling 
example of these specifics.

If one would take stock of the transformations that took place in 
the value orientations and identities in contemporary Russia, one 
can notice from the empirical data that people in Russia are being 
individualized quite fast. In tackling the issues of individualization 
the paper also attracts comparisons of the transformation of Rus-
sian, Polish and Chinese societies. Being different in the speed, 
duration and way of implementation, the reforms produce similar 
effects. One of them is the rising social inequality. There are some 
questions to deal with in this context: To what extent did the re-
forms conducted by different approaches bring about more social 
justice? Who are winners and who are losers of reforms? The com-
position of the groups of winners and losers are considered as lens 
through which one can evaluate the transformations outcomes. In 
Russia being a ’winner’ of reforms is associated with more individu-
alistic efforts in striving for success and less commitment to moral 
and social values. The paper argues that individualization in con-
temporary Russia is being forced by the changes in institutional 
settings and norms and takes place in the context of growing ine-
qualities which are seen by population as unfair zero-sum game.

JUSTICE ATTITUDES TOWARDS INCOME 
DISTRIBUTION: TURBULENT TIMES IN POST SOCIALIST 
COUNTRIES (1991-2008)

Zsotfa Ignacz 1

1HUMBOLDT UNIVERSITÄT ZU BERLIN, Berlin, Germany

Abstract: The concept of justice is a crucial aspect of legitimizing 
newly emerged democracies and free market economies, there-
fore, the research of justice attitudes is important. The past two 
decades have been turbulent for Post-Socialist countries, during 
which new values, norms, attitudes started to emerge, while old 
ones still remained to determine everyday life. Justice concepts 
within the population have been affected by the transition, as well.

The paper aims to explore whether people’s opinions concerning 
most of wage rules align with their opinion regarding income inequality in 
Post-Socialist countries in the past twenty years. In particular, the 
study focuses on justice attitudes toward income distribution by 
looking at whether people believing that prevailing wage rules are 
just, will also consider income inequality just.

By selecting countries (the Czech Republic, East-Germany and Hun-
gary), the paper attempts to describe how these countries have 
changed in the past two decades in regard to justice attitudes 
through justice profiles. Justice profiles attempt to grasp justice 
attitudes toward wage rules and justice attitudes toward income
inequalities. They summarize whether respondents consider wage rules just or not (meaning do they consider prevailing wage rules acceptable or not) and whether they consider income inequalities just or not (meaning whether they consider prevailing outcomes acceptable or not) in a four category typology.

The data of the International Social Justice Project between 1991 and 2008 are used to chart tendencies concerning justice profiles. Results highlight similarities between countries due to Socialist heritage, as well point to some unique aspects regarding each country.

NEITHER SHOCK, NOR THERAPY: WINNERS AND LOSERS IN ROMANIA’S POST-COMMUNIST TRANSITION

Augustin Stoica¹

¹UNIVERSITY OF BUCHAREST, Bucharest, Romania

Abstract: In this paper, I address the current debate on the winners and losers of market transition in Eastern Europe and China. Some scholars have claimed that, because a market economy tends to reward an individual’s skills and merits (or her human capital), the winners of market transition will be the individuals who have the necessary skills and education required by a market economy. Other authors have shown that the winners of market transition tend to be former communist cadre/officials due to their social capital/network capital. While employing and debating over such very broad concepts as “planned economies,” “markets” or “partial reform,” I contend that market transition scholars have not specified the institutional conditions under which their predictions might be confirmed.

Focusing on the infrequently discussed case of post-communist Romania, I show that who wins and who loses during market transition is a function of larger political and institutional conditions. Despite its violent divorce from communism, Romania is a country that favored a gradualist reform strategy, which has made possible the political and economic survival of many former communist politicians and party members. Employing data from a survey conducted in 2010 on a representative sample of 4500 respondents aged 25 years and older, I analyze the extent to which the transition to a market economy has maintained (or eroded) the advantages of former communist party members and officials. The results of my statistical analyses suggest that some former communist party members have not only managed to survive the transition but have been at an advantage during post-communism due to their social capital/network resources. The main losers of post-communist transition tend to be older individuals, with little education, and former employees of the oversized communist industrial sector. Also, a large part of the losers’ camp includes agricultural workers, formerly employed in the socialist cooperatives/collective farms. Thus far, market transition in Romania has had mixed results. In contrast to Hungary, Poland or the Czech Republic, in Romania income inequalities have increased drastically post-1989. Also, some pre-1989 inequality forms have survived. This is especially true in the case of relatively low income returns to education and gender-based income inequalities.

SPECIAL MOBILITY IN TRANSITION AND BEYOND

Alexi Gugushvili¹

¹Political and Social Sciences, EUROPEAN UNIVERSITY INSTITUTE, Florence, Italy

Abstract: In this paper I will demonstrate the long-term patterns of social mobility in terms of educational attainment in the former Soviet Union countries. Based on the Life in Transition and Europe-an Values Surveys, which contain data on the level of education achieved by respondents and their parents, I will employ ordinary least squares and logistic odds-ratios methods to reveal how fathers’ education has been associated with their children’s attainment in the consecutive cohorts born in 20th century. The special attention will be paid to the transitional cohort, the individuals who were born in 1970-80 and went through education system during the tumultuous late-socialist and post-socialist years, but had to complete their qualification at the time of the surveys in the late 2000s. Based on the earlier country studies, I expect that the overall level of intergenerational social mobility in terms of completed education has decreased, though the pattern of changes idiosyncratically varied across the regions and countries.

THE CONCEPT OF CAREER IN FORMER EASTERN BLOC AND FORMER SOVIET UNION COUNTRIES

Vikinta Rosinaite¹

¹Department of Sociology and Law, UNIVERSITY OF APPLIED SCIENCES, Vilnius, Lithuania

Abstract: Analyzing development of concept of career as a scientific term in the context of industrialized countries, we can distinguish three conditional phases: 1) The first half of the twentieth century was dominated by the concept of the vocational guidance; 2) The second half of the twentieth century (until 1990) - career orientation and organizational career concept; 3) At the end of the twentieth century (since 1990) - individual career concept. Western researchers identify a number of career forms developing today - from linear (hierarchical) to multidirectional. Some authors (Gunz, Evans, Jalland, 2000; Osterman, 1996; Gunz, Evans, Jalland, 2000; Moynagh, Worsley, 2005; McDonald, Brown, Bradley, 2005; Baruch, 2006) have a critical view of newly appearing scientific publications (Arnold, Jackson, 1997; Peiperl, Baruch, 1997; Arthur, Claman, DeFilipp, 1995; Hall, 1976; Arthur, Rousseau, 1996) in the US and Europe, which describe transformation of new organizational career in to individual. They postulate that the form of organizational career today is not the norm, but it is not completely extinct either. To say that the individual career concept has changed the organizational career concept would be an understatement.

There researchers studying career understanding of different socioeconomic systems (Kon, 1989; Standing, 1991; Kalleberg, Stark, 1993; Skorikov, Vondracek, 1993; Andrlie, 2000, Soulsby, 2001; Thomas, Inksin, 2007; Guido, Richmond, 2005sand so on.) juxtaposewotwontext thefcaerereconstruction: Socialist and Capitalist. Career understanding forwarded depending on one or the other economic systems values, leads todifferent formation of careers. The concept of career, formed in Western industrialized societies and based on Western values, assumethatindividuals are able to control personally wide range of possible choices of education and employment therefore they consciously and deliberately making progress in their lifetime and take responsibility for their career. Meanwhile, for post-socialist and/or post-soviet societies individual preferences were less important than the adjustment to parental expectations and the socialist and/or soviet principles. Therefore the aim of this presentation is to analyze the cur-
rent concept of career in former Eastern Bloc and former Soviet Union countries more concentrating on case of the Lithuania, but not only.

**ECONOMIC TURBULENCE AND LOCAL COMMUNITIES OF CENTRAL AND EASTERN EUROPE.**

Milosz Miszczynski

Abstract: In my paper, I examine the economic environment of local communities of Central and Eastern Europe. Based on my research conducted in three local communities in Poland, Romania and the Ukraine, I present my interpretation of economic turbulence. Beginning from 1989 and the systemic transition, I analyse the processes in which global turbulence, uncertainty and ambiguity emerge. By putting the weight on the lowest scale of social processes – locality – I draw attention to the issue of foreign investments happening after transition.

I calibrate the notion of turbulence to this part of the continent. In my presentation, this period is interpreted through the prism of economic processes of globalization. Thus, turbulence emerges from low transportation costs, high pricing of competences and innovation and the extremely low cost of industrial production. In the paper, I will argue that fierce global competition emerging from this economic environment involves even the most deserted and often-forgotten places of Central and Eastern Europe. I will also opt for understanding the ambiguity of the contemporary economic world by observing the change on the (lowest) local level.

I argue that this new level of transitional development involves new actors and reaches even the most remote and distant local (rural) communities. In my presentation, I illustrate my thoughts with three cases of local (rural) communities in Central and Eastern Europe. A foreign investor decided to locate a strategic business unit in each of the communities, of between 500 and 2,000 employees, mostly recruited from the region. Using selected aspects of the influence of external economic power, I analyse the process of this emerging stage of transformation through the local economic shift. By taking selected aspects from my cases, I analyze how systemic change (transition) and new turbulent stimuli (foreign direct investment) cause the evolution of local cultural processes in Central and Eastern Europe.

**HEDONIC HYBRIDIZATION IN SUBURBANIZED RURALITIES: A COMPARATIVE PERSPECTIVE OF ROMANIAN AND SWISS MILIEUS**

Stefan Mann 1, Silviu Totelecan 2

1Socioeconomics, RESEARCH STATION AGROSCOPE, Ettenhausen, Switzerland, 2Romanian Academy of Science, Cluj, Romania

Abstract: There is a controversial debate about the relevance of suburbanization in rural areas. While Champion sees suburbanization mainly as a phenomenon of the past, Wild and Jones (1988; 288) recommend to direct future research on “the many complex social changes accompanying these physical transformations” connected with suburbanization.

Several case studies from the last two decades indicate that the process of suburbanization has caused significant migration and other social transformation in areas long considered as rural. The radius around agglomerations in which people with urban lifestyles and occupations settle is apparently expanding fast. This is the case for the United States, but also for a number of European countries like Switzerland, Bulgaria, Romania, Estonia, Hungary and Portugal. This paper is concerned with the question whether the suburbanization of rural areas has relatively uniform social impacts, or whether they are strongly tied on the cultural, economic and social situation of the special case.

For this purpose, case studies from two European regions which are both concerned by rural suburbanization but could hardly be more distinct in every other respect are presented. After the development in the Southern Lake Zurich Region in Switzerland and the Gilau area North of Cluj-Napoca in Romania has been presented the qualitative method of comparing the social situation in the two regions is presented. Through stressing similarities rather than differences, the concept of hedonic hybridization emerges and is outlined.

We claim that the long-term trend of hedonism in society is mirrored nowhere as strongly as in suburbanized rural communities. While common missions and objectives vanish, particularly the new inhabitants enjoy low land prices, comfortable housing and the proximity of natural amenities. The presence of some traditional food production is enjoyed both by the ones sticking to it and by the observers. However, the hybridization between old and new “Lebenswelt” makes it difficult to define an identity of the suburbanized ruralities. Thus, individual utility maximizations lead to a social construct without a clear identity.

**POLISH HOUSING COOPERATIVES – POST-COMMUNIST STRUCTURE IN DEMOCRATIC SOCIETY**

Arkadiusz - Peisert

1sociology Philosophy and Journalism Institute, Gdansk Universityist, Gdansk, Poland

Abstract: My intention is to present the phenomenon of the polish housing cooperatives. Most of them have been founded in the communist period. The clientelism was present inside them at least from seventies of the XX Century. Initially, Cooperativism in the Nineteenth Century was a democratic, social movement, defending week economical position of the poor. The post-communist polish housing cooperatives are something completely different – cooperative estates are rather more similar to the russian ‘kolohoz’ than to classical cooperative.

The crucial characteristic of that housing cooperatives are: huge dimensions, strong managerial elites and low members-inhabitants’ activity. Most of members lives in cooperative estates larger than 15.000-20 000 inhabitants. Strong managerial elites have built their position in the communist period, when the housing cooperatives were centralized and actually governed by the communist state. The centralization have been removed twenty years ago, but managers’ elites in many cases was able to maintain its domination in cooperatives. The boards – an executive power in each cooperative, still dominate over the general assemblies. It is possible because of the patronage mechanism. I consider it as a barrier for reinventing citizenship and building democratic structures.

I would like to share the outputs of my research conducted in polish housing cooperatives in 2006-2008. It was partly described in my book edited in polish *Spoldzielnie mieszkaniowe – miedzy*
współnota obywatelska a alienacja. I used the perspective of Robert Putnam’s Making democracy work (clientelism in the southern Italy). Also Robert Merton’s description of American ‘bosses’ in his article Manifest of the latent functions seems comparable. I also consider the perspective of polish authors: Jadwiga Staniszki, who described the phenomenon of Post-Communism, and Andrzej Zyburtowicz, who proposed the concept of the structural conflict of interest in Central and Eastern Europe.

THE TRANSFORMATION OF RUSSIAN AGRARIAN SECTOR: FORMAL AND INFORMAL MECHANISMS OF NEW SOCIAL RELATIONS

Olga Fadeeva¹, Zemfira Kalugina¹

¹Department of Social Problem, INSTITUTE OF ECONOMICS AND INDUSTRIAL ENGINEERING, Novosibirsk, Russian Federation

Abstract: The paper presents the author’s understanding of the post-soviet development in Russian rural communities, analyzes the results of liberal transformations, shows the specific features of a current rural development model; outlines what would happen to Russian rural communities in the future; and describes mechanisms for achieving the strategic goals of future development.

The paper analyses the history and present status of land relations in rural areas of Russia. It also studies collisions of divergent interests of agricultural producers originated from the uncertainty of property rights to land and competitive struggles for the best resources. As far as full-scale market relationships for land does not exist and “virtual” joint shared ownership prevails in Russia it is reasonable to speak about the formation of local markets for land rental where the competition turns out to be among large agricultural producers and farmers and where informal agreements preventing land turnover and protecting interests of tenants are concluded. Thus, the informal system of agreements and compromises helps to compensate for the weaknesses of formal mechanisms for land tenure. Nevertheless, the barriers to transformation of land into capital assets dramatically hinder diffusion of innovations in agriculture development.

A differentiated approach is needed to working out the strategy and tactics of rural area development, social and economic policy measures, and implementing a new rural settling model. It is apparent that in so vast a country as Russia there could not be a unified pattern for agricultural development and combination of different management models. A new agricultural development paradigm proposes a change in the targets, i.e. transition from state paternalism to rural area development based on local resources and partnership between the government, business, and population.
RS 06 Maritime Sociology

SOCIAL ORGANIZATION AND AGENCY IN THE ICELANDIC FISHING INDUSTRY.

Thorolfur Thorlindsson, 1,2

1Department of Sociology, UNIVERSITY OF ICELAND, Reykjavik, Iceland
2SCTE, LISBOA, Portugal

Abstract: The “skipper effect” debate in the 1980s and 1990s has raised some lasting unresolved issues in maritime sociology and anthropology. The debate involved different aspects of fishing organization and fishing success. It focused, however, on the role of skipper’s knowledge and skill in fishing success in relation to other variables such as boat size, equipment and pure luck. The relative contribution of these various factors has been hotly debated. The debate has focused on empirical and methodological issues. Less attention has been paid to some theoretical issues involved. In this paper, I attempt to fill this gap in the research, recast the debate and focus on the social organization of the fishing and reframe it in the context of social structure agency perspective. I compare fishing organization in the cod and in the herring fishing in the classical area in Iceland. I show how differences in social organization and fishing culture interact with technology, the physical environment, the characteristics of the species of fish, to produce different types of agency. I conclude that the herring fishing involves different organization and different type of agency from the cod fishing. These differences are reflected in the role and the contribution of the skipper to fishing success. Finally, I discuss the implications of these findings for a theory of social structure and agency.

SOCIAL BONDS ON A SHIP – BETWEEN ORDINARY PLACE OF WORK AND TOTAL INSTITUTION WITH SPECIAL ATTENTION TO CHANGES INDUCED BY MODERN TECHNOLOGY

Arkadiusz Kolodziej, 1, Agnieszka Kolodziej-Durnas 1

1UNIVERSITY OF SZCZECIN, Szczecin, Poland

Abstract: Classic sociology has thoroughly explored and evaluated the changes within the matter of social bonds. Contractual and impersonal relationships prevailing in association are the source of alienation; the organic solidarity may be characterized by both autonomization and the growth of dependence of an individual on the society. The limitation of community-like (common, traditional) Weltanschauung develops the potential of emancipative discourse but facilitates the systemic processes the colonization of Lebenswelt.

A sea vessel seems to be for a researcher an interesting platform of interaction to analyze how the social order is created (and the bond constituted). Some part of the order is of course enforced by procedures (from “outside”), but some has to be constructed from the very beginning. Especially the spontaneous part of reproducing interactions is from sociological point of view an exciting issue. What is the consciousness of creating the order during the voyage? What kind of bonds is established? How the institutionalization of interaction pattern takes place?

In Polish research on the deep-sea vessels (especially fishing ones) the scientists often concentrated on the bonds between the crew members. They emphasized the specificity of their work stemming from the its team nature, dangerous conditions and uncertainty of profits. Currently the transformation of maritime economy in Poland has resulted in the significant reduction of the number of fishing vessels so the authors of this paper carried out the research among the members of merchant deep-sea vessels crews. The research material consists mainly in unstructured interviews with a list of topics to be covered.

One of the hypothesis which proved to be promising and worth of exploring in further research is the one about the pervasiveness of modern technologies as carriers of entertainment and sources of communication and about their impact in the erosion of the bonds between the crew members. The research results may be the beginning of constructing the theoretical frame of transformation of social bonds on the vessel in the perspective of action-network theory (ANT).

“I HAVE A SAILOR BOYFRIEND, TOO”. SOCIAL WORLD OF SEAFARERS’ LIFE COMPANIONS

Robert Michal Bartlomiejski 1, Maciej Kowalewski 1

1Institute of Sociology, University of Szczecin, Szczecin, Poland

Abstract: Women in maritime sociology were absent for many years, nor as authors nor subject of research. If they appeared, they were usually treated as a minor subject e.g. in the study of family life of fishermen and seafarers. The above trend in the last decade has changed as new books and articles related to the gender studies has been published in this subject. Problem of gender in maritime studies can provide an interesting contribution to maritime sociology, especially for researching seafarers life companions. Social worlds become the analytical concepts used for the study of collective action that arises when a number of individuals strive to act in the same way (Strauss 1978, Shibutani 1994).

Virtual social worlds are perceived as a primary subject of researches because they enables satisfying interaction and effective communication in cyberspace. In terms of social world’s theory, Internet forums and discussion groups can be considered as arenas. Social worlds perspective applied to maritime theory allows to find out and understand a common problems of seafarers life companions that they are sharing on the arena of forums and discussion groups in Internet. The article will discuss the creation of their social world and motivations to share personal narratives on the base of research online forums and discussion groups of seafarers’ life companions. Particular attention will be given to strategies of coping with the temporary separation and stress arising from concerns about health, safety and sexual fidelity of their relationship partners.

COD AND TRADITION. CULTURAL EFFECTS OF COD FISHERIES IN PORTUGAL

Manuel Pacheco Coelho 1, 2, 3, Jose Filipe 1, Manuel Ferreira 2, Rui Lopes 3

1Economics, SOCIUS ISEG/TECHNICAL UNIVERSITY LISBON, 2UNIDE-ISCSTE, Lisboa, 3Universidade Evora, Evora, Portugal
Abstract: In the 90s, Portuguese national fishing fleet lost more than 35% of the tonnage, a third of the fishermen, almost 30% of the production. The segment of distant water fisheries, especially of the cod, is accompanying this crisis. In one decade (1976 to 1986) this segment had to face two new restrictions to the development of fisheries: Extended Fisheries Jurisdiction and the integration in the Common Fisheries Policy.

The cod segment grew (in the 30s/40s) in a corporative logic of strong intervention and State protection. It had, underlying, the condition of open access to the resources. The introduction of the 200 miles Regime altered the rules of the game deeply, putting the traditional fishing zones (Newfoundland) under Canada’s jurisdiction.

With the EU adhesion, the situation became worse. The transposition of the bilateral agreements for the supra-national management of European Commission, the problems of overfishing and severe decrease of cod stocks, the evil-guided policy of subsidies; all were factors of aggravation.

After a profound downsizing process (from 80 units to no more than a dozen of big vessels) we are still confronted with an overcapacity problem, face to the disposable quotas.

Anyway, while the stocks rebuild, and given that Nature’s time is very different from Human time, the Public managers cannot stop defining social and cultural support policies for the affected populations and try to maintain the memory and the important traditions/ways of living associated.

One area mostly affected is Ílhavo. “The Sea for Tradition” is the slogan of the City hall to present Ílhavo to the visitors that attests well the strong connection of the municipality to the sea. The guidelines for public management highlight the role of fisheries in the local development (anchored in reasons of geographical and historical nature), and the continuous exaltation of the maritime culture, with its maximum expression in the Maritime Museum and in other cultural manifestations of cod-oriented traditions (as religious festivities).

The purpose of our communication is to study the socio-economic and cultural impacts of the institutional change of cod fisheries framework in Portugal.

THE SOCIO-POLITICAL CONFLICT AT PŻM

Andrzej Marek Michalak 1,1
1SOCIOLOGY, SZCZECIN UNIVERSITY, Szczecin, Poland

Abstract: The PŻM is one of the best shipping companies in the world. This is the state company. The foundation of the state company’s existence and activity is parliament act on state companies from September 1981. That act was result of the political and social pressure imposed by the newly established “Solidarity” Labour Union, on the communist government at that time. The essential decisions according to this act have been made by the labour board made of employees and acting as a self-government in the company. After year 1990 Polish government was privatizing state companies. The PŻM employees did not want to agree to the privatization. That became the source, as well as the background of the conflict between PŻM employees and polish ministry of treasure. The PŻM employees are afraid of privatization because earlier attempts to privatize other state companies in this branch were not successful.
STAGING HOLOCAUST MEMORY IN A POST-MEMORIALIZATION CLIMATE

Karen Elizabeth Frostig 1,2*

1School of Education, Lesley University, Cambridge, MA, 2Women’s Studies Research Center, Brandeis University, Waltham, MA, United States

Abstract: How does a country memorialize 20th century genocide in the 21st century? How do European nations resist the pull toward complacency, when marking the 75th anniversary of Nazism under National Socialism? How does a country examine its own record of grappling with genocide? Finally, how does a country take this moment to put forth a statement of moral consciousness, expressed by the citizens of that nation-state?

I acquired Austrian citizenship in 2008, 70 years after my father was expelled from Vienna and 67 years after my grandparents were deported to Riga. Beginning in 2006, I set out to document my journey of return as an artist and descendant, trying to piece together a broken past. Attaining citizenship became a concrete means of confronting this historic rupture, retrieving what I could claim, and establishing a non-specific commitment to reconcile my family’s story with my own sense of agency as an artist and activist. I had no idea at that time that I would initiate a Holocaust memorial project that would challenge underlying assumptions about Holocaust memorialization, as well as attempt to address the questions articulated in my introduction.

The Danube Memorial is being developed as a new time-based Holocaust memorial concept to be situated along the Danube Canal in Vienna, Austria in 2013. The Danube Memorial will be the first inclusive memorial in all of Europe to symbolically represent all the victims of National Socialism, the named and the nameless, within a given country. Forging a dynamic relationship between three independent disciplines, graffiti art, archival research and education, The Danube Memorial is envisioned as a “living” memorial based on a participatory model of engagement.

The original idea for this memorial grew directly out of my process to recover my family’s Holocaust narrative. The memorial project evolved over a year’s time. The project is now situated in a contemporary light, representing my independent voice as a conceptual artist, cultural historian, educator, feminist, and social activist. While, my family’s narrative continues to inform the project, the locus of negotiation now revolves around the politics of money in relation to developing a new public art project. The Danube Memorial is presented as performative memory, representing a new model for Holocaust memorialization that is fresh, critical, and inclusive.

THE CONTEMPORARY MUSEUMS AND THE SAFE FUTURE OF THE PAST. DISPLAYING DIFFICULT HISTORIES AND REFLEXIVE POLITICS.

Krystyna Ewa Siellawa-Kolbowska 3

3Faculty of Humanities Department of Sociology, WARSAW UNIVERSITY OF LIFE SCIENCES, Warsaw, Poland

Abstract: There may be wars about monuments (Tallin, 2007), and there may be wars about museums. In both cases it is a war about memory, about a presence of the past in the public space. Poland stands as a good example (Katyn Homicide, 1940). From 1945 to 1989 in Poland the collective memory, as well as the public space, was subject to political power and censored. Since 1989, in Poland, just like in other democratic societies the collective memory is built “from below”, is present and active in public discourse. This process has impacted the social situation of institutions and people who preserve the memory of the past. These new conditions may be called a democratization of public memory, and we would like to take a better look at its consequences.

The lecture will focus on the relations between the collective memory resources and institutions such as museums, based on data from two countries: Poland and Germany. It will be dedicated to the manners of telling about the difficult, because controversial, painful past, dramatic past. Such a past for Poles and Germans is still the II World War. Using selected examples of Polish and German museums I will present the key factors determining the narrative coming from the museums about the IIWW in both countries. The observations carried out in Poland and Germany makes us reflect upon the dynamics, the social mechanisms and commemorating institutions. Questions arise: are museums a party in a social discourse about the past? Do today’s museums help demolish the walls of national stereotypes and anachronies? Do they help the History from the past times reemerge to unite instead of dividing? Where do the observed differences between the Polish and German museums come from? I will present qualitative analysis results (observations of museums’ expositions). The aim is to show, how the actors of the history are presented and who they are, as well as if and what emotions and attitudes the museums’ exhibitions do transfer.

THE CULTURAL DIMENSIONS OF PUBLIC MEMORY: A POLICY CHALLENGE

Yudhishthir Raj Isar 4

4Global Communications, THE AMERICAN UNIVERSITY OF PARIS, Paris, France

Abstract: This paper will argue that the contemporary imbrications of collective or public memory with notions of ‘heritage’ and ‘identity’ need to be tackled as key issues of cultural policy because of the cultural and social behaviours they induce. It will deploy concepts drawn from the sociology of culture, memory studies and contemporary history and be buttressed by evidence from the volume Heritage, Memory, Identity (SAGE Publications, 2011) conceived and edited by the author. It will explore how the politics of public memory are intertwined with the politics of heritage and identity, e.g. in renegotiations of traumatic pasts in countries such as France or Spain, in debates about Communist-era repression in post-Communist countries or as regards the deliberate destruction of heritage in the Balkans, and how different forms of cultural expression are entangled with these politics. The latter are sometimes conflictual, often violent, involving exclusion and domination, the affirmation as well as the negation of difference, the conscious or unconscious manipulation or suppression of public memory. Enunciations of public memory also involve the forging – in both popular
CULTURAL POLICIES REGARDING AFRICAN CONTEMPORARY ART IN POSTCOLONIAL CONTEXT

Sara Martins

Sociology, Goldsmiths, London, United Kingdom

Abstract: This presentation will reflect my on-going PhD research on Cultural policies regarding African Contemporary Art in Portugal.

This project will consider the post-colonial experience and the impacts on the artistic and political field of the creation of a new Centre of Contemporary African Art in Lisbon in 2012.

The Centre is a political initiative from the Portuguese government announced during the celebrations to mark the anniversary of the Euro-African Summit of Leaders, while Portugal was the President of the EU – a cultural mark for public memory of the event. Despite general scepticism surrounding the creation of this institution because of the uncertainty of public funding in the cultural domain, this announcement was received with surprise, curiosity and expectation by the artistic and African related peers in the country, at the same time as claiming initial alliances with high profile international partners – African Art Centres in European and North American context, outside the African Continent.

The intention of this presentation is to explore sociologically the political evolution lending to the decision of opening this Artistic institution and its symbolic repercussions in its specific *milieux*.

MEMORY AND TRADITION AS CHALLENGES FOR HOPI DEVELOPMENT

Constance DeVereaux, Kristen Swanson

Comparative Cultural Studies, Communication, NORTHERN ARIZONA UNIVERSITY, Flagstaff, United States

Abstract: The Arizona Hopi are anomalous among Native American tribes. They are a sovereign nation in another sovereign land: the Navajo Nation, within the borders of the US covering Arizona and New Mexico. They are the westernmost Pueblo Indians; they trace their heritage to the Hisat-Sinom (aka Anasazi) people “some one hundred generations” ago. Hopi share their land with a branch of the Tewa, a tribe with its own language and customs. Hopiland consists of 12 villages of autonomous clans of approximately 10,000 people. They are the only Native American tribe without a treaty with the US government.

Like many Native American tribes, unemployment is prominent in Hopi life with reported figures as high as 85%. Tourism is considered a viable, and often the only, means for meaningful economic development because, many people believe, it would preserve Hopi autonomy and allow for practice of the Hopi Way. This option is affected by a variety of political and social challenges. One is the decentralized authority of the clans that often conflicts with the authority of the central tribal council. Another is the resistance by many tribal members to allow tourists of any kind onto Hopi lands seeing tourism as a threat.

The Hopi are inheritors of an oral tradition dating, at least, to 1000 CE based on living in concert with the values of humility, cooperation, respect, and universal earth stewardship. Tensions between collective and individual memory are a significant barrier to preservation of traditions, especially given the belief that no one person should “know all.” Clan secrets impact politics and social life of the tribe but cannot be shared between clans. Tribal values often conflict with, and are threatened by, dominant values of American society. Clashes between for-profit entrepreneurship and traditional Hopi values impedes effective economic development. Memories of white oppression and exploitation are also a factor. Return of families to tribal lands after years (sometimes generations) of absence has had an additional impact.

The authors are engaged in case study research to recommend a new tourism policy for Hopi/Tewa. This paper looks at how...
memory, tradition, cultural identity, and controversial pasts are affecting efforts by tribal members to develop viable economic projects for their benefit and the benefit of the Hopi tribe.

**COLLECTIVE MEMORIES AND TURBULENT TIMES: AN INTERNATIONAL COMPARISON**

Stefano Cavalli 1, Eduardo G. Guichard 2, Christian J. Lalive d’Epiney 1, 2, Aude Martenot 1

1Center for Interdisciplinary Gerontology, UNIVERSITY OF GENEVA, Carouge, 2Department of sociology, UNIVERSITY OF GENEVA, Geneva, Switzerland

Abstract: This communication focuses on the memories of the past that individuals of various age groups and living in three European and three Latin American countries have. What main socio-historical changes and events occurred during these persons’ life course do they retain as particularly striking?

According to the works of Schuman and colleagues, the major collective memories about the past are structured by age, and adolescence and early adulthood are the primary sources of historical memories. What happened during turbulent times? How a crisis shapes public memories, and in such a case, calls out certain memories while reducing the salience of others? Furthermore, do those events mark more particularly some generations (Mannheim) or do we observe in specific contexts the appearance of trans-generational collective memories? For the European countries of the old continent, did the 2008-09 economic crisis tend to give a shared dimension in the memory of the past? Besides, Latin American data allow us to investigate the impact of other crisis, which could be economic, political or some tragic periods characterized by military dictatorships.

Results are based on data compiled under the CEVi international research project – *Changes and Events across the Life Course* –, which focuses on the perception that adults from various countries have about their lives and about the societal environment in which they take place. The analysis regards here six countries: three from Europe (Belgium, Italy and Switzerland) and three from Latin America (Argentina, Chile and Mexico). Data were collected between 2004 and 2007 in Argentina and Mexico, and in 2009 in the other countries. In each country, a standardized questionnaire was submitted to about 650 persons of five age groups covering the adult life: 20-24, 35-39, 50-54, 65-69, and 80-84 years. Among others, participants were asked to answer up to four major events or changes that occurred into their countries or in the world during their lives.

**DANCING THE PAST. THE CREATIVE POWER OF DANCE**

Anna Lisa Tota 1

1Dept. of Communication and Performing Arts, UNIVERSITY ROME III, Rome, Italy

Abstract: Can the body remember? Memory studies tend to focus primarily on memory as activity of the brain. The hypothesis that the body itself might be able to remember has been long neglected. However, there are some evidences according to which this hypothesis might be better highlighted. The first one has to do with memories of traumatic past, such as repressed memories (memories of sexual abuse retained in the body, for example). The second one has to do with memories of a specific set of movements. If one tries to play a song on the piano after ten years, at the beginning one will experience several difficulties and if one tries to “remember” at any cost, it will be almost impossible, but if one just let the fingers go on the keyboard, a sort of miracle will happen and suddenly one will remember how to do it. In that case it seems that the fingers can remember better than the brain. The same might be said in relation to several sport activities. In many cases we make the experience of being able to do sets of movements that we seem not to remember with our brain. Where has this memory been stored? Could we imagine that our bodies remember also what our brains forget? It is very difficult to raise the proper questions and to find the adequate answers in relation to this field, however the case of dance might help us to better understand if and to what extent the body is capable of remembering. The Sensitive Dance originated in 1990 from Claude Coldy’s meeting with two osteopaths Marie Guyon and Jean Louis Dupuy. The aim is to reach movement awareness through specific sets of movements done in living contact with nature’s elements (the sand of the seaside, the water and the waves of the sea, the olive trees, the trees of the forest, the sand of the desert). However, during the seminars in natural surrounding each dancer starts to dance his/her past. The creative movements of the dance seem to free the stored memories of the bodies, the traumatic ones first, and later the positive ones. The case study is based both on ethnographic observation and in-depth interviews.

**ETHNIC MUSIC IN PUBLIC MEMORY: BETWEEN AUTHENTICITY AND INTERPRETATION**

Viktoria Zilinskaite 1

1Institute of Sociology, Lithuanian Social Research Centre, Vilnius, Lithuania

Abstract: The presentation will analyse ethnic music in public memory. Public memory is important in identity processes, both planned and spontaneous.

Public memory in the presentation is analysed through its impact on ethnic identity that is constantly changing, acquiring new and subliming old features. The spirit of the time manifesting itself as public memory is suggesting interpretative structures for ethnic identities and cultures and framing them.

Nowadays ethnic music raises a lot of questions. What tunes do constitute ethnic music? What does make tune a part of ethnic music of particular ethnic group? Is it particular harmony of tune? Is it age of a tune and historic truth about its emergence? Is style of performance and interpretation essential for ethnic music?

Age of performance, recording and copyright questions asks about possibility of life of ethnic music:

- Death of ethnic music, or at least imprisonment of it in old records and styles of performance, versus flexibility of interpretations, whether it is based on rock, jazz or classical harmonies;
- Spontaneous daily expression versus professional on-stage or recorded performance;
- Authorless tunes versus copyrighted contemporary compositions, based on ethnic harmonies.

Presentation will analyse criteria of ethnic music in public memory and compare them with folk and ethnographic music criteria. Ideological aspects of use of and understanding about ethnic music in

*Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times*
identity creation through public memory will be reviewed through analysis of public and scientific discourse. Analysis of use of ethnic music for identity presentation purposes will be compared to development of musicological terms.

**TRACES AND STORIES OF THE GDR-PAST IN THIRD PLACES. AN ETHNOGRAPHICAL ANALYSIS**

Barbara Grüning¹

1University of Bologna, Bologna, Italy

**Abstract:** Aim of the author is to explore the relation among ‘third places’, sociability and memory, by studying the forms of memory on the GDR-past. Thus the empirical analysis focuses on some ‘third places’ in Berlin such as pubs, taverns, inns, parks: places of informal relations and of familiarity among strangers where the ‘We’ here created is often contingent.

Then, what is to consider is: first, how third places store the material and symbolical traces of the GDR-past; second, how their forms of sociability can influence the narratives on the East German past and on the reunification. The relevance of these questions is also related to the main interpretation of the ‘Ostalgia’, the nostalgia of the East, as a form of memory that tends to edulcorate the GDR-society and that constitutes the basis for constructing an exclusive eastern German identity.

Thus core of the issue is to understand: first, whether third places mark a need of eastern German of narrating about their past in front of a feeling of unacknowledgement; second, whether they favor the construction of identities and memories crystallized in the past or of dialogical memories and identities opened to the present and to the foreigners.

**ART AND COLLECTIVE MEMORIES: HOW TO DEAL WITH MEMORIES OF WAR?**

Nadia Capuzzo Derkovic¹

¹Sociology, UNIVERSITY OF GENEVA, Geneva, Switzerland

**Abstract:** In turbulent times, such as in post-war societies where political institutions have to deal with transitional justice following crimes against civilians, human rights violations and war, how arts can reinforce, or not, the process of reconciliation? Considering monuments as art products, the message they deliver goes far beyond the society they concern. Having this in mind, many monuments and memorials rather glorify a selective interpretation of violent events and therefore foster a fragmented collective memory. On the other hand, some monuments produced by contemporary artists act as counter power (Braço Dimitrijevic, Nebojsa Seric-Soba, etc.). My paper will focus on the role art products such as monuments and memorials in Bosnia-Herzegovina play in the establishment of, either a shared public memory or, either strengthen the fragmentation of collective memory. The role of public memories in constructing national identities will also be discussed through other examples of artistic forms performing memory of the war in Bosnia-Herzegovina and the siege of Sarajevo.

**CAN A PHOTOGRAPH CHANGE ONE’S MIND: ATTEMPTING TO GENERATE DIALOGUE THROUGH ART**

Idil Cetin¹

¹GALATASARAY UNIVERSITY, Istanbul, Turkey

**Abstract:** *Face2Face* is a photographic project realized in the Middle East in 2007 by JR, a photographer of French origin and Marco, a technology consultant of Tunisian origin. The project consisted of taking the portraits of Israelis and Palestinians doing the same job, printing them in huge formats and putting them in various places on both Israeli and Palestinian sides. The motivation of the artists to produce such a project emerged out of their belief that Israeli and Palestinians looked very much similar to each other, “like twin brothers raised in different families”, although they were not aware of that. The artists thought that the realization of such a similarity could change the way they thought about each other and could motivate them to enter into dialogue with each other.

This article will set this specific photographic project as its starting point. It will focus upon the conception of dialogue of *Face2Face*, whose condition of possibility is based upon the idea of seeing the other from a new perspective, that is, realizing how similar they are in reality. The project problematizes the construction of the other, but not the self. However, it is through interrupting with the self-identicalness of the subjects that a dialogue can occur between the two communities. To be able to emphasize this point, I suggest to turn to two philosophers, that is, Mikhail Bakhtin for the concept of dialogue and Emmanuel Levinas for the concept of face-to-face. In Bakhtin’s dialogue and in Levinas’s face-to-face, the self is conceptualized in terms of being open to the other. This openness is realized by interrupting and disrupting the self. Both in Bakhtin and Levinas, the self is constructed through the other and, in fact, due to the other. It is by granting priority to the other in the identification of the self that the privilege of the self is broken and the openness to the other is obtained. It is because of this neglect of the necessity to disrupt oneself that the idea of dialogue in *Face2Face* remains simplistic. In order to be able to transform the way the Israelis and Palestinians identify themselves, I will argue, this photographic project should have taken into account various dimensions which make Israeli and Palestinian identity, such as their collective memories and the issues of diaspora, home and nostalgia.
OUT OF THE SHADOW OF THE FORMS. PUBLIC MEMORY AND THE PROBLEM OF COMMEMORATIVE RITUALS

Luca Mori¹, Lorenzo Migliorati¹

¹Tempo, Spazio, Immagine, Società, Università di Verona, Verona, Italy

Abstract: The sociological analysis of the commemorative practices represents nowadays a well defined branch of research into the wide and many sided fragmented area of memory studies. Much of the work conducted in this field has followed Emile Durkheim theory. Nevertheless, in the course of the last two decades, scholars have tried to move away from the Durkheimian orthodoxy in order to find more appropriate ways to account for the complex variety of the commemorative universes. The most valuable efforts conducted in this direction are represented by the concept of multivocal commemoration, elaborated by R. Wagner-Pacifici and B. Schwartz in their famous article on Washington D. C. Veteran’s Memorial Monument, and by the concept of fragmented commemoration, developed by V. Vinitzky-Seroussi in her study on Rabin’s death commemoration. Drawing on some empirical stimuli provided by an on-going research on the commemoration of the partisan victims of a massacre perpetrated in the village of Cornalba (northern Italy) by a fascist militia, our paper tries to show that multivocal and fragmented types of commemoration don’t fulfill the typology. In our opinion there is still room for another kind of commemorative rite that we would define conflicting commemoration. That is a specific kind of ritual that witness the emergence, during its own execution, of two or more conflicting representations of the same past that it tries to commemorate. In describing this kind of commemoration, we argue that it is more likely to show up in societies marked by pasts of deep social divisions, where a full reconciliation is still not accomplished. Once adopted the conflicting commemoration perspective, it becomes possible to critically address the theory of public memory proposed by J. Alexander and by the so called ‘cultural trauma’ theorists. More explicitly, the cultural process aimed at constituting a public memory that Alexander has called ‘spiral of signification’ seems to be always a one way trip, with too little room left for negotiations, revisionisms and conflicts. To the contrary, our paper concludes that the social sphere of public memory could represent an instable and uneven terrain, where the representations of the past apparently shared by the whole society can be suddenly called into questions by different social groups.

FACING THE 1980 COUP D’ÉTAT IN TURKEY AND PUBLIC MEMORY: TV SERIES NAMED CEMBERIMDE GUL OYA

Zeynep Matik¹

¹Journalism, ANKARA UNIVERSITY FACULTY OF COMMUNICATION, Ankara, Turkey

Abstract: The social change process following the 1980 coup d’etat is one of the most significant topics which have been studied from social, political and economic perspectives in Turkey since 1980s. Executions, tortures as well as unidentified murders, following the 1980 coup d’etat, lead to a substantial social trauma in Turkish society. However, this dark side of the history disappeared from the collective memory of the great majority of the society due to the “forgetting” and “suppression” policy of the Turkish state. Recently, some policies of confrontation with the past seem possible in Turkish society. TV series is among the most important arena in which we can follow the repercussions of this confrontation with 1980 coup. The TV series named “Cemberimde Gul Oya”, broadcasted on the TV station Kanal-D in the 2004–2005 seasons, could be seen as one of the interesting example of this confrontation and new “culture of remembering/recalling” in Turkey.

The goal of this paper is to analyze this TV series with a reference to concepts like collective memory, forgetting and remembering. The textual analysis of this series would be carried out within the context of construction of social memory of 1980 coup d’eta in Cemberimde Gul Oya. While analyzing the text, the specific role and function played by the remembering and confronting with the trauma will be evaluated. It is argued that confronting with the past necessitates a kind of culture of reminding/recalling. Hence, main objective of this study is related with the assessments of the reflections of the past events and culture of remembering in this TV series. It will be discussed that whether remembering via TV series could also be evaluated as a political action or not?

IMAGES OF THE PAST ON SCREENS AND STAGES

Katharina Niemeyer¹

¹Master Media and Communication Studies, Geneva, Switzerland

Abstract: Remembering events – shaping history and memory on screens and stages. The aim of this paper addresses primarily the question of the use of past events (fall of the Berlin wall and September 11) in the “present” time. Based on my former PhD work (From information to history – Television news between the fall of the Berlin Wall and September 11) this paper will point out the shift from television news images to other forms of cultural expressions (television series, arts, exhibitions).

• In which way can we observe a new montage of the memory-images in another audiovisual context (films, series)?
• The performing arts, how do they refer to the past events by a new creation process?
• Can we observe a specific remembering bringing together media and work on the stage? Which similarities and differences in the way of presenting past events can be noted?

The results of our research will be confronted with theoretic works (Maurice Halbwachs, Paul Ricoeur, Henri Bergson and Andrew Hoskins) and extended to a special reflection on the link between (media-)events and further mediated ways of remembering.

SYNCHRONICITY WITH MUSICIANS: COLLECTIVE MEMORY AND CONDUCTORLESS ORCHESTRAS

Danilo Chaib¹

¹Equality Studies Centre - School of Social Justice, UNIVERSITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: This paper presents a meaningful coincidence – Jung’s so-called synchronicity. Musicians in different continents are presented as taking similar paths in going against the archetype of the traditional orchestra with conductor, deconstructing the Myth as represented by the figure of the conductor. Four orchestras from Madrid, New York, Rio de Janeiro and Moscow have all performed...
without a conductor and bring to the collective memory a critique of the musical archetype of capitalism: The Symphonic Orchestra.

The traditional orchestra resembles Weber’s symbol of a bureaucratic world - the Iron Cage. It has been characterized as a site for the negation of the autonomy of the worker, resembling a Fordist factory. The idea of the invulnerability of the conductor as Myth is necessary for the construction of such an archetype. Adorno claims that orchestras will always need an individual leader and that, furthermore, orchestral musicians will always be negligent and intellectually deficient and, therefore, will never develop a fairer solution.

This study challenges Adorno’s theory arguing that synchronicity of critique is happening as a reaction to the collective memory in the form of orchestras without a conductor. The ‘conductorless orchestra’ is seen as a way of liberating musicians from the oppression suggested by the paternalistic and dictatorial figure of the conductor.

The first and oldest such orchestra is the Russian Persimfans, which only lasted from 1922 to 1932. Only in 1972 would another orchestra again dare to criticize the archetype imposed by the mythical figure of the conductor, and that was the Orpheus Chamber Orchestra. Synchronicity happened as no musician in Orpheus knew about Persimfans. The third orchestra, BandArt, has professional musicians from a number of different traditional orchestras all over Europe gathering together once in a while to play without conductor. Again the study explains their meaningful coincidence as they had no contact from Orpheus. The fourth orchestra is OrchestraRio, from Rio de Janeiro, where musicians seek solutions in a competitive environment where the conductor is seemingly invulnerable, even to the point of being supported by the government. Following the conduct of extensive interviews and research this study concludes that synchronicity is happening and transforming the established, collective musical ensemble memory.

WOMEN AND COPING WITH THE PAST IN NEW TURKISH CINEMA

Ozlem Ozdemir

Radio Television and Cinema, ANKARA UNIVERSITY FACULTY OF COMMUNICATION, ANKARA, Turkey

Abstract: Examples of Turkish Cinema in those day offers new opportunities in terms of remembering events occurred in the past. It is difficult to say that whether these events will lead to social confronting with the past or not in Turkey yet. Especially, films, dealing with the past events that related with minorities, and produced by woman directors, brings to mind the question whether woman directors establish a different relation with the past from man ones. It is possible to the declare that confronting with the past and society could open the way for living in a human way rather than choosing and judging the victims for national modern subject, which is determined by process of forgetting and remembering. Women are leading that kind of process in today’s Turkey by their novels, cinema films and research books.

When the examples of Turkish Cinema in the last period are scrutinized, it could be argued that matters such as migration, barter, and minority’s experiences of these events have stayed at centre. Meanwhile, the characters of these films are constructed around remembering and forgetting, so these films recalls past events, which dominant ideology has attempted to surpass in social memory for a long time, to spectators. They also inform people who do not have any knowledge about these events. Consequently, it can be said that these films reconstruct these events in the course of this knowledge transmission at the same time.

In this presentation, after mentioning the difference between history and memory, and discussing where memory differs from history, women’s problem laden ties with the national identity and its consistent story will be emphasized. Hence, women’s relation with memory, which has a cultural and social side, will be illuminated with a special reference to films directed by women. Moreover, what memory means in the resistant sides of “crude” material of history, which shields different narratives and possibilities of alternative modes of remembering, will be concretized.

POLITICS OF FORGETTING AND CONFRONTATION WITH THE PAST: SEPTEMBER 12 COUP D’ETAT IN TURKEY

Gamze Polat1, Demet Sayinta2

1Journalism, ANKARA UNIVERSITY FACULTY OF COMMUNICATION, 2Sociology, ANKARA UNIVERSITY FACULTY OF LANGUAGE, HISTORY AND GEOGRAPHY, Ankara, Turkey

Abstract: One of the depressions prevailing in modern societies is the collapse of transferred experience. This collapse finds its symbolic expression in the psychological depression brought about by World War I and the disengagement of amnesic soldiers and individuals from their mental and societal universe. One of the results of the so-called symbolic expression was collective memory become a part of life as a point of resistance against this collapse. The memory which we presume to be the history of individuals is, at the same time, the history of the society encompassing the individual. In this context, both history and memory constituted the past, but with the initiation of national formations, a past was created out of the need to create glorious histories and has been termed as “memory” since it was left out of fiction of nation. Finally, the endeavours of memory to attain visibility were faced with constant obstacles. Specifically, various examples can be given around the world as the deletion of “collective memories”, witnesses of reality under a phase of policy pursued with the aim of effacing (making the public forget) the unrighteous atrocities imposed as a result of totalitarian political regimes. One of these examples is the Coup d’état of September 12, 1980 in Turkey.

September 12 is one of the most traumatic periods of modern Turkey since it is when especially leftist ideologies, memories and identities were erased/suppressed via the oppressive regime and politics of forgetting. Witnessing executions, tortures, exiles and missing persons, all were erased from the memory of the society and a different past was constructed through policies implemented for this end in later years. Since the society, forgetting what happened, could not undergo a “confrontation” even today, it could neither overcome the trauma of September 12, nor attain societal and ideological freedom. This study, with an elaboration of memory and history, will try to open a window to confront the past by addressing and relating the 1980 period, politics of forgetting and the inflicted trauma through the witnesses of the Coup d’état victims.

QUESTIONING RECONSTRUCTED REALITY: 6-7 SEPTEMBER 1955 EVENTS IN THE TURKISH COLLECTIVE MEMORY
Duygu Onay Coker
1
1Communications Faculty/Journalism, ANKARA UNIVERSITY, Ankara, Turkey

Abstract: The destruction and looting of the property of the non-Muslim minorities living in Istanbul in 1955 is known as the “6-7 September events” in Turkish collective memory. In this paper, dynamics of distortion and reconstruction of the collective memory regarding these events in the Turkish press and the possibility of coming to terms with it 54 years later are discussed in two parts.

In the first part, selected newspapers will be analyzed for their perspectives on the events and reconstruction of the events and dynamics of distortion will be empirically discussed. The meaning of non-Muslim minorities for these newspapers, the tendency for memories to become vague, reinterpretation to tend the present, compliance with social experiences and conventionalized through the constraints of storytelling in terms of “6-7 September events” will be discussed.

In the second part, the possibility of confrontation in the collective memory that was constructed with distortion dynamics will be studied. To analyze this, the film “Güz Sancısı (Pain of Autumn)” by Tomris Giritlioglu will be discussed to confront the history of “6-7 September events”. The analysis will concentrate on the sociability and interactive recollection of memory, its processing with repetition and review, its selectivity and its tendency to forget something else to remember another thing. The film will be analyzed in terms of Nietzsche’s and Levinas’ perspectives of history where according to Nietzsche history must not be idolized and should be analyzed with critical respect and where according to Levinas responsibility is very important for collective memory.

REMEMBRANCE OF THE 1980 MILITARY COUP D’ETAT IN TURKEY

Elifcan Karacan
1
1Sociology, SIEGEN UNIVERSITY, Köln, Germany

Abstract: After the military coup d’etat in 1980 in Turkey juntha regime and the following government of 1982 have established new institutions to re-structure the cultural and social life in Turkey. The legal sphere was re-organized by the new constitution, the educational life was completely changed and controlled by the higher education institute and neo-liberal politics were adopted and applied in regard to accommodate Turkey into new world order. Finally the cultural life became one of the key issue for the new regime to be re-constructed in regard to re-construct past. The most obvious changes were the banings on literature, music, films and TV programs. However within past thirty years the arrangements on cultural life became more visible. The usage of the language, images in the public sphere, the turn of space were key elements of the process of reforming cultural life. In my presentation examples from films and TV serials based on the 1980 coup d’etat I will discuss the changes in cultural life after the 1980 and the practices of remembrance/forgetting of the past.

THE POSSIBILITY OF COPING WITH THE PAST IN TURKEY: THE DERSIM 38 MASSACRE

Bedriye Poyraz
1
1Journalism, ANKARA UNIVERSITY FACULTY OF COMMUNICATION, Ankara, Turkey

Abstract: The Turkish Republic, as a national state, has been successful in ignoring the sins of its past and has remained proud of its history until recent years. In this context, the relation with the past has been forgotten and past tragedies suppressed; it is even possible to say that this attitude of forbidding accurate historical remembrance became state policy.

However, as a result of identity struggles, it was revealed that the nation state has a dirty past and that some national heroes who were actually criminals. Thus, the Turkish Republic has, slowly and involuntarily, started to come to terms with the past.

In this study I will try to analyze the Dersim 38 Massacre that was planned and implemented by the state. In the early period of the national state, the Turkish Republic’s attitude to Dersim was to suppress and forget the massacre, even defining it as a rebellion. Although there is a determined state policy to ignore the Dersim 38, a speech last year by one of the nationalist parliamentarians made a huge blunder that was reflected in the public sphere with a bang. This case has been defined by the Dersim people as serendipity which started to move all of society, politicians and the media to account for the past. I will try to analyze this case through the media.
RS 10 Socio-Anthropological Approaches To Transnational Migrations

BEING HERE OR BEING THERE. FORMS OF TRANSMISSION WITHIN MIGRANTS’ FAMILY ARRANGEMENTS

Andreas Oskar Kempf

1Department of Sociology, GOETHE UNIVERSITY FRANKFURT/Main, Frankfurt/Main, Germany

Abstract: Since the collapse of the communist regimes, migration flows from Eastern Europe have increased. Simultaneously, constantly new patterns of migration have emerged over the last twenty years that quite substantially influenced migrants’ family relations. While at the beginning of the 1990s mobility had been highly regulated, today, due to the removal of visa regulations and the EU enlargement process migrants from Eastern Europe oftentimes circulate embedded in strong and durable social networks between their country of origin and their country of destination. As a result different family arrangements have emerged.

The question I would like to deal with in my presentation is whether these different family arrangements simply evolve out of new structural conditions of migration, namely modified political and juridical frameworks of mobility and crossing borders, or in how far they arise due to different forms of transmission? Going abroad as a parent (and at the same time being a child) and feeling the need to follow as a child, just to give one example, might be considerably a consequence of what has been passed on and how it has been (re)interpreted.

After intensive field research in a Romanian village as a starting point of close network migration to Italy I would like to focus in my presentation on the underlying subtext of migration with regard to transmission. On the basis of multi-sited and longitudinal field research in the country of origin as well as in the country of destination living within several families conducting biographical narrative interviews, additional, semi-structured interviews and participant observation I would like to present various dynamic and on-going processes between the different generations of migrant families oftentimes being reflected in migrants’ family arrangements. As a result, I attempt to show the dynamic interplay and interconnectedness inherent to the migration process among individual biographies, family strategies and their narratives and family configurations between the context of origin and the context of destination.

NARRATIVES OF TRANSNATIONAL MOTHERHOOD IN ROMANIA

Viorela Ducu

1Sociology, BABES-BOLAY UNIVERSITY, Cluj Napoca, Romania

Abstract: This paper will analyses 21 narratives of transnational mothers from Romania generated on the basis of 31 individual and 6 group interviews including 35 respondents (transnational community members, key persons, transnational family members).

Even though the narratives of migrant mothers seem similar, all of them having the same goal, to migrate in order to financially support their families and making efforts to fulfill their role as mothers, there are differences in their life experience that offer new information on what it means to be a migrant mother.

These narratives reflect the following: the role migrant mothers play in home communities; their confrontation with the negative discourse that accuses them of abandoning their children at home; the educational support they offer their children; the role of “non-migrant” women in transnational families in providing care for children; the way transnational relationships manifest themselves in these families.

Taking the model of active transnational family relations proposed by Balassar et al (2007) as a starting point, using the idea of displaying families proposed by Finch (2007), this paper will explain the way Romanian families having transnational mothers function.

These families are simply a type of family, beside many others, with upsides and downsides, one that is however in the phase of rejection within public opinion in Romania, together with other “new” family types: families with lone mothers, ethnically mixed families, homosexual families. Indeed, if we encounter tolerance of different degrees towards other forms of transnational families (ones with migrant adult children, or a migrant father), for transnational motherhood tolerance is low, due to the expectation of Romanian society that mothers permanently stay with their children.

TRANSFERS ON BUMPY ROADS—FORMS OF TRANSNATIONAL CARING AMONG SRI LANKAN MIGRANTS IN NAPLES, ITALY

Lena Näre

1CEREN Swedish School of Social Science, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: In the literature on transnationalism one of the most common metaphors to describe transnational practices is ‘flow’ (of goods, money or communication) (see e.g. Basch et al. 1994: 28). However, when we look at transnational practices in the concrete forms that they take, we notice that there is often very little that flows in real life. On the contrary, transnational practices are often costly, slow, involve physical effort and the goods and money that travel between countries easily get lost, stolen and so forth. The metaphor of ‘flow’ reflects the celebratory tone common in much literature on transnationalism. Instead of using the common metaphor of ‘flow’, I prefer to evoke the notion of ‘transfers on bumpy roads’, as these practices are by no means easy and immaterial as the metaphor of ‘flow’ denotes. From this perspective, the proposed paper looks at various forms of caring among Sri Lankan transnational migrant families residing in Naples, Italy and in diverse locations across the globe. Drawing on the typology of transnational caregiving proposed by Baldassar et al. (2007: 80–100), the paper discusses different forms of transnational care in Sri Lankan families, namely 1) economic and material support, 2) emotional and moral support, 3) practical support 4) personal hands-on care, and finally as an addition to Baldassar et. al.’s typology 5) ritual and
religious care. The paper is based on an extensive, 18-month field work conducted in Naples in 2004-2005.

"WILL YOU PREPARE GEFILLTE FISH FOR CHRISTMAS?": PARADOXES OF LIVING IN SIMULTANEOUSLY CONTESTED "SOCIAL WORLDS" OF EX-SOVIET JEWS IN GERMANY

Julia Bernstein

1 Department of Comparative Educational Studies, Cologne University, Cologne, Germany

Abstract: The paper concentrates on challenges and contradictions of multiple collective identities of Russian-speaking Jewish migrants in Germany. The main questions are how do migrants cope with given constraining conditions of inequality and different constructions of social worlds, which clash in their transnational biographic experiences? What individual strategies do migrants in Germany develop combining contradicting requirements in order to be loyal to different narratives?

Russian-speaking Jews in Germany do not “burn their boats” with the original society as it was often assumed through the Kontingentflüchtlinge status (refugees) in Germany. Rather, migrants as active, creative social agents maintain intensive networks and develop creative transnational spaces.

Transforming and performing their multiple, fragmentary identities in their everyday life Russian-speaking Jews search for their social recognition and participation in dominant discourses in Germany. Personal and collective affiliations are not only created and modified through verbal expressions but become visible in material culture used by migrants in each context. Based on extended cultural anthropological research[1], this paper reveals multiple affiliations and coping strategies of contradictory narratives as perceived, interpreted by participants as central research actors in their everyday practice, verbal expressions and food consumption in Russian food stores. I will particularly analyze the complexity and controversy of senses of home and homelands as they are created in transnational practice through exposure to different national narratives and images combinations in the food consumption of migrants.

[1] This paper is based on my cultural anthropological PhD work entitled “Food for Thought. Transnational Contested Identities and Food Practices of Russian-speaking Jewish Migrants in Israel and Germany”, Campus Verlag 2010.

DOING FAMILY IN TRANSNATIONAL SITUATION. THE IMPORTANCE OF CO-EXISTENCE AND TERRITORIALITY

Cédric Duchêne-Lacroix

1 Institut für Sociology, UNIVERSITY OF BASEL, Basel, Switzerland

Abstract: Si l’institution familiale reste centrale dans l’existence des individus en situation transnationale, sa cohésion ne va pas de soi, elle devient un problème d’intégration communautaire. En s’appuyant sur un modèle analytique en quatre dimensions (réticulaire, positionnelle, informationnelle et identitaire), la contribution proposée prend le contre-pied de la thèse de la déterritorialisation liée aux migrations transnationales, en pointant l’importance et la diversité des inscriptions proxémiques et territoriales dans la production de la famille transnationale. Le propos s’appuie sur les résultats empiriques d’une enquête sur la population française résidant à Berlin.

EDUCATIONAL CHOICES OF MIGRANT FAMILIES IN CYPRUS: THE ROLE OF HIGHER EDUCATION

Manto Papadopoulou, Iasonas Lamprianou

1 Department of Social and Political Sciences, UNIVERSITY OF CYPRUS, Nicosia, Cyprus

Abstract: According to official statistics, migration is one of the most important factors behind the increase of the population in Cyprus. The Ministry of Education is setting up mechanisms by which to support the children of immigrants, facilitate their access to education and increase the retention rate. However, these efforts do not necessarily yield a higher chance for immigrants to obtain access to Higher education.

The paper is based on an on-going empirical sociological research exploring the role of immigrant families when they structure the educational choices of their youngsters at all levels of the educational system in Cyprus.

Quantitative data are being collected about the number of immigrant dropouts from the educational system, at different levels of education. The research also focuses on the important transitional point where the youngsters have the opportunity to progress to Higher education. In-depth qualitative data from ethnographic fieldwork are also analysed in order to identify the role of the cultural capital and the social capital of families regarding educational choices at all levels of education – but especially at the transitional point from the upper secondary to the Higher education.

Although the data collection and the data analysis has not completed yet, we anticipate that our final results will be ready for presentation by June. This paper could be presented in French language.

INTERGENERATIONAL TRANSMISSION IN GLOBAL NOMADS’ FAMILIES.

Agnieszka Ewa Trąbka

1 Institute of Sociology, JAGIELLONIAN UNIVERSITY, Kraków, Poland

Abstract: According to D. Pollock global nomads (or Third Culture Kids) are people, who have “spent a significant part of their developmental years outside their parents’ culture. The third culture kid builds relationships to all the cultures, while not having full ownership in any”. The concept was coined in ’60, but the phenomenon is not new – people of certain professions have always moved in the frames of their work, and often their families have accompanied them. Yet it seems, that nowadays this phenomenon is getting more and more significant. That is why I decided to devote my research to TCKs. In the frames of my research I conduct biographical, narrative interviews, since I am interested in processual, narrative dimension of their identity and continuous reinterpretation of their past and present situations as well as in the strategies they plan to implement in future.

I this paper I would like to concentrate not only on TCKs, but also on their families and specific problems with intergenerational transmission they face. First of all, if children are brought up outside parents’ country parents usually try to transmit them their homeland’s culture, they teach them a language etc. The problem is
whether children will accept this culture as their own and whether the image of homeland they have from their parents is adequate. If it is not, and often it is the case, they have serious adaptation problems once they come back “home” with their family. They are “hidden immigrants” – theoretically they are at home and should not experience serious adaptation problems, but in fact this country may be almost as strange to them as any other country. Secondly, in global nomads’ families we can observe transmission of certain values and attitudes. I refer here to multicultural competences, tolerance etc. Subsequently I would like to answer the question whether parents’ mobile lifestyle is transmitted – my preliminary results suggest that very often TCKs choose for themselves a career demanding mobility. I have to mention however, that parents’ lifestyle may as well be rejected and children settle down somewhere. Finally I would like to shortly talk about TCKs’ relations with grandparents and discuss if we can observe any type of intergenerational transmission here.

During my presentation I will try to answer questions mentioned above discussing results of the interviews with TCKs I have conducted.

WOMEN’S LIVES BEHIND A MIGRATION STORY: THE CASE OF FATSA - TURKEY

Esra Demirkol

Abstract: Globalization is shaping today’s world cultural, social, political and economic structures. Globalization has significant role on changes in consumption patterns, cultural life and households. In that sense, migration movements could be seen as one of the tangible result of these changes which affects both men’s and women’s life dramatically. On the one hand, globalization makes migration more possible, on the other hand, migration affects the family decisions and relationships. Besides, migration brings separation to family. There is always somebody who stay behind and tries to keep in touch with the migrated one. Generally, the main attention is given to migrants themselves, within the understanding of globalization. However, the effects of migration on local lives gain importance when it is looked at how migration affects those who stay behind. The migration of men has crucial effects on the lives of women who stay behind. The changes of the women’s life after their husbands’ leaving is not only concentrated on the increase of economic well-being, but also the self-representation of women and their relations with socio-cultural environment. In this presentation, it is going to be discussed an ethnographic fieldwork from Turkey. Although, Turkey is known as one of the leader country sending migrants to Europe, especially to Germany, there is another country, which Turkish citizens have migrated within last two decades. This country is located totally opposite side to Europe both physically and culturally: Japan. Fatsa is a town, located in Black Sea Region of Turkey. The main economic activity in Fatsa is hazelnut production. However, within last two decades, families cannot earn much from hazelnut production and in addition to this, with economic crises in Turkey, families’ economic well-being has become worse. Because of these reasons, at the end of 1980s, the migration from Fatsa to Japan has started. Now, it is estimated that in Japan there are four thousands Fatsa people living. As it mentioned above, men are the ones who migrated to Japan and their wives are the ones who stay behind mostly. However, women are as important as men to understand this migration process. In this study, it is aimed to understand how women’s socio-cultural roles, economic well-being and self representations have changed after their husbands migration.

ELEPHANT IN THE ROOM. IMMIGRANT CAMPS IN SPAIN

Carolina Puga

1Grup Copolis, UNIRSITY OF BARCELONA, Barcelona, Spain

Abstract: Immigrant detention camps have existed in Europe for more than 25 years and currently there are over three hundred throughout the continent. In Spain, these institutions emerged in 1985, and currently add up to nine. The deprivation of freedom for people who have not committed a crime, presents great contradictions for rule of law, and is one of the most visible faces of social control related to the movement of people. Little research has been conducted on this topic in the field of Sociology of Immigration. Data available on this topic is scarce as gaining access to institutions is difficult. This article attempts to get a closer look at detention camps from a sociological perspective. Current theory is questioned to find out what can be considered an immigrant detention camp. Through a review of classical and current Social Science theories, I define what a detention camp is and outline their purpose. I analyze current data to see what characteristics detention camps have in Spain. By researching the trustworthy information available, I outline the most important characteristics of detention camp operations and propose a typology for detention camps in general. Finally, through ethnographic work performed at a detention camp in the Canary Islands, the question of what it’s like to live inside a detention camp is explored with detainees. The total institution and disciplinary character of the detention camps is demonstrated, as well as the lack of regulation, and the stress that is created by the uncertainty of living inside the institution.

ENGENDERING ILLEGALITY IN MIGRATORY CONTEXT: THE CASE OF AFRICAN MIGRANTS IN PORTUGAL

Tatiana Matos de Jesus Ferreira, Marzia Grassi

1Institute of Social Sciences - University of Lisbon, 2ISRTE - Lisbon University Institute, 3Institute of Social Sciences - Uniervo of Lisbon, Lisbon, Portugal

Abstract: This paper aims to discuss how gender shapes the migratory experience of individuals. In the context of an ongoing research project “Migrant Trajectories of African Origin, Illegality and Gender” coordinated by Marzia Grassi at the Institute of Social Sciences –University of Lisbon, we seek to analyze how the legal status in the different phases of the migratory process produces different conditions in the access to labor market and citizenship rights, and “how, when and why does it make a difference being male or female” (Eckes e Trautner, 2000:10) illegal migrant. Furthermore, we will discuss how the different experiences potentially affect the family dynamics and could be reproduced among the different generations. The discussion is based on the analysis of 50 in-depth interviews, carried out in Portugal to Portuguese speaking African countries migrants.

THE CONSTRUCTION OF MEANING IN REFUGEES’ MIGRATION STORIES
Marie Schneider¹, Helmut Willems¹
¹FLSHASE/INSIDE, UNIVERSITY OF LUXEMBOURG, Walferdange, Luxembourg

Abstract: As the numbers of international refugees rise the requirements for asylum seekers to get acknowledged as political refugees' increase. In order to meet the asylum norms refugees are asked to present displacement stories which are true, authentic and detailed. The underlying thought is that if someone has been a victim of violence and displacement it will not be a problem to give a detailed and exact report about what happened. But is that even possible?

Most refugees have been in situations where they had to fear for their life, where they have been hurt and violated and often have seen how close relatives or friends have been killed. So when they (can) tell their displacement stories they speak about violence, death and loss.

Given the fact that a lot of them are traumatized by what they have lived through it is not surprising that their narratives are filled with contradictions, interruptions and fractures. Most of them are not able to present their experiences as systematically self-contained life stories.

Refugees' difficulties of telling coherent, systematic and plausible stories about their life and recent experiences do not only show during the asylum hearings but they are also part of their everyday interactions. Refugees construct their narrated life stories according to their individual adaptation and coping capabilities. Their narratives therefore have to be seen as important tools to create meaning in life situations which have to be characterized as unpredictable and open.

In our presentation we will point out important objectives for autobiographical oriented empirical studies with refugees. In a second step we will present the findings of an empirical study, focusing construction strategies and mechanisms of refugees' autobiographical migration history narrations. Thirdly we will summarize important starting points for further empirical investigations concerning the construction of meaning in refugees' autobiographical narration.

TRAJECTORIES OF INSTITUTIONAL VIOLENCE, MEANING PRODUCTION AND AGENCY: A STUDY ON BIOGRAPHIES OF PORTUGUESE IMMIGRANTS IN SWITZERLAND

Ana Isabel Barbeiro¹, Dario Spini²
¹Social Sciences Institut, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Drawing from the contributions of peace research, namely the concept of structural violence (Galtung, 1969), and from sociocology (e.g., Bourdieu, 1972; Goffman, 1961; Meyran, 2006), institutional violence can be conceptualised as a type of violence perpetrated in the name of institutions. It usually takes place in the context of organizations (schools, factories, hospitals, prisons, courts), creating or maintaining social injustice, and targeting specific individuals or groups, often on the basis of their social belonging (Barbeiro & Machado, 2010). The sociological studies on institutional violence usually focus on one type of institution; the aim of this study is to grasp the impact of this type of violence through the biographies of immigrants and across their contact with different institutions. Thus, we focus on the point of view of immigrants, namely their understanding of this type of violence, their perception of themselves as targets and the strategies they mobilise to cope with it.

Biographic accounts of Portuguese immigrants in Switzerland have been gathered through semi-structured interviews, using life-calendars as an additional research tool. Hence, narratives about specific life-events and trajectories within institutions could be related. Data analysis puts in evidence (1) the specific contents of institutional violence against immigrants within a life-course perspective; (2) the perceptions about perpetrators and their legitimacy; (3) the perception of oneself as a target and (4) the strategies mobilised to cope with institutional violence. Whether these strategies concern legitimization of institutional violence, collective actions against it or individual mobility, they can be related to migration projects and identify concerns. In this sense, the biographic approach showed to be of use to understand the psychosocial dynamics of legitimization and mobilization when individuals and groups are dealing with a social structure that treats them unfairly. In other words, this study allows identifying structural/institutional constraints to the life-course of immigrants, but also highlights their agency, as actors that develop social practices and cultural meanings in order to face these constraints and build their share of biographical auto-determination.

"LES MISERABLES" OF MODERN EUROPE AND THE PURSUIT OF HAPPINESS: INFORMAL MIGRANTS AND THEIR SELF-HELP STRATEGIES

Malgorzata Irek³
³COMPAS, UNIVERSITY OF OXFORD, Oxford, United Kingdom

Abstract: Research on migration usually explores the tragic elements of the human condition, casting the so-called 'undocumented, low-skilled migrant without language skills' in the role a subject deprived of agency, describing his hopeless, hard life at the bottom of the social hierarchy in a host country, where he is supposed to live in gloom and despair until the merciful state saves him from his misery. Since this migrant has illegal or semi-legal status, his self-help activities fall within informal sector, which is considered structurally inferior to the formal economy, and as a consequence they are patronized, disapproved of or criminalized. But it is through these informal activities that the migrant is able to survive, support his family, fulfill his ambitions, have a better life, acquire a higher status in both the new society and his home country, and achieve 'transnational' financial success. Based on longitudinal fieldwork with participant observation in Poland, West/East Germany, the UK and Spain, the paper will discuss the typical informal migrant biographies, focusing on success stories of migrant smugglers, prostitutes and illegal workers, their understanding of happiness as well as the popular self-help strategies that made their personal success possible despite adverse structural factors. On the theoretical plane, the presented examples of integration through informal channels, rather than through the institutional route, will point out the third option in the ever-popular debate between multiculturalism and assimilation, namely that of inclusion through exploiting exclusion.

BEING EXPLOITED VERSUS BECOMING SOVEREIGN: THE PARADOX OF TRANSNATIONAL MIGRATION OF
ELDERLY POLISH WOMEN WORKING ILLEGALLY IN GERMAN HOUSEHOLDS

Agnieszka Satola

Abstract: Shortly before or after retirement in Poland, a lot of elderly women come to Germany for domestic and care work. In this way, they begin ‘a new career’ at an age when one would normally receive a pension and take care of their grandchildren. They work mostly illegally but have a regular stay in Germany and commute between Poland and Germany in different rotating intervals with other Polish women.

As derived from the interviews carried out, their lives and work situation have two sides: on the one hand it is clear, that dependency, expropriation of identity, humiliation and exploitation in the work place cause unbearable suffering. On the other hand, it is evident how, in spite of restrictions, the self-organised forms of work brings about the ability to act and become sovereign. In this context one of the central questions is: what kind of processes emerge and correlate in this irregular work relation and how Polish migrant workers cope or come towards these processes? Accordingly, we can assume that mainly two biographical processes of a women’s life cross and are dominant: the process of exploitation and the process of sovereignty. In my paper I will describe and analyse this paradox of processes, which develop in relation to the work and biography that occur at this age.

In general, we can say that labour migration does not only create the possibility for women to get out of their economic emergency situation in their home country. It also presents an adventure, which gives the women an opportunity to display their domestic and care competencies. This gives them a sense/feeling of fulfilment and changes their perception of their gender and family roles. The process by which they display their skills/competencies causes them to become distant from their own normative roles. With time their suffering become dominant due to their marginal position, exposure to exploitation, loneliness, isolation, inability to communicate, longing for their family and feeling of having lost time to develop their own identity. Finally, they develop different coping strategies to escape the situation of suffering that they are in.

The data collection was based on autobiographical-narrative interviews with elderly polish women, who work illegally in Germany.

CHINESE MIGRANTS IN ITALY: MIGRATION PATTERNS AND ENTREPRENEURIAL EXPERIENCES

Melissa Blanchard

Abstract: The Chinese have always played a leading role in international migration, but since the mid-nineties of the last century the Chinese emigrant population has increased and diversified. Over the past fifteen years the arrival of the Chinese in Europe has focused not so much on the traditional immigration countries (France, Holland, Great Britain), but above all on southern countries like Greece, Spain and Italy. In Italy, in particular, the presence of Chinese is far more complex and plural than the image that has been spread by the media and that raises public fears and concerns suggests. In the collective imagination, indeed, it is believed that the Chinese community is particularly closed and secretive, that migrants live and work on the margins of legality, exploited by their fellow countrymen and prey to ethnic mafia networks. Hence the Chinese embody all the fears and prejudices of the Italian population, exposed to contact with a community of people so “different,” coming from such a distant country. But what are these migrants really like? How do their lives unfold and what are their plans? What is their migratory experience and the relationship of this experience to work, and in particular to business?

On the basis of a socio-anthropological inquiry into Chinese entrepreneurship conducted in Turin (Italy) in 2010-2011, I will try to provide some answers to these questions. In particular, based on life and migration’s stories and on “business biographies” that I collected at the time of my fieldwork, I will attempt to analyze the reasons behind emigration, why emigration to Italy originates largely in one area (that of Zhejiang), and what role migratory chains play in determining new arrivals and defining job orientation. I will also examine the values and needs that underlie the very high “entrepreneurial vocation” of this migrant population, the objectives and strategies that underpin their business ethic, and whether the undertakings of Chinese migrants in Turin can be considered as ethnic business. I will also analyze how family businesses evolve, the role taken on by the second generation and how the varying degrees of integration of the different generations in local society affect business activity and the evolution of the original migratory project.

TRANSNATIONAL PRACTICES AS (COUNTER-)STRATEGY AGAINST DISCRIMINATION?

Susanne Becker

Abstract: In my paper I want to present some empirical data from a study in which people of the so called second generation of Turkish migrants in Germany have been interviewed. The empirical data showed the discrimination they face in everyday life and their transnational practices which could be seen as empowering or even as counter strategies against these experiences of discrimination. In my interviews two different ways of discrimination became relevant: Firstly discrimination through being marked as “the other” who doesn’t fully belong to Germany, secondly through non-recognition of their skills as cultural capital. I will argue that transnational practices can become a resource to compensate both types of discrimination.

To go beyond the classical perspective of assimilation and/or integration theories I applied a transnational framework to my research question and reconstructed the transnational practices of my interview partners in various fields of their lives on the basis of bibliographical interviews. In a second step I tried to work out in which contexts these transnational social practices become resources for the agents. Instead of regarding plurilocal practices as a lack of integration and judging this as a deficit, this transnational perspective allows seeing the potentials that lie in a plurilocal way of live. Although in my original research question on transnational social practices, discrimination did not play a major role, the biographical interviews taught me that I can’t analyze these social practices of a so called second generation of Turkish migrants in Germany without understanding the discrimination people face every day. In this perspective some of those transnational social practices can not
only be seen as a way of life but also as empowering practices or even as counter strategies against discrimination in Germany. In my presentation on the one hand I want to show the discrimination people face in their everyday life in Germany but also practices they come up with against this discrimination and the potential that lies in transnational social practices.

EMPRUNTS, REJETS ET RÉINTERPRÉTATIONS DANS LES MANIÈRES D’HABITER DES MIGRANTS ROUMAINS

Andra Letitia Larionescu (Jacob) 1, 2

1Sociology, BUCHAREST UNIVERSITY, 2Architecture, "Spiru Haret" University, Bucharest, Romania

Abstract: Le mouvement migratoire est un processus civilisateur important dans la transmission des innovations techniques, artistiques ou sociales, les éléments culturels se diffusant entre les sociétés aussi par le biais de la migration. Mais ces changements culturels se produisent par des filtrages et réinterprétations qui à la fin peuvent donner naissance à une nouvelle culture locale. Du point de vue de l’architecture, la manière dont on reçoit et intègre l’innovation par rapport à la tradition va générer des nouveaux styles et modes d’habiter.

Ces mécanismes d’assimilation et de résistance peuvent être appréhendés en décodant le langage des plans de maison et les autres traces matérielles, mais aussi les manières d’habiter, vues comme une « spatialisation des modes de vie ».

Notre question porte donc sur les traits culturels empruntés, adoptés ou assimilés - considérée par rapport aux références locales - qu’on trouve, après la chute du communisme, dans les modes d’habiter des migrants roumains issus du milieu rural.

Pour réfléchir à ce sujet, la recherche utilise une étude de cas d’un village roumain (Marginea), fortement marquée par la migration internationale. Notre cadre théorique et d’analyse s’appuie sur le croisement entre l’analyse socio anthropologique des processus migratoires et leur expression architecturale et matérielle.

En effet, la construction ou la modernisation d’un logement est une des principales finalités des stratégies migratoires dans l’espace rural, la maison étant un signe de prestige et d’ascension sociale, qui mobilise une forte proportion des transferts de revenus migratoires. Chaque ménage adapte son espace habitable pour le conformer à de nouvelles exigences et modes d’habiter. Ainsi, le cadre physique – qui inclut des éléments comme la maison et ses meubles, les annexes, les enclos, la cour – est modelé par rapport aux nouvelles valeurs, pratiques et styles de vie.

FEMMES MUSULMANES, VIOLENCES CONJUGALES ET APPROCHES FÉMINISTES INTERSECTIONNELLES : QUI PEUT DÉCIDER POUR QUI?

David Risse 1, 2

1École de service social, UNIVERSITÉ DE MONTRÉAL, Montréal, 2Université Laval, Faculté de philosophie, Québec, Canada

Abstract: Parmi les enfants des personnes immigrées de la seconde et de la troisième générations, de jeunes femmes maghrébines rencontrent des difficultés d’intégration socioéconomique et sociales spécifiques. Elles sont fortement invitées à paraître « libérées » – contraintes à se dévoiler – pour rester « intégrées », pour deve-

hir ou pour demeurer « indépendantes » ; quand elles ne sont pas forcées à être libres. Mais parfois, elles n’ont pas cette opportunité et elles en viennent alors à penser qu’elles ne peuvent pas opter pour un mariage mixte ou qu’elles sont condamnées à vivre un mariage forcé. À partir d’entretiens avec des femmes forcées à se marier et d’une auteure belge insoumise et dévoilée, il s’agira d’abord de voir pour quelles raisons une part importante de femmes musulmanes continuent trop souvent de penser que l’Islam n’interdit pas les mariages forcés et les violences infrasfamiales qui lui sont associées. Nous pourrons alors examiner les limites des avancées des théories et interventions féministes en matière de démythification de la violence conjugale envers les femmes musulmanes; d’une part, au regard d’analyses québécoises et françaises récentes à ce sujet et, d’autre part, à partir de parallèles possibles entre la situation de ces femmes et les femmes autochtones victimes de violence conjugale au Québec. Enfin, en articulant la question des représentations du mariage forcé chez les femmes musulmanes à celle des limites féministes à les changer, nous camperons une discussion critique sur la légitimité de l’approche féministe de réduction des méfaits pour ces femmes, sur les effets possibles de re-victimisation de ce discours dominant sur elles et sur la question de savoir pourquoi on parle tant des violences spécifiques de ces femmes et pourquoi ce ne sont pas plutôt elles qui parlent de leurs besoins réels et des modes d’intervention adaptés à leurs réalités.

HOME SWEET HOME? AMBIGUOUS REPRESENTATIONS OF THE HOMELAND AMONGST EAST EUROPEANS IN THE UK

Laura Morosanu 1, Eszter Szilassy 2

1Sociology, Politics and International Studies, UNIVERSITY OF BRISTOL, Bristol, United Kingdom

Abstract: Studies of migration often depict migrants as positively oriented towards their original homeland. Although they may prosper economically in the receiving countries, migrants continue to remain emotionally attached to ‘home’, a stance which is reinforced by repeated visits and investments in their place of origin. In this paper, we compare the experiences of Hungarians and Romanians in Britain in order to challenge this fundamental representation of the homeland as an idealised locus of belonging. Hungarians and Romanians are part of the recent East European migration to the UK, facilitated by the countries’ admission to the European Union. Unlike Hungarians who received free access to the labour market, Romanians face ongoing employment restrictions in Britain. Despite their more precarious situation, however, our Romanian participants, instead of expressing nostalgia towards the homeland, demonstrate a much more negative view which contrasts sharply with that of their Hungarian counterparts. We seek to examine the factors that produce a ‘good’ and ‘bad’ homeland in these two opposed cases. We interpret the different ways in which these migrant populations relate to their homelands in light of their relative socio-economic position at home and abroad, migration history, national self-image, and the context of reception. Hungarians entertain more conventional nostalgic feelings towards Hungary, idealise national and family values, and show a strong appreciation of homeland institutions. On the other hand, Romanian migrants voice a strong critique of the home-country, which revolves around a persisting lack of opportunities, deficient institutions and society, and a stigmatised image of Romanians circulating abroad. We further show how migrants’ transnational engagement
(through media, cross-border communication and visits home) may equally strengthen ideas of a ‘good’ or a ‘bad’ homeland, rather than univocally reinforcing ethno-national belonging. Revealing such ambivalent discourses adds more nuance to positive depictions of the homeland prevailing in current research.

LES STRATÉGIES DU RETOUR. ITINÉRAIRES ETHNOGRAPHIQUES DE FEMMES SÉNÉGALAISES.

Giovanna Cavatorta

Abstract: This contribution is issue of a research doctoral in course which is about to problematize the continuum « reapatriation forced – return voluntary » to a picture of ethnographic multi-situated between Senegal and the North of Italy. Many years after the effect of the Union Européenne, and its different states members have introduced, among the dispositifs de gouvernement of the migrations, of programs of reapatriation assisté.

Je prendrai en consideration un de cas rencontré pendant mon terrain: deux femmes sénégalaises, après avoir passé des années en Italie, sont retournées au Sénégal en mettant en place un projet de co-développement dans leur région d’origine.

À partir de leurs histoires de vie il s’agit de questionner les raisons de leur retour et le jeu des regards qui se construisent entre l’ici et l’ailleurs (Quiminal, 1991), juste au moment où ce qui est ici et ce qui est là-bas vient d’être bouleversé.

On considère que ça pourra soit contribuer à une meilleure compréhension des stratégies et tactiques transnationales qui les migrants mettent en place, voire les enjeux qui se construisent entre l’ici et l’ailleurs (Quiminal, 1991), juste au moment où ce qui est ici et ce qui est là-bas vient d’être bouleversé.

On considère que ça pourra soit contribuer à une meilleure compréhension des stratégies et tactiques transnationales qui les migrants mettent en place, voire les enjeux qui se construisent entre l’ici et l’ailleurs (Quiminal, 1991), juste au moment où ce qui est ici et ce qui est là-bas vient d’être bouleversé.

TRANSACTIONAL MIGRATION FLOWS BETWEEN THE UK AND PAKISTAN: THE CASE OF YOUNG BRITISH PAKISTANIS RETURNING ‘HOME’

Parveen Akhtar

Abstract: This paper examines transnational migration flows between the UK and Pakistan. In particular, it focuses on re-turn migration amongst second and third generation young men born and raised in the UK visiting, and sometimes settling, in their ancestral home. It is an ethnographic study utilising in-depth interviews and participant observation to document the way these young men conceive, understand and conceptualise their experiences of return migration. What are the factors which influence their return? What are their expectations of the country which was once (and may still be) the home of their parents or grandparents? Are these expectations met? What is their general reception in Pakistan? How do these experiences feed into their conceptualisations of the UK if/when they return? And, does this conceptualisation impact upon their civic and political engagement in the UK? The primary research for this paper was conducted in two locations: Birmingham, UK and in Kotli, Pakistan in 2010.

CIRCULATION MIGRATOIRE DES ENTREPRENEURS TRANSTATIONNAUX IMPLIQUÉS DANS LE COMMERCE EURO-AFRICAIN DE VÉHICULES D’OCASION

Martin Rosenfeld

Abstract: Cette contribution s’intéresse aux formes de mobilités migratoires prenant place dans le cadre d’une filière commerciale transnationale en ces temps turbulents de mondialisation économique. L’objectif est d’analyser les formes de circulations migratoires mises en œuvre par les importateurs présents dans la filière euro-africaine d’exportation de véhicules d’occasion. Pour ce faire, une méthodologie qualitative alliant étude de terrain multi site et récits de vie est mobilisée. Une attention plus particulière est ainsi portée sur les importateurs africains actifs sur deux places marchandes importantes de la filière commerciale : Bruxelles et Cotonou (Bénin).

L’étude du parcours de ces entrepreneurs transnationaux conduira à nous intéresser à trois aspects distincts de leur vie sociale. Leur activité professionnelle, organisée à cheval sur deux continents et dépendant fortement de leur capacité à circuler. Leur organisation familiale, fortement conditionnée par cette mobilité, au point parfois de devenir un véritable enjeu dans des stratégies migratoires visant l’accès à une nationalité européenne. Leur appartenance religieuse, Enfin, dans les rapports qu’elle entretient avec la réussite économique.

Cette étude, basée sur le discours des entrepreneurs eux-mêmes, nous conduira au constat suivant : malgré une circulation régulière entre Bruxelles et Cotonou, ces entrepreneurs africains ne semblent pas incarner les formes de double appartenance habituellement associées au profil du transmigrant. Malgré une présence régulière à Bruxelles, ils ne fréquentent qu’un micro quartier de la ville et n’ont quasiment aucun contacts en dehors de leur activité économique.

Cette proposition de communication offre donc une étude de cas intéressante à partir d’une socio anthropologie des migrations transnationales mises en œuvre dans le cadre d’une filière commerciale. En proposant une approche par le bas, au plus proche du discours des acteurs, c’est une facette nouvelle du processus de mondialisation économique en ces temps turbulents qui est également mise en lumière.

REPRESENTATIONS OF CAUSES AND CONSEQUENCES OF SENEGALESE TRANSTATIONAL MIGRATION: A CASE-STUDY IN LOUGA

Jenny Maggi

Abstract: This study is focused on representations of causes and consequences of Senegalese transnational migration from the point of view of a community of depart in Louga, a region with a strong migratory tradition toward Europe. Senegalese migrants are characterized in the literature as ‘trans-migrants’. In fact, they maintain strong socio-cultural, political and economic attachments with their community of origin, and frequently circulate between receiving
and origin contexts. Therefore, the analysis of representations on socio-cultural migration dynamics from the point of view of a community of departure is highly important in order to analyze why people migrate and to better understand the impact of migration on communities of departure, included the link between migration and development. As for methodology, this case-study has been based on a socio-anthropological approach (participant observation, field immersion, life-stories, group discussions, oral testimony), and on the use of audiovisual methods (i.e. socio-ethnographic film). The research has been conducted with the collaboration of a Senegalese migrant from the community under examination, in order to integrate an emic and an etic perspective both in data collecting and results analysis. The oral testimony of several categories of community actors has been taken into account: young people willing to migrate, families with and without migrants, farmers, fishermen, return migrants, migrants’ wives, actors of development, university students and the marabout of the community. Their chorical representations on causes and consequences of migration have been organized in several dimensions that will be discussed.

THE ROLE OF DIASPORA AND DIASPORA ORGANIZATIONS BETWEEN DEVELOPMENT IN THE ORIGIN COUNTRY AND INTEGRATION IN THE COUNTRY OF RESIDENCE. THE CASE OF THE SENEGALESE MIGRANTS BETWEEN ITALY AND SENEGAL.

Anna Ferro 1, Petra Mezzetti 2, Sebastiano Ceschi 2

1Migration and Development, 2CESPI - CENTER FOR INTERNATIONAL POLITICAL STUDIES, MILANO, Italy

Abstract: Migrant Diasporas are currently considered as actors of development for the countries of origin due to the social, cultural and monetary remittances sent home. Migrant associations are also determinant in sustaining the process of integration in the destination country, being the subject that provides mutual help to first arrival migrants (including undocumented migrants) and becoming the preferred interlocutor towards migrant communities for local institutions. Although migrant associations are not professional actors of the international cooperation (as the NGOs), they are spontaneous agents of the so called “co-development”. The paper presents the results of a three year project (FondazioneIAfrica-Senegal), a unique experience in Italy where 4 Italian NGOs, 3 Senegalese associations and the research institute Cespi participated in defining, projecting and putting in place different development and co-development activities in Italy and in Senegal. The originality of this project stands in its bottom up and participatory approach – combining research and action - and in the direct engagement of migrants groups. In particular, research activities have been undertaken in order to provide hints and useful suggestions to more operative activities within different components: 1) the role of migrant associations as actor of development and the need to build and reinforce the capacities of migrant groups – in order to obtain a double effect of development, in the origin country and integration, in the destination country (methodology: focus groups; interviews and participant observation); 2) the possibilities to involve the diaspora by channelling migrant remittances into job generating activities in the origin country (especially towards micro-finance institutions) (methodology: focus groups; interviews and participant observation; multisided research in Italy and Senegal); 3) the consumption of typical Senegalese food products abroad and the role of Senegalese women in relationship with food consumption and distribution (methodology: focus groups; interviews and participant observation); 4) a comparative analysis of the policies and a multisited research on the personal plans of migrant return, with particular attention to the possibility/capacity to give value to the experience of migration and to the competences acquired abroad (methodology: desk analysis, interviews; multisided research in Italy and Senegal).

UNDERSTANDING THE “SIDE EFFECTS” OF INSTITUTIONALIZED COLLECTIVE REMITTANCES PROGRAMS

Carlos Gustavo Villela 1

1Institute of Development Research & D. Policy, RUHR UNIVERSITY BOCHUM, Bochum, Germany

Abstract: All over the world migrants coming from the same country establish in their countries of residence organizations to, among others, finance public works in their places of origin. States officials, aware of the potential of such “Collective Remittances”, have started programs involving migrants as “development partners” in their countries of origin. In the Mexican Tres por Uno Program, migrant organizations in the USA are partners with each of the three state levels and co finance infrastructure projects in their towns of origin. Several academics propose that in Tres Por Uno a “transnational civil society” uses the program as “door” to bring migrants’ demands forward; more rights for Mexican nationals in USA and more transparency in the Mexican political culture. Some others, however see a strong influence of the Mexican state within migrants’ organizations and a reproduction of the Mexican corporatistic culture in the USA. A transnational civil society changing the country’s of origin culture or an extension of the country’s of origin corporatistic logic abroad? The proposed paper uses the results of an eight months multisite research in USA and Mexico to analyze the “side effects” of institutionalized partnerships with migrants’ organizations. It uses the “events lenses” in order to follow the transnational practice of collective remittances within the Tres Por Uno Program in the state of Zacatecas. This meant it followed the festivities of migrants’ organizations -where funds are collected- and the formal meetings-where interactions and negotiations occurred-. Based on an interpretative methodology and through a triangulation of the methods of participant observation, narrative and biographical interviews-, the paper aims to understand the actions in institutionalized collective remittances programs by interpreting the meanings that the actors give and follow in their interactions. Its goal is to reconstruct what does it means for the migrants to interact in an institutionalized way with state officials? And how does this context structures the way migrants and officials act? Only understanding the meaning behind these programs would enable to explain its possible effects and make sense of the discrepancy often seen between migrants stated intention to “change” their country of origin and some empirical observations that show them following the logic of how things “have been usually done”.

AN ETHNOGRAPHY OF PERUVIANS (RE)SHAPING SOCIAL SPACES IN MADRID

Felipe Rubio 1

1Global Studies, UNIVERSITY OF LEIPZIG, Leipzig, Germany
Abstract: The aim of my presentation is to focus on how globalization processes can create more social, cultural, and political incorporation as a means of minorities becoming part of the history of a city, and not solely ahistorical ethnic group(s) whose immigrant roots/routes (Gilroy 1999) do not partake in the transformation of urban centers. Between 1998 and 2007, 1,814,182 million Latin Americans have immigrated to Spain, with 608,656 choosing Madrid as residence. Moreover, 406,410 represent the Andean Region (Bolivia, Colombia, Ecuador, and Peru) with 140,000 specifically with Peruvian passports (INE). I will base and situate my presentation with special focus on the neighborhood of San Blas; chosen as research sites due to the high residency rates of Peruvian (and other Andean Region) populations. I will present on the reshaping in the notions of community, identity, citizenship, and hybridization (Garcia-Canclini 2005) processes. And how these actors have a say in the redefinition of socio-spatial relations between people that share a common geography.

My presentation will be informed on the concept of Thirdspace (Soja 1996), which is divided in two conceptual forms. First, the inclusion of space as a third pillar in the analysis of social relations; and second, the differentiation between spatial references: Firstspace (physical), Secondspace (imagined), and Thirdspace (lived).

Physical spatiality refers directly to what is comprehended to be empirically measurable space. Imagined presents physical space through language in the form of ideas, symbols, and signs. It plays a strong role in how we determine our spaces and places. Lived space(s) are played out on a daily basis at the local levels. Rapid urbanization and globalization processes (second half of 20th Century) have created ruptures, cleavages, and caveats in how people (re)define their lives.

My research is triangulated by participant observation of Andean communities using a global ethnographic approach (Burawoy et. al. 1996, 2001), narrative interviews, and expert interviews with faculty members from the Universidad Complutense de Madrid and the Universidad Autónoma de Madrid.

MIGRANTS’ STRATEGIES IN FINDING AND MAKING HOME

Marta Margherita Cordini1

1Sociology, CATHOLIC UNIVERSITY OF MILAN, Milan, Italy

Abstract: Housing is one of the most important features for migrants’ integration. Nevertheless, housing studies have often neglected this topic, to advantage of others subjects linked to migration as work. Housing studies usually have been focused on policies and market dynamics, partly ignoring the micro dimensioned elements, such as the individual sphere. This paper instead aims to present an approach based on what is called the “housing pathway”, which is a notion that provides a framework to interpret and study housing and what is correlated. This concept in fact indicates the patterns of interaction and practices concerning house and home, over time and space. It includes the concept of housing career, but it also highlights the meanings, choices, interpretations and relationships in which a household is involved in its daily life. Through the collection of life story and the use of visual materials as elicitation instruments, the research aims to investigate what resources and strategies immigrants use and put in action in order to access a home, experience an upward residential mobility, using neighborhood facilities, having relationships with neighbors and in general making home, which means giving shape and meaning to a place belonging to a society and culture where they haven’t been grown up. The comparison with their home and neighborhood in their country of origin is also provided, in order to better understand how culture influences their idea of home or how it is influenced by the host society. The fieldwork has been conducted in an area of Milan, highly populated by migrants, especially Egyptians and Pakistanis, the interviewees were both women and men, living in Italy at least from 5 years and having experienced at least one house moving. The conclusions here presented aims firstly to provide a deeper understanding of integration dynamics concerning housing and, secondly, to enhance a reflection on housing and immigration policies.

PERUVIAN MIGRATION, FROM EMIGRANTS TO IMMIGRANTS

Maria Luisa Setien1, Isabel Berganza2

1Faculty of Social Sciences and Humanities, UNIVERSITY OF DEUSTO, Bilbao, Spain, 2Dpto. de Movilidad Humana, Conferencia Episcopal Peruana, Lima, Peru

Abstract: Peruvian emigration, internal and international, is a constant in the country and its importance and volume is such that, in recent years has become part of the idiosyncrasy of the Peruvian population. It is to say that 90% of young Peruvians think that emigration is the best solution for their life. Several research carried out by scholars in Peru have uncovered these mobility trends and have shown that migration idea is in the collective imagination of Peruvians. Thus, Peru is a sending-country of people to different parts of the world and, in addition, the non-migrants, those who remain in the country, legitimize this emigration.

Spain is one of the places where the Peruvians have emigrated, especially since the closing years of last century and during this twenty-first century. In Spain, country that has passed from being a sending country to become a receiving one, Peruvians are one of the better-off groups in the labor market and in the social scale of migrants.

This paper is intended to highlight these realities related to the origin and destination of the Peru-Spain migrants, emphasizing the starting positions in the country of origin and trying to explain the role of Peruvian immigrants in Spain as a place of destination. The analysis was conducted using secondary data produced by government agencies of both countries and studying the history and current status of the subject in order to establish the state of the art about the affairs of these migrants flows. The field research that we conducted allowed us to directly approach to the migration experiences of the actors, to the role of transnational family networks and their role in the development and maintenance of migratory flows.

TRANSNATIONAL CHERECS? STRATEGIES TO RECONSTRUCT COMMUNITY IN EXILE.

Karolina Lukasiewicz1

1Institute of Sociology, Jagiellonian Univeristy, Kraków, Poland

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: Transnational Chechens? Strategies to reconstruct community in exile.

My presentation aims at analyzing adaptation strategies implemented in order to reconstruct Chechen community in Poland. Every year thousands of Chechens apply to be granted a refugee status in Poland. Soon after they decide to flee Chechnya, they establish transnational social networks which determine destination of Chechen migration. Next, from the first moment in Poland, Chechen establish social structures. Finally they create or they enter a Chechen community. The process is often defined in terms of isolating from Polish society or lack of will to integrate with Polish society. But it is Chechen community and Chechen solidarity that enables them to survive in a hostile environment. Through the community Chechens are able to fulfill their basic economical and social needs. They are able to find an employment or to rent an apartment. Furthermore, within the community they reconstruct their “Chechen-ness”, i.e. sense of national identity expressed in everyday life practices.

In my presentation I will describe and explain particular strategies applied to reconstruct community, e.g. reconstruction of clan structures. I will define both mechanisms which determine the process and its consequences. I will also describe transnational tools Chechens use to reconstruct their community in exile. My analysis includes dynamics between human agency and structural pressures. I will present how Chechens preserve sense of control on their live in Polish cultural and social context. My analyses are based on epirical research conducted among Chechen refugees. I applied biographical interviews and participant observation. I also analyzed Chechen internet forum (e.g. Amina.com, Chechnafree.ru or Chechen groups on the social networking site Facebook.com.). My research was based on grounded theory approach as a methodological strategy to collect and analyze data.

ITALIANS MIGRANTS CINEMA AND “NEW SWISS CINEMA” : A PARTISAN CONFIGURATION

Morena La Barba

1SOCIOLOGIE, UNIVERSITE DE GENEVE, Genève, Switzerland

Abstract: This communication illustrates an ongoing research on Italian migration to Switzerland during the decades 1950-1980, a research using qualitative methods. The central topic is the relationship between cinema and migration: two roads to penetrate, observe, and interpret the paradoxes and even contradictions of modernity. The movie is seen as a mirror and as an agent, as well as art mediums, construction of new myths and rituals, negotiator of conflicting instances (Casetti). Migration is seen as revealing removal, as a product of contemporary economic rationality resulting in new forms of identity made of transitions, ordering new territories.

Our empirical research examines a) Italians in Swiss movies, especially those of some authors from the so-called “New Swiss Cinema”, closely related to the development of television, b) the movies of Italian immigrants in Switzerland, especially the movies of Alvaro Bizzarri, originally a simple manual worker who became director of an important associative movement in Switzerland: the Colonie Libere italiane cinema clubs.

We will present the research that investigate the dynamics of construction and transmission of the migrant image from archival research, analysis of movies, video-participant observation and interviews with video and photo elicitation.

The communication will focus on the end of the 60s, somehow the "68" of Italians in Switzerland.

Cinema about/on and cinema of migration is a precious material for those who now search how to extract struggles of visions, representations, action participation, alliance strategies, solidarity and affirmation of transnational migrant subjectivity.

With a sociohistorical and visual approach, we explore the hypothesis that in a context of both economic growth and social exclusion (for the migrants in Switzerland during the Sixties), the “New Swiss Cinema”, the vivid Italian movies clubs, and the cinema of Alvaro Bizzarri, represented the expression of a new subjectivity (“migrant subjectivity?” claiming for a new citizenship (“migrant citizenship?”). We explore also the hypothesis that movies of and about immigrants are revealing a transnational new culture (“migrant culture?”) that encompasses migrants and nations life experiences and representations.

LIVING IN THE GLOBAL FLOWS AND THE „SECOND HAND” GLOBALIZATION. IMMIGRANTS’ STRATEGIES OF THE INTERPRETATION OF THE EXPERIENCE OF MIGRATION.

Dariusz Wojakowski1

1Faculty of Humanities, AGH - UNIVERSITY OF SCIENCE AND TECHNOLOGY, Kraków, Poland

Abstract: The paper refers to fieldwork concerning the life of immigrants in Poland in the years of 2005-2006. Some of them belong to the “main stream” of global flows, living their lives like the “tourists” described by Bauman. Their self-perception strategy refers to the vision of the postmodern human proposed by public culture of the western world (except for Bauman, Appadurai, Castells and the others). The stories of those immigrants are about their life in global webs and are adjusted to their migration experiences. For many of them “living in the global flows” is a significant indicator of their plans for the future – they live according to the rule “experience hunter”. Although on the European Union’s outskirts appears a significant group of “tourists” which doesn’t fit in the ideal type, but has strong aspirations to function the same way – they translate their experiences into the “tourist” language. The goal of this paper is to show principal outlines of those persons’ world view. Because of their uncertain social status, their statements reveal awaited features of “postmodern personality” much strongly than “typical tourists”: affirmation of strangeness and changes, rejection of concepts of social structure and social identity and creating their own authenticity. It also should be stressed that creating such kind of world view is based on some institutional factors which are used by those immigrants to reinforce their experience of participation in global processes, i.e. EU international programs and travel agencies’ offers.

MIGRATION IN A TURBULENT WORLD: IMMIGRANTS OR FOREIGNERS?

Olena Semenko1, José António Zagalo Cardoso Teixeira2

1Center of Social Studies, 2Faculty of Psychology, University of Coimbra, Coimbra, Portugal

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: According to Castles (2005), «legal barriers to immigration and to the final installation of immigrants has been seen not as absolute barriers, but as structures of opportunity that should be considered by individuals in their personal strategies, and in migratory networks in community infrastructure».

Specific and positive participation of immigrants in social and cultural life of the community falls in both the subjective and the objective interaction with others (their fellow citizens and national citizens), not pursuing personal interests: family, material or economic. It appears «practice and theoretically free, examines the conditions with less prejudice, their criteria for this are broader and more objective ideals, not tied to his action by habit, piety, or by precedent».

From the perspective of George Simmel (2005), the immigrant/stranger is a member of the organic society and, at the same time, he is not organically attached to it, so his life include common conditions and includes certain measures of proximity and distance, while impossible and imaginary dimensions. It is through the reciprocal combinations and proportions between these ‘geographical’ dimensions that forms the particular relationship with /of the immigrant/stranger in a turbulent world.

WHY IS THERE NOT A DEUTSCHE TRAUM? THE AMERICAN DREAM IN COMPARATIVE PERSPECTIVE.

Stefan Immerfall1

1Dept. Humanities, U SCHWAEBISCH GMUEND, Schwäbisch Gmünd, Germany

Abstract: Questions of diversity and identity have reasserted themselves as prime topics of political contention and social concern. Parallel concerns of an imminent loss of social and cultural cohesion warrant a paired comparison of US and German experiences.

One persistent feature of the American model of immigrant integration is the “American dream”. Although always more a myth than empirical reality, it still keeps a spell on a majority of Americans. Believing in the prospect of moving ahead and the possibility of obtaining material goods is one of perceptions shared by immigrants and natives alike.

The facts that this myth exists and has remained powerful for such a long time might have played a major role in integrating the immigrants. If that is the case could we think of some similar myth in Germany that everyone (immigrants and natives alike) would share and that would facilitate Germany’s transition into an immigration society? Is there a “German dream” like the once touted “Mittelstandsgesellschaft” attractive enough to foster integration? Could such a “German Dream” be attractive enough to foster integration? And how would it be expressed?
RS 14 Regional Conflicts

POSTWAR RECONSTRUCTION OF THE CHECHEN REPUBLIC: ACTUALIZATION OF THE PEACE AND CONSENT VALUES

Musa Movlievich Yusupov

Abstract: Regional conflicts on their consequences fall outside the limits of spatial borders of the local territory, the country. They create humanitarian and other problems of the international character. It actualizes the importance of the peace and consent values in the prevention and settlement of the conflict and post conflict situation. In the given context specificity of the postwar peace building in the Chechen Republic is of interest.

Methods: conflictological, action approaches, the sociological analysis.

Object of research – the role of the peace and consent values in a post conflict region reconstruction.

Results of research. In the North Caucasus, as well as in other regions, historical development was carried out through periodic change of conditions of the conflict and cooperation. However in social memory of the North Caucasian people any big interethnic conflicts, wars among themselves aren’t fixed. Interethnic contradictions, group, family and interpersonal conflicts were resolved by means of institute "MASLAAT" / intermediary/. the peace and consent values had symbolical and almost sacral meaning. This experience is used in an everyday life and at present. But people don’t have modern experience, effective mechanisms of the decision of contradictions between the power and the population, the center and region. It is one of the reasons of occurrence of the conflict in the Chechen Republic and instability preservation in the North Caucasus. In occurrence and aggravation of the contradiction of interests people are more concerned by the values of freedom and justice. In a transformation of the situation in an armed conflict actual become the peace and safety values. In the present the conditions in the Chechen Republic regard as normal – 63,7%, strained – 26,6%, conflict – 5,2% of respondents. Religious figures and respected persons conduct public work on reconciliation of clashing surnames. However the general situation in the North Caucasian region is difficult, in republics a confrontation of the armed groups and authorities exists.

The conclusion. The peace and consent values consolidate, rally the members of society, promote an order strengthening, cooperation development. This potential can be realized only by the coordination of interests of various social groups, the center and regions.

Keywords: intensity, the conflict, settlement, peace, consent

SECURITY AND DEVELOPMENT IN THE CONTEXT OF BORDERLESS BORDER IN WEST AFRICA

Willie Aziegb Eselebor

Abstract: Economic prosperity, cooperation and integration can only thrive in an environment that is peaceful, stable and secure. Despite the fact that West Africa is endowed with abundant human and natural resources, it ranks low in UN Human Development Index, due mainly to regional instabilities, porous borders, corruption and prevailing transnational organized crimes. Poverty, deprivation and acute suffering of Community citizens constitute a major setback for sustainable economic development as disconnect exist in non-linkage of security with good border management practices by members of Economic Community of West African States (ECOWAS). Today’s global flow of legitimate trade, people, finance and technology needed for development are functions of protectionism and empowerment, which cannot be attained under the present circumstances of uncoordinated borderless policies and insecurity of lives and properties. Achieving human security requires building on and going beyond Millennium Declaration and Millennium Development Goals (MDGs), by undertaking new initiatives to address the full range of critical and pervasive threats facing the people of West Africa. No doubt human security is complimentary to state security, which can trigger growth and development; but it should be aligned to good governance, accountability and sound democratic principles. This requires building strong and incorruptible institutions, establishing the rule of law and empowering the people economically and otherwise.

Keywords: Border, security, development, ECOWAS, MDGs

THE ENDOGENOUS AND EXOGENOUS CAUSES OF REGIONAL CONFLICTS: A COMPARATIVE ANALYSIS OF 11 AFRICAN COUNTRIES

Mayeul Kauffmann, Jan Kucera

Abstract: This paper is a massively comparative analysis of the development of violent regional conflicts in 11 African countries (Burundi, DRC, Eritrea, Ethiopia, Guinea, Liberia, Rwanda, Sierra Leone, Somalia, Sudan and Uganda) from 2004 to 2010. It uses advanced statistical methods with a new, highly disaggregated dataset of war victims specially created for this purpose. This dataset, created at the European Commission Joint Research Centre, records the exact count of documented victims (by victim type) with daily time precision and up-to-kilometric localisation accuracy and gathers a set of exogenous and endogenous related variables describing the conflicts and their causes in detail. The resulting statistical model empirically shows how important it is to analyse regional conflicts at the local level in comparative studies. It models the onset and development of protracted conflicts by taking into account their actors, their endogenous and exogenous root causes and their human and material consequences, thanks to a set of sociological, political, economic and military indicators, several of them measured at a local scale (with a square-kilometer unit of analysis). The analysis gives many insights in understanding the causes of regional armed conflicts and on devising viable resolutions to several long-standing regional conflicts in Africa.

Along with the dataset and model, a set of tools has been designed to facilitate the exploration and analysis of the data described.
EU AS A CONFLICT RESOLUTION ACTOR IN THE MOLDOVA-TRANSNISTRIA AND NAGORNO-KARABAKH CONFLICTS

Vanda Amaro Dias

Abstract: While being itself the result of a conflict prevention and resolution, the EU has been increasingly affirming itself as a relevant actor in this field, especially after the end of the Cold War, when it developed a foreign policy dimension. The Moldova-Transnistria conflict broke out with the fall of the USSR. After Moldova declared independence in 1991, Transnistria voted to join the Soviet Union. During that year Transnistrian authorities took under control all public institutions, newspapers and radio stations. While Chisinau tried to gain control of the east bank of the river Dniester, violent clashes took place in 1992. The intervention of the Soviet army stationed in Moldova played a decisive role in the conflict, contributing to de facto partition of the country. After countless attempts to solve the conflict, the negotiation process remains frozen and unable to provide a suitable solution. Since 2003, the EU has become progressively committed to conflict resolution, which is further confirmed by the establishment of EUBAM in 2005. The mission’s goal is to build confidence between the parties and to stimulate their economic interdependence, contributing to conflict transformation and its peaceful resolution.

The Nagorno-Karabakh conflict clashed in 1988 when Armenia made territorial claims against Azerbaijan. Since 1992, Armenian armed forces have occupied part of the Azerbaijani territory. Despite a cease-fire was signed in 1994, the negotiation process could not provide an effective solution to the conflict. Regardless its negligible role in the 1990’s, the EU, through the European Neighborhood Policy, committed itself to conflict resolution, stating the importance of civil society and exchange of information between the parties in this process. The designation of an EU Special Representative for the South Caucasus reinstates its commitment to the peaceful resolution of this conflict.

This paper aims to analyze EU’s impact on the resolution of these two conflicts. It argues that EU’s involvement has been a positive, though low-profile, contribution to their peaceful resolution representing an alternative to innocuous negotiation processes. Furthermore, while still pursuing its own interests the EU may be entering a new era of promoting peace, one that pays greater attention to local realities and places the construction of peace under the effective control of the conflicting parties.

THE INTERDEPENDENCE OF FOREIGN POLICY DECISIONS, THE EVOLUTION OF PUBLIC OPINION AND DOMESTIC POLITICAL LANDSCAPE IN THE US DURING THE WAR IN IRAQ

Yustiniya Khokhlova

Abstract: The purpose of the present study is to provide an analysis of the influence of the US public opinion, as represented by relevant opinion polls, upon the internal American state-society evolution with respect to the war in Iraq. At the outset the decision by the Bush Administration to go to war with Iraq in March, 2003 was supported by 73% to 79% of the respondents to polls conducted by polling agencies. This would seem to confirm the American and West European sociological thesis according to which the ability of the public to understand the meaning of foreign policy is limited. In this case however the public was rather misled (in February 2003 the majority of the US respondents erroneously believed Iraq was responsible for the attacks of September 11). The vigour with which some European and many other nations rejected the idea of the use of force against Iraq led observers to qualify the world public opinion as one more super-power.

By July 2004 as a result i.a. of the failure to find weapons of mass destruction in Iraq, press revelations about the abuses committed in Abu-Grave prison and increased loss of life of the GIs and the allied personnel, prevailing perceptions in the US had changed to the point where a majority said the war was a mistake.

On June the 8th, 2005 nearly 6 in 10 respondents were negative in their attitude to the war. The shift meant that the democrats could start to work out a different strategy from that of the Administration.

The January 11, 2007 poll found that 32% of respondents supported an increase in the US troop levels, while 66% opposed the plan. The shift in the perception of war by the US public opinion led, among other things, to changes in the composition of the US Administration (the resignation of the Defense Secretary D. Rumsfeld on November the 8th, 2006, a structural change) and to the beginning of the official discourse mentioning the pull-out of troops (behavioral change). On December, 11-14, 2008 64% felt the Iraq War was not worth fighting. The non-acceptance of war found its embodiment in the political stance of the then presidential candidate B.Obama, a Democrat. On January 27, 2010 President Obama announced that US combat troops would be out of Iraq by August. A peaceful word had the better of the sword.
RS 15 Rethinking Inheritance of Inequalities

SOCIOLOGICAL PERSPECTIVES ON ISSUES OF INEQUALITIES AND SOCIAL JUSTICE IN POST-REFORM RUSSIA
Mikhail Konstantinovich Gorshkov

1INSTITUTE OF SOCIOLOGY RAN, Moscow, Russian Federation

Abstract: Excessive social inequalities and social exclusion tends to remain the most fundamental social problems of modernity. This is especially true for Russia suffering from lack of appropriate social-protection system so essential bearing in mind that almost two third of Russians feel themselves presently more or less as representatives of «low classes», and it looks like that part of them will rather increase than decrease in the nearest future. Who is socially excluded in Russia and why this matters? What public policy, civil society and donors can do to reduce social exclusion? The author examines social exclusion and its forms in Russian society at both macro- and micro-levels – as practices of discrimination and deprivation. Analyzing forms and features of social exclusion typical for Russian society, he (1) fixes its indicators (such as, for example, lack of stable paid work, access to education, culture, medical care and social networks as one of the main mechanisms of resources’ redistribution, and so on), (2) singles out factors increasing the risk of being excluded and points out that none of them taken separately can be seen as the main reason for exclusion, (3) analyzes the main courses and consequences of social exclusion. The author concludes that though exclusion in present-day Russia has its national specificity (such as, for example, discrimination through exclusion from social networks, impossibility to take part in the most significant practices of traditional social interchanges, and so on), its common trends, practices and forms are rather typical, do not alter overall picture of exclusion development and contribute to further changes in social structure of Russian society. The main and fundamental problem is that Russia got involved in above processes, including that of marginalization of significant number of people from mainstream society, at the moment when it was not ready for them both in terms of social policy and legislation and of situation awareness. The author shares opinion of those experts, scientists and politicians who is sure that the main aim of social policy tackling problems of social exclusion should be not only support of the poorest strata but smoothing of highly varied and differentiated social chances and perspectives of different social groups in present-day Russia.

EXTREME POVERTY AND SOCIAL EXCLUSION IN ROMANIA
Manuela Sofia Stanculescu 1, Monica Marin

1POVERTY AND SOCIAL POLICY, RESEARCH INSTITUTE FOR THE QUALITY OF LIFE, Bucharest, Romania

Abstract: Purpose – The purpose of this paper is to analyze fieldwork results conducted in Romania on the topic of extreme poverty and social exclusion from the perspective of processes and results of social inequalities transmission. It will also draw on the debate agency-structure, especially in what concerns the case-study approach in an urban ghetto.

Design/Methodology – Previous research has identified type of areas of poverty concentration, concluding that the process of development of such zones is more advanced and extended in the urban compared to the rural areas. The research identified as extreme-poverty areas the dump sites, historical centers, ghetto-like and disaffected industrial zones. In all four types of poor zones, Roma people are over-represented but do not predominate. The young population accounts for 60-67% of the entire population, a proportion much higher than at the national level. Building on this extensive national level research, the paper will address the problem of public policies directed towards fighting extreme poverty. As local specificity counts to a large extent in the feasibility of public interventions, the study will look into an urban renewal project undertaken in the municipality of Alba Iulia.

Findings – The large majority of those in extreme poverty are Romanian children and young from nuclear or extended families. A regression model showed that the most significant factors determining extreme poverty are occupation (household members inactive or active in the informal sector) and education (gymnasium at most), regardless ethnicity, gender and all other demographic variables. The results also hold true at local level, in the research carried out in the central district of an urban municipality, including the ghetto-area of Turturica. The plan of action, initiated and assumed by the Mayoralty, has been designed to be done together with the citizens (and not “for the citizens”). The basic idea behind the Plan of Action is lying on a set of rules including rewards and penalties associated with behaviour rules. Also, the Plan of Action has special provisions for children.

Practical implications – The case-study provides an example of facilitating social intervention based on sociological research.

Originality/value – The paper presents an innovative methodology for the case-study conducted in an urban ghetto.

INSTITUTIONALIZED PRACTICES IN STATE CHILDREN’S HOMES AS THE INTERGENERATIONAL INHERITANCE OF INEQUALITIES RISK FACTOR
Agnieszka Golczyńska

1Institute of Sociology, UNIVERSITY OF LODZ, Lodz, Poland

Abstract: The paper presents some initial results of qualitative research project based on narrations rendered by adults who grew up in children’s home in Poland. We can indicate several risk factors conducive for inheritance of inequalities, which have been influencing the life course of individuals who – due to the poverty and family dysfunctions - were placed in residential care in childhood or early adolescence. The set of meaningful strategies and everyday activities performed within the children’s home institutional framework contains not only everyday interactions between children and staff, practices in the area of educational and vocational careers, procedures of leaving residential care, but also stigmatization and institutionalized violence experienced by children from the staff and other officials. Considering the issue of institutional care effectiveness the question arises: What factors are decisive for biographical success or failure (breaking through or getting bogged
in the "vicious circle" of poverty and social exclusion) in adult life of institutional care “graduates”?

PRISON AS THE NORM: LEGACIES OF INEQUALITY

Tracey McIntosh

1Department of Sociology, The University of Auckland, Auckland, New Zealand

Abstract: This paper will focus on the over-representation of Maori women in prison in New Zealand and particularly look at the experience of incarcerated female youth. The paper explores the intergenerational transmission of social inequalities and interrogates the types of research processes employed to do this sort of study. Research dynamics are dominated by questions of power (and often powerlessness). Power relations and power differentials are articulated from the point of setting research agendas right through to research design, research implementation and dissemination. Difference and familiarity in research situations are further complicated when the research participants are from marginalized groups. The conundrum of interpreting difference across such divides is one example of the challenges and opportunities that researchers and research participants may encounter. Ethical and cultural considerations, the quality of relationships, the political environment, status management, decision-making, research motivation and engagement are some of the issues that face this type of research each creating its own challenges and opportunities. This paper will look at the experience of a Maori researcher working with Maori whose everyday life is characterized by deprivation and state intervention. Within the research encounter how are social justice outcomes progressed? How do we move research from findings and analysis towards creating the possibilities of positive transformative change? What are the challenges to active and activist research?

CONTEMPORARY INEQUALITY AND HER MULTIPLE, HYBRID GENERATIVE FACTORS: AN EUROPEAN COMPARISON

Stefano Poli

1Di.S.A.-Dipartimento di Scienze Antropologiche, UNIVERSITÀ DEGLI STUDI DI GENOVA, Genova, Italy

Abstract: Post-modernity and her categories have definitely re-developed the contemporary concept of inequality, shifting more and more from a stratification model based on class structure, like in the traditional Marxist approach, toward a de-structured representation, where, for instance, the class belonging itself, such an influential identity factor for many of the past generations, seems nowadays to decline, partially almost disembedded (Giddens, 1990) and mostly blended in with the “non sticking” sense of fluidity that characterizes the complexity of contemporary identities coping with the explicative categories of liquid society, like individualization, fragmentation and risk (Bauman, 2000, 2001; Beck, 1992). At the same time contemporary inequality dimensions rely on multiple hybrid and cross-cutting generators (Pakulsky and Waters, 1996; Olin Wright, 2005, Pakulsky, 2007) leading toward “classless” inequality categories. Such elements can be find in different access to education and knowledge, combining the effects of credentialism and weberian social closure in monopolizing opportunities and leading to exclusion and usurpation processes (Parkin, 1979; Murphy, 1988). Similarly, the arising demand for new forms of citizenship and democracy, as a side effect behind the aim of social level-
Bernadette Müller¹
¹Department of Sociology, UNIVERSITY OF GRAZ, Graz, Austria

Abstract: Intergenerational social mobility provides important information about inheritance of inequality and the degree of openness of societies in general. Based on data from the International Social Survey Programme (ISSP) on Social Inequality I and IV patterns and changes in social mobility between 1987 and 2009 will be explored in eight countries (Australia, Austria, Great Britain, Hungary, USA, Germany, Switzerland, and Poland). Both objective social mobility measured by the difference of the respondent’s occupational status compared to the father’s occupational status using Worldwide Status Scores (Kelley 1990), and the perceived social mobility will be used in the analyses. The latter is based on a subjective appraisal of the comparison between the status of the own job with the status of the father’s job. Due to educational expansion and economic growth upward mobility has increased in the last decades, and is more likely than downward mobility. In this regard the results show variations among the eight countries as well as among individuals. Regression and multi group analyses will be used to examine macro-social and individual factors, which contribute to social mobility or status persistence. Furthermore, it will be investigated, how beliefs about opportunities for getting ahead in life affect social mobility.

DEMOCRATIZATION OF EDUCATION SYSTEMS AND INEQUALITY OF OPPORTUNITY: A RE-EXAMINATION OF THE CASE OF FRANCE

Nathalie Bulle¹
¹SOCILOGIE, CNRS UNIVERSITE DE PARIS IV SORBONNE, PARIS, France

Abstract: The research brought forward is based on an original index of measurement, which is insensitive to margins, and which aims to evaluate inequality of opportunity in the selection process for access to a discrete good G – i.e. allowing comparisons of allocation mechanisms. The methodological framework presented sustains a re-examination of previous evaluations of schooling policies, implemented over the second half of the 20th Century in France. This analysis shows that the method yields substantively different conclusions than those drawn in other contributions based on the same data. Equality in the selection process progressed through the integration of the major educational levels – primary, secondary and higher education – into a functional whole, and the development of girls’ education projects. Nevertheless this progress occurs on the basis of the level inequality of opportunity for access to a diploma of secondary education, which shows a strong stability over the 20th Century.

THE BARRIERS AFFECTING ACTIVITIES OF SOCIAL ENTREPRENEURS - THE CASE OF POLAND

Anna Szczucka¹
¹Institute of Sociology, JAGIELLONIAN UNIVERSITY, Krakow, Poland

Abstract: Nowadays we can hear a lot about social entrepreneurship concept, mostly as a solution to some of the problems in contemporary society i.e. poverty and social marginalization. In Poland there are many afforded undertaken by public institution to strengthen such initiatives. But the question is whether in practice public administration really strengthen (by knowledge, by public spending) social entrepreneurship (SE) or hinder their progress. The broad aim of this presentation is to analyse how different kinds of barriers affect activities of social entrepreneurs.

In my paper I focus on how the social entrepreneurship are affected by the local institutional context. We investigate that the major problem for most of social entrepreneurs is their local institutional environment (lack of cooperation, lack of satisfaction with the cooperation, little knowledge among the local administration etc). But exploring the institutional environment, we also can see the opportunities.

I am going to use research data and experience from the mix-mode survey conducted in 2010 as part of Entrepreneurship Academy project in Malopolska, Poland. While many researchers try to define how to measure social entrepreneurship impact by case study, the survey Social entrepreneurship monitoring was design to cover all the major aspects of social entrepreneurship, including: the start-up and growth of firms, their social and economic activities, human resources, financing etc.

Keywords: social entrepreneurship, institutional context, barriers,

GIRLS LIKE PINK: EXPLAINING SEX-TYPED OCCUPATIONAL ASPIRATIONS AMONGST CHILDREN

Javier Polavieja¹, Lucinda Platt²
¹IMDEA SOCIAL SCIENCES INSTITUTE, Madrid, Spain, ²Centre for Longitudinal Studies, Institute of Education, University of London, London, United Kingdom

Abstract: There is a high degree of sex-typing in young children’s occupational aspirations and this has consequences for adult occupational segregation. Yet we still know surprisingly little about the mechanisms involved in the formation of sex-typical preferences and there is considerable theoretical controversy regarding the relative role of parental socialization and individual agency in this process. This study analyzes the determinants of sex-typed occupational aspirations amongst British children aged between 11 and 15. We develop a model of parental socialization and test for different channels and mechanisms involved in the transmission of sex-typical preferences. We also propose an innovative definition of personal agency that is anchored in observable psychological traits linked to self-direction. We find that parental influences on occupational preferences operate mainly through three distinctive channels: 1) the effect that parental socio-economic resources have on the scope of children’s occupational aspirations, 2) children’s imitation of parental occupations, and 3) children’s learning of sex-typed roles via the observation of parental behavior. We also find a strong net effect of children’s own psychological predispositions —self-esteem in particular — on the incidence of sex-typical occupational preferences. Yet large sex-differences in occupational aspirations remain unexplained.

SOCIAL INEQUALITIES IN FINLAND - SOCIAL CLASS AND INEQUALITIES

Harri Melin¹, Raimo Blom¹
¹School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract Book

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
Abstract: In this paper we aim to analyse contemporary Finnish society. Our focus is on social change and social inequalities. Our thesis is that Social inequalities are rapidly increasing and the reason behind this process is mainly conscious political decisions made during past 15 years.

Those who have social problems are in a week and vulnerable social position. Most of them who are at the bottom are faced with many problems at the same time Social problems have cumulative nature of. During past few years important new trends have occurred. Social policy is more selective than before. Poor people are also stigmatized “it is your problem”. Economic crisis has meant more unemployment, increasing xenophobia and more poverty. The question is, is the Finnish society more polarized than earlier?

One important thing that has taken place is changing way to talk about inequalities and social problems. A new language has emerged: no more social problems, only welfare deficits. What has also happened is the individualization of social problems. At the same time the state is moving its former responsibilities to other actors. Leading politician say that the state cannot any more be responsible of this or that, instead they claim the civil society should be strengthened.

In many respects Finland is more equal than it was for 50 years ago, at the same time is becoming – again – more unequal. In sociology class analysis has given answers to questions related to social inequality. In contemporary societies class does matter, in the paper we analyze the relationship between inequalities and social classes.

TRADITIONAL ESTATE STRATIFICATION IN TODAY’S RUSSIA

Ossey Shkaratan 1, Gordy Yastrebov 1

1Economics Department, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The type of social stratification and the corresponding structure of inter-group relations validate our arguments, that in contemporary Russia there emerged a neo-etacratic societal order, which forms as an inertia of development of countries, which belonged to etacratic (pseudo-socialist) system in former Soviet Union. Our results invalidate the arguments of most Western and Russian researchers. The typical gradualist stratification hierarchy is not appropriate in the case of contemporary Russian society. Also the neo-Marxist and the neo-Weberian classification models give no adequate explanation for the nature of its social differentiation due to the presence of peculiar relations «power-property» and undeveloped labor market. By applying the method of entropy analysis we designed stratification criteria, which most adequately describe social differentiation. In case with neo-etacratic Russia we are most likely to deal with a special type of social stratification, which combines some elements of class differentiation (typical for developed post-industrial countries) and estate differentiation. In other words, the basic inequality criteria in Russia – authority status and closeness to sources of economic distribution, which determine estate belonging – has not changed since its pre-Soviet and Soviet past. We have found some certain proof to that by the data of repeated representative surveys (1994, January; 2002, November; 2006, December).

Thus, we deal with a stratification hybrid of some sort, where despite the sizes of human and cultural capital most of the population can be assigned to lower strata of non-owner frontline employees (74% of the population in 2006). 22% of respondents were nominal- ly assigned to intermediate, partly middle strata owning some minimum of property and having some degree of authority (small and medium proprietors, self-employed, minor shareholders and managers). The higher middle and partly higher strata, which consists of larger employers and top-managers, make 4% of the population.

INHERITANCE AND INEQUALITY TRANSMISSION ACROSS GENERATIONS

Marc Sydlik 1

1Institute of Sociology, UNIVERSITY OF ZURICH, Zurich, Switzerland

Abstract: Inheritances are an important research topic. This is more true today than ever before. After World War II an immense fortune has been accumulated in many countries, which has not been wiped out by either acts of war or inflation. This wealth is now being passed on from one generation to the next. A generation of testators is thus facing a generation of heirs. Inheritances are crucial in inequality transmission across generations. They have huge consequences for social stratification and they have and will continue to have immense effects on current and future intergenerational relations, be it during or after the lifetimes of the testators.

In this respect, a number of questions arise: Who provides these transfers and who receives inheritances? When do people profit? What are the factors that determine a higher or lower chance to inherit? Is poverty reduced by inheritances – or do they increase social disadvantages? Which differences between countries and political regimes can be identified?

The proposed presentation will investigate previous and future inheritances from an international comparative perspective in 14 European countries from Northern, Western, Southern and Eastern Europe, namely Sweden, Denmark, the Netherlands, Ireland, Belgium, France, Germany, Switzerland, Austria, Spain, Italy, Greece, Czech Republic and Poland (SHARE data). Theoretically, the presentation distinguishes between three levels of analysis: individual, family and society. The empirical analyses prove the importance of all three levels. Individual opportunities and needs, family structures as well as cultural and political contexts all play a crucial role. This applies both to previous and future inheritances. The analyses show that inheritances are an important form of intergenerational solidarity – and that they are linked to social inequality and social (dis)advantages. In general, inheritances reflect transfers from parents to their children. However, there are considerable differences between individuals, families, migrants and natives, and, not least, countries – for example, in regard to long-term consequences of political and economic regimes.

CELEBRATING BOXING FIGHTS IN A MEDIATIZED SOCIETY

Annika Leichner 1, Tilo Grenz 1

1 KARLSRUHE INSTITUTE OF TECHNOLOGY, Karlsruhe, Germany

Abstract: The history of fistfighting shows how the act of celebrating and therefore the subjective way of experiencing the ‘extraordinary’ developed and changed through the process of ever varying socio-historical contexts. In retrospect this development can be named as eventisation. Starting out as spontaneous happenings boxing fights have become ritualised and institutionalized sport events which can today be analysed as strictly planned media events. Considering the German concept of event-sociology, 2 major aspects can be found while researching this phenomenon: Firstly, the question about the perspective of each participant within these both local and temporal ‘spaces of experiencing’, in which the contexts provide the frame for this subjectively perceived extraordinary experience. Secondly, the perspective of the organisers and companies involved in a strategy of commercialising as well as a strategy to create and secure the extraordinary experience.

Regarding this phenomenon, economisation and eventisation were considered the processes which interdependently shape the form of contemporary (boxing) events and the way they are experienced. This statement though extremely under represents the role of media used to create the event on site which can be proven by 2 examples of boxing fights. Participants as well as organisers individually do have a culturally picture of boxing which shapes the event in situ. Taking the discourses within the new research branch of mediatisation into account it is possible to:

1) add to the concept of event, the aspect of media and thus the necessity to understand commercialisation and eventisation as interdependent
2) understand, how ‘media logics’ not only shape the picture in people’s minds but mould the experience itself whilst happening. This can be shown empirically through 2 box fights (i.e. when the event comes ‘to life’ from the mass audiences’ POV).

With these implications it is possible to describe a new form of ‘participating’ considering spatial, temporal and social disembedding of eventised celebrations in contemporary mediatized societies. Our research project focuses on the perspective of an organiser for whom mediatisation offers a drifted momentum. Furthermore, through participant observation it is possible to describe the perspective on a boxing fight from a participant’s point of view on site.

CHERBOURG CARNIVAL: A CELEBRATION OF REGIONAL, POLITICAL AND ANTI-CLERICAL BELONGING

Prof. Monika Salzbrunn 1

1 FTSR/ISSRC, LAUSANNE UNIVERSITY, Lausanne, Switzerland

Abstract: The reinforcement of local or regional feelings of belonging can be interpreted as an answer to the supposed disenchantedment of the world. During the last twenty years, several carnivals have emerged in French cities – as pure inventions or as re-inventions of local history. During its carnival, the inhabitants of the city of Cherbourg-Octeville not only celebrate their local and regional belonging (to Normandy), but also their political and anti-clerical attitude. Historical oppositions between the centrally located political power (in Paris) and the periphery are expressed through costumes, masks and speeches. The climax of the Cherbourg carnival is an ancient ritual of burning the carnival puppy that was previously condemned to death by a false judge. The discourse analysis of this speech is particularly enriching because it contains numerous ironic moments with a plurality of linguistic semantics. The belonging to a common political group and the assumption of an anti-clerical attitude is clearly expressed by the protagonist of the judgement. For the last ten years, the role of the judge has been taken by the founder of “Les Fumantes de Pantruche”, who reinvented the carnival of Paris. Referring to the heritage of Rabelais, he systematically ridicules the representatives of the church as well as the national politicians. The performing public contributes to the creation of a festive community by approving the judgement. Ironically, a Parisian – seen as the “good” exception of a “bad” group of privileged people – helps the carnivaleurs from Normandy to find new ways of celebration. In turn, several groups from Cherbourg – in particular musicians – join in the carnival of Paris, and have become its major force. The presentation of these forms of celebration includes a DVD with images from the main carnival rituals.

TRANSFORMATION OF HOLIDAY PRACTICES IN RUSSIA

Oksana Anikovich 1

1 economic sociology, NOVOSIBIRSK STATE UNIVERSITY, Novosibirsk, Russian Federation

Abstract: A holiday is an element of the sociocultural system, responsible for forming integration and solidarity in a society. By means of researching holiday practices it is possible to understand character of social relations in a society.

Gifts are indispensable attribute of a holiday. The anthropologist and the sociologist M. Mauss is considered to be the first researcher of gifts who described the nature of “gifts” in a primitive society. He referred gifts to “sacred”, in contrast to “worldly” or “secular”, referred to goods.

Do the gifts in modern “consumer society” keep “sacred” symbolic meaning? What are the differences between usual things, goods and gifts? What do congratulations mean today?

Today holiday practices are expected to become more various. It is possible to congratulate with a greeting card by e-mail, or sending SMS, MMS, the message in ICQ or in social networks, like “Facebook”. The market offers different places for celebration: cafes, restaurants, etc. Holiday services become more address and individual because today they are organized by the special firms, DJs, offering a unique way of celebrating an event.«Consumer revolution» also changed gifts: appeared wish-lists, gift certificates, money-holder greeting cards. So, the next question is seems to be actual and little-studied: how do the listed possibilities transform holiday practices and how do they change interpersonal relations?
The main purpose of the study is to describe forms of holiday practices, types of gifts and ways of congratulations (as an example, celebrating New Year and a Birthday).

Research methods: depth interview, visual analysis of greeting cards.

Initial results of research:
1. It is shown that gifts and ways of congratulation are different and depend on a type of holiday and degree of intimacy between men making present and man getting present.
2. It was concluded that the market plays a significant role in holiday practices. New ways of "transformation" money and "secular" things in gifts were revealed.
3. It may be stated that, firstly, there is a gap or mismatch between people’s opinion on money as a gift and their real behavior, and, secondly, a gap between a wish to give and to receive such gifts.

ACTING OUT TEXTS, WRITING UP EVENTS. TOWARDS AN ANTHROPOLOGY OF CELEBRATION
Ismo Juhani Kantola

Abstract: According to Emil Durkheim, any community celebrates and adores itself in religion. In this scheme, myths and totems are expected to play an important role as consolidators of the otherwise substantially fragmented collectivity. Indeed, texts and material artefacts seem to have the power of connecting otherwise incommensurable points of time and space within human experience. The present paper compares anthropological insights of Durkheim and Bruno Latour with the cultural sociological ones of Raymond Williams, within the study of how feelings are attached to material artefacts at the root of any collectively shared experience. Exerpts from World literature — Virginia Woolf: Waves; Marcel Proust: À la recherche du temps perdu; Volter Kilpi: Alastalon salissa; and Pauline letters — will be analyzed to illustrate the presence and/or absence of the material nexus in celebration. In concluding, the paper will discuss the place of materiality in the theory of celebration.

ETHNIC DRESS IN LUTHERAN CONFIRMATION RITUAL
Seija Risten Somby

Abstract: Dress and clothing research in the ritual context has attracted many anthropologists from the late nineteenth century. This paper focuses on the craft culture expressed by Northern indigenous Sami people in the evangelical Lutheran confirmation ritual. The craft, duodji, made by hand from natural materials, is a part of the Sami cultural tradition that is transmitted among generations. Sami dress as one of the cultural artefacts is the most visible element of the Sami culture and cultural identity. The duodji is manifested in the confirmation ritual ceremony where main actors are young boys and girls who are dressed in Sami traditional dress. The research material is based on interviews and participant observation in the churches and celebrations in Finland, Utsjoki parish and in Norway, Karasjok parish during 2005-2010. The native Sami author argues that the Lutheran confirmation as a collective ritual and a rite of passage has become an important institution where the Sami people maintain and transfer their cultural traditions of the clothing in modern Sami society. The author will discuss the embodiment practices, because the body is considered important to understand the rituals. Not only the body but also its movements and senses like smells, tastes, and voices are important in transferring the cultural meanings.

LA FÊTE COMME ESPACE D’AUTODÉFINITION IDENTITAIRE. UNE COMPARAISON DE LA FÊTE DE SAN JUAN ET DE PAWKAR RAYMI DANS LA RÉGION D’OTAVALO (ANDES ÉQUATORIENNES)
Jérémie Voiron

Abstract: Dans ma communication, j’ai l’intention de comparer les deux fêtes annuelles les plus importantes de la communauté autochtone (kichwaphone) de Peguche (Otavalo), dans les Andes équatoriennes, à savoir la fête de San Juan (ou Inti Raymi) et celle de Pawkar Raymi. Les ethnographies de tout le 20ème siècle rapporte la première comme la plus importante, tandis que la seconde existe en tant que tel depuis 1995 et a atteint un budget, lors des dernières éditions, qui tourne autour des 100'000 dollars.

En effet, la San Juan – un terme kichwa, Inti Raymi (fête du soleil) tente de s’imposer depuis quelques années déjà – se célèbre de manière spontanée. Aucune organisation formelle n’est nécessaire; les gens se déguisent et sortent le soir danser dans les maisons de la communauté et des communautés voisines. Elle constitue un symbole fort de l’identité Otavalo. Au contraire, la Pawkar Raymi nécessite un comité organisateur et des sous-commissions pour trouver les ressources financières et organiser les différentes activités, ainsi que l’utilisation de toute une série de médias. Elle est un espace où se retrouvent les migrants (qui reviennent pour l’occasion) avec leur famille et où se réédifie l’identité ethnique.

Même ces différences, quelles sont les similarités entre les deux fêtes ? Qu’est-ce qui fait le lien entre les deux événements en tant que « fête » ? Comment sont vécues chacune des deux fêtes ?

Je commencerai par décrire brièvement les deux manifestations, puis tenterai d’établir les différences et les similarités. Je parlerai ensuite du vécu et du rôle de l’échange de nourriture et de boisson alcoolisée dans les deux fêtes. Pour conclure, j’aborderai la fête comme espace où se joue l’autodéfinition identitaire.

TRANSLATION FRIENDSHIP IN CURRENT TIMES
José Diego Santos Vega

Abstract: In recent years sociology has taken an important turn towards the study of private life and private relationships, friendship included. This paper seeks to rethink our current concept of friendship. In it is argued that friendship is usually understood as a “substance” really unique and immutable once there, something universal that comes from the free, spontaneous and reciprocal complicity between human beings; or even a simple effect of the macro-social structures. Then, we consider that these perspectives are too limited because they are dominated by individualism and sociology. We propose that it is required to know the set of mediators (human and non-human entities) that continuously get
around to make friendly relationships work in everyday life. Using the notion of "translation" (Latour) we would like to show that friendship is always an uncertain result of the stabilization and embodiment process of diverse grammars of practices, which delimit and define different ways of conceptualizing and shaping friendly practices (making trips, to go visiting, birthday parties, having a drink...). Our research attempts to describe the practical rules of these "grammars of friendship" in which all actors are involved when managing their friendly relationships.

Keywords: sociology of friendship, social relationship, actor-network theory, translation.
RS 18 Economic Elites in Turbulent Times

CHANGES IN THE STRUCTURE OF THE FINNISH BUSINESS ELITE, 1860–1940
Kari-Matti Piilahrti

1Department of Philosophy, History, Culture and Art, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: In my paper I will point out some overall features of structural metamorphosis of the Finnish business elite from the 1860s to the WWII. The period was marked by numerous changes in economy, political life, culture and education. Among them were industrialization, freedom of employment, the emergence of commercial banks, the development of transportation and communication as well as vigorous changes in trade cycles.

The analysis is based on a quantitative study of the business elite comprising cohorts from the years of 1860, 1890, 1912, 1927 and 1938. From each year fifty most influential families/individuals were selected to the sample. In the case of Finland it has been quite common in previous studies to constrain the analysis of the economic elite to industrialists. In this paper the business elite is defined more widely and it includes besides industry, commerce, banking and insurance sector plus transportation.

The main focus of the presentation is to chart the overall trajectories of the composition of the Finnish economic elite by observing both the transition and constancy. Firstly I will untangle the structural change by observing the prevalence of the generational continuity among the established families of the elite (the old money) and their possibilities in maintaining their position among the highest economic crust. Secondly I will pay attention to the significance of social ascendance by observing the extent of the socio-economic newcomers from the lower class origins (the new bourgeoisie or Nouveau riche) entering the top of Finnish business life. Also the intriguing question of social descent will be discussed in the paper.

The focal questions are: How to define the intricate term of the business elite? How did the tumultuous changes of economic and societal life influence to the consistency and the generational continuity of business dynasties on the top of the Finnish economic life? Were the separable phases in the structural development during the era? To what extent the economic elite was renewed by "nouveau riche"?

I will also discuss how to define the intricate term of the business elite. An innovative theoretical framework, the business elite index, will be introduced as an operative tool for the definition and the analysis.

CONFLICTS AND COALITIONS IN THE FIELD OF THE SWISS BUSINESS ELITE 2010
Felix Bühlmann 1, Thomas David 1, André Mach 1

1UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: As one of the legacy of Mills’ conceptualisation of the power elite, elite research has long considered the economic elites as unified and homogeneous social groups. This approach worked fine in a period of stable elite coordination and reproduction. However, more and more evidence arises that in many Western countries the modes of elite coordination have been transformed dramatically in the last decades – networks of interlocking directorates have eroded, neo-corporatist connexions between politics and business have been loosened and national elites have been thoroughly internationalised. To understand these changes of elites functioning, it becomes important to reconsider the concept of a unified elite and to examine the different factions that compose it. The conflicts and coalitions between these fractions inform us about the central dynamics of change and allow us to explore emerging forms of elite coordination. In this presentation we examine the case of the Swiss business elites in 2010. Thanks to a multiple correspondance analysis of the CEO’s and presidents of the board of the 110 largest Swiss companies we first identify and characterise the main fractions of Switzerland’s business elite. From each fraction we then choose a number of characteristic individuals and analyse their ideology and their style of thinking (based on a discourse analysis of a corpus of about 200 interviews and newspaper articles from the business press). In this way we identify the main conflicts and coalitions within the Swiss business elite and draw a series of conclusions concerning the new forms of elite coordination in Switzerland.

THE EUROPEAN CORPORATIVE SPACE: CONTROL OR COLLABORATION?
Mireia Sierra 1, Anna Ramon 1, Jose Antonio Rodríguez 1

1UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: In this paper, we analyze the structure of European national and transnational corporative networks, attempting to see to what extend the internationalization of corporative and elite networks in Europe follows logics of control or of collaboration, and trust, or combination of both.

We will look at this issue from the perspective of social network analysis. We use ownership and interlocking directorate data for the largest corporations of 26 European countries. Comparing relational systems based on ownership with those stemming from the composition or the boards of directors we can identify networks where control is important and those where cooperation is dominant. Comparing them, seeing differences and similarities will help us to better understand the complex system of relations creating Europe.

“LOOKING INSIDE THE EUROPEAN BLACKBOX OF INTEREST GROUP” : RELATIVE STABILITY OF INTERESTS, INCREASING NUMBERS OF ORGANIZATIONS AND MAILBOXES IN BRUSSELS
Sylvain Laurens 1, Guillaume Courty 2, Helene Michel 3

1GSPE, UNIVERSITE DE LIMOGES, Strasbourg, 2CErAPS, IEP LILLE, LILLE, 3GSPE, IEP Strasbourg, Strasbourg, France

Abstract: In this communication, based on a collective research (Pressure project), we will explore all the directories published by different European institutions and mainly 6 directories of the Eu-
ranean Commission (published by the EEC or Delta Editions) since 1960.

Analyzing these directories, many inquiries have already noted the increasing number of European Business and Trade Association in Brussels since the 1980’s. However, recording this expansion, our statistical inquiry draw us to wonder not only “what could explain” this evolution but also “what” is behind this growing number of interest groups. In other words, we will raise the question of the number and nature of interests represented behind these numerous mailboxes based in Brussels or in different capitals.

This paper will explore the assumption that there is more stability than change in the interest groups dynamics inside and outside the European institutions; that the growth of interest groups in Brussels does not match with a constant progression of interests represented.

We must separate the rate of organizations and the rate of interest. One is an opportunity to explore the actors of interest representation, the other is a contribution to analysis the issues. Behind the increasing number of European organizations declared in official registers, constant interest may be represented by different structures ever more numerous facing policy makers and administrative staff.

CONTEXTUALIZING THE TRANSNATIONAL BUSINESS ELITE: THE EMBEDDED NATURE OF (NON-)EXECUTIVE MIGRATION PATTERNS ACROSS NATIONAL BORDERS

Kees Van Veen

Faculty of Economics and Business, UNIVERSITY OF GRONINGEN, Groningen, Netherlands

Abstract: Recently, the internationalization of boards of large multinational companies has drawn the increasing attention of management scholars, sociologist and political scientists. The recruitment of new board members of multinational companies has become more global and is no longer restricted to managerial labor markets in the country-of-origin of the companies. The result is increasing nationality diversity within these boards. In fact, this process represents the emergence of a transnational business elite.

We answer the following question: “How do country-level factors explain the distribution of nationalities among board members of large European Multinational Companies? Essentially, it is argued that country differences and characteristics determine the nationalities of a company’s board members, and that these factors influence both the attitude of companies in their selection and recruitment decisions as well as the willingness of potential board members to accept a cross-border board position. The hypotheses focus on a number of country level factors. For all countries/nationalities in our database, data have been collected for each of the possible country pairs.

We then estimate models to explain the presence of nationalities on the augmented databases that we have constructed. We adopt two estimation techniques. We estimate the model using standard ordinary least square regression techniques as a benchmark. In addition, to better model the dependent variable which is restricted to the unit interval we also present results based on fractional logit analyses.

The results of this study show that the emerging global labor market is strongly embedded in geographical, cultural and economic conditions. Migration of board members is strongly dependent on contextual factors which are rooted in the home-country of the board member, the host country of the board member and the relations between these two. The international market for managerial labor not only reflects these national labor market segments, it also shows that the way the market is evolving is highly fragmented and rooted in path-dependent historical relations between sets of countries. So in more sociological terms, the formation of the transnational business elite depends strongly on contextual factors which determine migration of individual board members.

WHO LEADS THE EURO ZONE’S (DES)INTEGRATION?

François-Xavier Dudouet, Eric Grémont, Antoine Vion

IRISSO, CNRS - Université Dauphine, OpesC, LEST, Université de la Méditerranée, Paris, France

Abstract: This original paper explores the structural embeddedness of the Euro Zone’s business world within and between five stock exchange indices: the AEX 25 (Netherlands), the BEL 20 (Belgium), the CAC 40 (France), the DAX 30 (Germany) and the MIB 40 (Italy) in the most recent period (2005-2009). From original database on the composition of the companies’ boards every 31st of December, we build a longitudinal interlocking directorate study of the figuration of European networks. Financial firms remain very central in national business worlds, as they consolidate core investment and credit activities through stock exchange inner networks: Allianz and Deutsche Bank in Germany, BNP-Paribas and AXA in France, Mediobanca and Generali in Italy play such leading roles. Conversely, their weaker ability to lever the Euro Zone’s financial integration may explain both the absence of a strong European business milieu and the difficulties to face the so called ‘Euro crisis’. In Europe, transnational concentrations have occurred much later in the financial sector than in the industrial one, so the financial figuration of the Euro Zone remains unpredictable. One major trend can yet be stressed: the CAC 40 provides the highest rate of transnational interlocks, as well as the highest number of them. Moreover, the CAC companies, and especially the financial ones, lead every bilateral network, so that they seem to be the most attractive partners of the Euro Zone, with a growing influence in Belgium and the Netherlands. Whenever France has no Mittelstand, French blue chips seem to lead the financial transformation of European capitalism.

A CRISIS OF OPPORTUNITY: THE NEW POLITICS OF ALTERNATIVE FINANCE

Adriana Vilella Nilsson

CRESC, UNIVERSITY OF MANCHESTER, Manchester, United Kingdom

Abstract: The re-regulation of banking in the United Kingdom has gone through two distinct phases involving economic and political elites since 2007. The first, in 2008 and 2009, reflected an elite consensus on what the crisis was about and what had to be done next, leaning heavily on established narratives about the importance of the City of London (and therefore the maintenance of business as usual) for the economy as a whole. The second and ongoing phase overlaps with the rise of the coalition between the Conservative Party and Liberal Democrats and the establishment of the Independent Commission on Banking, but its origins are on clear cracks in the previous elite consensus: already in the Summer of 2009,
prominent players such as Mervyn King, governor of the Bank of England, and Adair Turner, head of the Financial Services Authorities, were publicly questioning the actions of traditional economic elites before the crisis and proposing more radical action to prevent them from happening again. This paper focuses on the arrival of this competing narratives and draws on interviews with bankers and regulators to propose that the financial crisis has potentially aided the coordination of a second tier of elite players formed by ‘alternative’ banks, spurred to action both by the politicisation of the narratives around the governance of finance, reinforced by stories about new desirable forms of competition, and the need to protect their own business models from regulatory action being decided at supranational and national levels. One of the outcomes has been stronger and more organised ties between mutual/alternative banking institutions both in the UK and in Europe.

EVERYTHING CHANGES SO THAT NOTHING CHANGES?
THE FRENCH ECONOMIC ELITE, 1957-2009
Pierre François 1,2*, Claire Lemercier1
1CSO, CNRS-Sciences-Po, 2Ecole polytechnique, Paris, France

Abstract: Our research concentrates on the members of boards and executive managers of the top 100 French firms. While thus beginning with traditional sources and techniques of “interlocking directorates” studies, we have modified them in order to address key questions that have often been neglected in this literature.

Our general goal is to reconcile the firms-side approach (especially those concerned with corporate governance and cooperation issues) and the elite-side approach of interlocking directorates in order to understand how changes on each side interact. The French case is particularly suited to such a dual approach as it exhibits a remarkable stability in the general patterns of interlocking directorates and in the main types of top executive careers between 1979 and 2009. We will thus also investigate the situation in 1957, in order to decide if this stability was a very long term one.

We will also use non-mainstream data and techniques to investigate both the elite side and the firms side.

We have collected detailed career data for subsets of the board members and executives, which will allow us, partly thanks to sequence analysis, to discuss the persistence of the French “old boys network”. While the main career patterns have remained similar during the last 30 years, this does not mean that nothing has changed: it might also indicate that the profiles of new recruits have been changed in some respects so that other traits (such as social and academic recruitments) could be preserved.

From the point of view of the firms, we are also particularly interested in seemingly important changes that did not influence crucial ties. Two important cases in this respect are, on the one hand, the centrality of banks in the network, while banking has become a completely different economic activity during the last 30 years, and, on the other hand, the relationships between firms and the State. While most of the formerly State-owned firms are now privately owned, strong ties remain when the State is a client, is the one that contracts out a public service, and/or provides former ministerial advisers for managing positions. We therefore have chosen to focus on two sectors, finance and energy, in order to more precisely understand the joint changes (and non-changes) of strategies and careers, focusing on enduring patterns that in fact arise from partly new mechanisms.

GERMAN CORPORATE ELITE IN FLUX, 1960-2005
Saskia Freye1
1Max Planck Institute for the Study of Societies, Cologne, Germany

Abstract: Recent studies on the recruitment of the German corporate elite present ambiguous results, some suggest stable others changing patterns. The paper investigates the composition of the German corporate elite. It is based upon a unique dataset capturing the career paths of the CEOs of the fifty largest industrial companies in Germany between 1960 and 2005. For the first time the development of the career paths of German top managers can be analysed over a period of 45 years. The analysis reveals substantial changes in the career patterns of the German corporate elite, occurring especially from the late 1980s onwards.

AGENTS OF LIBERALIZATION? BUSINESS GROUPS AND THE PRIVATIZATION OF PENSIONS IN CONTINENTAL EUROPE
Marek Naczyk1
1Department of Politics and International Relations, UNIVERSITY OF OXFORD, Oxford, United Kingdom

Abstract: This paper explores the role played by business groups in the privatization of Continental pension systems. The literature on cross-class alliances and the varieties of capitalism has drawn attention to the cleavages that exist between employers in their preferences with regard to social provision. However, analyses of institutional change in welfare states rooted in this theoretical approach have up to date focused mostly on the labour market determinants of actors’ preferences. I argue that it is necessary to enlarge the focus of analysis by also examining the role played by segments of capital linked to the financial system, particularly by insurers. Because of their vested interest in the development of a market which should profit them as an industry, insurers can be expected to be a key proponent of retrenchment in public pension systems and their concomitant privatization. However, insurers’ preferences may clash with those of employers traditionally involved in social partnership such as manufacturers’ federations. The paper will show how differences in the institutional design of the existing public-private pension mix affect employers’ preferences with regard to pension privatization and how they constrain insurers’ strategies for liberalization. The theoretical approach developed in the paper is informed by case studies of pension reforms in France and in Belgium from the 1980s until the 2000s.
RS 19 The Tacit-Knowing Approach

...NOT WHAT, BUT “HOW” IS TACIT?

Anja Kraus

1Institut für Erziehungswissenschaft, PÄDAGOGISCHE HOCHSCHULE LUDWIGSBURG, Ludwigsburg, Germany

Abstract: The concepts of tacit knowing, implicit knowledge, know-how, or knowing-in-action etc., all refer to knowing and knowledge. Knowing and knowledge as such imply a clear subject-object-relation as a mere fact: A person knows something or she knows somebody.

Looking philosophically at the subject-object-relation by applying the phenomenological perspective, this relation turns out to be only a secondary phenomenon. It is seen as a (e.g. responsive, resonant) structure, as a result, as an aim, even as a hypothesis etc. dependent on situational factors and on social interactions constituting and shaping it. Seen from the phenomenological perspective, primordially every situation is a social situation, and social interaction in term is based upon the types of rationality and knowledge brought into it by the actors, on the qualities of their experiences, on their actual moods and/or on their intentionality; not at least social interaction can also be dependent on (social) abilities and competences.

In short, every subject-object-relation is deriving from diverse antecedent phenomena.

To define or describe tacit knowing, implicit knowledge, know-how etc. we therefore have to pay a closer look at
1. ... the possible ways how a subject-object-relation comes into play in a certain (social) situation. Then we can ask which parts of this relation could be signified as tacit ones. Repression, suppression, displacement, non-observance, fading out, insensitivity etc. are terms that describe the processual, evolutionary character of tacit dimensions.

Then we focus
2. ... inaccessibility, absence, deprivation, loss, etc. as possible aspects of a subject-object-relation.

In my presentation, this examination will be framed and structured by an empirical study.

EXPERIENCE, GUT FEELINGS, AND EVERYDAY IGNORANCE: GEORG SIMMEL AND THE NORMALCY OF NONKNOWLEDGE

Matthias Gross

1Department of Urban and Environmental Sociology, HELMHOLTZ CENTRE FOR ENVIRONMENTAL RESEARCH - UFZ, Leipzig, Germany

Abstract: Questions pertaining environmental issues or the safety of new technologies increasingly point to the limits of actuarial prediction, because there is not enough historical experience to fall back on in evaluating them. Thus understood, knowledge generated through scientific expertise is starting to take a backseat role in the face of the significance of ignorance. Accounting for unknown dynamics and variables poses a more fundamental problem than the inability to analyze known interactions accurately. What we then find are decision making processes built on tacit knowing, intuition, gut feelings, and different forms of trust and experience.

In this presentation I am going to develop further some of Georg Simmel’s reflections on the reverse side of knowledge – what he called nonknowledge (Nichtwissen) – and will illustrate Simmel’s ideas with empirical examples from strategies used to cope with ongoing situations involving ignorance in applied research settings such as field scientists dealing with contaminants in the ground and related issues. Framed with Simmel’s notion of nonknowledge, these strategies dealing with the unknown can be conceptualized as handled through intuition, tacit consent, or different types of “pessimism.” I will illustrate on how these “tacit” approaches can be empirically interpreted best in terms of strategic or accidental constructions of nonknowledge.

FINDING TACIT KNOWING IN THE KNOWLEDGE CONTINUUM

Keith K Morgan

1Management, BERKELEY COLLEGE, Clinton, NJ, United States

Abstract: The objective of this paper is to find tacit knowing in the Knowledge Continuum. The knowledge continuum is the following sequence of processes: Data à Information à Knowledge à Wisdom. The tacit knowing definition is based on Polanyi’s view of tacit knowing, since, he was the first to define it and there is an empirical proof of theory that his tacit knowledge dimension exists (Morgan, 2006 & 2008). Polanyi (1966) sees tacit knowing as being defined by two terms. The terms are labeled “proximal and distal” (Polanyi, 1966, page 13). The linkage between these two terms is a tacit link. “We know the first term only by relying on our awareness of it for attending to the second.” (Polanyi, 1966, Page 10). After the tacit knowing link is defined in the knowledge continuum, the question that remains to be answered is the tacit knowing link only from within the individual or is it observed or both?

KNOWING HOW: WHAT IS IT THAT REMAINS ‘TACIT’ ABOUT TACIT KNOWLEDGE?

Thanos Kastritis

1Currently unaffiliated (DPhil 2010 from Univ. of Sussex, UK), Athens, Greece

Abstract: Michael Polanyi’s approach focuses on the manner human awareness is interwoven with intentional action, in order to illustrate how actors come to know more than they can make explicit. In this paper I would like to retain Polanyi’s emphasis on the indispensable character of personal knowledge for making sense and using explicit knowledge, but also consider what is it of the actors skills, or embodied dispositions, that is responsible for this personal knowledge. After considering the contributions of, among others, Gill (2000), Tsoukas (2003) and Collins (2007), I draw emphasis on a separation between the actor’s sense of knowing how and the circumstances which facilitate both this sense and the activities recognised by others as a skilful performance. This enables a consideration of each knowing self as the premise where awareness of intentional action coincides with the coming together of
embodied and worldly mediating circumstances that become manifested as skilled activity. I argue that what remains ‘tacit’, in that it is known only to the self is this sense of place (which is not a position) and which other’s can’t share; furthermore that successful communication of skill rests on facilitating a set of circumstances upon which those concerned may come to coincide.

KNOWING HOW TO PUT IN PRACTICE WRITTEN RULES: ETHNOGRAPHICAL ANALYSIS OF THE PRACTICAL ACTIVITIES OF ITALIAN JUDGES

Luca Verzelloni

Abstract: In front to an unique procedural written law, certain and equal for all, many times the Italian judges put in practice the articles of the Code of Civil Procedure in ways so profoundly different. These behavioural differences, besides to calling into question the principle that “law is equal for all”, highlight the eminently practical character of the interpretation of law. Interpretation of law, far from being a cognitive activity, it is a concrete and material practice, which is created, recreated and reinforced through experience and through continuous individual and collective learning occasions. Interpretation of law is not based on perennial and immutable axioms, but it’s an activity built in practice, through subsequent “translations” of the formal and abstract rules into the “concrete” lawsuits. The distance between written law and practicing of the magistrates doesn’t highlight a dysfunction, but expresses exactly the “space” of interpretation of each judge. Being a magistrate doesn’t mean to acquire a body of abstract knowledge on how to interpret the rules, but vice versa signifies really to be able to practicing as a judge in a court of justice. Since the interpretation of law is not a cognitive process, but conversely a practical and situated activity, for study the logics that characterize the “fabrique du droit”, it is necessary to pass beyond the “institutional facade” of tribunals for investigate the “real” doings of practitioners. In the light of the large debate of Practice-Based Studies (PBS) and of the tacit-knowing-approach, on the basis of the data collected during an ethnographic research developed in over two years in four Italian courts of justice, this paper aspire to paint the practical activities of judges and to reflect on the processes of knowing and learning located in the courts of justice.

TACIT KNOWING & MORE - HIDDEN QUALITIES OF INNOVATIONAL ACTION

Daniela Wühr, Stephanie Porschen

Abstract: Though the topic innovation seems to be a very widely and intensively researched field in social science, the concrete actions of innovation actors are not. It has been extensively shown that high uncertainties and risks are typical for innovation, nevertheless it has still not been systematically studied what the characteristics of innovational actions are.

We argue that this specific focus on innovational action will help to better understand and grasp the general conception of tacit knowing and knowing in action. We will reveal, based on empirical research, that mostly hidden qualities play a key role for innovational actions. Because of its unpredictable character, innovation means for subjects and organisations turbulent times. Tacit and experiential knowing, informal cooperation and labour capacities are the innovation actors’ decisive strengths to cope with situations, when formalised processes reach their limits and a modus operandi according to given standards would be misleading.

To disclose these hidden, subjectified qualities we will introduce in our theoretical part a new concept of innovational action integrating the dimensions of creative, experiential, and playful action. This perspective offers an analytical approach to disclose (1) how tacit competences help innovation actors realise innovation (e.g. new materialised objects) and (2) how innovation actors attain the necessary competences in innovational action.

In the methodological part of our contribution we would like to offer an empirical approach towards the mostly hidden qualities of innovational action. Because of the focus on the micro level, the concrete level of everyday innovational action, we have designed a qualitative “Smart Innovation Process Analysis”. This research design aims to grasp elusive aspects of innovational action from different groups of labour power and investigates innovation using agile research methods as well as lean, practical and explorative principles following a participative approach.

Our results are based on about 85 interviews in 8 companies, most of them market-leading machinery manufacturers, but also including Engineering and ITEnterprises.

THE ROLE OF TACIT SKILLS IN THE CORPORATE COMMUNICATION PRACTICES

Antonietta De Feo

Abstract: This essay proposes a reflection on the professional practice in the corporate communication field. The corporate communication is an important management function through which an organisation presents itself to all its key stakeholders, both internal and external. This function involves complex activities such as planning and coordinating communication messages and, above all, managing the dialogic interaction between the organization and its public. In Europe, the skills required to achieve these activities are increasingly formalized in higher and specialized knowledge (Cornelissen 2008; Hübner 2007). In others words, corporate communication became a complex discipline that identifies the theoretical and methodological references to professional working. However, some reflections on the corporate communication practices emphasize the importance of relational skill, often identified as an individual disposition, hard to formalize (Combes 2002; Milburn 2002; Giannini 2009, 2003). Its meaning is not always clear because it seems to be a dimension incorporated in the actor’s attitude.

On this topic, we present a case study on corporate communication professionals practices in an Italian Energy Company. Through this empirical research, we analyzed the tacit dimension of relational skill in Bourdieu’s praxeological approach. In this theoretical framework, the relational ability is defined in terms of habitus, a social property of individuals related to life trajectories (Bourdieu 1994, 1972). So, we observed how this relational disposition is defined and how it changes subject to the network of relations of a particular organizational field.
TO ‘READ’ THE CUSTOMER—A TYPE OF TACIT KNOWLEDGE

Ylva Ulfsdotter Eriksson

1Dep of Sociology, GOTHENBURG UNIVERSITY, Gothenburg, Sweden

Abstract: Waiters/waitresses and care-workers are occupations with low educational demands and proficiency. A secondary school is often sufficient for employment, when such claims are made at all. They are examples of occupations that can be learned in the concrete practice of ‘doings’, i.e. learning from experience. The knowledge-base in these occupations can thus be defined practical, and tacit. An image of these occupations is thus that they can be conducted by almost anyone with minor efforts and a low degree of engagement. An interview study, conducted we have conducted in Sweden showed that both waiters/waitresses and care-workers used themselves and their empathy in order to carry out their tasks. They perform emotional work in fulfilling their tasks by meeting the needs of their clients and customers. Using emotion in work is thus a form of tacit knowledge since it is not pronounced and explicit, but rather intuitive and empathetic. These professions are occupied in different institutional contexts: Waiting staff in a commercial context and care workers in the public service. Both occupations is dominated by women and working with customers/clients with similar emotional tools and skills to ‘read’, detect, and take in the needs of a particular customer or clients. The purpose of this paper is to explore how tacit knowledge is used in these occupations with regards to the inter-relation between intuition and emotion. The paper analyses similarities and differences in how the waiters/waitresses and the care-workers describe how they use an inner and intuitively-driven knowledge to perform their tasks well and satisfactory. Theoretically the subject matter in this paper is found in the subsection of emotional labour and tacit knowledge. The paper draws upon sociology of emotions by focusing on ‘emotion as a clue’ as well as aspects of surface and deep-acting in different social settings as described by Hochschild (1983) and Bolton (2005). Aspects of tacit knowledge are foremost inspired by the intuitive knowledge identified by the Swedish philosopher Hans Larsson (Matti 1999) and those competences identified by Josefsson (1988:1991) called ‘excellence in seeing’.

“ARCHIVE” AND TACIT KNOWLEDGE: THE OPPORTUNITIES FOR METHODOLOGICAL CONCEPTS’ INTEGRATION

Liubov Yurievna Bronzino

1Sociology, PEOPLE’S FRIENDSHIP UNIVERSITY OF RUSSIA, moscow, Russian Federation

Abstract: According to the idea expressed by Michael Polanyi, the failure of unbiased science-based knowing undermines the prestige of science as well as destroys its specificity in terms of cognition since the elimination of bias from the scientific inquiry and ipso facto objective truth acquisition have been always considered as the best formulae to develop the criteria of the scientific character of research. On the one hand, Polanyi came up with an idea any scientist will inwardly adhere to. On the other hand, this very thought constitutes such a pivotal challenge to the contemporary methodology that it is hardly possible for it to gain public recognition.

As Polanyi himself shows, many problems associated with the impossibility to state objective laws and valid conclusions based on empirical data alone have not always been taken into account. Not in the least their recognition entailed the quest for any alternative fundamental theoretical and methodological approaches.

The solution to the problem can be found in the emergence of non-classical rationality and its specific manifestation in various domains of scientific knowledge. The approach to the study of society based on non-classical rationality provides an opportunity to include “tacit knowledge” as an indispensable component of scientific knowledge.

However, the complexity of verbal expression of tacit knowledge, the extension of a “mere” sign with specific connotations remains an essential problem given the fact that no other ways to work out a theory are envisaged by human intelligence.

According to M. Foucault, the “archive creation” may emerge as the missing element which can make up for the model of social cognition in which tacit knowledge will be expressed whereas Foucault integrates different practice patterns – first and foremost, knowledge and power – to create “knowledge archaeology”. Social practice and thinking/utterance integration provides an opportunity to develop the basic principles of the methodology involved. Its first-priority sphere of application is historical and sociological discourse.

The methodology used by M. Foucault to investigate the emergence of various social institutions prompts us to apply his model in a modified form (i.e., with due consideration of tacit knowledge) to study such institutions. The model can be of essential importance for the research of institutions associated with culture, e.g., art.

INFORMAL LEARNING OF TECHNOLOGICAL COMPETENCE

Anita Thaler

1IFZ, Alpen-Adria-Universität Klagenfurt, Graz, Austria

Abstract: This abstract introduces a research project, which deals with the concept of reflected technological competence (Negt 1968). This type of technological competence – comprising not only technological skills, but moreover reflected knowledge about technology – becomes more and more important as technologies pervade our everyday lives. It is part of societal key competences, which should enable citizens to live a good and self-determined life in today’s technological civilisation (Bamé et al. 1988).

Based on the assumption that informal learning has a huge potential for a democratisation of education and individuals’ emancipation as it is accessible for everyone, the main question of this research is: Can technological competence be learned informally? Therefore the distinction of intentional and incidental learning is crucial (O’Brien-Malone & Maybery 1998, Dohmen 2001, Shanks 2004). The concept of incidental learning is based on neuro-scientific knowledge, for instance the capability of human beings to perceive implicitly (Lemke 2003) and thus to gain implicit knowledge or ‘tacit knowledge’ as Michael Polanyi put it (1966/1985). Implicit knowledge comprises theoretical knowledge as well as practical skills, and influences thinking and learning processes. Some authors hold the view that implicit knowledge – although it is indispensable for explicit knowledge – cannot be recalled intentionally (ibid). In contrast, some authors think that although implicit learning is based on unconscious processes, it can
produce consciously accessible knowledge (O’Brien-Malone & Maybery 1998). A hypothesis of this study would be that reflected technological competence could be acquired in both formal and informal educational settings, but very probably only intentionally, and not incidentally.

However, there arises an important methodological question: How can informal learning of technological competence be observed and analysed? One answer could be the ethnographic approach (Denzin 1997), or more precisely: pedagogical ethnography (Zinnecker 2000), which comprises participant observation, casual interviews, and content analysis of learning arenas.

LISTEN TO MY STORY; THIS IS WHO I AM – TACIT KNOWLEDGE IN LIFE STORY NARRATIVES.

Marta Justyna Kowalska

School of Social Sciences, BANGOR UNIVERSITY, Bangor, United Kingdom

Abstract: Researching tacit forms of knowledge, especially those connected with individuals’ sense of belonging and identification, can be considered both a theoretical and methodological challenge. Identity research has a strong tradition of addressing identity as a form of explicit knowledge — by asking individuals who they are, academics claim to be able to understand the complex and multi-layered phenomenon of identity formation. The further the claims about identity go, however, the clearer it becomes that, more often than expected, people do not hold stable identifications. As they go through life, different elements of their personality become predominant and their social roles change over time. This makes identity a dynamic process of often unconscious modifications representing an individual’s response to changing social situations. Such tacit, unspoken characteristics of modifications can be traced and explored within individuals’ narratives. In the relatively free and self-structured flow of a biographical narrative the chain of events as well as their evaluations offer an insight into the processes of negotiation between the individual agent and the social structure. At the same time, narratives demonstrate the tacit character of individual and social relations. These processes can be especially visible in transnational biographies, which call into question everyday elements of social life usually taken for granted. The paper focuses on the mechanisms of how transnationals learn to live in a foreign society and develop new identities, both of which are processes tacit in their character. Narrators are rarely aware of the biographical as well as identity work they have had to undertake in order to find their own place in a new culture and society. This paper is based on the biographical narrative material gathered within the EuroIdentities research project. The data is derived from a sample of 30 life stories with transnational individuals from across Europe.

PROBLEMATIZING TACIT KNOWLEDGE INSIGHTS FROM DELEUZE’S THEORY OF “PROBLEMS”

Jörg Müller

Gender and ICT Research Program, INTERNET INTERDISCIPLINARY INSTITUTE, Barcelona, Spain

Abstract: The following paper aims to flesh out the possible contribution of Deleuze’s theory of “problems” for a tacit-knowing approach. The great potential of a philosophy of problems resides in the fact that “problems” are sub-representational, non-codified but at the same time a dynamic process underlying knowledge (or systems) production. The pedagogical literature emphasises in general the benefits of a “problem-based” learning approach; social theory conceives knowledge production as tied to self-reflexivity that emerges from problematic contradiction between two spheres (e.g. habitus and field in Bourdieu); psychology stress the importance of problem “definition” for creativity; Karin Knorr Cetina introduces “knowledge objects” as “…continually ready-to-hand, unavailable and problematic…”, shot through with passion. Although “problems” constitute a central reference in much theoretical work, seldom are they explicitly theorized. Deleuze’s work provides a solid framework which closes this gap.

Two central illusions are identified: first, problems are not a contradiction between existing terms and second, their reality does not depend upon their solvability. Deconstructing these two misconceptions allows to propose a new non-representational account of the problematic: far from being a temporary lack of knowledge or contradiction, problems have a perfectly positive and objective structure that comes to the fore in their regulative functionon the one hand and their aesthetic dimensionon the other. Deleuze’s theory of problems thereby provides a solid interface between the aesthetic, practice, tacit side of knowledge and its explicit codified form that cuts across many contemporary approaches (Strati, Gherardi, KnorrCetina, ANT, etc.)

This theoretical work informs a two year empirical research project (2009-2011) that compares professional knowledge production between highly feminized (teaching) and highly masculinized (IT) professions. Case studies involving ethnographic observations are carried out in two IT companies and two primary schools. Insights on the (a) applicability of Deleuze’s theory of problems to field research and (b) its fruitfulness for comparing differing “models” of professional knowledge (tacit/teaching vs. codified/IT) will close the presentation.

ARTISTIC RESEARCH AS A PRACTICE OF TACIT-KNOWLEDGE

Martin Anton Tröndle, Karen van den Berg

Culture, Communication & Management, ZEPPELIN UNIVERSITY, Friedrichshafen, Germany

Abstract: Tacit-Knowing wird derzeit an den europäischen Kunsthochschulen unter den Stichworten ”künstlerische Forschung”, ”Artisitc Research” und ”sensual knowlegde” verhandelt. Es geht dabei um die Frage welches Wissen künstlerische Praktiken verkörpern.

...Forschen durch Kunst” wird teils auch als ”Kunstforschung” oder ”angewandte Kunstforschung” bezeichnet. Die hier vertretene Konzeption der Kunstforschung schließt an die Position von Mats Rosengren (2010) an, der Kunstforschung akademisch verankert und ihr die Rolle einer doxologischen Methodik zuschreibt, die insbesondere die Subjektivität des Wissens betont und reflektiert. Das Selbstverständnis einer solchermaßen verstandenen künstlerischen Forschung ist eher transdisziplinär und anwendungsorientiert (vgl. Schenker 2004). Aufgrund der Komplexität real-weltlicher Probleme, die sich meist nicht an die engen Grenzen wissenschaftlicher oder künstlerischer Disziplinen halten, wird davon ausgegangen, dass der Forschungsprozess nicht durch eine Person aus einer Disziplin geleistet werden kann, sondern transdisziplinär an- gegangen werden muss und dass das Ergebnis nicht zwangsläufig
MAKING TACIT KNOWING SPEAK – CONSIDERATIONS ON THE ANALYSIS OF PROFESSIONAL PRACTICE OF JOURNALISTS

Sabine Schäfer

1Research School Education and Capabilities, BIELEFELD UNIVERSITY, Bielefeld, Germany

Abstract: Journalists become journalists not by studying journalism, i.e. by acquiring and reflecting explicit and codified knowledge about journalism, but by doing journalism in the newsroom. This common conviction among German journalists is reflected in e.g. the open access to the professional field which is ajar for almost all kinds of (academic) career changers. This openness makes journalism a perfect field for analysis of the modes of ‘learning by doing’ or ‘training on the job’ which seem to be useful descriptions of different concepts of tacit knowing. But how can researchers identify, observe and analyze tacit knowing of journalists?

When I asked German TV journalists about their everyday practice, e.g. what they do when they produce a news report, they had no problems telling step by step how they proceed. Producing a news report, thus, is obviously a piece of their explicit if not codified knowledge. But when I analyzed the interviews using the concepts or ‘think tools’ of Pierre Bourdieu I realized that a great deal of tacit knowing is hidden in the contradictions of their joint and often unspoken beliefs of what is right and important in journalism, i.e. the illusio of the journalistic field.

Tacit knowing in Polanyi’s notion is similar to Bourdieu’s concept of practical knowledge or his “sens pratique” in several aspects, e.g. both do not only draw upon the common antagonism of conscious and unconscious, meaning explicit and tacit, knowledge but they stress the characteristics of practice and the embodiment of knowledge. However, Bourdieu’s emphasis on power relations opens up a new perspective on the social mechanisms that derive from the unquestioned and taken for granted interplay of professional practice, illusio and the agents’ specific positions in the journalistic field.

TACIT KNOWING, EMBODIED KNOWLEDGE AND “BECOMING THE PHENOMENON”-BASED ETHNOGRAPHY

Chiara Bassetti

1Department of Disciplines of Communication, UNIVERSITY OF BOLOGNA, bologna, Italy

Abstract: I discuss methodological challenges and peculiarities of practice-based research, focusing in particular on the method that I call “becoming the phenomenon”-based ethnography (BPbE) and I have employed in my research on dance as a tool for the empirical study of tacit knowing and embodied knowledge.

It is not “simply” about putting oneself in the midst of the set of contingencies (Goffman 1989) of a particular social and phenominal (Merleau-Ponty 1942; Garfinkel 2002) field. It is also about to (a) explicitly centre the research on one’s own practical and situated learning, and (b) consciously, knowingly, reflexively and “sceptically” (Wright Mills 1959) exploit one’s own observed experience as an heuristic tool. It is about accessing the tacit understandings of practical knowledge through practice itself (O’Connor 2007) and writing about it.

Data primarily consist of fieldnotes and videorecordings. On the one hand, I have been observing two dance companies and the related schools, while, on the other hand, I have been attending dance classes for the first time in my life, so as to understand the meaning of becoming and being a dancer, to acquire a practical, visceral mastery, and to explain the agents’ praxeology (Wacquant 2009).

I address the problem of tacit knowing “visibility” and present BPbE as a strategy for avoiding the un-reflexive, un-observed use of membership knowledge that most autoethnographies do, as well as the mis-interpretation and imaginary-driven analysis (Becker 1998) coming from being a “stranger” to such a knowledge. I discuss the advantages of studying the process of acquiring – as an adult, “reflexively reflexive” (Bourdieu 2001) ethnographer – practical, embodied abilities, and pay attention to the opportunities offered by teaching/learning contexts (cf. Crossley 2007; Wacquant 2000). Finally, I discuss the ways in which BPbE could, and should, interrelate with “traditional” participant observation as well as video-based research in order to make the tacit visible.

Keywords: embodiment, embodied knowledge, tacit knowledge, practice, experience, “becoming the phenomenon”, ethnography, video-based research.

THE EXPLICITATION OF MEANING AND PRACTICAL KNOWLEDGE: THEORETICAL AND METHODOLOGICAL CONTRIBUTIONS TO STRATEGIES FOR ETHNOGRAPHIC RESEARCH ON TACIT-KNOWING

Telmo H. Caria

1Center for Research and Educational intervention, UNIVERSITY OF PORTO, Porto, Portugal

Abstract: The paper has two main objectives:

• identify the interpretations of the works of Michael Polanyi and Pierre Bourdieu that are congruent with identification of a subject of research that have particular interest to professional practice - the explicitation of meaning and practical knowledge.

• relate the study of this subject to the development of ethnographic research, focusing on reflexivity shared between the ethnographer and the professionals and their work and professional power.

To achieve these objectives the paper develops as follows:
• first, it summarizes the theoretical contributions of Michael Polanyi and Pierre Bourdieu (habitus and knowing), for the analysis of practical activity (embodied cognition, partial opacity of the meaning of activity and no reduction of practice to microsociological factors);

• second, it demonstrates the ways in which the two authors inspired studies and discussions to highlight the social and scientific validity of object ‘explicitation of meaning and practical knowledge’, especially when there is a discontinuity (gap) between what can be thought as implicit in practical activity, as competence to act in context, and what can be seen as formal and legitimate knowledge to use in context.

• third, it describes the different devices of ethnographic research in Portugal (in research group ASPT)) which developed to allow a clearer grasp of professional knowledge in practical activity in the workplace;

• fourth, it presents some results of ethnographic studies emphasizing the duality that always seems to exist in the relationship between implicit and explicit activity and professional practice.

Keywords: tacit knowledge, habitus, knowing, ethnographies, explicitation of meaning and practical knowledge
FROM OLD TO NEW FORMS OF CONFLICT. SYMBOLIC SOCIETY AND THE SOURCES OF MALAISE

Mark Elchardus

Abstract: The thesis that modernization, in particular secularization-rationalization and emancipation, causes cultural malaise, emerged as a central element of the conservative reaction to the French Revolution and to detraditionalization. It has been a recurring theme in sociology. Detraditionalization is often seen as causing nihilism, meaninglessness and therefore malaise.

In this paper we want to challenge that thesis. We do so on the basis of the theory of symbolic society (Elchardus, 2009).

Detraditionalization is considered as the decline of a specific form of social control based on scarcity, obedience, self-restraint, religious or ideological belief and authority. Those forces and institutions have lost much of their power in modernized societies. This did not however lead to individualization, but to a new mode of social control, called symbolic society. This mode of control is based on the belief in individual autonomy and the strong steering capacity of education, media, the capitalism of desire and therapy.

In the light of that theory malaise is considered as a consequence of a transitional phase between detraditionalization and the rise of symbolic society. The causes of malaise are predicted to differ for people socialized in the old and people socialized in the new mode of social control.

Those expectation will be tested on the basis of random samples of people 75 year old (N=1500) and people 18 tot 45 (N=1400) from the Flemish region of Belgium. Malaise is operationalized on the basis of three, strongly interrelated variables: anomie (the Srole-scale), feelings of insecurity and negative expectations with regard to the future.

SIMILAR CHALLENGES, DIVERGENT RESPONSES: INEQUALITY AND SUPPORT FOR DEMOCRACY IN WESTERN COUNTRIES

Jan Gemen Janmaat

Abstract: This paper proceeds from the assumption that public support for liberal democracy constitutes an important basic value contributing to the stability and legitimacy of western democracies. It tests three perspectives on support for democracy as system of government using World Values Survey data of Waves Three (1995), Four (2000) and Five (2005). The first perspective expects levels of support to be highest in the liberal Anglo-Saxon group of countries because of the strong civic traditions in these countries. Countries with weaker civic traditions, such as Germany and Italy, should demonstrate lower levels of support. In the second perspective support for democracy is not so much a reflection of civic culture but primarily of individual socio-economic status. Disparities of support across social groups should be greatest in the Anglo-Saxon countries since these are the countries with the highest inequalities of income and wealth. The third perspective builds on the second. It presumes that globalization contributes to polarization at the national level by creating a society of winners and losers. The winners will converge culturally at the international level while the losers will remain thoroughly national in their outlook. It expects disparities of support for democracy across social groups to have increased in all western societies.

The paper finds that support for democracy is lower in Anglo-Saxon countries than in mainland Europe, which refutes the first perspective. It also finds that disparities of support across social groups are largest in the Anglo-Saxon countries, which is consistent with the second perspective. Contrary to what the third perspective anticipates though, it finds that disparities have become larger in only some countries (most notably in the US) while in other countries they have become smaller or have remained the same. This suggests that specific national institutions and socio-structural conditions make societies respond differently to the same challenge of globalization.

THE CULTURALIZATION OF POLITICS IN THE CONTEXT OF MUSLIM IMMIGRANTS - THE RISE OF ISLAMOPHOBIA SINCE 9/11

Wolfgang Aschauer

Abstract: The increase of cultural heterogeneity in many European societies is currently perceived as a major threat by local populations. The fear of foreign infiltration on western values leads to new forms of cultural racism which favors the exclusion of specific ethnic groups and in particular Muslims. The emergence of Islamophobia is usually traced back to the time of the collapse of the Soviet empire. Particularly after September 11th this new concept of an enemy is used by political actors, mass media and also relevant scientific communities. The discourse on Islam can mainly be interpreted as a one-sided view of complex problems. All troubles of Muslim immigrants, such as unemployment, discrimination, poverty and marginalization, are interpreted through a cultural lens. The more space is dedicated to the topic of Europe being “foreignized” and the more strongly a rejecting attitude towards Muslims is spread by the media, the stronger is the support for right-wing populist parties. They gain ground in many European states, use the individual scenarios of threat which are sketched in respect of Muslim immigrants and influence the perceptions of the locals. Remarkable with these developments is the fact that the openly practiced policy of Muslim exclusion is not restricted to the right wing of the political spectrum but achieves even more approval also in the political centre.

In my presentation, I want to analyse the culturalization of politics in the context of Muslim immigrants by three major steps. Firstly, I want to show how September 11th can serve as an explanation for the emergence of Islamophobia. The basic assumption is that not the terrorist attack alone but the combination of psychological, legal and political consequences triggered off a long-term and con-
tinuous cultural change in Western societies. The second step is to give an overview of the current political, media and scientific discourse on Muslim immigrants. Islamophobic statements by opinion leaders intrude the minds of the affected populations and can be responsible for attitudinal changes. Therefore the analytical approach of the paper should be enriched by empirical facts. It will be measured, based on the European Values Study 1998 and 2008, if there is an increase in Islamophobia during the last decade and how the extent of Islamophobic attitudes varies between European countries.

THE INSTRUMENTALIZATION OF CULTURE IN POLITICAL CONFLICTS: CULTURAL IDENTITIES VERSUS RELIGION, ETHNICITY AND LANGUAGE

Mayeul Kauffmann1

1Global Security and Crisis Management, EUROPEAN COMMISSION - JOINT RESEARCH CENTRE, Ispra (VA), Italy

Abstract: A wide range of articles have tried to explain the root causes of political conflicts (especially, but not only, violent conflicts) in terms of cultural categories. Among those, several are presenting one or two of the following factors as the main factor(s) of conflict: religious composition (including the presence of religious fundamentalism), ethnic composition (especially the so-called existence of ancestral grievance) and linguistic composition. The present paper shows that those categories are only mildly relevant perhaps, but the combination of those three factors is often the basis for the construction of cultural identities, which in turn explain much better political and armed conflicts than each of those factors taken individually. A political model of cultural factors in conflicts is developed in the paper. Its validity is in turn empirically assessed thanks to a statistical model encompassing political and cultural factors of conflicts for about 160 countries over four decades. The main empirical finding is that, in many conflicts, cultural identities are instrumentalized in the political arena and are used to exacerbate conflicts in strategic political behaviour.

ITALY BETWEEN FEDERALISM AND SECESSIONISM: THE LEGA NORD FEDERALISM. STEREOTYPES OF FOREIGNERS AND SOUTHERN ITALIANS AS DETECTED IN UMBERTO BOSSI’S NATIONAL-POPULIST SPEECH.

Gabriela Octaviana Jianu1

1History, UNIVERSITY OF ROME TOR VERGATA, Roma, Italy

Abstract: The decentralization of Italy’s political and administrative power represents a recurring theme of the local political issues over the last twenty years. Federalism is seen as the solution aiming at overcoming the economic and cultural differences between the North and the South of the Country. In fact, as opposed to what has been proposed by the Lega Nord, a so-called “soft federalism”, having nothing to do with secessionist policies, shouldn’t hurt the awareness of the national unity – a goal achieved, in practice, only 150 years ago.

The implementation of a set of rules leading to this type of “soft” and “compassionate” federalism brought forward by different other political forces, is not easy in a Country, where the political and cultural background is incompatible with the excessive interests in local policies of the Lega Nord- the political party representing the so-called “padano nationalism”.

The Lega Nord leader – Umberto Bossi - Minister for the Federal Reforms – is backed in this task by his “colonels” Roberto Calderoni and Roberto Maroni who play important administrative roles in the Berlusconi Government. The Lega Nord ideology is also characterized by pegan elements such as - the rite of the “river Po water ampulla”- typical of intolerant and closed political cultures.

Just a simple glance at the main guidelines of the Lega Nord program such as the bills proposed on federal matters, both at local and national level, gives us a clear idea of the self-centeredness of the politicians of this party.

This paper aims at portraying a federal Country as envisaged by the Lega, or better said, a federal – secessionist Country as a result of the political actions of the exponents of the Lega party. The grounding idea on which this strategic project is based, is the so called “municipal federalism” which would allow income to remain mainly where it is produced, that is to say in the North of Italy and – at the same time having the rest of Italy especially the South take on the responsibility for its own expenditures.

At the same time the paper wishes to detect, from a sociological point of view, the main stereotypes attributed by Umberto Bossi both to southern Italian people and to foreigners in his national-populist speeches with the relevant political and administrative consequences.

REFLECTION ON THE CONFLICT BETWEEN OPPIDENS AND MIGRANT WORKERS

Ma Hui1

1Center for Leisure Studies, CHINESE NATIONAL ACADEMY OF ARTS, Beijing, China

Abstract: According to the statistics from Chinese authorities, currently there are around 230 millions migrant workers in the country, (among 61.6% occupied by 16-30 years old young people) who are already the mainstay of “Made in China” manufacturers and the major workforce of industrial workers. Most of them engage in hard work by physical labor in urban area, but they are remaining the identity of ‘farmer’, still contracting with land, family earning to depend on labor in urban.

It indeed has shown us that it is depend on migrant workers who devote themselves to the modernization and urbanization in China over the past three decades. But, it is difficult for them to be considered as the ‘resident’ of the city. Their earning are quite low and even defaulted, with length work time (over 10 hours/day) lack of safety and social security not to mention the occupational disease as well as unforeseeable accidents; moreover, It is also the issues for them to get professional skill training, their children’s education, even an inhabitable home, whilst lack of guarantee on aspect of human right, development right, enjoyment right. For a major reason, the dual social structure in China on the political, cultural, economical which have been kept a operation for long time so that arise in the more gap between oppidans and migrant workers and also between city and countryside.

This article explore What reasons to bring out the contradiction and confliction between “resident”in city and migrant worker? Where is fault in the systems of management and service from government? where is the common cultural foundation? What results should be
happening when most of cities in China run over to urbanization and modernization with the eager for quick success and instant benefits? Try to use the culture sociology's theories and method find out the same cause.

THE DEFENCE STRATEGY OF BELIEF IN CONFLICTING DISCUSSIONS : THE CASE OF THE CONSPIRACY THEORY

Aurore Van De Winkel

1economic, social and communication, University of Namur-FUNDP, Namur, Belgium

Abstract: In the NTIC era, the media has proven to be the diffusion channel and the informer of all sorts of conflicts. The media also creates the place for the conflict expression. This place incubates, develops and can even disintegrate the judgment communities which themselves defend their vision, their world and society beliefs in several fields. It is the case in the political field, where conspiracy theory believers will confront the sceptics and politicians at official speeches.

Considering that:
- beliefs are constructed by interaction with the environment, by interpersonal discussion or interaction with others, or even a mix of these elements;
- beliefs are not always radical and they can evolve, be qualified or be reinforced by discussions or conflicts;
- beliefs are an identifying factor and their sharing & defence have a socializing effect;
- conflicts inject dynamism into strategic, tactical and organizational competences of the people defending their beliefs;

the paper will present content analysis results of fifty conflicting discussions on conspiracy theories involving Europe or European politicians. These discussions are randomly collected on websites, chats, forums and social networks. They reveal opposite or complementary beliefs by the judgment communities on these conspiracy theories. This content analysis allows the finding of indications on cognitive, identity and social strategies developed by the judgment communities in order to construct, adhere, reinforce, share, promote or defend their beliefs in a conflicting situation while interacting. This content analysis also allows the understanding of the conflict’s effect on construction, defence, promotion or disintegration of a secular belief in these communities.

TURBULENT PAST COMPLICATES CRIMEA’S MINORITY RELATIONS

Tatiana Alexandrovna Senyushkina

1political science and international relations, TAURIDA NATIONAL V.I.VERNADSKY UNIVERSITY, Sevastopol, Ukraine

Abstract: Governing society is one of the most functions of social systems. Governing a society fallen out of its customary life rhythm and searching for a new course of development is doubly complex. And governing a polyethnic society in a transitional period exceeds either of the former tasks in complexity. The Crimea is such a polyethnic region, unique for its potential of economic growth and cultural development. Unfortunately, it has an equally great potential for ethnic conflicts.

The Crimea is in the zone of geopolitical interests of three states: Ukraine, Russia and Turkey, each with a coast on the Black Sea, which washes the peninsula. Stability in the Crimea largely depends on the stability of the entire Black Sea region. Yet the pulse of its ethno-political life is set by processes within the local community. Recent experience shows that positions taken by the local authorities and the whole community determine whether conflicts will escalate or be resolved.

The current problems of inter-ethnic relations in Crimea are rooted in the past. Different ethnic groups inhabiting the peninsula give different interpretations of history. The Crimean Tatars claim to be the indigenous population, with a right to self-determination. But the ethnic Greeks also have a legitimate historical claim to their argument that they have priority in settling the peninsula. And the Russians, who make up the majority of the population in the Crimea, point to the fact that the peninsula’s principal economic and cultural potential emerged during the period of Russian, and then Soviet, domain.

Most of the current problems generating inter-ethnic tension on the peninsula result from the deportation of entire ethnic groups during World War II. The past tragedy is indelible from the memory of several generations, and for some, it is still a cause for bitter resentment. For the groups who were deported, the return from exile means regaining their lost motherland. But repatriation on the global scale is a rather rare phenomenon, and is fraught with conflicts, as is confirmed by the experience of several former USSR territories, where bloody ethnic clashes have flared up.

CONSTRUCTING A THEORY OF INTERETHNIC CONTACT SELECTION

Katerina Manevska, 1 Peter Achterberg 1, Dick Houtman 1

1CROCUS, ERASMUS UNIVERSITY ROTTERDAM, Rotterdam, Netherlands

Abstract: A well documented problem within interethnic contact research is that of reversed causality between contact and ethnocentrism: it is as plausible to argue that interethnic contact leads to less negative thinking about ethnic minorities, as to hold that such negative thinking will lead to avoidance of interethnic contact. Not taking self-selection into account will therefore complicate the understanding of the relationship between interethnic contact and ethnocentrism. It is common practice to take note of this problem of self-selection in its field of research, but its solution is generally sought in empirical evidence. A theory of interethnic contact selection might however be needed, since this would enable hypothesizing on contact selection and as such incorporate it into contact theory. This is especially needed since researchers have emphasized the importance of interethnic friendships for reducing ethnocentrism, even though it is known that friendships are most prone to self-selection.

In this paper we aim to formulate a theory of interethnic contact selection from the perspective of an individual’s cultural status. We distinguish between types of contact that are prone to selection and those that are not. In both cases we expect to find an influence of cultural status: in contacts that are prone to self-selection, we expect to find it responsible for individuals’ degree of avoiding interethnic contact. In contacts that are not influenced by self-
selection, we expect one’s cultural status to influence the consequences of interethnic contact for individuals’ opinion about ethnic minorities. This theory of interethnic contact selection is tested with data from the Netherlands taken from the European Social Survey. The results show that the association between interethnic friendships and ethnocentrism is attributable to cultural status based self-selection. For interethnic contact with colleagues and neighbours, it is shown that cultural status influences the way interethnic contact is translated to an individual’s opinion about ethnic minorities. Based on those results, the assumed importance of interethnic friendships for reducing ethnocentrism can be questioned. Furthermore, our results contribute to the contact literature by showing the importance of an individual’s cultural status, and by offering a way of incorporating self-selection into contact theory.

IS THERE A NEW WAY TO BE A JEW IN FRANCE ? THE PATTERN OF INTEGRATION INTO THE FRENCH SOCIETY FROM A SOCIO-HISTORICAL POINT OF VIEW
Renée Waissman

Abstract: This paper aims to analyse the different events which occur to change the pattern of integration into the French society since the Jews living in France during the eighteenth century (1789) obtained the french citizenship. In the first part we shall point out the kind of influence which occur out of these events on the jews community in France ; in the second part we choose the crisis of the Six-Day War as an important event which changes the relationships between the french Jewry towards the State of Israel, and reveals to the french Jews the different ways of being a Jew. The analysis of this part is based on a sociological survey[1] carried out in Paris ( May-July 1967) among a population of 350 French citizens who defined themselves as Jews. In the third part, we analyse our main hypothesis : : the Interdependance in the destiny beetween the Jews of the Diaspora and the Jews of Israel ; the feeling of a shared identity. We adopt the concept of public space [2] to explain the process through which the French Jews made public in 1967 their private identity. These two dimensions of the jewish identity : private/public remains the core of our paper.

THE TRANSFORMATION OF THE KURDISH CONFLICT IN TURKEY
Murat Ergin

Abstract: The 2000s in Turkey witnessed a new phase in Turkish-Kurdish relations. The Kurdish question, which used to be largely limited to struggle between Kurdish activists and representatives of the Turkish state, has stretched to increased tensions and community-level clashes between ordinary Turkish and Kurdish citizens. What could be the reasons for this turnaround of events? In reporting these incidents, the media tend to use the euphemism “people of Eastern origin,” which everyone knows refers to the Kurds. In trying to downplay the “ethnic” side of the events, both the government and mainstream media seems to assume that it is normal for different ethnic groups to clash. Framing the problem in terms of ethnicity, for many, would not only justify existing tensions but also encourage further clashes. However, foregrounding ethnic difference is not necessarily a recipe for violence, especially if we consider the novelty of these incidents compared with the nature of the conflict which was historically between Kurdish organizations and the state. This presentation will argue that, rather than being exceptional incidences, community-level violence between Kurds and Turks in Turkey corresponds to a particular configuration and framing of diversity, which is particularly visible in cultural debates. Changes in the perception of diversity in Turkey requires us to ask whether popular perceptions toward the Kurds revolve along ethnic or racial definitions. The data come from fifty in-depth interviews conducted in three major urban centers, a small town, and a rural village in Turkey.

ACTOR’S POSITION AND DISCOURSE TERMS IN WELFARE STATE POLITICS
Janne Mikael Autto

Abstract: My paper studies the discursive strategies that public decision makers and citizens use in welfare state politics. I focus especially on the ways that the relationship between the state and citizens is constructed in political representations. My theoretical starting point is Pierre Bourdieu’s theory on symbolic power and social fields that pays attention to positions of agency. However, Bourdieu is criticized for being overly position-centred. The paper aims to a dialect between Bourdieusian approach and approaches that emphasize discursive terms of political action, especially Foucauldian studies on subject positions. As a result, the paper comes up to suggest an approach that focuses on the interplay between the positions of agency and the discursive subject positions.

The paper is based on a qualitative analysis of debates on child day-care in Finland. Firstly I analyse discursive subject positions that have hegemonic position in the politics of day-care. After this, I examine how decision makers in the parliament and in a municipality as well as citizens use these discursive recourses in their political representations.

NEW FORMS OF PATRIOTISM IN THE CONTEXT OF GLOBALIZATION IN TURBULENT TIMES
Miroslava Sergeevna Tsapko

Abstract: Problems of youth integration into the social and political life are always actual and important. The population ageing and the young people wish to leave the country make the authorities to draw their attention to the youth. The political process determining the youth policy at the Putin’s age includes political reforms of non-democratic nature at the background of weak and underdeveloped democratic institutes (such as political parties, mass media and NGOs), centralization of the power and forming the soft authoritarian regime with abridged rights of the federal subjects and abolishment of governor’s elections and adoption of the new electoral
law, as well as returning to the archaic imperial and military rhetoric.

This sociological research shows that the young people’s consciousness is not more progressive and modern in the political sphere. They are infected with the virus of revanchism and they are sorry about the end of the empire and dreaming of a strong state. The youth electoral activity’s level is less than 12%. The youth absenteeism may be explained by the low standard of life, no effect of the political activity and political ignorance along with the low level of the political culture and emotional alienation from the authorities and high barriers for the youth in politics. And at last, the young people don’t see any existing political parties, which are able to defend their interests.

We analyze different forms of the youth political and civil activities within political parties, pro-Kremlin, ecological and radical and forbidden organizations.

**PERFORMING MEMORIES AND RE-IMAGINING DUTCHNESS**

Rogier van Reekum¹, Jan Willem Duyvendak ²

1Amsterdam Institute for Social Science Research, ²Department of Sociology and Cultural Anthropology, UNIVERSITY OF AMSTERDAM, Amsterdam, Netherlands

Abstract: As in other European contexts, the public understanding of diversity issues in the Netherlands has seen a marked shift towards pessimism and, correlative, a greater emphasis on national belonging. As multiculturalism is, yet again, said to have failed, public discourse is acutely concerned with leaving behind this “failed past”. In this article we argue that the performance of memories play a key role in legitimating the shifts in discourse and policy as such memories present the politics that need to be surpassed in the here and now. Moreover, we show that these memories cannot be related in any straightforward way to what actually happened. By analyzing a number of key texts we show how specific and selective memories of the recent past are performed and what role such performances play in justifying “new” ways of dealing with diversity. The performance of memories seems not so much concerned with the recent past, but rather with new images of national belonging. They are also markedly different from the ways in which “multiculturalism” has become an object of critique in Britain, Germany and France. It turns out that contentions over policies and their pasts can be affective moments of national re-imaginations.

**RUSSIAN POLITICS MODERNIZATION: SOCIOCULTURAL APPROACH**

Yuriy Vasserman¹

1Department of Sociology and Political Science, Perm State Technical University, Perm, Russian Federation

Abstract: The intent of this Abstract is to draw attention to some correlations indicating that the some aspects of sociocultural differentiation in contemporary Russian society are reactions to its modernization. These aspects are reflections of the contradictions in the society resulting from the clash of sociocultural features that are normally associated with different stages of historical process of social modernization. According to the theoretical framework, the process of cultural change must follow the process of technological one in adapting human behavior to new technical environment. First appearing in the West, the new types of socio-cultural groups displaying different attitudes towards modernization, then extend their influence outside of Western countries through the process of global modernization People’s culture doesn’t correspond to the new environments. Russia is a powerful example of such inconsistencies. Just a few generations ago the majority of Russian population was rural. Their culture corresponded to the low-level technological environment characterized by manual labour. The modernization has changed economy and other sides of environment in just a few dozen years, leaving the cultural adaptors far behind. People experience conflict with impacts and challenges of modernization such as market economy, new models of division of labour, etc. There are a number of groups with different levels of culture modernization and different reaction to continuation of modernization. The author attempted to investigate the problem of sociocultural differentiation. The main concept of our research is a concept of the sociocultural type. Socio-cultural types have different degrees of adaptation and connectedness to, or disconnectedness from, the relations of modern market economy. The Likert’s scale was used for the elucidation of the culture modernization level of respondents. The first and tenth decile groups emerge from the study results. The first decile group had minimal culture modernization score and tenth decile group had maximal culture modernization score. The results of our study show us not only the change in attitudes (culture modernization score) but also in activities and real life decisions. Sociocultural approach gives an opportunity to see the range of social political and cultural identities produced in the context of processes of politics modernization.

**FROM INDIGENOUS ROYAL CULTURAL PRACTICES TO CONTEMPORARY ARTICULATION FOR SOCIO-POLITICAL SPACE. SHIFTING IDENTITIES IN SOUTH AFRICAN TRADITIONAL MUSICAL PRACTICES.**

Ndawamato George Mugovhani ²

²Department of Performing Arts, TSHWANE UNIVERSITY OF TECHNOLOGY, PRETORIA, South Africa

Abstract: A nation’s choice of cultural practices has a significant meaning to its identity, and socio-political considerations manifest themselves in such practices. In South Africa, indigenous cultural practices such as Tshikona were performed for very important ceremonies and rituals by Vhavenda such as at the installation of a new ruler, the commemoration of a ruler’s death (dzumo) and the sacrificial rites at the graves of a ruler’s ancestors. Tshikona music even served to maintain ties between different communities. Parties of musicians would sometimes be sent by one chief to another’s territory to entertain and to be entertained for a few days. This musical expedition is called bepha. Bepha could be sent by one ruler to another for a variety of reasons, the most common of which is to express sympathy (u imela) for the death of a member of his lineage. Other smaller ensembles frequently used for bepha are Tshigombela (traditional amusement dance and song for unmarried girls) or Tshikanganga (traditional amusement dance and pipe playing for boys). The chief who receives them is bound to return the complement.

This paper reveals that the primary objectives for the original establishment of these indigenous cultural practices have changed. Politicians also use these indigenous cultural practices in their rallies as
entertainment for their would-be voters. The process is hereby exploited for personal benefits of the politicians (Mugovhani, 2008). Nowadays Tshikonza can also be performed at any other entertainment occasions sponsored by political leaders or other prominent people; such as political gatherings, inauguration of the country’s president or a university chancellor or principal, and so on. The paper discusses this shift in the relations between cultural heritage practices and a people’s socio-political objectives and identities. It explores the extent to which culture is manipulatable as a space for the articulation of power.

PROTECTION FOR THE KAINGANG PEOPLE: A SOCIAL DEBT

Maria Isabel Barros Bellini 1, Marinez Garlet 2
1NETSI, FSS/PUCRS E ESP, 2NETSI, FSS/PUCRS, Porto Alegre, Brazil

Abstract: Dealing with the topic “indigenous peoples” is always a delicate and complex matter, burdened as it is with the historical baggage of the invasion of Brazil and the colonization process, with the subsequent decimation of these peoples. With the Federal Constitution promulgated in Brazil in 1988 the indigenous population obtained recognition and autonomy over its cultural organization (uses and customs, language, education, health), but at the same time, 20 years later, it is clear that much is still missing for these peoples to actually attain what the constitutional text dictates. This article focuses on the urban presence of the indigenous population, specifically the Kaingang children living in São Leopoldo/RS/Brazil, a phenomenon that covers different agendas and contexts in our society. The various “rural exoduses”, which arose from a number of factors, have forced rural workers and Indian communities alike to leave their “origins” behind and migrate to the outskirts of several cities in the state of Rio Grande do Sul. Approximately 230 indigenous peoples are spread throughout the Brazilian territory. The settlement of the indigenous population in the urban environment is a recent phenomenon that calls for further studies and theoretical analysis. This article reflects on a Kaingang community living in the city of São Leopoldo, Rio Grande do Sul. The handicraft they produce runs counter to the logic of accumulation, not serving the purpose of creating wealth, but of survival. Selling these goods provides the Kaingang with food and clothing, while expressing at the same time cultural, social and political resistance, and preserving their cultural and ethnic specificities. Our research focuses on issues related to the urban settlement of the Kaingang people in Brazil seeking to understand what leads Kaingang to sell handicraft in the cities.

A BEAUTY CONTEST FOR THE LOWER EDUCATED? AUTHORITARIANISM AND THE PERSONALIZATION OF POLITICS

Peter Achterberg 1
1Sociology, Erasmus University, Rotterdam, Netherlands

Abstract: The ‘personal’ has always been central to politics. Political leaders have always been widely known to the public at large. There is a tendency to name governments after its leaders and people tend to base their choice in the voting boot on the mere voice or appearance of politicians. Using proverbs like ‘personalization’, ‘presidentialisation’ or ‘Americanization’ it is often argued that the personal is becoming more important to Western politics. Some even argue that the increased salience of personal factors is the one and only defining feature of western ‘postmodern’ politics. Hence, if one seeks to understand the politics of western countries, one needs to find out for whom the personality of politicians is very important for their voting behavior and why.

This paper analyses exactly this question. There is some controversy about the question whether it are the lower educated or the higher educated who legitimate their voting choice by the way they think about the personality of the candidates. While some argue western politics to be ‘a beauty contest for the higher educated’, in this paper I find the opposite. Analyzing recent election survey data for the Netherlands (2008) I find that the lower educated are the ones to vote personally.

Three explanations are tested. The first explains the increased tendency of the lower educated to vote personally by their lower levels of political competence — those lacking knowledge of key political issues will not easily know whom to vote for and might choose politicians by their mere appearance. The second explanation focuses on the lower level of ideological coherence among the lower educated — as they have multiple incentives to vote multiple parties at the same time, they are argued to be more easily persuaded by the personality of political candidates. The third last explanation focuses on the higher level of authoritarianism and concomitant the stronger preference for leadership among the lower educated which might lead them to attach more importance to the personality of political candidates. My findings point out that this third and last explanation is empirically corroborated. At the end of the paper, the theoretical implications of these findings are discussed.

PUBLIC AND PRIVATE IN THE SYMBOLIC SOCIETY: COMPARATIVE ANALYSIS ON PERSONAL AND SOCIETAL SATISFACTION

Kobe De Keere 1, Mark Elchardus 2
1Sociology Department, VRIJE UNIVERSITEIT BRUSSEL, Brussels, Belgium

Abstract: On the basis of data from the European Social Survey of 18 countries we compare public and private satisfaction. We show, as is often claimed, that modernity does not cause the boundaries between the public and private to fade, but on the contrary, we discovered that a new kind of structuring is being constituted. We explain this new structuring on the basis of the theory of the symbolic society. This theory sees detraditionalization as a shift in the mode of social control. From a situation in which the conduct of conduct is based on tradition, threat of scarcity and belief, societies shift to social control on the basis of socializing institutions like schools, mass media, consumption, advertising, and therapy. Societies in which this shift has occurred are called symbolic societies. What we see is that, within highly developed symbolic societies, indicators for the new modes of social control, like media use and education, have an increasing importance in creating public satisfaction while, on the other hand, they have a declining importance for private satisfaction. Our conclusion is that, within symbolic societies, material indicators like scarcity and financial uncertainty are still important for structuring personal contentment but not when it comes societal contentment. For the latter these material indicators are gradually being replaced by symbolic or cultural ones. This proves that within modern societies, the public and the private are not reduced to just one single sphere but are influenced in fundamental different ways. This also presupposes new public configura-
tion and conflict that are primarily symbolically mediated by, among others, media and education.

**THE IMPORTANCE OF CONVENTIONAL CITIZENSHIP INVESTIGATED. EXAMINING COUNTRY DIFFERENCES OF ADOLESCENTS’ PERSPECTIVES ON CONVENTIONAL CITIZENSHIP IN EUROPE.**

Eva Franck 1, Saskia De Groof 2*, Mark Elchardus 2*, Dimokritos Kavadias 3

1Department of Sociology, UNIVERSITY OF ANTWERP, Antwerp, 2Department of Sociology, 3Department of Political sciences, Free University of Brussels, Brussels, Belgium

Abstract: According to recent international research youngsters from different countries vary to a great extent in their perceptions of the importance of “conventional democratic citizenship” (intention to vote in elections, join a political party, respect government representatives, etc) (Schulz et al., 2010). It has hardly ever been investigated why some European countries seem to better be able to stimulate young people towards engagement in civic and political life than others. An interesting way to try to explain these European differences is by taking national level variables into account (see De Groof et al., 2010). This paper examines the impact of several macro characteristics on the importance youngsters attach to conventional citizenship throughout Europe and tries to explain cross-country differences.

Building on a European subsample of the 2009 IEA ICCS-survey (International Civic and Citizenship Study) consisting of 58,000 14-year olds from 3000 schools in 21 countries and using multilevel regressions we will test the impact of various large-scale societal trends broadly described as modernization (Mannheim, 1971; Giddens, 1991). Some authors believe that processes related to modernization - post-scarcity, decline of religious belief, the loss of self evident traditions and of traditional conceptions of roles and ethics, etc. – have caused alienation and disenchantment from civic life. Other authors believe these developments have not so much lowered participation but paved the way for other forms of engagements. These processes have not taken place to the same degree in all societies and seem to be particularly strong in the North-western European welfare states (for empirical evidence see Inglehart, 1997; Inglehart & Welzel, 2005). This paper will try to disentangle the impact and consequences of these processes on adolescents’ perceptions of the importance of traditional conceptions of citizenship and provide a macro-sociological explanation in terms of “de-traditionalization” (Elchardus, 2009).

QUESTIONNAIRE CHANGES IN LONGITUDINAL COMPARATIVE SURVEYS: EFFECTS ON DATA QUALITY AND ANALYSIS
Valentina Hlebec 1, Simona Justin 1
1UNIVERSITY OF LJUBLJANA, FACULTY OF SOCIAL SCIENCE, Ljubljana, Slovenia

Abstract: One of the purposes of repeated cross-sectional (longitudinal) comparative studies is also to observe changes in time. In order to study changes in time, survey questionnaire should be relatively fixed. Nevertheless, some changes may be introduced to improve quality of indicators. European Quality of Life survey (EQLS) has been carried out in twice, in year 2003 and 2007. If we compare those questionnaires, we find some differences in questions, answer categories and also in measurement scales. We would like to know, comparing both questionnaires, which changes in questionnaires (question wording, answer categories and measurement scales) would introduce systematic changes to data (different frequency distributions, increased or decreased mean values, etc.). We conducted a split ballot experiment with both versions of EQLS questionnaire. Web survey, using convenience sample was carried out in Slovenia in January and February 2011. Preliminary results show that some changes in questionnaire (most often changes in answer categories and measurement scales) introduce systematic variability in the data, while others (changes in question wording) do not influence the data. In discussion we point out that users of secondary data sets, such as EQLS, should be aware of (un)intended changes in measurement instruments and their consequences for substantive analysis (changes in time).

VALIDITY AND RELIABILITY OF MEASUREMENT OF EGOCENTERED NETWORK COMPOSITION INDICATORS
Tina Kogovšek 1, Valentina Hlebec 2, Germa Coenders 3
1Faculty of Arts and Faculty of Social Sciences, 2Faculty of Social Sciences, UNIVERSITY OF LJUBLJANA, Ljubljana, Slovenia, 3Faculty of Economics and Business, University of Girona, Girona, Spain

Abstract: Egocentered networks are common in social science research. Here, the unit of analysis is a respondent (ego) together with his/her personal network (alters). Usually, several variables are used to describe the relationship between egos and alters.

In this paper, the aim is to estimate the reliability and validity of the network composition indicators (percentages of kin, friends and others) by the multitrait-multimethod (MTMM) approach. The MTMM approach has been used several times to study the quality of measurement of complete (e.g., Ferligoj and Hlebec, 1999) as well as egocentered social networks (e.g., Kogovšek et al., 2002; Kogovšek and Ferligoj, 2005). This approach usually requires several repeated measurements (methods) of the same variable (trait) for model identification. This places a considerable burden on respondents and increases the cost of data collection. Therefore, in this paper, we use a split ballot MTMM experimental design, first proposed by Saris (1999), in which separate groups of respondents get different combinations of just two methods. The design can also be regarded as having a planned missing data structure.

The procedure is applied to social support data collected in 2000 by computer assisted face-to-face and telephone interviews from a random sample of 1033 residents of Ljubljana, Slovenia.

MEASUREMENT EQUIVALENCE: APPLICATION ON ATTITUDES TOWARD INTEGRATION OF IMMIGRANTS IN LUXEMBOURG
Marie Valentova 1
1CEPS/INSTEAD, Differdange, Luxembourg

Abstract: This paper aims to contribute to these discussions by constructing a reliable and valid measurement of attitudes toward integration of immigrants and by showing how these attitudes vary among different groups of Luxembourg residents and how they have evolved during past ten years. In the paper we use the European Value Study data from 1999 and 2008, in particular a battery of seven items regarding integration of immigrants.

The analysis is conducted in two steps. In the first step, the paper focuses on the measurement construction and validation. We create two theoretically based composite indicators of attitudes toward integration: multicultural and assimilative integration indicators. The indicator of multicultural integration consists of items measuring plurality and openness toward diversity, while the indicator of assimilative integration gathers items focusing on compliance with institutional, linguistic and cultural settings of the country. Empirical validity of these constructs is verified by confirmatory factor analysis. To make sure that the measurements can be used in comparative analysis, the overtime- and between-groups measurement equivalence of the indicators (namely, invariance between 1999 and 2008) and among different groups of residents depending on their migratory background (natives, first and second generation immigrants and offspring of mixed couples) is tested.

In the second step, we use the created indicators of attitudes toward integration to answer the following substantial questions: Do residents with different migratory background apprehend the integration process in the same way? Have perceptions changed over time? If yes, do they evolve more in direction of assimilation or multiculturalism? Have the perceptions of natives and residents with migrant history converged or diverged during past 10 years?

Subjective indicators of attitudes toward integration may provide a useful feedback to policy-makers and researches formulating, implementing or evaluating integration policies. The proposed measures can be used in a cross-country comparative research.

SURVEY-SATISIFICING IN TELEPHONE AND FACE-TO-FACE INTERVIEWS. AN EMPIRICAL COMPARISON.
Henning Best 1, Jörg Hagenah 2

Abstract: One of the purposes of repeated cross-sectional (longitudinal) comparative studies is also to observe changes in time. In order to study changes in time, survey questionnaire should be relatively fixed. Nevertheless, some changes may be introduced to improve quality of indicators. European Quality of Life survey (EQLS) has been carried out in twice, in year 2003 and 2007. If we compare those questionnaires, we find some differences in questions, answer categories and also in measurement scales. We would like to know, comparing both questionnaires, which changes in questionnaires (question wording, answer categories and measurement scales) would introduce systematic changes to data (different frequency distributions, increased or decreased mean values, etc.). We conducted a split ballot experiment with both versions of EQLS questionnaire. Web survey, using convenience sample was carried out in Slovenia in January and February 2011. Preliminary results show that some changes in questionnaire (most often changes in answer categories and measurement scales) introduce systematic variability in the data, while others (changes in question wording) do not influence the data. In discussion we point out that users of secondary data sets, such as EQLS, should be aware of (un)intended changes in measurement instruments and their consequences for substantive analysis (changes in time).
Abstract: Answering interview questions requires substantial cognitive effort from respondents, no matter which interview mode is used (telephone, face-to-face or mail). The respondents need to concentrate on the interview, interpret the question’s meaning, recall knowledge on attitudes or past behaviors, and finally formulate an appropriate answer. Starting from Simon’s (1955) concept of bounded rationality, Krosnick (1996) argues that respondents tend to simplify cognitive processes and therefore to reduce the effort involved in answering survey questions (“survey satisficing”). Effects of satisficing include acquiescence, response sets, and non-differentiation in item batteries. Holbrook et. al. (2003) hypothesize the tendency for survey satisficing to be stronger in telephone interviewing, as compared to personal interviews. The consequences of satisficing behavior then may lead to a lower data quality in telephone surveys (“satisficing bias”). We test Krosnick’s and Holbrook et al’s Hypotheses using data from a large German survey on media consumption. The survey was conducted in 2000 using CATI as well as CAPI, using identical questions and item batteries. First results indicate the amount of survey satisficing to be higher in the CATI survey. Additionally, the mode effect is stronger in respondents with a low education.

AGREE-DISAGREE RESPONSE FORMAT VERSUS IMPORTANCE JUDGMENT

Dagmar Krebs1

1Institute for Sociology, UNIVERSITY OF GIESSEN, Ludwigshafen, Germany

Abstract: Characteristics of response scales are important factors in guiding cognitive processes underlying the choice of a response category in responding to the request for an answer on an attitude item. This paper deals with two different requests and two different response formats as well, yet addressing the same topic. For example, assessing the importance of an item to respondents one can ask directly for importance judgments (on a scale ranging from very important to unimportant) or one can formulate an item containing already the statement of importance and then offer a response scale ranging from agree to disagree. In both cases responses express respondents’ subjective importance of identical items and therefore responses can be expected to be similar on both response formats.

Compared are first, judgments of how important a job characteristic is to a respondent by offering a scale ranging from important to unimportant (f.e. high income is “very important”). Second, items expressing the importance of a job characteristic are presented by offering a response scale ranging from disagree to agree (f.e. Item: high income is very important to me; response category: scale from agree to disagree). Scale direction starting with either the negative or the positive response option can also be taken into account. For all questions on both response formats a 7-point response scale was used. Respondents were students answering to an online questionnaire. Reported are results on questions about job motivation.

CONCEPTS OF LABOUR STATUS AND THEIR OPERATIONALISATION IN CROSS-NATIONAL SOCIAL SURVEYS

Juergen H. P. Hoffmeyer-Zlotnik1

1KNOWLEDGE TRANSFER UNIT, GESIS - LEIBNIZ-INSTITUTE FOR THE SOCIAL SCIENCES, MANNHEIM, Germany

Abstract: The social background variable “occupation” is based on the implicit assumption that the position of a person in the social structure of a modern society is primarily determined by the employment pursued. Education and income are closely tied to the occupation variable. However, the reason given for the importance of professional activity and position is that they are considered important determinants of lifestyle, attitudes, and individual and group behaviours.

In order to assess occupational prestige and socioeconomic status, a range of information must be gathered. It is not enough to determine whether a person is in employment or not, even when employment is measured in terms of an activity that characterises that person.

It is important to capture all aspects connected with the employment situation and all alternative positions in the life cycle.

The paper will discuss all aspects of the variable “occupation” measuring respondents’ labour status and labour market situation.

ADVANCE TRANSLATION IN THE EUROPEAN SOCIAL SURVEY (ESS) ROUND 5, 2010

Brita Dorer1

1GESIS - LEIBNIZ INSTITUTE FOR THE SOCIAL SCIENCES, Mannheim, Germany

Abstract: In cross-cultural surveys, wrong questionnaire drafting or translation may be severe sources of measurement errors. To reduce these risks of errors, a so called “Advance Translation” was introduced for the first time in ESS Round 5 during the drafting stage of the source questionnaire. Two countries that used two different languages (Swiss-French and Polish) participated. The two Advance Translation teams were asked to perform a problem-oriented translation. The purpose was to get input from different cultural and linguistic backgrounds before finalising the source questionnaire for cross-cultural implementation. The teams were asked to comment above all on translation-related problems, reaching from linguistic or grammar issues to wording, meaning or intercultural aspects. The quality of the translations delivered by the two national teams was less important than the comments they provided. For each item earmarked for Advance Translation, the teams had first to select from a pre-determined list of problem categories and then to comment on their problems in their own words.

The Advance Translation comments led to a number of changes in the final source questionnaire: Annotations, i.e. footnotes, were added in order to clarify certain words or expressions, or the wording or the syntax of the source text amended in a way to facilitate translation into some 30+ language versions.

Currently, a test is being prepared in order to have a direct comparison of the translatability of questionnaire items before and after the Advance Translation.

The paper describes the Advance Translation procedure in ESS Round 5, gives some examples of the comments and changes made and describes the outline (and possibly some first results) of the
test. It provides a first assessment of the usefulness of the Advance Translation for ESS Round 5 and highlights potential improvements for the future.

THEORY AND METHODOLOGY FOR COMPARATIVE SURVEYS

Peter Ph Mohler¹, Timothy Johnson²
¹UNIVERSITÄT MANNHEIM, Mannheim, Germany, ²Univ. of Illinois at Chicago, Chicago/III, United States

Abstract: Comparative Survey Research lacks up to date a unified theoretical and methodological framework. For a long time ‘equivalence’ has been thought to fulfill that role, however, over the years more than 100 definitions of equivalence popped up in the literature. None of these could claim to be a canonical definition.

This paper proposes to replace equivalence by the concept ‘similarity’ because a. there is no empirical evidence of two or more really equivalent entities (requiring identity, actually equivalence is notgradable) and b. similarity (or dissimilarity) is a standard concept in statistics. Using similarity as agradable concept in comparing characteristics of entities thus allows to link theoretical considerations (concepts and constructs) with statistical modeling and measurement (indicators and items).

THE MEASUREMENT OF WORK STATUS IN THE INTERNATIONAL SOCIAL SURVEY PROGRAMME (ISSP)

Evi Scholz¹
¹GESIS, Mannheim, Germany

Abstract: From the very beginning of the ISSP, there was a set of obligatory background variables called the ISSP standard background variables. Problems with the ISSP background variables originally developed for a small number of co-operating Western countries have occurred with the increasing number of ISSP members. Concerns about the ISSP background variables resulted in a review and revision process.

This presentation reports on the measurement of work status in the ISSP. While the variable called WRKST - to be applied until ISSP 2009 – intended to capture the current employment status, economic position, and main source of living, the review of ISSP members implementation showed several problems: differences were found across countries for example in time reference; in the number of hours that define part-time employment; in coding respondents temporarily out of work or working in family business; or in the meaning of vocational training.

The idea guiding the revision of the work-status variable was to focus on any form of labour force participation distinguishing between three basic groups according to their assumed risks for self-sustenance: in labour force with a regular job; in labour force not having a regular job; and outside labour force.

One major problem was how to deal with respondents belonging to several categories at the same time (e.g., students working part-time). The ISSP solution of multiple status is to split the old work status variable into two variables: one on labour force participation and one on the subjective main status.

The German ISSP 2009 and ISSP 2010 run together in split with the German General Social Survey ALLBUS. While ISSP 2009 includes the former ISSP standard background variable on work status, ISSP 2010 includes the revision with the new variables. This special fieldwork situation offers the chance to contrast old versus new ISSP variables and to investigate the surplus in information gained by differentiating between labour force participation and subjective main status.

THE INTERNATIONAL STANDARD CLASSIFICATION OF EDUCATION 2011 AND ITS APPLICATION IN CROSS-NATIONAL SURVEYS

Silke Schneider¹
¹NUFFIELD COLLEGE, Oxford, United Kingdom

Abstract: A continuing challenge of comparative research is the harmonisation of country-specific educational attainment information into cross-nationally comparable variables. A classification that is commonly used in official and also increasingly so in academic surveys is the International Standard Classification of Education, ISCED. In contrast to its academic ‘competitor’ classification CASMIN, ISCED covers almost all countries in the world and is centrally maintained and documented by the UNESCO Institute for Statistics.

ISCED is currently being revised. The proposed paper will argue that official and academic measures should be compatible; describe ISCED 2011 and the most important changes as compared to the older version, ISCED 1997; how it can be applied to cross-national social surveys (using the example of the European Social Survey round 5) and existing data; and what kinds of measures of educational attainment can be derived from it. Remaining open issues and problems of the classification as well as disadvantages as compared with CASMIN will also be discussed.

The most positive developments of ISCED relate to a) the increased differentiation of tertiary education in accordance with the Bologna process; b) specific guidelines for the measurement of educational attainment in addition to enrolment-based statistics and c) the adoption of standard three-digit codes for detailed education categories. If consistently applied by the scientific infrastructure, it will become much easier in the future to provide and apply coding routines for education-related information. In the long run, this should foster the cumulative character of sociological evidence. A core drawback of the classification remains the fact that education is politically highly charged and those who adopt the classification in the end are public officials who may pursue their own (or their government’s) agenda. ISCED can however be adapted to cover aspects that are not officially part of the classification.

THE MODIFIED QUESTION FOR THE INCOME MEASUREMENT IN THE EUROPEAN SOCIAL SURVEY

Uwe Warner¹
¹CEPS/INSTEAD, Differdange, Luxembourg

Abstract: In social surveys the measurement of “total net household income” is influenced by
• the household definition and size,
• the income composition,
• the main source of income,
• the respondent’s capability to remember income element, and
• the respondent’s family relation to the main income earner.

Comparing the household income across countries, these impacts are obvious and visible in the first round of the European Social Survey. The data collection of ESS did not consider the different national income distributions and did not take into account the various national concepts of income for the operationalization of the income questions.

In the fourth round of the interviews for ESS, the survey question about “total net household income” was modified. The construction of answer categories took the national distributions of household income into account.

This presentation shows the modifications of the fieldwork instrument and illustrates the improvements for the quality of the income measure in a cross country comparative social survey.
RESEARCH PAPER

RS 22 European National and Regional Identities

BELONGING IN THE TIMES OF CRISIS: LATVIANS BETWEEN ETHNIC, NATIONAL, AND EUROPEAN IDENTITIES
Ilze Ievina

Abstract: The topic of European identity has become a well-established field of academic studies, one closely tied to the political, economic and social life of the European Union. It raises the challenges of the enlargement (and the discussions thereof), as well as the debates about the European Constitution. However, the world economic crisis is proving to be a quite different challenge: it has brought to the forefront questions about solidarity between the European states and peoples, created divisions between the economically more and less successful states, and raised debates related to the labour migration issues within the Union. But how does the economic crisis and its effects impact the collective feelings of attachment of the Europeans? Does it strengthen the national and European identities of the peoples? Or, perhaps, just the opposite?

The paper will take up this question and explore the situation in Latvia: one of the European Union countries that are experiencing the crisis most severely. The economic crisis transmutes many spheres of the daily life in Latvia and affects almost all citizens as the economic hardships increase, the unemployment levels rise, and more and more people immigrate to other European countries to find work. On the surface, this situation seems to have created a widespread disillusionment both in the state and the European institutions but little is known about the impact on the underlying feelings of attachment and belonging.

The research paper asks: how is the current economic crisis (and its social consequences) impacting the feelings of attachment to (1) the state and to (2) Europe in Latvia? Since Latvia is an ethnically divided country – almost a third of the population is ethnic Russian – special attention will be paid to the ethnic differences in the feelings of belonging. This is a focus that will, in addition, go beyond the general focus on identities of geographic-reference in the European identity discussion. The empirical exploration of the research question will combine the insights from a nationally representative survey (November 2010) and expert interviews (March 2010), as well as some preliminary results from interviews with Latvian and Russian families in Latvia.

BETWEEN COSMOPOLITANISM AND NATIONAL IDENTITY - LAY CONCEPTS OF COLLECTIVE EUROPEAN IDENTITY
Rosemarie Edda Sackmann

Abstract: The presentation will present research findings. Our research started from the idea that European identity is something new and, however it may look, we cannot expect that it will simply resemble the old national concepts of collective identity. Moreover, it is plausible to expect not one, but several more or less complex patterns of European collective identities. If the notion of European identity is open to unexpected constructions, research should employ a general concept of collective identity. Additionally, a method designed for the discovery of patterns of meaning is needed. We have used Q methodology. Essential for Q methodology is the idea of relatedness and interconnectedness of thematically defined statements; a basic assumption is that meaning depends on patterned relations. This makes it an ideal tool for explorative research on patterns of collective identities.

The presentation will present findings from a cross-country research project on patterns of collective European identities, which followed two main questions: How do lay concepts of European identities look like? And do we find similar patterns of collective identities in different countries? Data base: Interviews with 120 students (40 in each country) from different milieus.

Findings: Two patterns of collective European identities which are clearly shared across all three countries: One is a cosmopolitan identity construction (in which the EU is seen as an actor at the global scale and in which all individuals are regarded as responsible to improve democracy at all levels). The other is a construction which emphasizes the importance of nation states; in this construction the EU is only accepted as far as it is useful for its member states. Beside these stable shared concepts, we found several country specific differences of European identity patterns. Additionally our findings show, that a person, who calls herself, for example, ‘German-European’ may hold to a national, a cosmopolitan, or to another identity construction.

The study was initiated by Ulrike Liebert (University of Bremen) and Zdzislaw Mach (Jagiellonian University Krakow); the research has been coordinated by R. Sackmann. Researchers were: Olga Brzezińska, Beata Czajkowska and David Skully in Poland; Maria Heller, Erika Kurucz and Borbala Kriza in Hungary, and R. Sackmann in Germany. The study was supported by RECON.

IDENTIFICATION THROUGH OTHERING: THE CONSTRUCTION OF EUROPEANNESS IN MEDIA DISCOURSES ON ISLAM
Karin Creutz-Kämppi

Abstract: The global aspects of media stories bring with them changes in spatial consciousness. When the individual’s subjective world of knowledge is widened from the immediate surroundings to a global perspective, the self-categorization needs to be redefined to obtain relevance in the new context. The rhetoric of global topics and polemics, as for example “the War on Terrorism”, puts questions as “whom do I represent?” and “who represents me?” to the media public. Media discourses of this kind stipulate conceptions of “the world outside”, simultaneously as they participate in the production and reproduction of schemas for self-identification.

The construction of boundaries is fundamental to the notion of nationalism; collectivity is established through exclusion. The na-
tion, however, seems to have a less important position as a factor for identification in connection to global discourses on Islam. Instead the notions of Europe and the West function as the entities where the “own” and “right” values and traditions prevail. By excluding specific norms, values and cultural attributes from these concepts, denominators for collective identification are constructed. As collectivity on a global level is distant to the everyday-life of the individual, without attachment to daily practices, it is from a sociological viewpoint interesting to look at how these conceptions of belonging are rhetorically constructed and legitimized as positions for identification. This assessment simultaneously shows articulations of the discursive power specific institutionalized knowledge forms possess. In this paper I discuss identification in media debates on Islam in Finnish and British newspapers (Helsingin Sanomat and the Times). The study bring to the forth the manners in which national and supranational belonging are defined and negotiated.

EUROPEAN IDENTITY OF ETHNIC MINORITY YOUTH IN CENTRAL AND EASTERN EUROPE

Natalia Waechter

1INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria

Abstract: Since the collapse of the communist regime(s) a new generation was born and raised in the Central and Eastern European countries. In contrast to the older population they have not experienced the communist regimes themselves but only the post-communist era. This young generation is assumed to be more “Europe-oriented” than the older generations and to have developed more positive attitudes towards the European Union. In the FP7 project ENRI-East, funded by the European commission, we have investigated those assumed differences between the generations by analyzing if and to what extent the young generation in our researched countries has already developed a different understanding of their possible European identity than the older population. As part of the young generation we consider those who are 25 or younger.

Thereby, we focused on the largest ethnic minorities in each country investigated (Belarus, Hungary, Poland, Latvia, Lithuania, Russia, Slovakia, and Ukraine), who live in the border regions of the nation states of the European Union. Considering the assumed two-nation-orientation (“home” country and “host” country) of ethnic minorities, we have investigated the differences in the European orientation between the total young population in the researched ENRI-East countries and the young people within the researched ethnic minority groups.

According to previous survey research, we have also assumed countries-specific differences regarding the young people’s attitudes towards Europe and the European Union. All analyses are based on the new quantitative data (n=8000) which has been collected within the project as well as on international survey data (European Value Survey). At the conference I want to present a typology of countries regarding the young people’s attitude towards Europe and the European Union, thereby considering differences between minority and majority populations as well as differences between generations.

RECONSTRUCTING IDENTITIES IN HIGHER EDUCATION

Cláudia Valadas Urbano

1Sociology, CESNOVA-FCSH/UNL, Lisbon, Portugal

Abstract: Thinking about Europe’s identity is to think about its social systems. Our challenge with this paper is to add a new subject to the debate on economic, political and geographic issues: the higher education system, concerning the fact that it is where individuals are qualified, where knowledge is produced, where science and research take place.

How are identities built in higher education? Taking the Portuguese case as an example, similar to many other higher education systems, we look at its binary structure, with universities and polytechnic institutes. The university is ancient. Regarding to its social notoriety the polytechnic has only two decades. For each of them, a different identity emerges. So: which are the actions, the references the oppositions between them and, above all this, how is the higher education system built?

These guidelines are part of a PhD research in Sociology about the polytechnic subsystem in Portugal, whose theoretical framework is based on the concept of identity as a social construction.

THE PLAUSIBILITY OF THE CONSTRUCTION OF EUROPEAN IDENTITY

Anamaria Topan

1Sociology, LUDWIG-MAXIMILIANS UNIVERSITY MUNICH, Munich, Germany

Abstract: The issue of European identity gains more and more ground in the debates across Europe, especially at a time when the economic, social, political and institutional settings are affected and disrupted by crises generated through global phenomena. The object of my paper is a critical investigation into the project of the European identity from a systems-theory perspective. The need for stabilization, security and rebalance in the context of the unsettlement of fundamental social ties is addressed by proposing an identity assumed to operate in an integrative, unitary way across national differences. The concept of difference, essential for Luhmann in the construction of identities, operates at the centre of the EU project, albeit in a veiled way, positively portrayed when it comes to internal differences and neutrally portrayed when it involves external references (the dichotomy Self / Other). European identity aims to nurture a sense of belonging to a space that automatically operates on the distinction of inclusion and exclusion. Nevertheless, by making the unity appear plausible, it provides identity processes with an imagined space and semantics that negotiate the European identity, stabilize expectations and legitimize the management of difference in a such a way as to conceal the paradox of its own construct. The paper discusses the discourse that makes this illusion of unitary space (unity that in Luhman’s view cannot operate in practice) plausible, and the operative ‘neutral’, ‘positive’ processing of the difference between self-reference and reference to others. The discussion will be structured in 3 sections: section 1 offers a general overview of the systems-theoretical framework; section 2 centers on the processes surrounding the official discourse of a European identity and citizenship being promoted by European institutions (the European Commission in particular). The discussion is informed by the conceptual framework of systems theory, with emphasis on the key notions presented in section 1. Section 3 concludes the discussion with final remarks.
FROM EQUALITY TO AN ETHOS OF EXCELLENCE:
EDUCATION AS A DIVERSIFYING IDENTITY MARKER
AND AS AN INSTRUMENT FOR IMPLEMENTING
NEOLIBERAL IDEAS

Tiina Räisä

University of Helsinki, Helsinki, Finland

Abstract: Examining the current references to “Europe” in a society that has traditionally regarded itself as geographically marginalized reveals interesting material on the collective “self” in relation to “the other”.

The Finnish case within the “Identities and modernities in Europe” 7th framework programme enlightens questions on belonging and distance, excellence and threat, community and individuality as depicted in an education context. A conscious collective transformation of an agrarian nation into a knowledge-focused society began after WWII, creating a society which embrace education as a powerful instrument for fighting poverty and gaining prosperity: education has been considered to be the sole factor in the strive for enhancing social justice and minimizing differences between social groups.

The fine Finnish PISA-results nevertheless surprised the nation and the policy makers. Recently PISA has become an object for self-reflection and a crucial element by which a Finnish “we” is constructed. Defining the European “other” create narratives of an excellent, if not superior “we” in relation to a less developed and modern “Europe” but also an anonymous “global” community.

Scrutinizing the interview material done with Finnish education stakeholders on higher education reveals partly an opposite perspective: the Finns are not “international” or “innovative” enough: a brand like the Finnish PISA success is depicted as the aim for university level education. There is an obsessive urge to conceptualize education, to export the ideas of an efficient education system to European and international markets.

The search for excellence within education seems to derive from an ethos of excellence, uniqueness and competitiveness; reflected by the current neoliberal ideology. Concepts of sufficiency and equality are left behind, replaced by official political programs orientating towards an education paradigm where ideas on freedom of choice and individual responsibility are emphasized, fundraising and tuition fees replacing equal opportunities for everybody.

Evaluation programs like PISA measures also a nations self-perception: comprehensive education places the nation on the highest ladder, university education almost on the lowest ladder. The purpose of education has changed so that it produces winners and losers: the equality idea has been replaced by a competitive, excluding market orientation paradigm.

SOCIAL SOLIDARITY AND EUROSKÉPTICISM

Andrei Gheorghita, Horatiu Mihai Rusu

1Sociology and Social Work, LUCIAN BLAGA UNIVERSITY OF SIBIU, Sibiu, Romania

Abstract: Sociality was a central concept and value in the development of the EU as we know it. On the one side, sociality was a key expression of the constituting post-war continental welfare states that was easily translated (or extended) into the much claimed ‘European social model’. On the other side, the seeds of a trans-national solidarity were to be planted, given the diverging (and sometimes conflicting) cultural backgrounds and various levels of economic development of the European partners. However, the EU building process has dramatically challenged the very meaning of solidarity within its borders, due to a long series of transformations: (a) the expansion of market, with free flows of capitals and investments, opposing workers in nations with high wages and those from low wage countries; (b) globalisation of social problems, setting high pressures to rich countries due to extensive migratory flows; (c) growing relevance and complexity of international organisations and laws, becoming arenas of political struggle between diverging interests (Stjernø 2004). In the course of such evolutions (but not necessarily due to them), euroskepticism followed an ascending trend in most of the Old Europe’s societies. This paper aims to investigate the relationship between euroskepticism and the various forms/levels of solidarity within the EU context: family/local solidarity, social solidarity and global/transnational solidarity (Abela 2004; Kankaraš and Moors 2009), based on the last wave of European Values Survey (EVS) data.

IDENTITIES AND MODERNITIES IN EUROPE: DIFFERENT PATHS OF HUMAN AGENCY AND IDENTITY CONSTRUCTION

Atsuko Ichijo

1Faculty of Arts and Social Sciences, KINGSTON UNIVERSITY, LONDON, London, United Kingdom

Abstract: The paper presents the first overall view of the result of collective efforts for an FP7 project, Identities and Modernities in Europe (IME). IME investigates European identities. European identities in this project refer to a wide range of definitions of „us”, the Europeans” proposed and acted upon by various actors in and around the current European Union (EU), in particular in nine cases: Bulgaria, Croatia, Finland, France, Germany, Greece, Hungary, Turkey, and the United Kingdom. The project addresses three major issues regarding European identities: what they are, in what ways they have been formed and what trajectories they may take from now on. IME first investigates the diversity of European identities as it manifests in the nine cases. It then examines the various ways in which these diverse self-definitions have been formulated and maintained in different societal, cultural and systemic settings and in which they have been interacting with various processes and forces. It then aims to identify commonalities among diverse European identities in the nine cases as the basis of grounded projection of possible trajectories European identities may take as the processes of European integration continue.

The paper outlines the results of extensive fieldworks carried out for IME. Focusing on the policy are of education, the IME consortium has been uncovering different actors’ views of identities, the nation and Europe, and in doing so have been gathering data to outline the contour of understandings and manifestations of modernity in Europe today. The paper outlines the major findings from a comparative point of view.

NATIONAL AND EUROPEAN IDENTITY OF ELITES

Borbala Goncz, Gyorgy Lengyel

Geneva 2011 / ESA 10th Conference / Social Relations in Turbulent Times
1Sociology, CORVINUS UNIVERSITY OF BUDAPEST, Budapest, Hungary

Abstract: The aim of this paper is to analyse the way national elites perceive the different aspects of their national and European identity and to model how these are connected to European attachment. We explore what components of national and European identity can be discerned when dealing with European political and economic elites. We refer to theoretical approaches that differentiate between civic versus cultural, voluntary versus inherited, or in a slightly different form as active versus passive form of identification. We argue that while attachment to the nation and to Europe do not exclude, but rather strengthen each other, the presence of an exclusive identity based on primordial factors are rather against European attachment.

We also aim to provide insights on what factors explain the different components of identity. As identity formation is not only an individual process but has an important collective dimension based on a country’s historical, economical and cultural development it is important to take into account these contextual characteristics. In our models the country-level contextual variables consist of historical and contemporary measures of a country’s economic development and possible out-group challenges. The analysis is based on the IntUne elite research conducted in 2007 across 17 European Union countries.

MULTICULTURAL IDENTITIES IN THE DISCOURSE.

Thea D. Boldt1

1INSTITUTE FOR ADVANCED STUDY IN THE HUMANITIES, Essen, Germany

Abstract: This paper summarizes some empirical results of the German case study in the EU 7th framework project “Identities and Modernities in Europe”.

German case study focuses on discursive construction of German and European identities as articulated from diverse nationally bounded positions between 2000 and 2010. Our results trace the process of collective negotiation of German national identity construction between one based on blood relations (ius sanguinis) and Leitkultur on the one hand, and one based on multicultural belonging on the other hand. Our analysis show that this discourse is defined predominantly by the discourse of integration, migration and citizenship, which are interlinked and overlap each other. Themes of education, religion and diverse models of cultural representation are negotiated at different levels of that constellation.

At the same time we can observe that the German discourse of multiculturality is very much in accord with the European Zeitgeist. Integration and naturalisation procedures were simultaneously introduced in different European countries implementing a similar model of integration as Germany does, for example (cf. Holland, Belgium). Also, the dominant tone of the German public multicultural identity debate resembles some French and English voices. After German chancellor Angela Merkel declared “multiculturality as failure” both, French president Nicolas Sarkozy and British prime minister David Cameron did the same. Therefore it seems certain that discourses on the shape of multicultural European identities in different European countries are interrelated and Germany strongly influences this development.

This paper mainly concentrates on diversity of argumentative strategies articulated from different positions in the German discourse. It points out the power constellation underlying the negotiation of “we” and “other” as well as shows how the process of labeling between majority and minorities effects the sense of belonging to German and European society.

The study was based on the following data: policy documents on integration, migration and naturalisation (2000-2010), focused interviews with civic organisations (migrants and religious associations), and focused interviews with private individuals from both, majority and minorities of the German society.

AFTER RETURNING TO EUROPE: THE POLISH ATTITUDES TO EUROPE BEFORE AND AFTER ENLARGEMENT

Piotr Cichocki1

1WESTERN INSTITUTE, Poznan, Poland

Abstract: The long-awaited accession of Poland to the European Union had frequently been referred to as “return to Europe” in the Polish public discourse. Such phrasing would often be contested on the grounds that being European does not mean being within the borders of the EU, and ample evidence would be quoted from public opinion surveys indicating that the Polish had been declaring strong European identifications throughout the pre-accession period. This high level of European attachment and pride, among the highest in all the new member states of Central and Eastern Europe, ran parallel to similarly highly intense feelings of national identity, indicating that these two domains are not conceptualized as mutually exclusive in the Polish context. At the same time, however, these supposedly strong European identifications were not backed by much knowledge or reflexive judgment concerning European affairs, which could be attributed to a number of factors including the lack of critical controversy surrounding accession in the public sphere. The utopian metaphor of the Polish return to Europe seemed to have trumped over any other public concerns and party interests, and major controversies concerning the Polish European vocation swiftly emerged in the mainstream public discourse almost immediately after the accession celebrations were concluded. On the basis of an analysis of Polish national polling data as well as Eurobarometer surveys conducted in the period 2000-2010, the present paper endeavors to examine the ways in which the declared European identifications changed among the Polish citizens, focusing especially on the effects on the debates concerning European questions and controversies on the public opinion trends.

EUROPEAN IDENTITY AND (POST)MODERN FRAGMENTATION: DISSOCIATION AND INJUNCTION

Rita Maria Ribeiro1

1Sociology, UNIVERSITY OF MINHO, Braga, Portugal

Abstract: Recent theoretical approaches on identity have exposed that it is not appropriate to think identity issues in a classificatory or monolithic perspective. Contemporary societies have produced conflicting and liquid social structures and consequently forms of belonging and identification became more fragmented and transitory. Identity frames in Europe should not be merely thought according to concentric circles of identity model because boundaries are getting more and more slippery; territorial and political identification is often surpass by other forms of recognition and belonging. Late modernity allows individuals to slide along interstices and to
accumulate identities in strategic and contextual ways. Therefore different levels of identification (local, regional, national, European) are not only competing but being used as resources of legitimacy and action in multi-level configurations.

European identity is also facing disjunctive conceptualization that permeates the debate on European societies, particularly those that refer to symbolic territories of dissociation and fragmentation in political, sociological and philosophical contemporary thought. One can say that we have the theoretical devices to talk about national, communities, and minorities, we have concepts for theorizing differences and fringes, but the concepts are scarce to uphold the mythification of Europe, its social unity and cultural identity. For these reasons, European identity has been an injunctive process caused by the need to ensure that citizens establish feasible and visible bonds of belonging and loyalty with European cultural and political space. Nevertheless European identity remains an ambivalent concept with a weak dimension in citizen’s life, that tend to be much more touched and concerned with local and national affiliations.

HOLOCAUST IN EUROPE: MEMORY AND IDENTITY TODAY
Julia Maria Koszewska

Abstract: Experience such as the Second World War, and especially Holocaust, has vast impact on Europe and other regions of the World. The War that broke out at one continent, became an universal experience. Holocaust, planned mainly for the Jewish nation, became the issue which concerns all nations.

Title issue refers to the presence of the subject of Holocaust in the collective memory and public discours, in the cultural memory and memory dominant, which results in identity.

The presentation focuses on the two countries: Poland and Israel in the years 1995-2009

After the World War II, the political division of Europe (especially in the period of the Cold War), including the division of the country of the War initiator (namely Germany), has been reflecting the division of the values, political system as well as the official history and interpretation of the past in Europe. In early 1990s, after the political changes in Europe: fall of communism, collapse of the Berlin Wall, the official mainstream of 20th century history teaching has changed. Also then (1995) the World has been celebrating the 50th anniversary of the the liberation of Auschwitz-Birkenau camp. The following years set a new form of history teaching in different countries, as well as developing common guidelines by the Council of Europe and European Union. In 1998 the Task Force for International Cooperation on Holocaust, Education, Remembrance and Research has been founded. The following years brings standardization of the guidelines on the Holocaust education and introduction of the International Holocaust Remembrance Day.

The changes occurs in the identity of the post-socialist countries but also the European Union experiences changes in own identity.

SOCIAL AND CULTURAL DETERMINANTS OF TERRITORIAL IDENTITY COMBINATIONS: CASE OF FRENCH PEOPLE IN BERLIN
Cédric Duchêne-Lacroix

Abstract: While Europe is becoming integrated, transnational practices are gaining in intensity through different layers of population. It may now be easier to travel or communicate between certain geographically very distant points than between nearby places without direct or fast connections.

The living places are archipelagized and nested, and the landmarks are jumbled. What could be the territorial self-identifications in this situation? In particular, what is the place of Europe in the identity of European people who live in a foreign European country? How could the different identity combinations of transnational migrants be interpreted? The presentation will answer this question on the basis of a mixed method analysis on French people in Berlin. A mapping of social space according to the combinations of territorial identity will be shown.

SOVIET CONSCIOUSNESS VS UKRAINIAN NATIONAL IDENTITY
Alla Karnaukh

Abstract: This paper examines transformation of phenomena of consciousness, giving example of multiethnic Ukrainian society in conditions of change of social, cultural and political reality. It referses (among others) to the concepts of nation (E.Gellner, B.Anderson, E.Lewandowski, U.Altermatt), an ethnic group (G.Babiński, D.Wojakowski) or national identity (Z.Boksztański, Z.Bauman).

Systematic destruction of collective memory in the period of reign of Stalin and Brezhnev led to the identity crisis in the contemporary Ukrainian society. During seventy years of Soviet governments a new social and cultural community – a soviet nation - was formed. Building of national consciousness by any of ethnic minorities or nations was in fact building communist consciousness established as the sole and legitimate. Is it possible in that case to speak about Soviet national identity in relation to contemporary Ukraine? Or maybe about existence of Russian-language Soviet nation?

In Ukraine, like in majority of post-soviet countries, there is larger or smaller group of people, that have serious problems with defining their consciousness. Qualitative research conducted in the area of eastern Ukraine (Zaporizhia), on Ukrainians, Russians and Bulgarians (as most numerous ethnic groups in explored area) shows, that significant number of people in eastern Ukraine, regardless of nationality, consider themselves as "soviet", secondary importance attaching to the territorial identity.

I argue that in Ukraine after gaining an independence the Soviet identity is gradually disintegrating and a process of acquiring of new Ukrainian national consciousness, often in hybrid form, is shaping. This paper is devoted exactly to the analysis of these post-communist changes in the national consciousness of contemporary people in Ukraine.
LIMITS OF EUROPE’S MENTAL BORDERS: TURKISH CASE AS A LITMUS TEST

Hatice Yazgan

INTERNATIONAL RELATIONS, ÇANKIRI KARATEKIN UNIVERSITY, Turkey

Abstract: LIMITS OF EUROPE’S MENTAL BORDERS: TURKISH CASE AS A LITMUS TEST

The European Union (EU) is a constantly changing entity and besides an economic and political debate going on inside, European identity is a much more debated phenomenon among academics and the public more than ever before. In this respect, enlargement of the EU contributes to this debate by forcing the EU to define and clarify its borders and identity. Then who will be included/excluded become the central question for the Europeans. In this respect, a nationalist perspective which puts economic and political interests in the centre draw the borders as broad as it can be, which comes to define the borders of Europe as “fuzzy”. The same applies to the constructivist point of view which defines enlargement, a significant foreign policy tool of the European Union as a policy of extending its values mainly characterized by democracy, human rights and rule of law to the other countries. These values compose the contours of the EU’s identity and have been reinforced through common symbols and policies. In contrast to this perspective, European identity phenomenon, some circles in the EU separate European identity from the others by strict religious, geographical and historical lines and rising nationalism in Europe contributes this perception negatively. From this point of view, Turkey as an ascending country to the EU will be an ultimate litmus test for the Europeans to clarify their mental borders and future visions. A country which is anticipated as “the other” and “different” from the rest in terms of its identity, culture, religion, and language leaves Europe to face its own identity crisis. Against this background, main argument of this paper is that, Europe’s enlargement policy as a value transfer policy may be endangered due to Turkish otherness in the minds of some Europeans in terms of culture and identity. If the EU is envisaged as a real value based entity, it will be vital to eradicate the stereotypes concerning the other cultures from the minds of the Europeans. It is the main responsibility of the European elites to eliminate the mental borders of the Europeans, effectively contribute to the construction of European identity as a set of values and set up a clear enlargement vision for the EU. This will also enhance the EU’s credibility for further enlargement and will give a significant message to the other parts of the world.

REGIONAL IDENTITIES IN POST-COMMUNIST SOCIETIES

Zbigniew Rykiel

Institute of Sociology, Rzeszów University, Rzeszów, Poland

Abstract: Territorial identity has traditionally been implied rather than explicited in traditional sociology. Three main assumptions are made in the paper, i.e. that (1) territory should be analysed relationally rather than substantially in social sciences, (2) territory is thus a correlate of social relations, and (3) the territorial identity is a question of a participation in a culture rather than a membership in a group. In this context, relations between ethnicity and territoriality would be pointed to, and a mythology of the territory in occidental and victimisation categories analysed. Examples would be given of changes in a group identity – from territorial through national to minority or regional. A relative strength of territorial identity would be indicated on the background of the overall social identity, and a differentiated role of regional identity in selected European countries on the background of the overall territorial identity shown in the context of the ‘sociological emptiness’ in (post)communist countries. A question would be asked if there are any social regions with hardly any regional identities. A misidentification of social regions with political units would be an unavoidable result of this finding.

THE HIERARCHIES OF MULTILINGUALISM: WHEN THE LOCAL CONTEXT CHALLENGES THE GLOBAL ONE

Laura Ferilli

Institut of Social Sciences / Lab of Sociology, UNIVERSITY OF LAUSANNE, Lausanne, Switzerland

Abstract: Although the benefits of today’s linguistic diversity are acclaimed by numerous partners from all horizons – whether it be cultural, political, scientific or economic – multilingualism is not in itself a value as such. In many professional fields the command of several languages is a prerequisite in order to gain access to the workplace. As far as other jobs are concerned, notably those which appeal to migrants and which are considered of little value, no importance whatsoever is attributed to workers’ language skills at the time of employment.

Those who put forward their physical energy to earn money, whether it be Italian nationals who came to Switzerland in the sixties, or those nationals from Eastern countries who are currently in
Italy, acquire in time, a certain social and linguistic know-how. Neither employers, nor the so-called host society recognize or value such linguistic abilities in any case, yet they both take advantage thereof.

Through examples selected from different backgrounds in life, I propose to show how the (non)-recognition of linguistic skills goes hand in hand with the (non)-valorization of professional activity, independent of time and place.

I investigated in a village of 4’500 inhabitants called Morciano, in Puglia, Southern Italy. The precise region’s name is the Capo di Leuca, in Salento. The official language is Italian but the vernacular speeches are first the Capo di Leuca Dialect and then Italian.

I collected information through extensive interviews of three immigrants and observations on their workplace: Iboo, from Senegal, on the beach; Elena, from Romania, in a popular café; Bobby, from Ukraine, in a bakery’s laboratory. All of them are multilingual.

INTERPLAY OF EUROPEAN, NATIONAL AND REGIONAL IDENTITIES: SOCIOLOGY OF ETHNIC MINORITIES IN CENTRAL AND EASTERN EUROPE (MAIN OUTCOMES OF AN INTERNATIONAL RESEARCH PROJECT)

Alexander Chvorostov1

1INSTITUTE FOR ADVANCED STUDIES, Vienna, Austria

Abstract: The paper summarizes the main outcomes and findings of the international research project ENRI-East (Interplay of European, National and Regional Identities: Nations between the States along the New Eastern Borders of the European Union, www.enri-east.net) funded by the European Commission. This cross-national study has focused on the detailed multidisciplinary investigation of the historical paths and contemporary status-quo of more than 12 ethnic minorities in nine EU and neighboring countries: Germany, Poland, Belarus, Lithuania, Latvia, Russia (Kalinigrad oblast), Hungary, Slovakia and Ukraine. In each of these countries we have selected one or several ethnic minorities, each of which would have their nominal “mother nation” being a “titular nation” in a neighboring country. For example we have studied and compared the history and the present of Belarusian ethnic minority in Poland on the one hand and Polish minority in Belarus on the other.

This complex study includes a critical re-assessment of theoretical frameworks for the studies of identities as well as of nationalism in CEE region. Furthermore, we have designed and implemented a large-scale formalized sociological survey (ENRI-VIS, or “Values and Identities Survey”) among 6,800 respondents representing the targeted ethnic minorities. At least one half of survey questions have been borrowed from other international surveys, such as ISSP, WVS, NDB and others to secure the compatibility and comparability of data with other “majority surveys”. The next empirical tools deployed in the study are a series of Biographical Interviews (144 interviews) and 40 Expert Interviews. In addition, we have undertaken an innovative “Content analysis of web-long and on-line periodicals” dedicated to the study of internet-life of the target ethnic groups.

Outcomes of all the empirical studies outlined above are being summarized in a form of the series of contextual “Minority Reports”, as an empirical accompaniment to the historical and political reviews of the 14 ethnic minorities in Central and Eastern Europe.

This ESA paper outlines the research design of the ENRI-East study in general and presents the main outcomes of the project as well as announces the data collections that shall be made available for wider research audience after the completion of the project.

THE CITIZENS SLOVAK REPUBLIC OF HUNGARIAN NATIONALITY: ETHNICAL IDENTITY LADISLAV MACHACEK, INSTITUTE OF SOCIAL AND POLITICAL SCIENCES UCM IN TRNAVA

Ladislav Machacek1

1Institu of Social and Political Sciences, UNIVERSITY OF SS CYRIL AND METHODIUS, Trnava, Slovakia

Abstract: The current social and demographic data illustrate that the Hungarian minority in Slovakia is not only the most numerous, but also most developed civil and cultural minority. This is a result of Slovak state policy in relation to minorities in Slovakia, which does not emphasize the concept of cultural assimilation and allows highly developed action on the part of the Hungarian minority. The Hungarian minority is organised politically in the SMK-MKP (1998-2006) or MOST-HÍD (2010-2011), which were/are a member of the ruling coalition of the Slovak Republic. And consistently receives of parliamentary seats in the National Council of the Slovak Republic. The Hungarian minority also has a strong presence in regional government. They hold crucial positions in local government in many towns and villages in southern Slovakia.

"ENRI-East is an international research project dedicated to the analysis of socio-ethnic identities in Eastern Europe, issues of individual or group self-identification and ethnic belonging. FOCUS Agency has made data collection according to prepared project and sociological questionnaire in Bratislava, Slovakia in 2009 (November and December). Through random selection was carried out 801 interviews with respondents, who constitute a representative sample of the Hungarian national minority living in Slovakia, especially with regard to regional allocation. Young generation as well as old generation of Slovak citizens with hungarian nationality is committed to the dominant identity of "I’m Hungarian living in Slovakia”. The typical answer from 10 deep interviews (2010): I am a Hungarian living in Slovakia, I am not a Hungarian, but not a Slovak as well, simply I am a citizen of Slovak republic (Os man, 50 old).

VALUE CONDITIONALITY OF IDENTITY IN THE NORTH CAUCASIAN REGION

Musa Movliyevich Yusupov1

1Law Department, CHECHEN STATE UNIVERSITY, Grozny, Russian Federation

Abstract: In the modern world globalization processes actively proceed. It promotes the modernization of many spheres of social life, change of socio-cultural values, the formation of specificity of regional and national identity.

Methods: the structural and functional approach, and also the methods of comparative and quantitative analysis were applied.

Object of research – the influence of socio-cultural values on formation and development of identity.

Results of research. In the North Caucasian region the general tendency of strengthening of religion is observed though it is more
expressed in eastern part and less in western. Identity formation occurs in a context of contradictions, religious and secular, traditional and modernization values. The character of the course of these contradictions depends on the level of education, urbanization, social employment, historical and cultural experience. Many identify themselves with a residence, territory, a national (ethnic) belonging. The Caucasian identity is formed, first of all, by emotionally endured natural-geographical environment, a single social and cultural system of values. The Russian identity for example is more expressed in the North Ossetia, less in the Chechen Republic. It is explained by the armed conflict consequences. With a stability establishment, the growth of economic well-being and strengthening of civil institutes, the level of identification with the civil community of Russia will raise. The European identity is realized by an insignificant part of the population, probably, because of external dissimilarity of the way of life, but the European social values are attractive and shared by many people. They correspond to the spirit of the socio-historical practice of region.

The conclusion. In the North Caucasian region the local and national (ethnic) identity dominates. Formation and development of all types of identity cause social and cultural values, historical memory, inclusiveness degree in the economic and cultural space of the country and in globalization processes.

Keywords: value, identity, region, globalization, transformation, environment

"...JUST INCREDIBLY BEAUTIFUL" - A NEW APPROACH FOR TESTING SURVEY ITEMS ON REGIONAL IDENTITY

Lisa Donat1
1Sociology, UNIVERSITY OF INNSBRUCK, Innsbruck, Austria

Abstract: Research on collective, territorial identity has up to now failed to distinguish between a positive identification ("patriotism") and a negative type of identification ("chauvinism") at an empirical level of analysis. There are reasons to believe, that the items in use are formulated general in terms of the addressed time frame and consequences for respondents daily life (Latcheva 2010).

This paper is going to introduce a new approach to test these items by leaving the tracks of only verbally formulated contents towards visual stimuli. Following the approach of projective techniques and therefore facing the crucial challenge of choosing a few pictures from a wide variety of possible contents, this paper presents a first idea of how such pictures can work in the process of the interview.

This new approach was tested in a qualitative pre-study on "Regional identity in Tyrol". We have conducted 28 in-depth interviews using 7 pictures on landscapes, sports, history, culture, religion, flags and values. Proponents where asked for their cognitions and feelings by an open ended question. In April 2011 a representative survey (N=500) is going to be conducted in this region including the insights gained by this qualitative approach.

The pictures in use created a completely different atmosphere of communication during the interview. Even respondents addressing the issue of region in a functional, rationalistic and socially desirably manner started to present deep emotions during this part of the interview. Some respondents even referred to their childhood, addressing issues of tradition vs. modernization or anoma vs. cohe- sion. All respondents appreciated this instrument as interesting and self-reflective compared to "normal" oral interviews.

Respondents trying to address patriotism in a more functional way showed more emotions on pictures including objects (landscape, values, flag) compared to respondents exhibiting an emotional way of identification and therefore reflecting more on pictures presenting people (history, sports, culture, religion). Obviously, there are two ways of identification (emotional and functional) which create various patterns of attachment. Future questionnaires should recognize these patterns by allowing for a warm-up section addressing functional contents of identification followed by an in-depth section addressing emotional components like ethnocentrism or anomia.

CULTURAL IDENTITIES AND MUSIC: INTERPLAY OF LOCAL, NATIONAL AND GLOBAL

Lyudmila A. Nurse1
1OXFORD XXI, Thame, Oxfordshire, United Kingdom

Abstract: Geopolitical changes in the Eastern European countries since the fall of Communism and enlargement of the EU created new dynamics to the reproduction of the ethnic minorities along the new EU borders and construction of the their cultural identities. Music among all arts constitutes an important part of cultural heritage. The aim of this presentation is to analyse the place and role of music in the formation of cultural identities of the ethnic minorities and its association with and contribution to changing identities of the place. The paper is exploring perception and preferences of various types of music in the inter-generational perspective thus enabling us to reflect upon mode of changes in cultural profiles of places and nature and dimensions of European cultural identities at local, regional and national levels. The presentation is built upon findings from multi-disciplinary research in the area of cultural identities, cultural identities and music in the Cultural Identities and Music study, and ENRI-VIS quantitative survey: components of the FP7 ENRI-East: Interplay of European, National and Regional identities.

LOCAL MEANINGS IN POPULAR MUSIC. MUSICAL HERITAGE AND LOMBARDIAN IDENTITY IN ID&M FESTIVAL

Silvia Tarassi1
1CATHOLIC UNIVERSITY, Milan, Italy

Abstract: Within popular music studies, meanings of music have often been related to the politics of place and to the struggle for local identities and belonging. The notion of music as experience of placing (Firth ed., 2004, p.37) and as vehicle of construction of local identities has been emphasized, because “music provides means by which people recognized identities and places, and boundaries which separate them” (Stokes, 1994, p.5). The concept applied by Martin Stokes (1994) of “cultural relocation” seeks to explain how local identities are threatened by patterns of globalization or immi- gration, indigenous populations may try to redefine their local identity and reinvent their ethnicity by appropriating the local music and style, and by constructing an idealized version of local folk culture and music.

Besides, as Biddle and Knights (2007) have underlined, new forms of ‘regionalism’ can be figured as new kind of nationalism, aimed at creating and maintaining a unified identity, where language becomes a central vehicle of regionalism. In doing so, the paper will look at the ways the Right-wing party Lega Nord is exploiting those
forms of Italian folk culture as sources to reinforce the northern Italian ethnicity, by using a regional language, the dialect, as a central feature. The paper will outline how Lega Nord party is using Northern Italian dialects folk music, as a way to preserve Northern Italian local identities and heritage, against immigration and to strengthen the existence of a Northern Italian “imagined community” (Anderson, 1983). The project here presented has analyzed the folk music festival ID&M (which stands for Identity&Music) which was thought up by the Minister of Culture and Identities of Lombardy from Lega Nord party together with Davide Van De Sfoos, the most popular folk dialect musician from Northern Italy; and was aimed at enhancing new music production in dialects, by selecting emerging musicians singings in Lombardian dialects. By doing participant observation in the main events of the Festival and in-depth interviews to the different actors involved (artistic director—musicians and politicians from Lega Nord party) the research aims at understanding the ways ID&M Festival and dialect music can contribute to the development and preservation of local identities and at looking at the meanings and values given to dialect music.

NATIONS BETWEEN THE STATES: THE EFFECT OF DIFFERENT FORMS OF DUAL IDENTIFICATION
Natalia Tchistiakova
UTRECHT UNIVERSITY, Utrecht, Netherlands

Abstract: The study of super-ordinate category of receiving nation raises issues about the role of national identification of ethnic minority group members in determining their allegiance to the receiving country. It also raises issues about the roles of majority group relative prototypicality and adherence of minority group members to sending nation in determining their allegiance to receiving country. Using data for individuals sampled within 8 east European countries the analyses show persistent differences in allegiance to receiving country between respondents with different types of ethnic identification after equalizing for differences in perceived security and attachment to minority group.

Current theories of social identity emphasize the important role that identification with higher order category, inclusive for minority and majority groups, plays in formation of intergroup attitudes, social coherence and allegiance of minority group members to receiving country. Common Ingroup Identity Model CIIM predicts that identification of members of different subgroups with one higher order (super-ordinate) category benefits positive intergroup relations by developing a new in-group solidarity; In-group Projection Model IPM where an ingroup’s relative prototypicality is defined as the degree to which the in-group is perceived to be more (or less) prototypical for a given super-ordinate group than the out-group, argues that positive effect of identification with super-ordinate category on inter-groups attitudes depends on the level of prototypicality.

We conclude that current theories of social identity focus on the consequences of identification with super-ordinate category. We expect that understanding of the factors that stimulate this identification could give a key to resolution of important theoretical as well as political problems of culturally heterogeneous societies. In our research we develop and test a comprehensive model for predicting identification of “residual groups” of large ethnic community (“mother nation”) that are located on the territory of state where the majority of citizens belongs to another ethnic community (“host nation”) with super-ordinate category of the “host nation”, conceptualized as magnitude of allegiance of ethnic minority group members to the receiving society.

EUROPEAN, NATIONAL, AND REGIONAL IDENTITIES: AN EMPIRICAL ANALYSIS OF THEIR INTERRELATIONS AND DYNAMICS
Georg Datler

1Institute for Sociology, UNIVERSITY OF ZURICH, Zürich, Switzerland

Abstract: In a nutshell, contemporary sociological theory on social identities puts forward two prominent claims: Social identities are to be conceptualized as flexible and dynamic. Social identities are not mutually exclusive, i.e. individuals hold “multiple identities”. However, with regard to regional, national, and European identities empirical evidence is weak for the first theoretical claim and inconclusive for the second. It is weak with regard to the issue of identity stability vs. identity flexibility, because the body of available empirical studies builds on cross-sectional data, and therefore cannot explore the dynamics of processes of identification at all. It is inconclusive on the issue of “multiple identities” as there are both empirical analyses that lend support to the proposition that national and European identities can be combined (admittedly, this is the majority of recent studies) and studies that come to the opposite conclusion. Again, these contradictory findings may at least in part be due to the use of cross-sectional data. Positive (or negative) covariation at one point in time does not tell whether both identities co-evolve or whether one identity is on the rise and the other on the fall. Of course, these methodological facts are well known, but impossible to overcome with data sources such the Eurobarometer or the ISSP.

This paper digs into a rather neglected but unique data source: The German “Intervallstudie Risiko” provides panel data on young people’s identification with regions, the nation, and Europe in 1992, 1993, and 1995. Though the data is old, its full potential has not been exploited yet. Employing structural equation modeling (SEM) the paper addresses the theoretical claims of identity dynamics and “multiple identities”. Modeling the process of identification across the years, it is possible to judge how stable, flexible or even fluid these identities are. In addition the causal relations between identification in timepoint t1 and timepoint t2 as well as the influence of growth or decline in one identity over time on growth or decline in another identity can be tested. The aim of the paper is twofold: To show the potential of panel data analysis for assessing theoretical claims in social identity research; and to advance the scientific contribution to a highly relevant issue in European (identity) politics.

NATIONAL IDENTITY AND WELL-BEING IN EASTERN EUROPE. A COMPARATIVE STUDY
Sergiu Baltatescu, Adrian Hatos

1Department of Sociology and Social Work, University of Oradea, Oradea, Romania

Abstract: Among the factors associated with transition to market economy and democracy that are supposed to influence national identity of the citizens of the post-communist states, we’ve been interested in well-being, both objective and subjective. Using data from fifth wave of World Value Study (2005-2007), we tested the hypothesis that individual and perceived collective well-being have an influence on citizen’s attitudes towards their nations and, in
turn, strong national pride and identification are associated with their subjective well-being. In Eastern Europe, higher GDP and average national life satisfaction are strongly correlated with national pride, while in Western Europe there is a significantly lower association. Historical and structural explanations have been proposed for this difference. Using multilevel techniques, we found that national pride and identification is correlated at individual level with life satisfaction, even when we control for socio-demographics and national characteristics. Finally, we proposed three causal models for the identified relationship.

THE ‘WORLD-CULTURAL’ MAKE-UP OF REGIONAL IDENTITIES: CASE STUDIES OF REGION-BUILDING IN CONTEMPORARY POLAND

Sebastian M. Büttner

Institute of Sociology, UNIVERSITY OF ERLANGEN-NUREMBERG, Erlangen, Germany

Abstract: Processes of regionalization are usually conceived as bottom-up processes of political and economic mobilization, or as courses emphasizing particularistic collective identities. On sub-national scale in marked contrast to these conventional approaches to identity it is argued in this paper that the current wave of regionalization in Europe should be understood as a vital element of increasing global integration, and that sub-national regions are constitutively shaped by and embedded in a wider transnational institutional context (‘world-polity’). This external institutional context encourages the ‘reflexive resurgence’ and the ‘staging’ (Goffman) of regional identities in terms of most contemporary notions of development, such as innovation, cohesion, competitiveness, sustainability and so forth (‘world-culture’). In Europe, this has been encouraged in particular by the EU Cohesion Policy which specifies, reinforces and accelerates the diffusion of certain transnational models of ‘good’ regional development all over the EU territory. Starting from a macro-phenomenological research perspective (in the tradition of the so-called world-polity- approach of John Meyer and colleagues) this contribution focuses on the emergence of new administrative regions and practices of regional mobilization in contemporary Poland. These new administrative Polish regions which were just created about a decade ago constitute an ideal ground for exploring and analyzing the emergence of ‘world-cultural’ regional actor-identities and the role transnational expert models and expert practices of (regional) development play in this context. Accordingly, the aims of this paper are threefold: providing, on the one hand, a detailed analysis and explanation of what I call the ‘world-cultural’ make-up of sub-national regions in contemporary Europe based on the theoretical premises of macro-phenomenological sociology; secondly, suggesting to conceive of sub-national regions as ‘modern’ world-cultural actors, which enact relatively general and standardized practices of regional development. This should show that regional identities are not just given and locally fixed but reflexively discovered, invented and promoted within a broader transnational social context. Case studies of regional development strategies in three different Polish regions, namely the Voivodships of Lower Silesia, Lublin and Sub-Carpathia will underline this argument.

WHAT IS WALES? CONSTRUCTIONS OF THE NATION AMONGST LOCAL STATE PERSONNEL

Robin Mann 1, Laura Jones 2

1 School of Social Sciences, Bangor University, Bangor, 2 Institute of Geography and Earth Sciences, Aberystwyth University, Aberystwyth, United Kingdom

Abstract: This paper examines constructions of the nation amongst local state actors in Wales. We argue that the national identities of local state personnel - who are neither ‘ordinary’ citizens nor ‘political elites’ - is a relatively under-researched field. Addressing this we present new data drawn from a series of qualitative interviews carried out with senior managers in local government and related public sector organisations. Our empirical focus is on the way these actors ground and locate Wales and Welshness in relation to their professional and policy concerns. Three particular themes are discussed: First is career or professional biographies – we explore how career trajectories shape their sense of orientation to Wales and Welsh identity; Second is knowledge provenance - we identify the types of knowledge drawn upon – for example local, professional, statistical knowledge – and the way these knowledge relate to different ways of knowing Wales; Thirdly is self-positioning - we examine how these actors position themselves (e.g. as responsible, involved, outside or set apart from) in relation to the political and social transformations in Wales. In providing new data in this area we contribute to a general interest to do with the national identities, discourses and imaginations of government actors who are engaged in the processes and practices of the devolved state and, thereby, engaged in the process of making and re-making ‘Wales’.

HOW DOES ETHNIC COMPOSITION INFLUENCE SOCIAL CAPITAL? MODELS OF SOCIAL CAPITAL IN COLLECTIVITIES AROUND THE HUNGARIAN-ROMANIAN BORDER

Adrian Hatos

University of Oradea, Oradea, Romania

Abstract: Controversy surrounds the presumable effects of ethnic diversity on social trust, community involvement and associative participation. According to many social scientists, including Putnam, ethnic fragmentation produces mistrust and an erosion of community bonds. Not all the research and theorization on this topic has provided, however, results that converge with the previously mentioned pessimistic view, the counterarguments highlighting either a positive or lack of relationship between diversity and social capital or the fact that between the two dimensions the relations are far more complicated than assumed by the proponents of negative relations. The ethnically diverse area around the Romanian-Hungarian border is an ideal setting for testing the effects that variable ethnic composition may have on trust and sociability. My article will investigate the variations in trust, community involvement and voluntary membership with regard to individual and contextual variables using the data from the ENRI (European, National and Regional Identity) surveys in Hungary and Romania in hierarchical linear regression models. Masurement tools for trust, associative membership and community involvement are tested on samples of around 800-1000 adults randomly selected from 4 bordering counties of the two countries and between-country comparisons are provided. Then, between-individual variation in scores of social capital are modelled using both individual variables as well as the contextual focal variables - type and size of the settlements and especially their ethnic composition. Results are discussed from a theoretical and a policy point of view.
CONSTRUCTION OF REGIONAL IDENTITIES THROUGH THE INTERNET ON THE EXAMPLE OF THE UPPER SILESIA IDENTITY

Maria Świątkiewicz-Mośny¹

¹Institute of Sociology, JAGIELLONIAN UNIVERSITY, Kraków, Poland

Abstract: Regional identity may be defined as a particular case of social and cultural identity based on regional tradition referred to exactly defined territory (place), its specific social, cultural (symbolic), economic or even topographic features which distinguish it from other regions (places)” (Szczepański 2006, 22). Territory is thus the key element of the definition. However, it seems that regional identity is in large measure revived thanks to the Internet, which is principally territorial. As Castells notices, globalisation trends in contemporary world conflict with identity trends and cause revival of ethnic and religious movements.

I shall present the identity discourse and rebirth of the Silesian identity on Internet forums and social websites on the example of Upper Silesia. Thanks to those tools of communication, the Silesian identity, defined as a membership of regional group, may be realised outside the territory (in case of Upper Silesia a serious social problem are migrations, particularly to Germany). The question which appears here is if the discussed and defined Upper Silesian identity in the Internet may still be treated as regional identity?

The second important element of the presented text is constructing the language for the needs of Internet communication. The Silesian dialect does not have a language status or any rules of spelling.

The revival of the Silesian identity discourse contributed to several consequences, important from the point of view of the region, among others: trials have been undertaken to grant the Silesian dialect the status of a regional language, the coalition governing the Silesian authorities was joined by the Movement of Silesian Autonomy (Ruch Autonomii Śląska), during National Common Census it will possible to declare the Silesian nationality for the first time.

The theoretical frame for research is Social Representation Theory (Moscovici, Wagner) and mass media theory by Hans Keppinger.

Upper Silesia is a region of cultural borderland, which is a laboratory of multiculturalism in homogenous Poland, interesting for a sociologist. Silesian identity, not supported by many (e.g. education) was made difficult for children who spoke the Silesian dialect, today is being revived in large measure thanks to the Internet.

STATE YOUR IDENTITY: THE SOCIAL AND POLITICAL BASES OF BRITISHNESS IN SCOTLAND

Michael Rosie¹

¹Sociology, UNIVERSITY OF EDINBURGH, Edinburgh, United Kingdom

Abstract: Over the last several decades Scotland has proved a highly illuminating ‘test case’ in which to understand sub-state identities in Europe. The investigation of Scottishness, in particular its largely civic and territorial construction, has produced influential insights into the ‘markers and rules’ of national identity. Yet, perhaps surprisingly, the study of Britishness in contemporary Scotland has thus far escaped systematic study.

Research has consistently shown that feelings of Britishness need not conflict with feelings of Scottishness. Indeed, for many in Scotland, the identities are complementary rather than competing. But is Britishness simply a ‘state’ identity, doomed to fading relevance as Scotland wins increased autonomy within and from the United Kingdom? Or does Britishness in Scotland possess ‘national’ qualities which would ensure its continued relevance even in a politically independent Scotland?

This paper unpacks the social and political bases of British identity in contemporary Scotland through analysis of large scale social surveys. Britishness is no monolith: it has quite distinctive bases founded upon discrete social aspects including age, place of birth, and religion. Likewise its relationship with politics is complex, simultaneously possessing right- and left-wing variants. One cannot straightforwardly ‘read’ an individual’s politics – whether party allegiance, view of European integration, or attitude to Scotland’s position within the United Kingdom – from their feelings of Britishness. The paper will investigate this ‘non-alignment’ of political views and state/national identity and ask, given this, whether Britishness ‘matters’. The paper concludes by speculating on the future role of Britishness in a Scotland likely to garner even more political autonomy within the UK state.

STRONGHOLDS OF EUROPE: EUROPEAN IDENTITY AND ETHNIC MOBILIZATION AMONG ETHNIC MINORITIES IN EASTERN EUROPE

Natalika Patsiurko¹

¹Sociology, UNIVERSITY OF ABERDEEN, Aberdeen, United Kingdom

Abstract: Development of the European identity in Eastern Europe is challenged not only by the shifting borders and recent accessions to the EU, but also by a complicated ethnic make-up of the new EU members and neighbours. The paper will examine how the strength of ethnic identification, the degree of mobilization in various minority organisations, and the relationship of ethnic minorities with titular nations in the region influence their attitudes towards Europe and their European self-identification. The analysis will present new evidence based on the recent interviews with members of ethnic minorities and with activists of ethnic minority organisations in eight Eastern European countries, collected within the FP7 Project ENRI-East, Interplay of European, National and Regional Identities: Nations between the States along the New Eastern Borders of the European Union.

THE EUROPEAN EMPIRE AND ITS WALL. SOCIOLOGICAL CONSIDERATIONS ABOUT THE NEW IRON CURtain BETWEEN AFRICA AND EUROPE

Max Haller¹

¹DEPARTMENT OF SOCIOLOGY, UNIVERSITY OF GRAZ, Graz, Austria

Abstract: The European Union itself, but also some social scientists see the EU as a new cosmopolitan unit, transcending the traditional, parochial and egoistic nation state. Yet, the abolition of the borders between the member states has gone hand in hand with an enforcement of the outer borders of the EU. This is particularly so in the case of the border between Africa and Europe. A new, invisible but highly effective Iron Curtain has been erected which makes it practically impossible for an ordinary person from Africa to travel to Europe. (Quite a similar situation, however, exists at the border
between Mexico and the USA). On the other side, the border can easily be crossed by Europeans. This is much the same as it was the case for the walls which historical empires (e.g. the Rome, China) have built around them. In my paper, I will proceed in four steps: (1) Show similarities and differences between the walls of historical empires and that surrounding the European Union today; (2) elaborate the main reasons for the erection of the new wall; (3) confront the border control and the treatment of refuges and illegal immigrants in the EU with the self-proclaimed ideals of the European Union; (4) show some alternatives and the prospects of their realization to the present form of locking out of Africans and people from other poor regions of the world.
RS 23 Bringing Lefebvre Sociology Back in Urban Studies

Abstract: Même s’il a été pendant quelque temps oublié en France, la pensée de Henri Lefebvre connaît actuellement une large postérité, en particulier dans le monde anglo-saxon, et surtout dans les études urbaines. Un constat s'impose: une grande partie des concepts qu'il a élaboré sont très fructueux pour étudier la ville et les phénomènes urbains d'aujourd'hui. Que ce soient les concepts de centralité, de production de l'espace, de différence, de vie quotidienne, de rythmanalyse, de droit à la ville... de nombreux travaux s'en inspirent. Il s'agira de faire un rapide état des lieux de ces applications et diffusions. Mais la réalité urbaine a changé depuis l'élaboration de ces concepts, qui remontent pour la plupart aux années 1960-1970. Si on peut constater leur application parfois facile à la description des situations actuelles, n’est ce pas oublier leur contenu proprement subversif à l’époque de Lefebvre? Dès lors, cela ne nous incite-t-il pas à réfléchir aux conditions de l’utilisation de ces concepts aujourd’hui? L'état des lieux de la réception de Lefebvre nous permettra de situer les enjeux de sa réception, alors que la condition urbaine a radicalement évolué depuis les années 1980. Et plus largement, elle posera la question: qu'est ce que penser avec Henri Lefebvre? Cette question est cruciale face aux enjeux qui sont propres à cette période de crise et à la conflictualité qui est inhérente aux processus urbains actuels.

HABITER ET MONDIALISATION AU REGARD DE LA PENSEE D'HENRI LEFEBVRE

Nassima Dris

Abstract: Cette communication interroge la pertinence d’une problématique de l’habiter dans un monde dit “globalisé” au travers d’une perspective centrée sur le « droit à la ville ». Selon Henri Lefebvre, l’habiter est mis à mal par la domination de la technique, du pouvoir politique et de l’économie capitaliste. On sait combien Lefebvre a été clairvoyant sur les “effets néfastes” de l’urbanisation moderne qui a produit de l’“anti-ville” ou la “non-ville”... Pour Lefebvre, l’habiter correspond à un contenu lié à la dimension humaine. La complexité de la réalité sociale montre bien que l’habiter ne peut être analysé comme une simple question technique car les manières d’habiter et la spatialité appartiennent à la logique de l’expérience et s’inscrivent de fait, dans l’histoire des sociétés. H. Lefebvre a insisté sur l’importance de l’espace dans la vie quotidienne en mettant en relief la place du quotidien dans l’approche des conflits essentiels de notre temps. Il s’agit de “la pratique sociale dans la totalité” qui selon l’auteur, signifie la concentration de richesses, de pouvoir, d’information, de connaissance, de culture, de rencontres, de simultanéité, etc. C’est en ce sens que la vie quotidienne permet l’amorce d’une problématique où la trivialité, la banalité et le routinier sont par certains de leurs aspects liés au structural. Cette proposition de communication a pour objectif de montrer combien la pensée d’Henri Lefebvre a été clairvoyante et permet de comprendre les réalités sociales dans un monde de turbulences.

LEFEBVRE’S RHYTHMANALYSIS RE-EVALUATED: A NEW PROJECT

Andrew Otway

Abstract: Henri Lefebvre’s notion of a trans-disciplinary ‘new science’ of rhythmanalysis is potentially one of the most effective and interesting tools of political and sociological analysis, especially in its application to the condition of modern cities. Rhythmanalysis concerns the analysis of opposing natural rhythms and artificial repetitions and their interaction within society, and in urban society in particular. It incorporates ideas both from Lefebvre’s period of study of the urban during the 1960s which culminated in such political works as *The Right to the City* (1967) and *The Explosion: Marxism and the French Revolution* (1968), and from his more abstract but still very political work on urban space of the early 1970s, in which he wrote *The Urban Revolution* (1970) and *The Production of Space* (1974).

The contemporary relevance of rhythmanalysis is discussed with brief reference to recent literature. A new urban rhythmanalytical project is proposed, with a restored political focus, centred on a particular place: the French Mediterranean city of Marseille. It is based mostly on ideas from Lefebvre’s posthumously published *Rhythmanalysis: Space Time and Everyday Life* (1992) and in particular on two essays from this book: ‘Attempt at the Rhythmanalysis of Mediterranean Cities’ and ‘Seen from the Window’. Despite Lefebvre’s ability to predict future trends, for a contemporary rhythmanalytical project to be effective a re-evaluation of Lefebvre’s ideas on Marxism, the State and the urban is necessary given the changes in the world situation twenty years after his death. The place of nature within the urban and the concept of the environmentally sustainable city are also examined in the light of Lefebvre’s emphasis on, and perhaps favouring of, natural rhythms. This new project would also involve a change of emphasis from Lefebvre’s over-reliance on the self-trained rhythmanalyst’s subjective perceptions of certain rhythms and repetitions of everyday life so as to be able to include others which are more deeply hidden within both the social and the more material strata of the city.

THE RIGHT TO THE CITY: RIGHT(S) TO “POSSIBLE-IMPOSSIBLE” VS. A MERE SLOGAN IN PRACTICE?

Nezihe Başak Ergin, Helga Rittersberger-Tılıç

Abstract: Lefebvre had elaborated the survival of capitalism and its growth from its means of occupying space and producing a space.
He puts forward the right to the city, like a cry and a demand; however as a transformed and renewed right to urban life. Especially from the preparation meetings for European Social Forum, the right to the city is tried to be proposed as a unifying slogan “in the making” by various urban oppositional groups, multiple agents against over-imposed urban projects, abstract spaces of homogenization and commodification in Istanbul. It gains various meaning by different groups even by associations of newly (re)formed gecekondu neighborhoods in Istanbul and activists, intellectuals outside neighborhoods mobilizing against demolitions in gecekondu and historical areas, as a bridge to form alliances with different urban social movements all over the world. The concept will be questioned in what extent it could be a bind between practice and theory, an integrative expression of “lived experiences” for different urban grassroots groups of different neighborhoods having different political identities, histories, characteristics. The right to the city of Lefebvre will be elaborated in terms of the production of space and of the transformation of the city by changing ourselves in collective struggles as “a collective right to be seized” with its theoretical inspirations on Harvey, Marcuse, Soja, Mitchell, de Souza, Dikeç and Purcell including recent discussions in Turkey. The right to the city beyond being a mere slogan should be considered in the framework of challenging the right to dwelling based on possession/property, as a horizon for the right to oeuvre and appropriation, the right to participation, “autogestion” and to the priority of the use value over the exchange value. In the construction of transformed and renewed urban life, the right to the city paves another way for defining another type of citizen. The paper aims to reveal the core of the right to “social space” on the path to another city, to “another society” inherent in Lefebvre in terms of practical implications and different appropriations especially in urban resistances in Turkey, Istanbul of this concept with “which right” and “whose right” questions in mind.

CONTRADICTORY SPACES OF LABOR: THE SOCIAL AND SPATIAL PRACTICES OF WORK LIFE IN ISTANBUL

Yıldırım Şentürk

Abstract: Whether advocating or criticizing, most studies on urbanization and globalization are based on a hidden functionalist notion of “a working global economy.” In this line of thinking, even though its outcomes are contested or questioned, integrating into the global economy becomes “the only solution” for every locality. Such perspective is especially problematic for scholars interested in examining the cities of the developing countries. In order not to repeat similar fallacy, we need to question the notion of “a working global economy” at the beginning. A global economy is working, but it does not work like “a system.”

On the basis of a qualitative field research consisting of social and spatial practices of 80 occupations, I am planning to explore how people working in different economic sectors make their living in Istanbul. “Making a living” can help us to show how working people ranging from workers in manufacturing sectors to professionals in service sectors reproduce certain social and spatial practices, and how their practices encounter the dominant ones. Indeed, people can make their living in places and by occupations which are devalued or ignored by the dominant image and practices of the global economy, or people’s effort of making their living can be directly prevented by these dominant practices. Such notion can help us both question the ongoing spatial and social practices in cities and propose alternative ones which aim to enhance the well being of people rather than “the working” of the global economy.

In this regard, Lefebvre’s works on space, especially the concept of contradictory spaces, have significantly inspired my research. He acknowledges that in every society economic practices lead to certain level of “consistency” and “coherence” within its social space. Indeed, the mainstream globalization and urban studies mainly emphasize this aspect of the contemporary world economy. Nevertheless, as Lefebvre rightly argues some processes have also produced their contradictory spaces, thereby simultaneously challenging “the cohesiveness” in a social space. In this paper, as I explore how people make a living in a city, I will utilize Lefebvre’s “contradictory space” concept as an alternative urban research agenda to overcome the hidden functionalist notion of “a working global economy.”

PRODUCING THE SPACE, CONTESTING THE CITY: URBAN WILD SWIMMING

Maciej Kowalewski

Abstract: According to Lefebvre (1991), ‘lived space’ is (re)produced through social actions; even they are marginal and go far beyond everyday life, contesting the mainstream principles of the city. An interesting example of producing space by questioning the rules of symbolic economies of the city is urban swimming. Security is an obsession of the city’s citizens, but sometimes they also go out of control: youth, children and adults are using the city environment for swimming, taking bath in the urban ponds, fountains, city rivers, even in industrial areas (pools). All urban swimmers, those who are making jump from the bridges, taking showers in fountains, practicing urban sports or ‘urban olympics’, taking regular baths in industrial reservoirs are also producing their own notion of non-commercial leisure space, regardless of how dangerous or irrational it is.

For sociologists, urban wild swimming can be placed somewhere between alternative sports and practices of everyday life: swimmers are less organized than parkour runners (traceurs) and much more unpredictable and inappropriate than regular walkers described by de Certeau (1984). (Half) naked urban swimmer’s body presented in the public space cause sensations, smile, scandal, but it makes primarily a comment to the urban social text. Their practices are similar to those presented in Iain Borden’s study on skateboarding as a form of performative critique of the city. Both (swimmers and skateboarders) can be viewed as city-contesters, as they ‘produce themselves bodily and socially, and they produce the city in terms of their own specific bodily encounter with it’ (Borden 2003:296). Thus, urban swimmers make an opposition to the existing rules of leisure, demand their ‘right to the city’. In this paper different forms of urban wild swimming will be discussed, in terms of Lefebvre’s theory of constructing the social space of the city, referring to selected examples from European cities.

RETHINKING ‘URBAN RESTRUCTURING’ AT THE JUNCTION OF LEFEBVRIAN SOCIOLOGY WITH
MOLOTCH AND BOURDIEU: THE SEARCH FOR A UNITARY THEORY FOR THE CASE OF ANTALYA

Reyhan Görk¹

¹Political Science and Public Administration, CANKIRI KARATEKIN UNIVERSITY, CANKIRI, Turkey

Abstract: This paper aims to outline a unitary theory to explore the relation between cultural policies and global capitalism, and its impact on restructuring Antalya in social, spatial and cultural context. My reference point for studying this subject dates back to the end of 2002, when I started working as a Research Assistant in Akdeniz University in Antalya. Living and working for about two years, I felt, I had been grabbed by the rhythm of the city. As Lefebvre (2004) coins the term, 'Rhythmanalysis', refers to the analysis of the rhythm of everyday life found in the workings of towns and cities, in urban life and movement through time and space. Lefebvre also proposes that to properly analyze the rhythm of a city, "one must get outside of [this grasp]" (Ibid: 88). Thus, my 'outsider' position in Antalya as a Simmelian 'stranger', allowed me to analyze the rhythm of the city.

Above all, any rhythmanalysis necessitates a ‘feeling’ of transformation from one phase to another. First and foremost, it requires almost an observable change beforehand, a signal of structural transformation or restructuring because at that moment any ‘ar-rhythmia’ as the discordance of ‘rhythm’ can be analyzed.

Still, the starting point of my conceptualization of all of these happenings in Antalya took place after reading a statement made by Menderes Türel, the Mayor of the Antalya Metropolitan Municipality after the April 2004 election: “I am determined to make Antalya soar. To this end, I am going to pave the way for the private sector. You will see that the most famous universities will establish campuses here. At least 30,000 international students will come and study in Antalya. We are going to turn the Golden Orange Film Festival into an international film festival organization like the Cannes Film Festival. Meanwhile, celebrities will come to Antalya and buy villas here. I plan to build a hotel in the sea with an aquarium” (Hürriyet, 12.04.2004, accessed on 08.01.2005).

In the endeavor to outline a ‘theory of practice’ for the actors comprising a ‘growth machine’ in Antalya for urban restructuring, Lefebvre sociology is complemented with the theories of ‘growth machine’ (Molotch) and ‘transformation of forms of capital’ (Bourdieu).

THE ANTINOMIES OF (NEW) URBANISM. HENRI LEFEBVRE, HAFENCITY HAMBURG AND THE PRODUCTION OF POSTURBAN SPACE

Thomas Doerfler¹

¹UNIVERSITY OF BAYREUTH, Bayreuth, Germany

Abstract: Current urban renewal sheds a light on contemporary political antagonisms in a controversial way. To camouflage political struggles it has to act in the name of the social. This post-political situation on debates about urban futures have to claim to be democratic and just, but in the name of experts, who perform the ‘democratic’ representation of the city’s people. So, these projects are moderated by the bourgeoisie in the sense of their interests. The result is a new regime of ‘democratic’ exclusion: no one has to be offensively expelled nor gentrified, as the new ‘governmental’ urban landscapes are designed for social groups that claim to be middle class or “creative” and shall thereby represent the future citizen: the succesfull, ecological and cosmopolitan entrepreneur.

My contribution would like to analyze these antagonisms in urban planning by referring to one of the most prestigious projects of waterfront development in Europe, and how it struggles with the complexity of urbanity: HafenCity and Wilhelmsburg Hamburg. It focuses also on the counter actions by residents in Wilhelmsburg, an old quarter of immigration nearby, which is envisioned in this process to get a «green» and «social» district, which often means to get rid of its former inhabitants in an ‘intelligent’ way: by green economies, creative industries and governmental politics.

To show this, I would like to develop the idea that planned urbanity is a post-political antinomy in the Zizekian sense: it makes urbanity both possible (for the hegemonial politics and a new urban elite) and impossible (as a lived space (Lefebvre) for the current inhabitants). Some insights are given into this problem, which is regarded as a severe restriction of urban redevelopment projects. In getting aware of these antinomies, it is hoped to foster further critical thinking on enhancing critical urban performances.
Rs 24 The Sustainable City and the Arts

The Sustainability of the Arts in Urban Social Movements - Case Studies in Hamburg, Germany

Volker Kirchberg

Abstract: For about two years a combined artistic, political, and social movement has evolved in Hamburg that was launched by the manifesto “Not in Our Name” (NION, see www.signandsight.com /features/1961.html). This strong crossover of artistic, social and political objectives (e.g., against neoliberal urban development strategies of the city government and for modestly priced artists’ living and working quarters) is without comparison, at least in Europe. The NION movement created a strong international media echo plus a renaissance of political consciousness for a liveable and socially non-exclusive urban environment. I will describe five Hamburg case studies that - in different degrees - relate to the NION manifesto and that - in different degrees - give proof to the collaboration of artists with political activists and to the amalgamation of urban arts and urban politics. Together with students in a recent cultural sciences project we have tested five urban sociological approaches (from Lefebvre’s “Right to the City” approach to Molotch’s “Growth Machine” concept) on their explanatory value for this political-artistic movement. Last but not least I will describe and assess the Hamburg case studies with respect to sustainability issues such as the degree of auto(ec)poiesis and the sustaining effect this movement might have in the long run.

Sustainability as Gentrification; Urban Sustainability Seen Through the Eyes of the Non-Western Observer

Hans Dieleman

Abstract: Between 1880 and 1910 the former Mexican president Porfirio Díaz redesigned parts of the center of Mexican-City. Díaz strongly believed in European superiority and he created a city with a more European look. The now fashionable neighborhoods of “La Condesa” and “La Roma” are copies of French/Italian style neighborhoods; comfortable places seen through the eyes of the western tourist, the expat, the artist and the representative of the Mexican elite. Díaz is recognized as the president that introduced modernity in Mexico, but at the cost of marginalizing mestizo and indigenous cultures and creating an ever larger gap between the elites on the one hand and the majority of the people on the other hand. His presidency led to the 1910 Mexican Revolution. Is something similar going on now, under the heading of sustainability? The actual city government is currently changing the city center to improve it according to western environmental standards. The ambulant salesmen in the streets are removed, the pavement renewed, and various environmental measurements are realized such as car-free zones, 300 kilometers of bicycle paths, a bicycle rent-to-go system and more. The aim is to change the city into a more sustainable place. But making the city more sustainable is contributing a lot to the gentrification of the city. “La Condesa” and “La Roma” are now more than before the places “par excellence” to manifest western twenty-first-that-is-sustainable urban lifestyles. The large majority of the population is excluded and the gap between the elites and the masses is again widening.

The paper will describe the changes currently taking place in Mexico-City, and will analyze them in the context of three key concepts: the concepts of “sustainability”, “urban culture” and “gentrification”. It will put forward that gentrification is the result of using a western definition of sustainability and linking this definition to a wrong idea of urban culture. It will present alternative views on sustainability and will address Castells notion of the myst of the urban culture meaning that these cultures are rather modern than urban. Urban sustainability-without-gentrification in non-western cities implies the redefinition of sustainability and of urban cultures.

Revitalization of Cities in the Absence of Legislative Support: A Case of Unsuccessful Politics and Overactive Policies, from Poznań, Poland.

Marek Nowak

Abstract: The problem of revitalization would seem to be especially important for Central and Eastern Europe. The reasons for this relate to the problems of the radical reorientation which began 20 years ago. In consequence, the deindustrialization and urbanization of city centers took place very quickly. The crux of the problem might be described as a theoretical challenge, in which the answer to the possible questions depends on the answers to other questions. First of all, we need to enquire about the ideological formula of the city, and particularly the question of just what is the machina of growth, or the process of shrinking in time.

The revitalization of an old quarter, Śródką, in the city of Poznań, Poland, was based on the local community’s idea of self organization. The city government supports locals only through social programs and cultural integration projects. The Jordana Bridge in Śródką was rebuilt to improve communication, and as a part of a local tourist trail (Trakt Cesorski). An open consultation and social revitalization plan was prepared by local activists in the prelude to the project. After 5 years of the project, the revitalized area was no more vital, there seem to be symptoms of gentrification, and the number of long-term inhabitants has decreased.

The text discusses the reasons for the project’s disappointing results, as an example of the problems that affect revitalization in Central and Eastern Europe. The interpretation is based on quasi-evaluation consists of observation, sociological investigations, and a reconstruction of the dynamics of property pricing in collaboration with scientist from varies disciplines, and universities.
THE AFFECTIVITY OF THE CITIES IN TRANSITION
Fiammetta Fanizza¹

¹Department of Human Sciences, UNIVERSITY OF FOGGIA, Foggia, Italy

Abstract: During the last years, several Italian town-planners have considered the concept of urban transition only in a positive way, like something aprioristically able to produce new social practices and new paradigms to represent reality.

As a consequence of the application of the principle of functional urban area (FUA), coherently with the Lisbon and Gothenburg decisions, the urban systems have supported many structural changes with the aim to develop the social cohesion and to improve the sustainability. These structural changes outline the growth of an urban polycentrism, which considers relevant not the city, anymore, but rather the network of cities of the metropolitan area. So that, the overcoming of monocentric town model upsets the urban condition, because for people the adaptation to the polycentrism involves new codes to face the action-reaction relationship with the urban environment.

The aim of this paper is to analyse the transition effects in the metropolitan area of Bari (a large town located in Southern Italy) to evaluate whether this transition is important just for the territorialization of the local policies, rather than for the social community. At last, it is conceivable that this kind of transition is a governance strategy. In fact, most of the recent public works ignores the need of empathy, useful to outline a genuine urban contest. In particular, the territorialization affects the ways through which citizen attention develop. Because the level of attention regulates the empathy, citizen attention is essential to distribute the affectivity into urban relationships as well as into relations toward public institutions.

Since this thesis takes the cue from the results of recent studies regarding the negative effects on the affective tone produced by the botulinum toxin used in plastic surgery, this paper argues that public works are performed according to an aesthetic view that denies the value of beauty as sociability. In few words, the transition fights the affectivity, because the transition determines a new normative tension that tries to reconfigure the human being and his forms (feelings, emotions, values and languages).

Keywords: urban planning, governance strategy, local policies, citizen attention, empathy and social identity

‘CREATIVE CITIES’ AND/OR ‘SUSTAINABLE CITIES’: DISCOURSES AND PRACTICES

Dan Eugen Ratiu¹

¹Philosophy, BABES-BOLYAI UNIVERSITY, Cluj-Napoca, Romania

Abstract: This paper reflects on the notions of ‘creative cities’ and ‘sustainable cities’, aiming at conceptual clarification of debates on these topics and related urban practices. While it addresses a wide range of issues implied by these notions, the focus is on the arts and their role in achieving urban creativity and sustainable development. First it explores the emergence of creative cities discourses and practices and the conditions of sustainability for the urban and artistic environment and development. Is it about shaping viable urban communities rather than about entertainment, profit and property development (as in the managerial discourse)? Individual creative artists are they only dispensable tools of urban regeneration or did/could they play a key role in fostering a wider sense of place and of community? The main argument is that different approaches to the issues of creativity and sustainability, as well as different strategies for building the creative city, depend not only on various levels of urban space and agents considered – cultural district / city, small cities / metropolis, individual artists / artistic institutions –, but also on values. For example, the value attached to risk taking versus status quo, or to the advent of creative cities in the context of ‘the new economy’, by highlighting not only its positive but also its ‘darker dimensions’. While claims to scientific objectivity are common, most approaches are not merely descriptive but largely normative. Therefore, the ideological and political implications of these topics are relevant, a program of social democracy standing out against the neoliberal political agenda. The polemic is exemplified, among others, by A.J. Scott versus R. Florida debate on the nature and significance of creative cities, where the implementation of the elementary principles of social equity, justice and participatory democracy as conditions of viable creative cities is contrasted to the global competition to attract, retain and nurture talented individuals – ‘the creative class’ – in creative cities, expect to dissolve the classical division between the productive bourgeoisie and the bohemian, and give rise to a new creative subject.

Keywords: arts, creativity, creative cities, sustainability, sustainable cities, urban development

CULTURES OF SUSTAINABILITY IN THE EUROPEAN CAPITAL OF CULTURE - A CULTURAL PHILOSOPHICAL REFLECTION ON URBAN CHRONOTOPES FOR SUSTAINABILITY PROCESSES

Oleg Koefoed¹,²

¹Department of Culture and Identity, CUID, UNIVERSITY OF ROSKILDE, Roskilde, ²Cultura21 Nordic, Copenhagen, Denmark

Abstract: “Cultural values are a key to sustainability and (...) deliberate strategies and criteria are needed for the arts and creative industries to assist sustainable development” (Rhodes, 2004)

“Culturally instigated innovation leading to cultures of sustainability needs to encompass a mix between authenticity and complexity. The first is the clue to the past, the second to the future.” (Koefoed, 2010)

Taking its departure in dialogues with cities opting for the title of European Capital of Culture 2017, a study will be carried out amongst EcoC cities. The aim is to uncover how the EcoC cities manage to incorporate such a perspective in their work with long-term, excellence-oriented cultural policy programs. The cities are forced to at least some degree of long-term thinking. But, as many theories of cultural economy and urban development show, cities are complex machines that do not easily offer themselves for controlled processes of policy and planning. Another issue is the interplay between ambitions of the city team and the other actors in the networks around them; policies of the European committee as well as the member state; pressure from inside and outside; and the character of the cultural arenas in the cities. Inspired i.e. by Bruno Latour, Eric Beinhocker, Edgar Morin and others, we will look at cities as examples of networked complex adaptive systems in which the relation between culture, economy, and sustainability must be seen as intrinsic, rather than as mutual externalities.
Central to the study is the issue of the role of culture as potentially playing an important in a possible transition to more sustainable society (see Dieleman (2006, 2008), Kagan (2008, 2011), and Hartley (2009)); as well as the potential of cultural policy in highlighting sustainability (social, environmental, economic, and cultural), and raise questions such as: do the EcoC cities prioritize cultures of sustainability in their planning, bidding, and real work that follows with the title? Do they opt for commercial solutions in times of crisis – and is this beneficial to the cultural fields? To what extent does the EcoC framework allow for processes of cultural experimentation, and how does this further or impede with cultures of sustainability? Etc.

The study will take place through a combination of interviews, document analysis, and visits to the cities in case; lasting from june to december 2011.

**HAVE CREATIVE CITIES A DARK SIDE?. SOME IDEAS AND EVIDENCES IN SPANISH CITIES**

Clemente J. Navarro

1 CENTRE FOR LOCAL POLITICAL SOCIOLOGY AND POLICIES, UNIVERSIDAD PABLO DE OLAVIDE, Sevilla, Spain

Abstract: This paper attempts to introduce some arguments and analysis about the pay-offs between ‘economic sustainability’ and ‘social sustainability’ of creative cities. In fact, theoretical elaboration about culture and creativity show these could perform an effective role promoting local development. Normally, these stress the impact of culture on economic development. However, cultural projects and strategies oriented to promote a creative city model could also promote inequalities inside the city.

The pay-off of creative class attraction or visitors could be, for instance, new segregation processes and the generation of ‘tourist bubbles’. This paper tries to show the impact of the creative city strategies in three big Spanish cities analysing the impact of cultural scenes on urban segregation. Cultural scenes are cluster of cultural amenities (museum, theatre, galleries, scenic places, and so on) that stress different opportunities to cultural consumption oriented to specific publics. The bohemian scene and tourist districts could attract creative class and visitors, but could also to expel traditional inhabitants. These scenes are measured across neighbourhoods in tree cities (Madrid, Barcelona, and Sevilla) according to existing cultural amenities. Their relation with inhabitants traits are analysed (occupation, level of formal education, immigration and ethnic origin,...), segregation index are computed, as well as maps, to show the impact of these scenes on social inequality.

**NO MAN’S LAND BUT SUSTAINABLE. URBAN SPACES AS HIEROGLYPH OF POWER**

Laura Verdi

1 Department of Sociology, UNIVERSITY OF PADUA, Padova, Italy

Abstract: Public and social spaces must put human beings in touch with their senses and with nature, and arise as a fundamental condition of democracy since they let to establish and maintain relationships. Here I’ll focus on some aspects of sustainable urban development in its relationship with power and territorial ambitions, and with the symbolic and political uses of nature, without forgetting the relationship between cities and nature. In the present day, cities in developed countries are primarily faced with “green” problems (Nu, 2008). Following Čapek (2010) I’ll suggest that urban sociology would benefit from a socio-ecological approach that enriches our understanding of nature and city and that allows us to participate more fully in discussions of sustainability. The social construction of space, by means of an economic and social landscape, is seemingly distancing from nature, as it is building also territoriality. According to Zukin (2002) I’ll try to confront the construction of urban spaces with the patterns of urban plans that are, at the same time, “hieroglyph of environmental, economic, and social power”. So I’ll consider some case-studies, as the sustainable architectures of Sheppard Robson, with their aspiration to a more “responsible” architecture, conceived as a process of redefinition of the possible relationships among environmental, social and economic aspects of the sustainable project. It will be part of my aim to consider the example of the mega events (see Milan Expo 2015) through the principles of the sustainable development. So Bob Allies and Graham Morrison are the creators of the London big Olympic project 2012, which involves both the concepts of regeneration and of post mega event planning, to make a real and normal city (a city as a system, following post-industrial functionalistic principles) after the Olympic games.

As part of the largest social problems of our time, I’ll seek to examine how and if it is still possible to rule through landscape, as in the case of historic gardens (Mukerji 1997, Verdi 2004). I shall finally approach to new land art expressions, bringing provisional and conceptual meanings.

Keyword.s: space and power, nature and city, eco-sustainable buildings, urban development, new land art

**CREATIVE CITIES: A SUGGESTIVE FASHION OR A RELEVANT SIGN TO CONTEMPORARY URBAN SUSTAINABILITY?**

Nuno Miguel Serra

1 Center for Social Studies, COIMBRA UNIVERSITY, Lisboa, Portugal

Abstract: The actual debate on urban phenomena and urban economy reflects the rising of some new approaches that emphasizes some immaterial dimensions of the contemporary cities. Those issues lead, by one hand, on the consideration that cities emerge as relevant economic actors in the beginning of the 21st Century and, on the other hand, that the question of cities identity is more and more important for its economic development, quality of life and sustainability.

For some authors, the internationalization of the economy and the crises of the central state gave to the urban spaces a new social, economic and cultural protagonism and a new role on contemporary societies. More than local and regional organizers of the territories, cities are seen as actors playing in wider scales, taking place as «global cities», on the famous expression of Saskia Sassen. At the same time, the urban crises emerging from deindustrialization posed relevant questions about the patterns of future economic urban development, with a search of new spheres of activities, capable to support the competitiveness of urban spaces in a social, cultural and economic internationalization.

In this context, the proposals related to the concept of «creative cities», which Richard Florida introduces in the debate, are relevant in differential perspectives. From an economic point of view, the creative cities are often presented as the adequate answer to the
economic contemporary challenges to the urban spaces. And from a sociological and cultural point of view, «creative cities» underline the importance of immaterial dimensions as the identity, attractiveness, quality of life and sustainability.

But the concept of «creative cities» also involves critical dimensions. The question of the meaning and the criteria needed to evaluate creativeness in urban spaces, by one side, and the question of scale and political significance, on the other side. Discussing the concept of the «creative cities» and its implications to the urban contemporary challenges it’s the main the purpose of the presentation.

**I LOVE NH. THE POSTINDUSTRIAL LIFE OF THE IDEAL SOCIALIST CITY.**

Jacek Gadecki

Faculty of Humanities, AGH UNIVERSITY OF SCIENCE AND TECHNOLOGY, Krakow, Poland

Abstract: New Huta in Krakow, which was founded in 1940. directly next to Lenin’s Steelwork, was one of the most impressive example of an ideal socialist city. After a period of stagnation in 1990., this industrial district of the city become a place of both top-down and spontaneous processes of the restoration. By focusing on the new and limited group of gentrifiers, the paper is trying to capture the transformation from working class district to the creative class one. The paper is presenting the initial and romantic phase of gentrification to identify ongoing restoration processes and to identify the transfer from heavy industry to cultural industry in very local and highly specific socio-cultural context. The paper is intended as point for discussion about the usefulness of such concepts as gentrification, cultural industry and creative class in the context of postsocialist urban reality.

**THE CREATIVE CLASS IN THE REDESIGN OF THE METROPOLIS. NEOLIBERAL CONSTRUCTION OF THE CONCEPT OF CLASS**

Jorge Sequera

UNIVERSITY COMPLUTENSE OF MADRID, Madrid, Spain

Abstract: The restructuring of the use of contemporary cities, reconfigured as the new factories for production, consumption and innovation, must employ novel ideological paradigms to sustain themselves. This is the case of the “creative class,” a branding concept which is used as one of the engines of neoliberal policy of the space. The postindustrial city is reborn as a vessel for cultural production, a key element in postmodernism. Because the innovation process requires high concentrations of creativity, people become the natural resource and the source of a new model of accumulation, with the goal of “catching,” so to speak, the knowledge of such creative workers in the global inner city. This paper is an inquiry into the hidden intent behind this formula: a) The prioritization of the public policies capable of distinguishing the lifestyle necessary for the creative class—fulfilling needs like inspiration, leisure and security—through the gentrification process, while simultaneously subordinating the space to these needs by transplanting the right to the city exclusively to this class; b) The restructuring of “class” as a concept, so that it is no longer connected with property holding, but with a combination of one’s lifestyle and profession; c) A new sociospatial relationship that articulates certain consumption patterns, which serve to redefine the middle class in postfordism, through the harnessing and translating of the cognitive capitalism into major global cities.

KEYWORDS: creative class, gentrification, cultural production, global city, neoliberalism

**TOWARDS A CULTURALLY ACTIVE PUBLIC: CREATIVE NODES ON AUSTRALIA’S GOLD COAST**

Shanene Louise Ditton

Griffith University, Southport, Gold Coast, Australia

Abstract: Australia’s Gold Coast is often culturally stigmatised as being creatively deficient. Although a culturally active public is indeed missing from the Gold Coast, there is actually an abundance of practising artists and cultural workers residing and working in the city. This discrepancy between the volume of artists and the lack of a culturally active public can be accounted for through an analysis of Gold Coast cultural networks. There are several factors which lead to this cultural stigma and discrepancy. Firstly, the Gold Coast’s economy is based in tourism and development, branding it as a space of leisure and mass consumption. Secondly, the Gold Coast is an exopolis, one that is geographically dispersed along a rectangular plot of coastline, with insufficient transport and services infrastructure. Finally, the Gold Coast is marked by a transient population and very rapid growth. These factors all work to produce constellated, occluded and often fragile cultural networks that are unable to pass resources through a common centre of communication. This makes it difficult for artists and cultural workers to engage with one another, let alone build a culturally active public around them. However, through deeper analysis we can observe important changes in cultural networks. On the Gold Coast, key artists and cultural workers in ‘weak-tie’ networked positions act as ‘nodes’ and are vital contributors to a new shift in cultural production; their role is crucial to the sustainability of these networks. My research suggests that by identifying these creative nodes and working with them to create a space of mass self-communication, we might strengthen and engage cultural networks. By doing so, we might provide the conditions for a culturally active public to be engendered and therefore a sustainable arts practice.

This paper will present some findings from my PhD research, which consisted of a mix of large- and small-scale conversations with up to forty participants as well as interviews. It will demonstrate how we might identify and work with key creative nodes in dispersed urban settings, and in doing so, provide the conditions for a culturally active public to be created, reinforcing and sustaining the regional landscape.

**’A TALE OF TWO CITIES’: ART AND ECOLOGY IN BEIJING AND TAIPEI**

David Hirsh Haley

MIRIAD, MANCHESTER METROPOLITAN UNIVERSITY, Manchester, United Kingdom

Abstract: Despite their political and ideological differences, Beijing and Taipei market themselves as ‘Creative Cities’ (Landry 2000).
While this image is promoted by the global Art World, each city’s development trajectory sours exponentially at the expense of traditional cultures.

This paper considers two of the author’s projects from 2010. Funded by ASEF (Asia-Europe Foundation), the first, Making Our Futures: The Art of Sustainability, was conducted between Manchester Metropolitan University and the Central Academy for Fine Art, Beijing. It considered the potential for future artists (postgraduate students) to creatively engage with the needs of local communities in each city, as civic authorities come under pressure from climate change and other 21st Century challenges.

The Taiwanese project reflects upon the new Taipei Artists Village at Treasure Hill. This development re-engineered a hillside cluster of vernacular dwellings to socially engineer a community, to become a popular tourism destination. In terms of sustainability, the real treasure of Treasure Hill may have more to do with the ancient art of Feng Shui than with ‘Art’.

The paper compares and contrasts the two experiences, and explores both the loss of sustainability and cultural meaning as each city grapples with different stages of the post-industrial condition. Having dispensed with or erased their respective cultural traditions, each society seems now to be dependent on global markets to reinvent and re-present itself. So, as they each buy into the ‘green economy’, just how sustainable are these cities? And what role does Art play in generating ‘futures capabilities’ (Haley 2009)?

CITIES AS HOTSPOTS OF CLIMATE CHANGE AND AS HOTSPOTS OF CULTURAL CHANGE; THE CASE OF MEXICO-CITY

Hans Dieleman

Abstract: Mexico-City is the second biggest city in the world and responsible for 0.21% of all the CO2 emissions worldwide, approximately 60 million tons per year (in comparison, Portugal emits around 58 million tons per year). All the urban areas of the world together are responsible for 70% of the total global CO2 emissions. The world is urbanizing and the cities are “hotspots” of climate change. It is fair to say that urbanization is equivalent to increased climate change. The paper will raise the question if cities, and Mexico-City in particular, are also the hotspots of creativity needed to combat climate change, and to create cultures, technologies and lifestyles of sustainability.

The paper will explore the topic in various ways. In a short theoretical introduction the concept of the city as space of creativity will be addressed, followed by an exploration of Mexico-City as creative space and centre within Mexico. Various concrete activities and projects coming from the world of politics, science, design and art will be analyzed, such as the city’s action plan in climate change, the city’s virtual research center in climate change, as well as projects like the design project "Verticalverde", the artistic intervention “Rodar, rodar”, Mexico-City’s participation in the massive public art installation 350 EARTH, the 2010 edition on climate change by the journal “Artes de México” and other projects.

The conclusion will be that Mexico-City can be regarded as a center of creativity in climate change activities, and that this creativity is strongly related to the city’s participation in transnational –formal and informal– networks. Foreign presence is essential in realizing most of the projects and activities. This presence varies from the involvement of the city of London in the development of the Mexico-City action plan to Danish artists in residence creating their projects in Mexico-City. The paper will evaluate this situation in the context of theories on creative cities and the network society.

SOME ROLES OF ARTISTS AND INTER-/TRANS-DISCIPLINARY PROJECTS IN THE EMERGENCE OF SUSTAINABLE CREATIVE CITIES

Sacha Kagan

1Inst. für Kulturtheorie, Kulturforschung & Künste, LEUPHANA UNIVERSITÄT LÜNEBURG, Lueneburg, Germany

Abstract: After the rejection of unsustainable creative cities models (such as Richard Florida’s ‘Creative Class’), which alternative models are being sought after, by artists and agents of cultural organizations concerned with issues of sustainability in urban development? The self-understanding of possible roles of artists and art-based inter-/trans-disciplinary projects in the emergence of sustainable creative cities will be explored in the paper, looking into the discussions held at a workshop in October 2010 alongside the ASEF8 Summit, and in the extended report that followed (released in February 2011), coordinated by the author together with the Asia Europe Foundation. Gathering 16 participants from Asia and Europe, representing a selection of cultural organizations involved in alternative cultural projects, and a few researchers, the workshop highlighted many open questions, about e.g. the modalities of participatory processes and the importance of un-designated urban spaces.

The paper will focus especially on three cases presented in the report, i.e. projects conducted by the inter-/ trans-disciplinary collectives MARAA (Bangalore) and FoAM (Brussels), and by the ecological artist David Haley (Manchester), and will analyze them from the perspective of ‘cultures of sustainability’ and ‘aesthetics of sustainability’.

THE NEW PUBLIC SPACES AND THE PUBLIC ART IN A POST-SOVET INDUSTRIAL TOWN

Sofia A. Tchouikina

1Département d’études slaves, UNIVERSITE BLAISE PASCAL, Clermont-Ferrand, France

Abstract: The transition to a Post-Soviet situation has stimulated change in the strategies of the Russian cities and towns. Previously dependent from the planned economy, they became independent economic actors. The years 1990 and 2000 have seen new tendencies in the towns’ development: the competition for workforce, the effort to create the positive image in order to attract migrants and to prevent the youth from migration. Nearly all cities and towns, except for the poorest, have made an effort of constructing new public spaces with monuments. What is the role and function of the beautiful urban things, what is the direction and the logic of the symbolic transformation? My paper will be based on empirical research in an industrial town Cherеповцы, 300.000. inhabitants, situated in Western Russia, hosting a concern Severstal, a giant enterprise of steel industry and chemical plants. The research is based on observations in the public spaces for several months in 2006 and on the analysis of the local press. I analyse the reconstruction and the use
of public spaces from the perspective of the sociology of memory. In this approach the urban space is regarded as a mediator which has a fundamental role in the transmission of the practices and visions of the past through the present to the future. The space plays its role for the continuity of the urban social groups (Halbwachs; Mazzella), it is used as a stage for the politics of memory such as commemorations, ceremonies, manifestations, festivities (Nora, Assman, Ricoeur). The sociology of memory links the unintentional changes undergone by the urban space, the deliberate use of the urban space by the governors and the reworking of these changes by the conscious community. The pattern of the post-Soviet transition of Cherepovets can be described as the conversion from the “typical workers’ settlement”, as it presented itself in the Soviet times to an individualized town with its newly constructed history and relatively unproblematic collective memory. This mono-industrial town is characterized by the greater valorization of the Soviet heritage than the average Russian town.

"60X60 : FROM ARCHITECTURAL DESIGN TO ARTISTIC EXPERIMENT RESEARCH AND LOCAL PARTICIPATION IN THE CONTEXT OF URBAN ENVIRONMENT CHANGE (GENEVA)

Sylvain Froidevaux

Abstract: In the trend of Contextual Art (Swidzinski, Ardenne), Art Interventionism and Social Practices (Sholette, Hirschhorn), the “60x60 Project” investigate a city area of Geneva - Cité Carl-Vogt Honegger - built in the early 1960’s for a mostly swiss working-class population. The housing complex was originally conceived by the architects to create a formal and functional environment “favourable to community life”. 50 years after, the area is faced with current problems such as social and cultural segregation, individual distress, buildings in bad repairs, etc. How can artists intervene in contemporary urban change? What does it mean to produce art in public space considering the context of over-densification and housing shortage on the one hand, gentrification and real estate speculation on the other hand? Participation and “fluidization” (information, perception, relationship) could be the keys to open a field of research and of intervention by the means of art, reminding of the necessity to work with the people who are the first concerned by their environment giving them the opportunity to know it better for the purpose of having an effect on it.

2- 3 STRAẞEN (2-3 STREETS): A PROJECT BETWEEN ‘CREATIVE’ URBAN DEVELOPMENT, ART AND A POSSIBLE LINK TO (UN)SUSTAINABILITY.

Annette Grigoleit 1, Julia Hahn1

1LEUPHANA UNIVERSITY LÜNEBURG, Lüneburg, Germany

Abstract: The art project “2-3 Straßen”, initiated by Jochen Gerz, was part of the European Capital of Culture year RUHR.2010. The participants became part of a trade: one year of rent-free living in one of 3 cities of the Ruhr-region in exchange for continuous writing. Further aspects of “2-3 Straßen” were participatory projects in the neighborhoods, an installation in the Museum Folkwang, the publication of the “collective text”, “visitor schools” as well as the large media coverage. We would like to present certain theoretical points and questions building on the results of our conducted study of this project. A way of reading this project is to understand the artistic intervention as a proposal towards the specific neighborhood, which connects itself to the existing structure, is open and offers new social contexts through collective effort. This interpretation can be based on approaches that emphasize artistic creativity as a “game” or “flow” and focus on its circumstances. Further, indications point to the artistic intervention of “2-3 Straßen” as ironically hinting but at the same time becoming part of Creative Class and Creative City strategies. Analyzing the perspectives of the questioned participants regarding the facets of the project and their environment shows a complex and differentiated picture. Critique towards the project as well as the overall artistic concept are among the aspects which allow for a consideration of the cultural perspectives of (un)sustainability. This enables us to identify and reflect upon rather unsustainable characteristics of the project. Empirically important critique such as the modernistic understanding of artistic autonomy can point to aspects hindering the openness of the project. Instead “...the aim (...) to facilitate the emergence of local urban processes of social change in partnerships between artists, cultural practitioners and communities” (Kagan/Verstraete 2011) is important. In this context Kagan’s concept of the artist as a “double entrepreneur” can be pointed to, which requires reflexivity in Dieleman’s sense of an “artistic mode of knowing”. Whether indications for this reflexivity can be found within an inward and outward understanding of artist Jochen Gerz remains questionable.

Keywords: Artistic intervention, creativity, (un)sustainability

DEFINING LOCALITY: POSSIBILITIES FOR SUSTAINABILITY IN CURATORIAL PROCESSES

Aura Seikkula

1Department of Social Sciences and Philosophy, UNIVERSITY OF JYVÄSKYLÄ, Helsinki, Finland

Abstract: In my PhD I am discussing the institutional, contextual and authorial development of the curatorial practice by using theoretical concept analysis strategies. I am questioning the sustainability of existing, current curatorial methodologies, including evaluation, selection, display and contextualisation of art. I aim to redefine the character of the curatorial endeavor and explore the prospects of a sustainable exhibition process in order to participate in the changing meaning and relevance of the artwork, which is epistemological, aesthetic and ethical in nature. I have arrived to the conclusion that local engagement, context and resources are in the core of sustainable artistic process and activity. Thus in defining sustainability the notions of Locality and Legacy play a central role.

This presentation will introduce curatorial practice and its development and consider locality focal in defining sustainability.

THE SOCIOLOGICAL ANALYSIS OF ARTISTIC CREATIVITY AND THE CREATIVE CITY

Arturo Rodriguez Morato, Matias Zarlenga

1Department of Sociological Theory, UNIVERSITY OF BARCELONA, Barcelona, Spain

Abstract: Since the 90s creativity has won relevance in urban studies. Creativity has appeared like a central key to development in
contemporary cities (Landry, Hall, Florida, Scott). The concept of creativity used within this kind of literature has many facets but it always makes a central reference to two aspects: the artistic and cultural creativity and the cultural workers. In this sense, it would seem as if the sociological analysis of the creation dynamics, well developed within the sociology of culture and the arts, should be extremely relevant for the study of creative cities. However, this analysis has a low incidence in that literature. One reason for that is that the sociological models about creation dynamics are built within sectoral disciplinary parameters of an implicit modern character while the creative cities literature is more sensible to the epochal postmodern change and it has a holistic sight of the cultural flows. In this paper we will develop a critical reflection on some of the main sociological models for analyzing artistic and intellectual creations: the models by Bourdieu, Collins, Farrell, Becker, Peterson, and Menger. At first, we will consider to what extent their different views could contribute to define an appropriate model for analyzing cultural creativity in a contemporary urban context and which are their flaws in this respect. Second, we will focus on two very relevant aspects in the contemporary urban context that those authors tend to ignore: on the one hand, the inter-disciplinary and trans-disciplinary relations between different artistic fields and between those fields and informal cultural practices, and on the other, the relations between artistic creativity and place. Finally, we will conclude stating some principles for a sociological analysis of cultural creativity in contemporary cities.
RS 25 Evolution and Sociology

ON THE EVOLUTIONARY STABILITY OF CULTURES OF CORRUPTION
Georg P. Mueller
1Social Science and Economics, UNIV. OF FRIBOURG, Fribourg, Switzerland

Abstract: This paper focuses on the possible equilibria between shares of subpopulations, representing opposite cultures like e.g. the use of majority- or minority-language or the acceptance or rejection of corruption. The stability and the location of these equilibria in the corresponding state-space determine, whether there is cultural co-existence or homogeneity due to processes of crowding-out of one of the cultures.

In order to be able to study such equilibria, we are following the paradigm of the analysis of evolutionary stability, originally introduced by J. Maynard Smith ("Evolution and the Theory of Games", 1982). It is based on the idea of interacting subpopulations, which may chose between different strategies of behaviour, corresponding to the norms of the different cultures. According to Maynard Smith, this corresponds to a two-party game with mixed strategies, which has a payoff-matrix that defines the returns of the players. Maynard Smith further assumes that the higher the returns of a strategy, the higher the population growth of the followers of the strategy. In the case of culturally defined strategies, population growth is of course not determined by biological reproduction but rather by immigration and emigration or by voluntary or forced conversion from the less to the more "successful" culture.

In this paper, the ideas of evolutionary stability are applied to the culture of corruption, which is opposite to a non-bribing civic culture of honesty. Being corrupt opens economic opportunities and risks for the briber and the bribee, which can be formalized in accordance with the paradigm of Maynard Smith. As a result, we are able to define growth-functions for the corrupt and the non-corrupt populations of citizens and officials, which can subsequently be analyzed with regard to the stability of the two cultures. Partly this is possible by formal mathematical reasoning, partly it requires computer simulations of the evolution of differential equations. The results of these formal analyses can be compared with international data about corruption in ca. 100 countries. This finally allows a preliminary empirical test of the evolutionary model proposed in this paper.

THE ADAPTIVE VALUE OF CITIZENSHIP: THE USEFULNESS OF AN EVOLUTIONARY UNDERSTANDING OF SOCIAL CITIZENSHIP
Mark Edwards
1School of Sociology and Social Policy, UNIVERSITY OF LEEDS, Leeds, United Kingdom

Abstract: Citizenship is a contested concept. Citizenship debates revolve around different ideas about membership, rights and responsibilities, and conditionality. Together with the extent to which some characteristics of citizenship can be considered universal, citizenship is considered here from an adaptionist perspective, that is, the extent to which it can be understood in terms of evolved cognitive mechanisms for social exchange that proved adaptive in primitive human society. An adaptionist perspective is found to be useful in this context. A route is traced from the genetic to the social through the progressive selection for the discrete human traits of altruism, reciprocity and morality. The following assertions are made: i) Citizenship is an adaptive social mechanism which facilitates and protects the system of cooperation which constitutes human society by functioning as a mechanism for membership recognition. ii) The root-genesis of citizenship is the innate human disposition for altruism, as such citizenship is itself an intrinsic social mechanism. iii) Rights and responsibilities (reflected here in terms of obligation) are a universal characteristic of citizenship.

CHILDCARE AS A GRANDPARENTAL INVESTMENT IN EUROPE
Mirkka Danielsbacka, Antti Tanskanen
1Social sciences, UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: Many studies have shown that grandparents are not in equal position in interconnection with grandchildren. Often this relationship is referred as a grandparental investment in grandchildren, because it usually means flow of time, care or other resources from a grandparent to a grandchild. The difference between grandparental investment in grandchildren can be best explained by predictions made by evolutionary psychology. Theories of kin selection and parental investment predict stronger investment in children and grandchildren by women and maternal kin. Due to paternity uncertainty, parental and grandparental investments along paternal lineages are based on less certain genetic relatedness with the children. In addition the hypothesis of preferential investment in more certain kin predicts investment to vary according to available investment options. Using the second wave of the large and multinational Survey of Health, Ageing and Retirement in Europe (SHARE), collected in 2006–07, we study the preferential investment hypothesis in contemporary Europe based on self-reported grandparental provision of child care. We predict that 1) maternal grandmothers provide most care for their grandchildren, followed by maternal grandfathers, paternal grandmothers and last by paternal grandfathers; 2) maternal grandfathers and paternal grandmothers provide equal amounts of care when the latter do not have grandchildren via a daughter; 3) women who have grandchildren via both a daughter and a son will look after the children of the daughter more; and 4) men who have grandchildren via both a daughter and a son will look after the children of the daughter more. Results support all four hypotheses and provide evidence for the continuing effects of paternity uncertainty in contemporary kin behavior.

ESR1 POLYMORPHISMS, ESTRADIOL, ANGER EXPRESSION, DAILY HASSLES AND DEPRESSIVE SYMPTOMS IN ADOLESCENT BOYS AND GIRLS
Hans Vermeersch
1Sociology, GHENT UNIVERSITY, Ghent, Belgium

Abstract: This paper focuses on the possible equilibria between shares of subpopulations, representing opposite cultures like e.g. the use of majority- or minority-language or the acceptance or rejection of corruption. The stability and the location of these equilibria in the corresponding state-space determine, whether there is cultural co-existence or homogeneity due to processes of crowding-out of one of the cultures.
Abstract: Background: Sex-differences in depression have been studied extensively within the sociological, psychological and biomedical sciences with few instances of integration.

Prior research has suggested that estrogens, anger expression (inwardly versus outwardly) and social stressors may play a role in the etiology of adolescent depressive symptoms. In the current study we aim at a biosocial integration by studying how estrogens, genetic markers for estrogen receptor sensitivity, anger expression style and daily hassles predict adolescent depression.

Objectives: In this paper we analyzed (i) whether Pvull and Xbal, two polymorphisms on the ESR1 gene (Estrogen Receptor Gene α), and free estradiol (FE2) were related to depressive symptoms, and (ii) whether trait anger and/or anger expression mediated this relationship, (iii) whether daily hassles moderate the relationship between FE2, ESR1 gene polymorphisms and depression.

Methods: Data from a sample of 301 boys and 298 girls were analyzed using General Linear Model (SPSS 18.0).

Results: Analyses suggested that ESR1 polymorphisms are relevant to the intra-sexual variability in depressive symptoms in boys and as a moderating factor for the relationship between FE2 and depressive symptoms in girls. Additionally, ESR1 polymorphisms are related to anger expression styles in girls. Anger-related variables, however, did not mediate the relationship between ESR1 polymorphisms and depressive symptoms. Daily hassles were more strongly related to depression in boys with genotypes that indicate increased estrogen receptor sensitivity.

Conclusion: ESR1 polymorphisms are relevant with respect to the intra-sexual variability in depressive symptoms, and may help to understand the increase in depressive symptoms in pubertal girls, a period in which estradiol levels increase dramatically. We will argue that – next to an evolutionary approach – a biosocial approach that integrates findings from sociology, psychology and biomedicine in a theory-driven way, may advance our knowledge on phenomena of sociological interests and may be a way to avoid unwarranted sociological or biological reductionism.

THE IMPORTANCE OF TIMING IN MEASURING PARENTAL CONDITION. A TEST OF THE TRIVERS-WILLARD EFFECT AMONG THE SUPER RICH.

Sebastian Schnettler

1Laboratory for Economic and Social Demography, Max Planck Institute for Demographic Research, Rostock, Germany

Abstract: Based on evolutionary theory, Trivers/Willard (TW) predicted the existence of mechanisms leading parents with high levels of resources to bias offspring sex ratios to favor sons and parents with low levels of resources to favor daughters (Trivers/Willard 1973). A number of ensuing social consequences of male-biased sex ratios (e.g., Edlund et al. n.d.; Jin et al. 2010) speak for a high relevance of this topic also for sociologists. Despite numerous supportive studies, a similar number of negative findings, small sample sizes, and publication bias have left the decision for or against the hypothesis undecided (Brown/Silk 2002; Festa-Blanchet 1996). In a recent meta-analysis, Cameron (2004) draws attention to the timing at which parental resources are measured and shows that support for the TW hypothesis is very high when parental conditions are measured close to conception. This is consistent with the argument for a proximate mechanism at or even prior to conception in a recent theoretical synthesis (Grant 2007). Here, we will test the role of timing of wealth accumulation on the TW effect among US billionaires and extend previous research on the case of billionaires (cf. Cameron/Dalerum 2009). We draw on an improved data set, based on the 2009 “Forbes 400” ranking of the richest U.S. Americans - amended by information from biographical sources. Preliminary results based on the first 200 cases of the list confirm that timing of wealth accumulation plays an important role in determining the strength of the TW effect: the sex ratio in the billionaire sample is slightly higher than in the US population (112 boys to 100 girls vs. 105:100) (cf. Mathews/Hamilton 2005). For billionaires that inherited their wealth, i.e., who grew up in a wealthy environment before starting their reproductive phase, the sex ratio is even much higher (149:100). Regression results confirm the role of wealth inheritance and further reveal an important interaction effect with gender of wealth holder: the TW effect is only found among male billionaires. We discuss this finding against related research on the effect of occupational choice on sex ratio biasing among women (Ruckstuhl et al. 2010). We conclude with a possible theoretical explanation for this effect and make suggestions how future empirical research on the TW effect in elite samples can bring us closer to uncovering the underlying mechanisms for sex ratio biasing in this group.
GLOBAL-LOCAL RELATIONS AS KEY DIMENSION OF THE GLOBALIZING WORLD SOCIETY. THE GLOCALIZATION OF SPAIN

Manuel Ahedo1

1BUSINESS ADMINISTRATION / SOCIOLOGY, UNIVERSITY ROVIRA I VIRGILI, Tarragona, Spain

Abstract: Global-local social relations are a critical aspect in the constitution of contemporary societies. Together with the economic, political and cultural dimensions, the social dimension of globalization has received increasing attention, by sociology-inspired approaches to globalization. Moreover, the Westphalian model of nation-states has suffered an important opening up and downwards, and between the global and the local a multi-level analysis is increasingly necessary to overcome sociology’s traditional methodological nationalism. While the global dimension is a necessary ingredient in contemporary sociological analysis, the local dimension is still an important source of meaning, interest and identity to many social groups. This analysis of the increasingly intertwining relations between global and local dynamics is better conceptualized as a glocalization process. In order to analyze glocalization processes it is necessary to look at both incoming effects from the global to the local, and outgoing elements from the local to the global, and to identify the key social groups and societal actors behind the process. Quantitative and qualitative longitudinal or evolutionary methods are necessary to capture the mutual shape of the global and the local.

These questions are analyzed in the case of Spain, a middle-sized country, with an increasingly active engagement in the European Union integration and in global issues, and with a relatively high and diverse internal heterogeneity. Various examples of glocalization in economy, politics and culture are presented as evidence of the globalization dynamics. However, the analysis stresses the importance of the social or societal glocalization, and looks especially at the dynamics of two specific social groups: a) the policy circles, who have promoted market-orientated neo-liberal global policies and practices; and b) the emergence of a new scientized and internationalized elite generation, based on two sub-dynamics: the high participation of young students in the EU’s university exchange programs, like Erasmus, and the networking effect of various globally-oriented private business schools. As conclusion, it is argued that substantive changes in the Spanish society in the last three decades can be partially explained by its intensive glocalization process, and it is also emphasized the important role of the local social forces and groups in shaping glocalization.

COORDINATING THE ACTIVITIES OF ADVOCACY NGO NETWORKS: THE ROLE OF AN INNER CIRCLE IN A NETWORK OF ADVOCACY NETWORKS

Adrienne Herve1

1NONE, Paris, France

Abstract: Advocacy NGOs frequently join networks of advocacy NGOs as a means of advancing their policy goals. How do NGOs cooperate with one another in these advocacy networks? In my doctoral thesis at Sciences-Po (Paris), I studied a set of ten advocacy networks consisting of 436 NGOs in 75 countries. The NGOs belonged to one or more networks in the set which was devoted to environmental and development issues.

A study of joint NGO memberships among the advocacy networks revealed that twelve NGOs belonged to four or more advocacy networks. The activities of members of this ‘inner’ circle included participation in the governance of the advocacy networks and in the development of long-term relationships with foundations that funded these organizations. The presence of these twelve organizations in several networks contributed to the exchange of information and expertise that facilitated the accomplishment of the goals of these networks. Members of the inner circle were also more active than other NGOs in the production of information and knowledge in the form of reports posted on NGO websites and NGO advocacy websites.

My findings strongly suggest that the network of advocacy networks was a social community in which member organizations and networks cooperated with one another. Instead of several isolated networks working separately to advance their causes, the result of the activities of the inner circle was a network of networks that presumably heightened the visibility of its members among target IGOs and policymakers at the national and international levels.

TAMING TERROR: MEDIA DISCOURSES DOMESTICATING THE WAR ON TERROR IN PAKISTAN

Ali Qadir1, Pertti Alasutari2

1School of Humanities & Social Sciences, University of Tampere, Tampere, Finland

Abstract: This paper addresses the question of how the global War on Terror has acquired a national paradigm status in the media sphere in Pakistan. The War on Terror, inaugurated by the United States administration in the wake of 9/11, marks a global moment of securitisation across the world, resulting in homogenous security-oriented policy environments. However, despite the United State’s initiative of beginning the War on Terror, in the full glare of mediatized history, increasingly the popular discourse it has spawned has acquired a distinctly national flavour in other countries such as the “frontline” state of Pakistan. Scientific realist theories of international relations and politics can explain how external coercion and internal legitimacy-seeking lead to governmental policies that are globally harmonious yet domestically popular. By contrast, there is less attention to, and no obvious realist explanation for why, the term and its associated discourse have rapidly increased in the relatively independent media in Pakistan while at the same time becoming a popular framework for national concerns: from being “their” War it has become “our” War. I explore how the same process leads to globally isomorphic, security-oriented sensibilities on the one hand and a strong “nation-speak” on the other. Building from a sociological institutionalist perspective of World Polity Theory, the paper utilises a framework of domestication of global policy models to discuss media discourses in a popular English language daily in Pakistan. Comparing newspaper articles in 2002 and 2010 on the War on Terror, I show the notable increase in frequency, even though the term’s usage drops within the US me-
The analysis also reveals how the content demonstrates increasingly national ownership of the discourse by application to thoroughly “national” issues such as the dispute with India over Kashmir. Finally, I analyse this and related findings to suggest some implications of this domestication. These include exploring how globally similar, or isomorphic, attitudes emerge alongside “banal nationalism,” eclipsing exogenous influences to naturalise the discourse by nationalising it and shaping actor roles to convey a sense of local agency.

THE GLOBAL DIFFUSION OF TRUTH COMMISSIONS
Anne K. Krueger

Abstract: How do societies deal with past human rights violations in the wake of democratic consolidation? With the breakdown of Latin American military dictatorships this question drew the attention of political actors, NGOs and academia and led to the rapid development of transitional justice research. Apart from questions of legal prosecution or amnesty, another major emphasis was put on truth commissions. Since the 1980s, 36 truth commissions have been established worldwide to disclose the “truth” about past human rights violations in order to bring “reconciliation” to shattered societies.

In contrast to most of the research on truth commissions, which has focused on questions of national past politics and effects on democracy, this project addresses truth commissions as a global phenomenon, conceptualizing them as institutionalized organizations for dealing with past regime crimes. Following recent trends in world polity and new institutionalist organizational theory, it sheds light on the institutionalization process on both the macro and the micro level, thereby highlighting the particular role of narratives (Colyvas, Powell 2008; Meyer, Bromley, Ramirez 2010).

The project is guided by the question why truth commissions could spread worldwide across cultural diversity and political divides. In other words: Why have truth commissions become accepted as a legitimate solution to the problem of massive human rights violations after political transitions?

Following the assumption that truth commissions are constituted because the formally institutionalized myth (Meyer, Rowan 1977) of “truth leading towards reconciliation” has become accepted globally for legitimating this particular kind of transitional justice, the global diffusion of truth commissions is analyzed as the institutionalization of a narrative on organizational legitimacy which is formally organized in truth commissions.

The project aims at introducing truth commissions as institutionalized organizations for dealing with past regime crimes to world polity and organizational research in order to explain macro processes of the global diffusion of structure and meaning on the micro level of organizational legitimacy.

THE NATIONAL TRUTH OF PISA - THE DOMESTICATION OF THE OECD PISA STUDY BY THE FINNISH MEDIA
Marjana Rautalin

Abstract: In this article, the task is to describe a process in which transnational policy model or idea is introduced and discussed at the local level and its possible policy implications. The Finnish media interpretations of the OECD PISA Study, and in more particular, results achieved by Finland in it, are taken as a case in point. The starting point for the study is that there is a growing isomorphism among nation states’ policies and their political systems worldwide. It is assumed that the international governmental organizations (IGOs) among others play a crucial role in this harmonization process. By providing the nation states with comparative statistical information about nation states’ policies and about how these could be improved IGOs urge nation states to adopt similar policies. However, local players ultimately determine the nature of a policy in an individual nation state. The national media is one such player. By framing exogenous news events, such as the PISA Study, the media ‘domesticates’ international information for national audiences, i.e. it reports what it means to ‘us’ as locals. These interpretations provided by the media of international events or phenomena are further used by different local actors aiming to further their political interests and strengthen their positions in a new political situation. The question posed in this article is: How is it possible that in tandem with the public PISA discussion in Finland a Reform of the National Core Curriculum for Basic Education was carried out, which seems to be essentially at variance with how the national PISA success is explained in Finland? To answer this question, the Finnish media interpretations of the PISA Study and of the curriculum for Finnish basic education alike are analysed. The main finding of the analysis is that because the media did not provide one single grand interpretation of how Finnish basic education should be improved in compliance with the PISA Study, it was possible in Finland to carry out a reform which needed no public justification. That is to say, because the media interpretations expressed general satisfaction with basic education, the reform work can go ahead.

BEYOND METHODOLOGICAL NATIONALISM: OVERCOMING METHODOLOGICAL GAPS IN TRANSNATIONAL STUDIES
Anna Amelina

Abstract: Addressing isomorphic change and formation of transnational models transnational studies are confronted with various methodological challenges. This paper summarizes five of these and suggests an innovative methodological strategy to overcome them.

First, when analyzing isomorphic cultural change sociologists sometimes fall into the trap of methodological nationalism. Looking at, for example, the successful diffusion of world models in different nation states they unconsciously refer to the “container” of “national society” (Wimmer and Glick Schiller 2003).

Second, when studying the diffusion of world models in global “space” scholars often assume a static view on spatiality, without considering spatiality as historically changeable and socially constructed. To put it in other words, attention needs to be paid to how social (political, economical etc.) processes of territorialization and de-territorialization take place and form transnational and global socio-spatial scales (Brenner 2004).

Third, while referring to the local level of world culture social scientist sometimes implicitly mean ethnic belonging. Arguing in this way
we fall into the trap of “ethnic lens” by implicit reduction of local phenomena to ethnic phenomena (Wimmer 2008).

Fourth, with the focus on the global diffusion of world models social scientists overlook the dimension of time and history. Thus, we sometimes assume a teleological notion of (one) history of world society, instead of referring to the non-teleological concept of entangled (multiple) histories of world society (Epple 2010).

Finally, introducing the term “world culture” researchers sometimes forget to reflect on their own scientific position within societal discourses. However, according to post-colonial studies only by reflecting on the own positonality we will be able to overcome the implicit Eurocentric reasoning within our studies (Spivak 1988).

In order to overcome these methodological traps the author introduces the concept of methodological transnationalism, which denaturalizes nations, spaces, ethnicities and histories on the one hand and reflect on researcher’s on the other.

**RESEARCHING MIGRANT IDENTITIES: CRITICAL REFLECTIONS ON THE CONCEPT OF IDENTITY AND THE CHALLENGE OF METHODOLOGICAL NATIONALISM**

Peter Holley

1Department of Social Research (Sociology), UNIVERSITY OF HELSINKI, Helsinki, Finland

Abstract: The following paper attempts to sketch out an approach to the study of national identities that challenges the ubiquitous assumption that the nation is the natural basis of analysis in modernity—that is, methodological nationalism.

In recent years the term identity has been challenged as an adequate tool for the analysis of the increasingly complex realities encountered by individuals today. Its usefulness has been questioned by theorists particularly when studying nationalisms and other forms of collective belonging. Whilst some suggest that the social sciences should abandon “identity” as an analytic idiom, here I rather offer an alternative approach by which identities are understood as a subject positions, held by protagonists when constructing/negotiating the symbolic boundaries of a perceived “national community”. In addition to the above, this paper also presents a cognitive perspective which treats nations as sets of collective cultural representations through which the social world is interpreted. In this sense, I understand nations as institutionalized cultural and political forms, and reject the “groupist” social ontology that treats nations as real entities per se.

By understanding nationness as a category of practical knowledge that is strategically and selectively employed when positioning oneself as a member of the “national community”, I seek to develop insight into the ways in which transnational migrants construct a “national identity” and its symbolic boundaries, whilst avoiding the pitfalls of methodological nationalism.

**SOCIOLOGY OF INTERNATIONAL RELATIONS IN SEARCH OF RESEARCH AGENDA**

Renata Włoch

1Institute of Sociology, WARSAW UNIVERSITY, Warsaw, Poland

Abstract: The paper argues for the need to distinguish sociology of international relations. It addresses the question of its theoretical, empirical and methodological conditions. Starting from the classical works of Marcel Merle and Raymond Aron through the constructivist turn in international relations and departure from methodological nationalism in sociology, the author traces the shaping of the discipline. The paper stipulates that there are three main areas of intercourse between sociology and IR: a) the common theoretical ground (mainly in direction from sociology to IR, as shown in the seminal work of K. Waltz, Theory of International Politics and recent works of A. Wendt, especially Social theory of international relations), b) common empirical ground (mainly global social processes transcending the boundaries of both disciplines), c) common methodological tools. It also discusses the research agendas in sociology of international relations to date, particularly the McSweeney’s idea of reflexive IR and A. Holzheiter/S. Stetter enumeration of areas of empirical interest common to sociology and IR. At the end, the author presents her own proposal of research agenda in sociology of IR.

**GLOBAL MEDIA, PIRATE CULTURE AND NATIONAL IDENTITY: THE RISE OF NEW MEDIA IN SOUTH KOREA IN THE 1980S**

Sungmin Kim

1Interfaculty Initiative in Information Studies, THE UNIVERSITY OF TOKYO, Tokyo, Japan

Abstract: This study investigates the dynamics of the relationship between the global and the local in South Korea to understand the social and cultural changes that have been brought about by global media in East Asia. It does so by examining the phenomena related to new media, such as video, walkman and satellite TV that emerged in South Korea in the 1980s. The study ultimately attempts to explicate the cultural contradictions involved in and the struggles between global media environment and local cultural orders to which the new global media has given rise. In South Korea, the authoritarian government has imposed various institutional and discursive disciplines on mass media such as broadcast, film, and popular music to identify and control the characteristics of national media culture. Some disciplines were practiced on an ambiguous and unstable basis, devoid of a firm structure, from the time it was imposed. At the same time, violation of these disciplines has given rise to characteristic cultural experiences. The most noticeable phenomenon is the rise of “pirate culture” in the country. The experiences among pirates have been accumulating on both the public and individual levels. This study shows that the pirate culture by uses of the new media in the 1980s has shown a number of contradictions and struggles between the global and the local, as in the following: 1) enjoyment of the new global media and cultural disciplines, 2) global regal/institutional system and the domestic cultural politics, 3) authority of public media and emergence of private copy media, and 4) new technology of the global media and the domestic cultural policy. Cultural flows and media consumption through these pirate culture, elements that seemed to compromise the clarity of national being, have created new local identification in the context of globalization. The world of politics, which had played a fundamental part in the development of national cultures and identities, has been subordinated to the world of economy and the world of cultures.
HISTORIES OF THE VENICE BIENNALE: FROM NATIONAL CULTURAL DIPLOMACY TO A COSMOPOLITAN PUBLIC SPHERE

Monica Sassatelli

1Department of Sociology, GOLDSMITHS, UNIVERSITY OF LONDON, London, United Kingdom

Abstract: The Venice Art Biennale was the first of its kind, coining a term and a format, the Biennal, that has become a dominant structural feature in contemporary art worlds, especially in the global art world. In other European metropoles first and then gradually expanding towards geographic and cultural ‘peripheries’, Biennals (and their variants Triennials, Quadriennials, etc.) rule the day. In Venice, the original format of National Pavilions competing for a prize has characterised it since its inception in 1895, and is maintained but also increasingly challenged by the Biennale’s own expansion and diversification. The politics of display in international cultural diplomacy has become just one of the possible narratives of an increasingly transnational, global public sphere. By looking in-depth at the Biennale and its evolution it is possible to probe into the rise and fall of these competing narratives that provide a context for current, globalised trends in cultural production and participation. This paper will first trace the genealogy of the Venice Biennale from 19th century world fairs as providing an important interpretative key to the Biennale as a whole (and not only its most renowned sections, Art and Cinema), as well as to the so-called more recent biennalization of contemporary art well beyond – but originally out of – the Venice Biennale and the World expo concept. From this angle, the paper proceeds to revisit the long and troubled history of the Biennale. On that basis, it will then reassess its implications for cultural politics, with particular reference to the role it plays in reaffirming, challenging or inventing inter- or trans-national models of representation and practice in the art world. The paper draws on ongoing research on festivals and public culture in Europe; it reports on the case study of the Venice Biennale, based on historical and documentary sources, fieldwork observation and interviews with key informants.

SPREADING GLOBAL MODELS AND ENHANCING BANAL LOCALISM: THE CASE OF LOCAL GOVERNMENT CULTURAL POLICY DEVELOPMENT

Pertti Alasuutari

1SCHOOL OF SOCIAL SCIENCES AND HUMANITIES, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: This paper addresses the question of how cosmopolitan consciousness coexists with persistent banal nationalism or localism. The argument put forward is that these two phenomena are reinvigorated by a single process, here called the domestication of transnational models. The newspaper media coverage of an R&D project aimed at developing local government cultural activities in Finnish towns and cities is the object of a case analysis. The results show that although the project contributed to standardizing local government cultural activities and spreading the idea of cities as strategic actors, through the way in which the project was covered in the local media, it strengthened a local viewpoint on the whole process. It drew on and constituted residents’ identification with their local domicile and the idea that local government citizens are members of a team that has to do well in global competition. Second, the comparative data made available was capitalized in local politics.

THE DOMESTICATION OF GLOBAL NEWS: NATIONAL COVERAGE OF THE 2011 UPRISING IN EGYPT

Karin Creutz-Kämppi, Pertti Alasuutari

1Centre for Research on Ethnic Relations and Nationalism, University of Helsinki, Helsinki, 2Department of Social Research, University of Tampere, Tampere, Finland

Abstract: The paper reports on a discursive analysis of how the 2011 uprising in Egypt was covered in Finnish and British newspapers. Previous research on the domestication of foreign news items has concentrated on showing how the framings of the stories are tied to the interests of the nation in question, but such a perspective overemphasizes the role of journalists and downplays the role of news media in maintaining banal nationalism. The analysis of the press coverage of the Egyptian uprising in Helsingin Sanomat and The Times shows that the news are linked to domestic events and actors in various ways, for instance by reporting on the situation of compatriots or on domestic demonstrations. The news items adequate information for the domestic readers but at the same time they reflect and reinvigorate the self-evidence of nationhood and the national order of things.

DOMESTICATING THE KNOWLEDGE-BASED ECONOMY IN FINLAND

Laura Valkeasuo

1School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The economic model of the so called knowledge-based economy has spread into national policies all over Europe, United States and more. Since the mid 1990s a country and international coalition after another has announced themselves as knowledge-based economies. Knowledge including education, information technology, research, development and innovation is highlighted in strategies and reform programmes on all policy sectors as contributing to the competitiveness and economic growth. In this paper the discourse of knowledge-based economy is studied as a world cultural model adding to isomorphic change among nations. It is studied from the perspective of the neo-institutionalist world polity theory concentrating on its domestication process on a local level. The results of the paper aim to shed light on the process of local use of such models, and to add to the understanding of why local actors are so keen on domesticating them into their own policy argumentation without any external coercive pressure. The empirical data analysed consist of Finnish ministry documents of the past two decades. The method used consists of discourse and rhetorical text analysis. Analysis showed that the discourse of knowledge-based economy is a useful measure for the ministries as they take part in a local field battle over limited resources. Due to the accepted premises of the discourse about how society and economy work, it functions as already tested and valid argumentation, a framework, which local actors can use to justify their existence and aims. By successfully implanting their duties and aims into the framework, the acceptance of the premises is spreading to cover them as well. The
use of the discourse as ammunition in this regard is crucial in a situation where the actors need to constantly update their social significance and entitlement for resources in the eyes of decision makers.

There are two characteristics in the discourse that make it especially useful in this regard. First of all, the discourse has grounds on scientific knowledge, which adds to its credibility because it appeals to the widely shared value of evidence-based policy. Secondly it is rarely thoroughly opened and explained which adds to its blurriness and flexible nature, providing almost unlimited affordances for the actors to use.

EMPLOYEE REPRESENTATION IN TIMES OF FINANCIAL CRISIS: A CASE STUDY ON A LARGE EUROPEAN SOFTWARE CORPORATION

Christian Dirk Ledig

1Department of Social Sciences, HUMBOLDT UNIVERSITY BERLIN, Berlin, Germany

Abstract: I present findings from my doctoral project on the installation and first legislature of the works council at SAP AG, Germany. I would like to discuss findings from 20 expert interviews, conducted with employee representatives at SAP AG. My presentation will focus on accounts of events at SAP AG in the aftermath of the financial crisis in 2008. Regardless of the political grouping the interviewed actor belonged to, all acknowledged the significance of the executive board’s reaction to the financial crisis.

For the executive board of a European corporation, a country like Germany, with a rigid social legislation, is difficult to handle. The interviews showed that lay offs in countries without a substantive legislation, the Czech Republic was often named as example, were executed immediately. In Germany, the executive board had to adhere to the Work Constitution Act and inform the works council of its plans to cut jobs. I argue that the 30 page long agreement between the executive board and the works council, presented to the public on the 14th of March 2009, is a direct consequence of a substantive rationality of labour, ensured through the Work Constitution Act and enacted through the works council at SAP AG.

The questions addressed in my presentation are: What was the exact consequence of these management decisions for the range of possible actions to the works council? What would have happened if the board of directors would not have issued a list of austerity measures and a lay off plan for Germany? Did the historical instance of a financial crisis alter the development of political practice of employee representation at SAP AG significantly? How can the findings at SAP AG be positioned in the wider European context?

DISCONNECTION BETWEEN WORLD POLITY MODELS AND LOCAL TERRAINS. MULTICULTURALISM POLICIES AND THEIR IMPLICATIONS IN SOUTH KOREA.

In-Sook Choi

1University of Göttingen, Göttingen, Germany, 2ENS de Cachan, Cachan, France

Abstract: The ensemble of normative and legal frameworks supporting ethnic, cultural or religious minorities’ rights resided as policies of multiculturalism has been often discussed as an exemplification of a world polity model.

The recent and fast career of multiculturalism as a public slogan in South Korea represents a puzzle both in contrast to the boldly fostered ethnic nation-state model of Korea and multiculturalism’s struggled discursive history in Western societies. Conceptual concerns, opposition against its practical contents, and refusals to accept multiculturalism merely as a demographic de-facto situation by policy makers are only some of the examples of the multidimensional critiques which have been expressed in Western societies. How can we therefore make sense of the sudden emergence of multiculturalist debates in Korea, the seemingly quick embrace by public authorities, NGOs and the academic community? Which implications can be drawn about the incorporation of migrants and minorities in Korea?

Research contributions on multiculturalism policies are largely focusing on local and national variations by comparing the ways of incorporation of migrants or minorities. However, through the Korean example, I would like to focus on another empirical and theoretical alternative to differentiate the research on world polity models, the necessity to study the disconnection process between a world polity model and local practices.

GLOBALIZATION AND THE STRUCTURE OF THE GLOBAL SYSTEM. A SYSTEM LEVEL ANALYSIS OF THE IMPACT OF POLITICAL AND ECONOMICAL GLOBALIZATION ON INTERNATIONAL INTEGRATION AND INEQUALITY.

Lindsay Marie Jacobs 1, Ronan Van Rossem 1, Mathias De Roeck

1Sociology, GHENT UNIVERSITY, Gent, Belgium

Abstract: Globalization, the increasing interdependence and interpenetration of countries and regions, has speed up substantially since the 1960s. This paper examines how globalization affects the structure of the global system. Two central questions are asked: 1) Does globalization affect all dimensions of the global system equally, or does it differ in its effect on economical and political integration; and 2) How does globalization affect the inequality among countries. According to the liberal or modernization perspective globalization should decrease international inequality by providing opportunities to the least powerful countries, while according to the world system model globalization continues and even reinforces the existing inequalities between countries. The latter model also emphasizes the predominance of economic relations rather than political ones.

Although globalization is said to weaken international borders and to undermine the role of states, countries do remain important actors in the global system. In this paper we examine annual data on economic, political and military relations among countries from 1965 to 2000: imports, exports, trade in major weapon systems, presence of troops, alliances and diplomatic representation, and examine how these are affected by globalization. Globalization is operationalized using a series of political and economical indicators including global measures for alliances, diplomatic relations, trade, foreign direct investment etc. Standard social network measures such as density, reciprocity degree variance and prominence are used to operationalize the structure of the global system. Block-modeling is used to discern countries’ global system roles.

Results show that the global system over time remains comprised of significantly different hierarchical blocks in a core-periphery structure, but that substantial mobility takes place. globalization...
thus has certainly reproduced and even amplified inequality and hierarchy in the global system. The global system is integrated more politically than economically and the inequality is larger in political than in economical networks. Furthermore, political and economical globalization have diverging effects on this integration and inequality in the global system.

THE GLOBAL SYSTEM AND POLITICAL REGIMES. A SYSTEMIC EXPLANATION OF THE DEMOCRATIZATION OF COUNTRIES.

Mathias De Roeck¹, Ronan Van Rossem¹, Lindsay Jacobs¹

¹Center for Social Theory, GHENT UNIVERSITY, Ghent, Belgium

Abstract: That the integration of countries in the global system affects their political regime is widely recognized. However, there is still a debate about the nature of this effect. Where (neo-)institutional theories consider integration as a way to spread democracy, world system and related theories stress how dependency and a peripheral role in the global system hamper democratization. In this paper we examine whether the role of a country in the global system influences its level of democratization. The theoretical basis for this study is provided by world systems theory and the theory of imperialism, but with a (neo-)Weberian twist.

The global system is conceptualized as a multiplex power system, and operationalized using network data on the political, economic and military relations between countries. To operationalize democracy and take into account its multidimensional nature, a series of indicators is used: (1) Vanhanen’s index of democracy (2) Todd & Gurr’s polity IV-data and (3) Coppendge et al.’s components of political contestation and inclusiveness. Longitudinal analyses are performed on annual data for the period 1965–2000, using social network analysis techniques and growth curve models.

The results show that (1) the degree of democracy varies according to a country’s role in the global system, even after controlling for the effects of economic development; (2) the effect of world system on the degree of democracy differs according to which dimension of democracy is included in the analysis; and (3) within global system roles significant differences remain regarding the level of democratization.

The findings confirm that a country’s integration in the global system affects its political regime, but that the effects are different depending on what aspects of democracy are emphasized.

ALL THE WORLD’S SAME STAGE?: HOW ARE CULTURAL PRODUCTS REGIONALIZED?

Yen-Fen Tseng¹

¹Department of Sociology, NATIONAL TAIWAN UNIVERSITY, Taipei, Taiwan

Abstract: Migration from Taiwan to China has picked up speed and volume during the past decade, due to a removal of legal barriers for Taiwanese to work and live in China. This paper analyzes the resulting regionalization of cultural products brought about by Taiwanese migrants working in cultural industry in Chinese settings. By cultural industry, this paper refers to those business sectors involving the production of goods and services, with aesthetic or semiotic content. Just as the economic geographer Allen Scott(2008) has pointed out, that cultural industry is increasingly concentrated in a number of large cities world wide; among them, Shanghai and Beijing is on the rise. Drawing from in-depth interviews with Taiwanese workers in advertisement, publishing, art, and design sectors in Shanghai and Beijing, this paper aims to highlight the ways how Taiwanese migrants have made cultural footages, in some quiet corners of Chinese big cities.

While cultural skills are not as generic as other professional skills such as information technology, the “new world” is not necessarily the same stage for delivering the same performances. The understanding on how Taiwanese transplant and transform cultural sensibilities and sensibilities to work with Chinese local contents and create a regionalization of cultural products will shed interesting light on the globalization of cultural products and producers travel and negotiate their “settlements” in an era of regionalization. In some areas where the cultural production and consumption has become regionalized, migration of cultural workers, as in this case of study, often plays a significant catalyst.

THE DOMESTICATION OF ETHICAL POLICY ADVICE: ESTABLISHING THE NATIONAL ADVISORY BOARD ON HEALTH CARE ETHICS IN FINLAND

Jukka Syväterä¹

¹School of Social Sciences and Humanities, UNIVERSITY OF TAMPERE, Tampere, Finland

Abstract: The national bioethics committees advice governments in making health policies and regulating developments and uses of life sciences and medical technologies. During the last decades, national bioethics committees (and similar bodies with other names) have been established in most countries with advanced economies. What is new in this development is not so much the use of expert advice in itself but the emphasis on the use of ethically qualified expertise in policy-making. In this paper, the idea of “ethical policy advice” and the concept of “national bioethics committee” are conceived as transnational models dominated by nation states.

While the world polity theory is well suited to explain the global diffusion of transnational policy and organizational models, the actual process in which models are enacted by nation states has remained to be explained more thoroughly. This paper analyzes the case of establishing the National advisory board on health care ethics as an example of the domestication of the ethical policy advice in Finland. By examining the domestication process, the paper aims to add understanding about the globalization of political bioethics and, more generally, about the logics of institutional isomorphism between different nation states.

The data, consisting of policy documents and parliamentary discussion, is analyzed discursively and rhetorically to shed light on rationalities underlying the need to establish a national body of ethical expertise. In order to get grasp on the interfaces of national and transnational when the introduction of a new policy model takes place, the paper focuses in the various roles and functions the “international”, as a point of reference in the rhetoric of policymakers, plays in the early stages of the domestication process when the reform is justified. The empirical analysis shows how the examples from other countries are used to make sense of a novel governmental technique, the ethical policy advice. The conceptions of the present realities of other countries are also used as resources in imagining and governing the domestic futures.
THE PRINCIPLE OF FRATERNITY AND MIGRANTS’ ROLE IN THE CO-DEVELOPMENT PROCESS AS TRANSNATIONAL ACTORS. AN EMPIRICAL STUDY IN ITALY

Francesco Marini

Abstract: The paper aims to analyse how transnationalism contributes to the definition of the Migration-Development nexus. It focuses on co-development as a strategy that is capable of addressing the needs of home and host countries. The Italian literature on co-development dealt with this topic by reflecting on its link with globalization and transnationalism and by focusing on the empirical evidence provided by case studies proving the applicability of this strategy (Ambrosini-Berti, 2009). Furthermore many pieces of research were conducted by CeSPI concerning the analysis of transnational phenomena that can be put to value for the implementation of co-development. Actions for the implementation of a nationwide policy of co-development able to overcome the fragmentation and the small scale of actual experiences have also been studied (Stocchiero 2007, 2009). About the fraternity principle, as a principle that promotes people’s diversity and forms of reciprocity between them, some research perspectives have developed aiming to rediscover its actuality from a political (Baggio, 2007), juridical (Marzanati and Mattioni, 2007) and economical (Bruni, 2006) point of view. But they didn’t take into consideration its implications for the migratory issue. Starting from this state of the art, the paper proposes to analyse co-development, as a transnational phenomenon, and its potentialities through the principle of fraternity.

The main question the paper tries to answer is: can the fraternity principle be useful to interpret co-development and how can it contribute to the affirmation of this model of cooperation?

I tried to address such question using an empirical research based on a case study relating to the Tavolo “Migrants and Cooperation”, created by the Friuli Venezia Giulia Region. A qualitative approach was privileged for the analysis.

The paper aims to bring together the research fields about co-development and about the principle of fraternity, introducing the principle of fraternity as a theoretical element for understanding the transnational dynamic of co-development’s strategy and its triple effect for migrants and for host and home countries. The fraternity principle highlights that theMigration-Development nexus can be fully implemented by co-development that is to say through a synergy between integration and cooperation policies.

THE USE OF THE OECD IN DEBATING POLICY REFORMS

Ari Rasimus

Abstract: During the past two or three decades, all advanced market economies have undergone a number of fundamental changes. Despite some national distinctiveness, these changes have been remarkably uniform on their basic characteristics. Significant reason for the equality of the changes has been the Organization for Economic Cooperation and Development (OECD) that has played a key role in affecting and coordinating policy reforms in its member countries. Despite the uniformity, the processes by which these changes have come to exist have differed more or less from country to country. When new policy ideas originating elsewhere are introduced in the country, their reception and success depend largely on national cultural representations and institutional legacies. When policy ideas are implemented into concrete reforms, changes made in the legislation and actual changes in existing practices and procedures are always outcomes of national political skirmishes and compromises between different parties and other powerful agents. This national context is a linchpin of this paper. It intends to shed light on the complicated process in which supranational models and trends are absorbed into part of the national frames of interpretation and structures of sense-making. In this paper, I examine how the ideas, recommendations and reports emanating from the OECD get used at the national level. To do that, I analyse the references to OECD in the records of the parliamentary debates in two OECD member countries, Finland and Canada, in 1997-2009. The main questions asked are: In what ways is the OECD referred to in parliamentary debates in these two countries? Why is referring to OECD perceived as an appropriate device for advancing or justifying the reforms in question? Is there any conformity regarding of what kind of contexts referring to OECD is interpreted as useful or worthwhile? It should be noted that the objective of this paper is not exactly to demonstrate the similarities or differences between the uses of the OECD in Finland versus Canada, but to analyse the uses as such.

RUSSIAN SOCIETY IN GLOBAL DIMENSION: CIVILIZATIONAL PERSPECTIVES
Vladimir Kozlovsyk

1Department of Sociology, SAINT PETERSBURG STATE UNIVERSITY, St. Petersburg, Russian Federation

Abstract: Civilizational changes in Russian society of the early 2000’s have two clearly marked tendencies. Firstly, they have become the leading form of transforming the social and cultural order. Development of economic and political institutions in Russia has slowed down and stepped to the background, despite its much acclaimed public priority. Secondly, civilizational processes have become a way of embedding of different social groups in a global environment. The search and design of civilizational identity (J.P. Arnson, S. Eisenstadt, N. Elias, B. Wittrock) at societal, group and individual levels become the dominant form of social and cultural self-determination, the strategy of life course. Sociocultural identification is a process of choosing among multiple modernities and trying to appropriate them. The diversity of fluid modernities (P. Wagner), which constitutes the environment of Russian society, is a new format of global realities. Definitions of contemporary global society are multiple: information society, knowledge society, society of education, consumption society, creative society, network society, society of communication, etc. The multiplicity of modernity forms, with all the cultural distinctiveness of different societies, becomes the main means to moderate social inequalities at the global level. Socio-political revolutions in Eastern Europe and the Arab world are not only an example of modern civilizational change, but gaining a new modernity’s global type. Russian society is already assimilating new global modernity’s forms. This process is likely to be called a civilizational modification of the Russian society in the global contemporary realities.

SOCIAL ASPECTS OF RUSSIAN SOCIETY MODERNIZATION: SOCIOLOGICAL PERSPECTIVES
Mikhail Konstantinovich Gorshkov

1INSTITUTE OF SOCIOLOGY RAN, Moscow, Russian Federation

Abstract: Post-reform Russia needs a modernization leap which is crucial to its survival under the conditions of modernity. Such a leap is associated with Dmitry Medvedev’s initiatives to establish a politically stable, democratic and jural state with a high-tech economy and developed social sphere. A true solution to this problem is equivalent to the formation of a competitive society able to come out to the forefront in the world and provide high levels of welfare. The very cornerstone of effective functioning of society must be reconstructed thereto. Namely a socio-economic system capable of self-development and quality growth has to be established. It means that Russia is to go through the profound transformation of the established social order, to make the transition to a new development model, to create an effective and diversified economy. The main specificity of Russia is that it needs not unidirectional, socially and politically limited, but system modernization, i.e. qualitative renewal of Russian society both horizontally and vertically. System modernization should cover all spheres of vital activity and all levels of an organization of public life. To what extent are the interests of the state model of modernization compatible with the interests of millions of people involved in implementing this model? Does the proposed model of Russian society modernization meet the requirements of our citizens? Who can become an active participant and who just indifferent witness to this process? Above questions are of the utmost importance since the task of modernization is put forth under hard conditions of ongoing world economic crisis. This means that recognition of modernization objectives set at the state level should go along with understanding the mindset of the society, determination of whether the model of modernization proposed «from above» corresponds to mentality, interests, abilities and capacities of the population. This article presents the results of the first national sociological investigation conducted by the Institute of Sociology RAS in March – April 2010 that has as its objective an evaluation of various aspects of Russian society modernization.

CREATIVE CLASS IN RUSSIAN SOCIETY
Yuri Grigorjevich Volkov

1SOUTHERN FEDERAL UNIVERSITY, Rostov-on-Don, Russian Federation

Abstract: The supreme political government proclaiming the head for modernization supports formation of social groups presenting the locomotive of the process of modernization. The creative class’s formation in Russian society defines the ability of the society to produce modernizational spurt by using cumulative scientific potential and social energy of those groups that in terms of “resource-expensing” economics are forced change their profession or doomed for emigration. The potential of creative class exists in student youth and socially active people. As for the point of transformational activity of elites and adaptive inclination to innovation of the basic structure of the society this point remains for the creative class the “status” of intellectual “service staff” and of a group of intellectuals that are busy with earning money. The creative class is notable for professionalism as the alternative to dilettantism of many modern managers that don’t have an elementary notion about organisational and technological parameters of the determined social and professional activity. The creative class is in need of legal guarantees, taking of prestigious social and professional niches and of mechanisms of influencing on the dialogue between society and state.

This category is not a product of sociological imagination and complication of its analysis consists in not being occupied with transference of modern patterns like it happened with “middle class”.

Probably unexpected for itself creative class changes into that socially and initiative mass being in constant self-determination which doesn’t delight the powers yet but presents not ordinary but the only and the most safe ally on the way of the social life’s transformation. Each epoch produces its own view of ideal class. XIX th cen-
tury is a century of bourgeoisie’s end and awareness of the fact that none of the groups is not able to immortalize stability.

Under the conditions of growing social dynamics and uncertainty only one class is able to win, carry out historical revanche, become social advance guard since this is the class that is open to self-development, social self-criticism and it can give answers to global challenges of up-to-dateness, fascinate the society with the idea of universal creation that is not connected with the narrow group social privileges.

HOUSEHOLD IN THE CONDITIONS OF CHANGING SOCIETY

Elena Ikingrin 1, Olga Sido 2

1NIZHNEVARTOVSK STATE UNIVERSITY FOR HUMANITIES, NIZHNEVARTOVSK, 2Lomonosov Moscow State University, Moscow, Russian Federation

Abstract: In the conditions of transition to a market economy and a deep slump in production the serious economic role of households becomes obvious, because of its importance as a stable and capable to adapt social and economic unit of society. Households may provide the survival of society in difficult conditions, ease the consequences of unemployment and redistribution of employment.

The concept of household includes private subsidiary farms, sole proprietorship, family trade, leasing of real estate or consumer durables, purchase of securities. Increased expenditure on food and the threat to the existence of semi-starvation caused unheard surge of activity of families in food self-sufficiency. As we move to the south private subsidiary farms acquire more importance as the source of income. This source was mentioned by 3% of population of Nadym (Yamalo-Nenets Autonomous District), 20% - Nizhnevartovsk (Khanty-Mansi Autonomous District), 34% - Northern Urals, 40% - Southern Urals. Such differences are not observed in collecting berries and mushrooms (17%, 25%, 28%, 25% - respectively). The highest salary level is among inhabitants of Nadym, but, on the other hand, they have less opportunities to supplement a family budget from other sources.

Long-term observation of young families testify, that the importance of households was increasing during the crisis periods. Then during the stable period Cottages, home gardens are often used for recreational function.

SOCIOCULTURAL PROCESSES IN THE NORTH CAUCASUS IN THE CONDITIONS OF GLOBALIZATION

Rashid Dumalichevich Khunagov 1

1Philosophy and Sociology Department, ADYGHE STATE UNIVERSITY, Maikop, Russian Federation

Abstract: Globalization processes produce a great effect on each society: the traditional cultural values are modernized and the values of a globalized world become dominating. Here we shall examine a globalization phenomenon, paying special attention to cultural globalization in the North Caucasus society.

Globalization represents a contradictory process. On the one hand, it opens borders to the people and the states and connects them through knowledge, the information and technology. On the other hand, it causes intensity and the conflicts related to strengthening a role of the industrialized countries which bring the greatest contribution to maintenance of a global world order. Hence, globalization represents the global problem comprising the big prospects and dangers, especially in sphere of spiritual culture.

The North Caucasus is experiencing globalization challenges. New information technologies and migrations in all senses of a word generate frequently the cultural shock, threatening ethnic cultures in the region. Interaction of the global and local in modern conditions strengthens intensity in traditional cultures. Therefore glocality becomes time imperative.

Globalization influences greatly the identity, opening a way to set of identities in the global world. However Americanization has also the negative effects related to formation and combination of national and ethnocultural identities. Thus, a change of identification markers occurs under the influence of globalization. In the world social humanities, there is a set of scenarios of shaping new forms of identities. Influence of globalization on the information-communicative environment is especially appreciable. This is felt also in a North Caucasus society.

DOWNSHIFTING AS A NEW MIGRATION TREND FOR RURAL COMMUNITIES IN THE NORTH OF RUSSIA

Nikita Evgenievich Pokrovsky 1

1General Sociology, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: Downshifting is considered as a new trend of migration for the rural communities in the north of Russia. Young professional in IT-technology shere from Moscow and St.Petersburg more and more often prefer to look for a better living conditions other than those provided by a big city. The quality of the environment plays a more significant role in this search for better life free of polution, street crime, and traffic jams. Vast unpolulated areas in the North of Russia seem to be more and more appealing to those ‘new rural dweller’. This process should be viewed and examined from both theoretical and applied perspective.

RURAL COMMUNITIES IN THE NORTH OF RUSSIA IN SOCIAL SPACE AND TIME: INFORMAL ECONOMY AND ‘ARCHAIC’ ETHICS

Uliana G. Nikolaeva 1

1Russian Academy of Sciences, INSTITUTE OF SOCIAL AND POLITICAL RESEARCH, Moscow, Russian Federation

Abstract: Rural communities in the North of Russia live today in a condition of deep social and economic crisis, including the decline of agricultural production, depopulation, social pessimism, spread of corruption and the ethic of violence. What are the reasons of this crisis? What is the nature of the existing social system in today’s Russia and if there any room for a ‘northern village’ in this system? Social process in 1990s in Russia and other post-Soviet states has deeply influenced all the aspects of life and economic practices. The rise of criminality, informal economy and corruption in “transforming” societies was one of the major negative effects of the dramatic attempt of Russia to join the economic globalization. Instead of the anticipated ‘model’ capitalist market which was to emerge, Russia in reality exemplifies a different economic system. It includes vast elements of “gangster capitalism”, “criminal capitalism”, “corrup-
TURBULENT TIMES: A RESEARCH AGENDA

Oleg Yanitsky

Department of socio-ecological researches, INSTITUTE OF SOCIOLOGY RUSSIAN ACADEMY OF SCIENCES, Moscow, Russian Federation

Abstract: If ‘turbulent times’ is not a slogan but something qualitatively new in the structure and dynamics of the global community, it seems necessary to offer a research agenda of priority items and directions of research. First, I would try to define what, to my mind, the ‘turbulent times’ actually means and its particular features in comparison with that of in the past. Then, I would offer my own definition of the ‘turbulent times’ in terms of my concept of all-embracing risk society. After that, I will consider some key points of the research agenda for the topic under consideration focusing on the processes of restructuring global social and geopolitical space under the influence of transnational stake-holders. A special attention will be given to the actors which produce this ‘turbulence’ in the non-European world including the analysis of the role of aims and values of mass youth protest movements in the North Africa and beyond. The politics of tolerance failed in Europe, but it not makes sociologists free of careful study of the processes of cultural interchange. In conclusion, I’d like to speculate on some acute methodological topics of sociological analysis, namely the position of a sociologist in the multidisciplinary field and of the methods for research of metabolism between humanity and nature.

Key words: globalization, turbulent times, research agenda of, restructuring global space, multidisciplinary studies, Europe, Russia.

MIDDLE CLASS IN CONTEMPORARY RUSSIA

Svetlana Mareeva

Dept. of socio-economic research, Institute of Sociology RAS, Moscow, Russian Federation

Abstract: Genesis of mass middle class as a special social subject is usually connected to the general transition of society to late-industrial type. Industrial development of Russia actualizes problematic of middle class for it as well. Middle class in the conditions of economic growth carries out a number of important functions in society. That is why research devoted to middle class formation is especially important when addressing the question of direction Russia is headed to. Based on pan-Russian research data from years 2003-2010, size, dynamics and characteristics of middle class were analyzed in this research.

According to our estimations, middle class in Russia nowadays amounts to about a quarter of population. However, Russian middle class is heterogeneous in its structure. It has a core in which characteristic features are most prominent, and disproportionally big and unstable peripheral groups (size of which testifies that process of middle class formation in Russian society currently continues), in which these features gradually weaken.

Specifics of Russian middle class in comparison with middle classes of western countries lie in concentration of its representatives primarily in state sector, rather low rents on their human capital, larger role of ascending social mobility and smaller role of intergenerational reproduction in middle class formation. However, structural positions corresponding to middle class in Russian society are al-

HUMAN RESOURCE MANAGEMENT SYSTEM IN RUSSIAN COMPANIES

Olga Zelenova

Management, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: The report has been prepared according to the results of the Russian part of the international research practices in people management CRANET (Cranfield Network on Comparative Human Resource Management). The research undertaken within the project of Scientific fund at the National Research University – Higher School of Economics in 2008-2009 and 2009-2010.

The report explores the distinctive characteristics of the Russian system of human resource management in comparison to that in other countries. The overview of HRM management systems in other countries is based on the data available through CRANET network of comparative HRM studies. We discovered as the prevalent features of HRM system the undisputed authority of line managers in selection, promotion and personnel rewards; high horizontal and vertical differentiation of wages and benefits; extremely low formalization of performance assessment; limited possibilities of collective bargaining. Although the system helped Russian companies to adapt quickly to the conditions of shortened demand and declined sales in 2008-2009, the financial recession caused serious deterioration in the quality of jobs – especially by worsening payment conditions and creating contractual relations unfavorable for employees.

The problems of HR management at a time of dramatic economic changes, and in a country as large as Russia, have drawn the attention of numerous researchers over the past two decades. The absolute majority of studies, however, have viewed the transformation of HR management systems in Russia as an isolated phenomenon. At the same time, a comparison of the basic parameters of the HR management system with the respective parameters in other countries can help to look in a different way both at the essence of the problem and at specific aspects of the current state and potential evolution of the principal subsystems of HR management. This report makes an attempt to compare the basic elements of HR management systems in Russia with other countries and to define both the general and the specific features of this system.

ATIONAL ECONOMY”, or “shadow capitalism”. The important factor in this development was the psychology of this new system characterized by general moral indifference, the indiscrimination between the legal and the illegal. Thus, businesspeople complied with the necessity to pay to criminal groups and corruption among state officials and law-enforcement bodies have become a “norm” and even a virtue. My assumption underlying the analysis of macroeconomic processes in contemporary Russia is that by now only those processes have been theoretically conceptualized that have to do with developed market relations. All the non-market and premarket economic structures have been outside of economists’ attention which resulted in limited explaining potential of many contemporary economic constructions. The ‘pressure ethics’ became dominant in all spheres of the society. I consider the system gangsterism (racketeering) and the system corruption in Russia as two forms of parasitical economic relations. The resurrection of Russian rural economy and social life can take place only under the condition of overcoming corruption, ethic of violence, and semi-archaic social relations.

The abstract book of the conference is available for download on the conference website.
ready generated in mass scale, and they are characterized by the same qualitative features (autonomy of work, resources of influence at workplace etc.) as structural positions of middle class in developed countries. Moreover, people who occupy these positions show close resemblance to representatives of “classical” middle class by specifics of their position, consciousness and behavior; at the same time, they qualitatively differ from representatives of other classes and groups in Russian society.

It is still early to talk about Russian middle class formation as the special social subject as a finished process. However, despite incompleteness of its formation processes, Russian middle class successfully develops and carries out important social functions.

**SOCIAL POLICY IN RUSSIA UNDER GLOBAL CHALLENGERS**

Tatiana Sidorina

1Philosophy Department, HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: In the middle of XX century the sphere of social policy was rather clear – health, provision of housing, social insurance and some participation of social services in solving problems of social groups with special needs.

In former decades the sphere of social policy has greatly expanded. Nowadays the global character of the social problems and the role of social policy in their solving are in the center of researchers’ interest.

There are more and more social questions that couldn’t be solved only by the nation-state.

Social problems are beyond of the limits of separate (individual) state. The danger of international terrorism, the growth of opposition between the wealth and the poverty in the majority of countries in the world are more significant than social stability of separate (individual) economical developed state.

The interest shifts from the sphere of state’s activity to the activities of the world society. I mean the world social policy.

Social policy in Russia has also undergone cardinal changes for the last two decades. However the civil society hasn’t been formed yet. The paternalistic strategy continues to dominate in social policy and it defines the situation in social sphere. This can be proved by priority national projects and the absence of basic modal or basic conception of national social policy. The global perspective and the social policy participation in solving global problems in fact are not considered. Social policy is still the system of activities.

In my thesis I’m going to consider the social policy in the present situation and the future perspective in XXI century under the vision of foreign and Russian researchers.

Sergey Alexandrovich Kravchenko

1Sociology, MOSCOW STATE INSTITUTE OF INTERNATIONAL RELATION, Moscow, Russian Federation

Abstract: The success of the process of modernization that has begun in Russia depends on the newer approaches to the human capital. The essence of the human capital historically changes and becomes more and more complicated as the Russian socium acquires the complexity qualities, including points of bifurcation. Under these conditions the author argues for the necessity of the network human capital. Our approach is radically different from the pragmatic, one-measured interpretations of the human capital when it is expressed in money equivalent, “political weight”, income per head, length of life or level of education. Certainly, they are important thought often one or two characteristics are absolutized producing “One-Dimensional Man” (H. Marcuse). Contrary to these views our approach has its roots in the humanistic ideas of P.A. Sorokin, who paid special attention to the necessity of altruistic love as an attribute of the human. Moreover, today in my opinion even newer and broader approaches to the human capital should be elaborated.

The main features of the network human capital are: they should include the capacity of the man to leave comfortably and feel ontological security (A. Giddens) under the conditions of the non-linear social and cultural dynamics and risk traps; to deal with ambivalent consequences of posthuman realities, discontinuities and paradoxes of modern socium, different types of rationality as well as irrationality, to develop mobility and contingent ordering (J. Urry). The network human capital presupposes governmentality (M. Foucault) that excludes the manipulation of people by people. And at last but not least – cosmopolitan vision of the human capital: Russia for the successful modernization needs all her sons and daughters no matter where they leave, on what continent.

**YOUTH LABOR MARKET IN RUSSIA: PRESENT STATE, SPECIFIC FEATURES, CHALLENGES AND PROSPECTS**

Irina Olegovna Tyurina

1INSTITUTE OF SOCIOLOGY RAS, Moscow, Russian Federation

Abstract: The role of youth in the Russian labor market can hardly be overestimated. Being a part of the national human resources, it has its own peculiarities able to predetermine characteristics of the youth labor market in Russia such as: instability and imbalance of supply and demand; low as compared with the other age groups competitiveness of the youth labor force; discrepancy between professional knowledge and skills of the young specialists and employers’ requirements; poor infrastructure and lack of effective government youth development and support programs; specific interpretation of the state’s obligations to its citizens in the sphere of employment; significant youth unemployment rates, high level of unemployment among different groups of young people as well as a widespread among them practice of hidden unemployment and so on. What job young Russians are dreaming about? Whom and how do they work today? What requirements should possess a job able to satisfy them? What are the competitive advantages necessary in order to get a desired job? Which groups of young people are most successful in the workplace? Answering these and some other questions the author concludes that the state and society should not wait for the national youth labor market self-adjustment. Taking into account that post-reform Russian social policy should be a complex – between liberal and paternalist alternatives – one, connecting mechanisms of free-market forces and social compromise, we badly need a balanced and reasonable strategy for securing and regulating youth employment. It means that the state and society has to develop and implement a special system of measures, create
and realize federal and regional programs, not only providing young Russians with some guarantees of employment, but also assisting them in processes of their adaptation to specificities of the current economic situation, limiting the uncontrolled growth of youth unemployment, ensuring the rational use of labor resources.

CAREERS OF MANAGERS AND PROFESSIONALS IN RUSSIAN ENTERPRISES IN THE MIRROR OF THE SOCIAL ORGANIZATION OF NATIONAL BUSINESS

Pavel Sorokin¹, Evgeniya Balabanova²

¹Centre For The Research In Social Organization Of a Firm, NATIONAL UNIVERSITY - HIGHER SCHOOL OF ECONOMICS, ²Centre For The Research In Social Organization Of a Firm, NATIONAL UNIVERSITY HIGHER SCHOOL OF ECONOMICS, Moscow, Russian Federation

Abstract: Intra-organizational career growth is one of the main trajectories of vertical social mobility on the society. Principles, factors and mechanisms of career shaping are closely connected to the social institutes, emerged in the particular societal system. However, they are dependant on the specifics of the business-organization (size, industry, market position, etc.) as well. Therefore the studying of the career growth in national scale leads us to understanding of the fundamental basics of the social organization of Russian business and Russian society as a whole.

Career of the managers and professionals in Russian business organizations was investigated in the all-nation study of the Russian firms’ social organization (under the direction of Azer Fendiev, more than 2000 respondents).

The questionnaires were developed to assess along side with the system of social representations concerning carrier growth, behavioral practices connected with career development in Russian firms.

As a result the factors and mechanisms of career growth were not only carefully studied but also analyzed in the context of the Russian business' social organization. Multidimensional statistical analysis, including factor analysis and cluster (K-means) analysis were carried out which made it possible to study the models of managers and professionals career growth in Russian business. This has significantly enriched our research outcome.

RUSSIAN POLITICS MODERNIZATION: SOCIOCULTURAL APPROACH

Yuriy Vasserman¹

¹Department of Sociology and Political Science, Perm State Technical University, Perm, Russian Federation

Abstract: The intent of this Abstract is to draw attention to some correlations indicating that the some aspects of sociocultural differentiation in contemporary Russian society are reactions to the process of its modernization. These aspects are reflections of the contradictions in the society resulting from the clash of sociocultural features that are normally associated with different stages of historical process of social modernization. According to the theoretical framework, the process of cultural change must follow the process of technological change in adapting human behavior to new technical environment. The cultural and symbolic systems of these people do not correspond to the new environments. Russia is a powerful example of such inconsistencies. Just a few generations ago the majority of Russian population was rural. Their culture corresponded to the low-level technological environment characterized by manual labour. The process of modernization has changed economy and other sides of environment in just a few dozen years, leaving the cultural adaptors far behind. People experience conflicts with impacts of modernization such as market economy, new models of division of labour, etc. There are a number of groups with different levels of culture modernization and different reaction to continuation of modernization. The author attempted to investigate the problem of socio-cultural differentiation under the impact of modernization using the methods of quantitative sociology. The main concept of our research is a concept of the socio-cultural type. Socio-cultural types have different degrees of adaptation and connectedness to, or disconnectedness from, the relations of modern market economy. The Likert's scale was used for the elucidation of the level of modernization of culture of respondents. Two groups emerge from the study results: the first and tenth decile groups. The first decile group had minimal culture modernization score and tenth decile group had maximal culture modernization score. The results of our study show us not only the change in attitudes (culture modernization score) but also in activities and real life decisions in sphere of politics. Sociocultural approach gives an opportunity to see the range of social political and cultural identities produced in the context of processes of politics modernization.

RUSSIAN SOCIO-CULTURAL TRADITIONS AND MODERN AGE

Avrora Savka¹, Avrora Savka¹

¹RUSSIAN ACADEMY OF NATIONAL ECONOMY, MOSCOW, Russian Federation

Abstract: The social transformations taking place in the present-day world as well as the challenges that society is facing, including assessment and understanding of its place in the historical process, bring to the forefront the problem of modernity and the closely related to it problem of identity. Integration of not only present, but also of the past culture is a key feature of modernity.

Today, the concepts of identity arouse great interest among researchers in social sciences and humanities, which is not accidental.

The current socio-economic and spiritual crisis, which is unfolding on the global scale, brings to the forefront the problem of socio-cultural specificity of Russia. Orthodoxy plays a special role compared to the other socio-cultural traditions, which is determined by a whole range of historical circumstances. Conciliarity is a value characteristic of Russia. Being located between the two cultural poles – the West and the East - and absorbing them, Russia combined the Eastern submission of an individual to the ancestral clan and community with the Western individualism and respect for the person. In Orthodoxy, the concept of “conciliar” suggests a possibility to unite people on the basis of spiritual commonality. It is a consequence, a result of the free human nature, “freedom of human will”, and of the divine "grace".

The form of government in Russia is the history of the idea of social organization, a “symphony”. The Eastern-Christian idea of interaction and relationships between the state and society treats their central issue as search for the meaning of life and internal transformation of personality.

The idea of symphony - mutual agreement and, at the same time, independence of each of the areas in there relationships between
the Church and the state», which gave an opportunity to influence not from the outside but from the inside, determined the strength of the secular state where subordination was limited to the framework of duties,

The specific features of the Russian civilization model were largely determined by the established ownership system.

The ever-growing scope of environmental problems brings to the forefront such ideas as philosophy of economy and Russian cosmsim, implying a moral attitude towards nature, “Sophian economy” instead of economic reductionism, universality (“vseleinskost”), and noospherism, which emphasize the indissoluble unity of society and nature.

RUSSIANS’ HEALTH IN THE EUROPEAN CONTEXT
Irina Vladimirovna Zhuravleva

Abstract: In 2010 a new program of modernization of the Russian Health care initiated with objectives to create conditions for equal access for all Russians to quality healthcare service. Where do Russians stand in terms of public healthcare service in comparison with residents of European countries?

Methods: Fourth Round (2008) of European Social Survey (ESS) conducted in 28 European countries involved questioning of 54,988 people, including 2,512 - in Russia.

Results: The share of Russians who rated their health as "good" was 31.2%, which is 2.5 times less than in Belgium, Switzerland, UK and corresponded to the last but one (27) on the list of participating countries. At the same time the share of Russians with a "bad" health amounted to 20.1%, which is approximately 3 times higher than in indicated countries. In addition to subjective appraisals of health, 38% of respondents in Russia stated that they had limitations associated with disability or physical defects, whereas in most (21) countries it corresponded to 20-28% respectively. Such condition of health may to a certain extent explained by the poor efficiency of public health service. By the 10-point scale Europeans estimate their health system as 7 points or less (Belgium, Israel, Switzerland), whereas the Russians only 3.73 points. Even lower (2,98) they consider the fairness of medical staff in health service. The estimate of this particular aspect of medical service by the respondents in most countries was at the level of 6-7. Despite the low ratings of their public health service, more Russians (9.11 points) believe that the provision of health service is «entirely the responsibility of the state» than the majority of European respondents (7-8 points).

Conclusions The data of Russian national surveys fully confirms the European data and emphasizes the need for greater personal responsibility for own health not doubting the importance of the role of the state in this area.

UNEMPLOYMENT IN RUSSIA: STAGES AND COPING STRATEGIES
Marina Khokhlova

Abstract: In the 90s despite an unprecedented depth of the transformational crisis, unemployment, the severity did not get totally catastrophic. The spontaneous change of professional occupations was a safety valve, of sorts, during those times. The advent of the new social order made redundant a variety of occupations connected with ideology of the defunct state and its management (the elected and full-time officials of the party and some voluntary organizations, as well as cultural professionals). As a result of the de-industrialization that was underway many mass industrial occupations experienced drastic cuts. Many trades were displaced due to the large-scale imports. Under such conditions the availability or acquisition of an occupation in a great demand was a key to physical survival (during the period from 1992 to 1994 the number of street vendors increased 50 - fold, attendants or dispatchers increased more than 13 times, the number of lawyers stepped up 90 times and more!).

In 2008 to 2009 the tempo of the unemployment growth surpassed the nineties (during as short a time as 8 months from the beginning of the 2008-2009 crisis the number of the unemployed increased by 3 million persons whereas for the 6 previous years by slightly more than by 5 million persons). Just the same the situation differed fundamentally from the nineties because the potential for spontaneous change of occupations was fully spent. The crisis this time was taking place in the framework of an already existing market economy. During the period in question the economic and social crisis was taking place not only in Russia, but in the whole world. Social contradictions, if any, had a latent character; at the Russian state power bearing the responsibility with regard to the electorate, had monetary and other means available to carry out the programs of the targeted anti-crisis policy in the field of employment, oriented at the support of the lower part of the social pyramid. All this was accomplished.

Starting from the year 2010 the aim of the modernization of the economy has lead to the search of ways of the human capital development, to increased adaptability potential in the changing circumstances, to the maintenance of a social inclusiveness, in particular at the expense of the use of the vocational, educational and professional potential of the unemployed.

LABOUR UNIONS AND CIVIL ENVIRONMENT: “SOCIAL MOVEMENT UNIONISM” IN RUSSIA AND USA
Irina Olimpieva

Abstract: The paper will focus on the phenomenon of Social Movement Unionism which is described in the literature as collaboration between organized labor and civil society organizations and social movements. The emergence of social movement unionism is often seen as a result of the labor unions search for additional levers and partners to address labor issues. This intensified search can be generally explained by the decline of the role of labor unions as economic institutions that has been caused by a number of economic and social factors such as the changing nature of employment in contemporary economies, changes in the modes of production, the crisis of the welfare state and the impact of globalization among others. Social Movement Unionism has been increased in recent years all over the world; however, it considerably varies among the countries in its forms and content depending on particularities of
The paper will analyze the role of labor unions as civil society agents. It will also compare the phenomenon of social movement unionism in Russia and USA, focusing on the differences in the scale, modes, and challenges of collaboration between labor unions and civil society in these two countries. The analysis will use data received in the course of two empirical studies of labor unions in St. Petersburg and Leningradskaya oblast conducted by the Center for independent Social Research in 2009-2010, and the study of social movement unionism in Maryland, USA, conducted by the author in 2010-2011.

NON-GOVERNMENTAL ORGANIZATIONS IN RUSSIA AND THE EUROPEAN UNION: A COMPARATIVE ANALYSIS

Olga Usacheva

Department of socio-ecological researches, INSTITUTE OF SOCIOLOGY RUSSIAN ACADEMY OF SCIENCES, Moscow, Russian Federation

Abstract: The paper aimed at comparative analysis of the evolution, goals, structure and type of activity of non-governmental organizations (NGOs) in Russia and the EU during last two decades. Firstly, I intend to compare the context in which these organizations have emerged and evolved with the focus on political opportunity structure of their activity under the process of globalization. Then, I’d turn to the comparison of their strategic goals, tactics and action repertoire. Special attention will be given to the similarities and differences of NGOs and social movement organizations (SMOs). After then, I would concentrate on a set of main types of NGO’s activity, namely: enlightenment, education, various forms of assistance to local population, care of disabled, expertise, development of social technologies of collective action and some others. Later, I will turn to the role of the internet communication in overcoming the disconnection of people, in exchange of efficient social technologies, building the European and global network of the NGOs and in accumulation of shared social capital. In conclusion, I would compare the behavior of these organizations in ‘turbulent times’, in particular during natural and man-made disasters.

SCIENTIFIC COMMUNICATION IN RUSSIAN BLOGOSPHERE: COMPARATIVE STUDY OF TWO SOCIOCONFLICTS IN LIVEJOURNAL

Alexander Semenov

Department of sociology, NRU HSE, Moscow, Russian Federation

Abstract: The aim of my research is to apply a new conceptualization of scientific and communication in public discourse of blogosphere. For that purpose we use two cases of public scandals in Russian LiveJournal.

I deploy Habermas’ concept “issue public” to study scientific communication in LiveJournal in terms of interactions around “issues” that shape “publics”. I specify 4 types of interaction: 1) befriending; 2) quoting/linking; 3) commenting; 4) posting. Each of them can be quantified and presented as a network.

The analysis of friends and comments’ networks, hyperlinks and network analysis of texts of blog-postings can reveal the structure of “issue public” and its perspective towards an issue.

To illustrate this approach I use the case study of the scandal at the department of Sociology, Moscow State University, which exploded in 2007 and was mediated mostly through LiveJournal. The scandal started in February 2007, when a student posted in her blog about the procedural violations in the election of the Dean V.I. Dobren’kov. Soon after that a group of students, called “OD-group”, started a discussion in blogosphere about unreasonably high prices in canteen, prohibited reading of several authors, including Pierre Bourdieu’s works, propagation of Orthodox sociology and death penalty. All this claims caused huge discussion in blogosphere, online media and reached even New York Times. Notwithstanding this fact, in 2011 V.I. Dobren’kov was awarded the honorary title “Honored Worker of Higher School of the Russian Federation”. This example demonstrates that in this “Communication” vs. “Institution” struggle, the latter won.

The second case demonstrates another example of academic issue in Live Journal. It started when the Dissertation Council on Social Sciences rejected a PhD thesis of a very prospective student. This fact caused another discussion in blogosphere and on-line media, where such points as “procedural violations”, conflict of “old, Soviet” and “new, Western” sociology, “theory vs. practice”, were discussed. This time, “Communication” took its revenge on ”Institution”: the decision of the Dissertation Council was cancelled by the Higher Attestation Commission.

Having this two cases we can compare different issues, discussed mostly by the same people, see the forms and structure of scientific communication in blogosphere and reveal, what factors could cause the difference in outcomes.

THE DIFFUSION OF THINGS AND ESTABLISHING OF SOCIAL DISTANCES (THE CASE OF SOCHI-2014 OLYMPICS CONSTRUCTION PROJECTS)

Nataliya Ikonnikova

Higher School of economics, Moscow, Russian Federation

Abstract: The paper presents the results of the first stage of the research project in progress. It is proved that Olympics are not only sports event and not so much sports event as it is diffused event: cultural (look at any of latest Olympics and the part played by cultural programme), social (look at Paralympics’ growing programme, the project of “First Nations” branding in Vancouver, volunteers’ movement, local communities engagement campaigns), of course, economic (both for multinational brands and nation and local business enterprises), and political (concerning National branding and international relations) event. The involvement of the local community is complicated and complex, too. Different groups that compile the local social environment share different values (as meanings and as resources) and benefit of incur losses in different ways.

The paper considers the diffusion of technically complicated media and its influence on local community, while media itself transforms into everyday things in the context of the construction of Olympic objects and other preparations. The dissemination of high-tech media effects in social stratification, strengthening social inequality. The diffusion of technically complicated media is not only horizontal net spreading but also in depth of social organization penetra-
tion, it changes the nature of social ties in communities. The model of the transformation of corporeal environment and the diffusion of technologies in the juxtaposition with social practices and cultural units has been called "Tornado model". This metaphor allows to organize the initial visual data and divide some different strata of diffusion of things and technologies. The Tornado's influence causes specific processes of separation of social position at each stratum.

THE PROFESSIONALISATION OF RUSSIAN DOCTORS AS A STEP TO THE CONSTRUCTION OF CIVIL SOCIETY

Valeriy Mansurov, Olesya Yurchenko
Dept. of Applied Research, INSTITUTE OF SOCIOLOGY OF RAS, Moscow, Russian Federation

Abstract: The political reforms of the 1990s in Russia and the subsequent trend towards the market and liberalisation resulted in a change in Russian doctors' statuses. Transformations have occurred in the common standards of practice, ethics, discipline and payment. Moreover, the medical profession has acquired some possibility of self-regulation: the scope of autonomy (clinical, cultural and social) has slightly increased. The paper examines the resurgence of professional associations and their work in redefining their rights and obligations. Nowadays the professionalisation tendencies of Russian doctors oriented towards the enhancement of their professional standing are rather distinct, albeit not advanced. Professional associations attempt to cooperate with the state in different spheres from the management of the health care system to the creation of new professional ethical principles. Interviews with some heads of professional associations showed that doctors consider two options to enhance their professional social standing. The first option is traditional in Soviet Russia of escalating the group’s social standing by the state, termed in the sociological literature as ‘professionalisation from above’ (McClelland 1991). The second option that some of the associations consider is ‘professionalisation from below’, similar to the classical model of professionalisation of the British medical profession that involved striking a regulatory bargain with the state which provided the professional group with relative autonomy. The paper examines these professionalisation tendencies in the wider context of the construction of civil society in Russia.

CIVIC ACTIVITY AND INSTITUTIONAL ORDER CHANGE

Sergey Patrushev, Ludmila Filippova
INSTITUTE OF SOCIOLOGY, RAS, Moscow, Russian Federation

Abstract: Through social interaction individuals reproduce the established norms and deviate from them, thereby transforming the social order. We can distinguish two types of civic engagement: 1) civic participation - adaptive public activities related to realization of the rights and freedoms, ensuring the reproduction of the constituent values and norms of civil society, the prevailing practices, civil identity, and 2) civic action – non-adaptive public activities related to problems with the implementation of rights and freedoms and to formation of new institutional and legal norms.

The basis for distinguishing non-civic and civic activity are specific and universal solidarity, personal and social trust, equality (selective or non-selective), specific and general reciprocity.

The existence of an actor – holder of the new rules and/or practices – is crucial for the institutional transformation. An actor will potentially become subject to exclusion from participants - those who are "inside" the institute and, therefore, receive preferences under the existing rules and practices. When an actor emerges, the institute loses its "supra-individual" nature and appears as a "possession" of participants who are satisfied with the status quo, and, simultaneously, an "object of infringement" of those who seek to change existing rules.

Possible actions of those dissatisfied with the functioning of an institute can be described using the well-known model of "voice" and "exit" by A. Hirschman. There is a significant obstacle to employ the "exit" strategy - a price for using this strategy may be too high and outweigh the benefits for an individual. The lack of competition makes it impossible to use an "exit" strategy: absenteeism or the use of "non-civic" methods cannot be viewed as an "exit".

In Russia "voice" strategy also has a high "cost". The majority of Russian citizens do not possess sufficient resources to influence public and political institutions (in theory, it may be overcome by collective action). As a result of growth in the level of protest voting ("voice") and the refusal of citizens to participate in elections ("exit") the electoral law was amended so that the use of these strategies for transforming the institute of elections has become practically meaningless.

Empirical data of the paper is based on all-Russian surveys in 2006 and 2009.

SOCIAL TEMPORALIZM OF BIOGRAPHY

Valentina N. Yarskaya
Department of Social Anthropology and Social Work, SARATOV STATE TECHNICAL UNIVERSITY, Saratov, Russian Federation

Abstract: Multi temporalities is not an allegory, but a reality, the postmodern life course is institutionalized, tightened. Not only a strategic withdrawal, but also descriptive discourse has a value in the context of post-modernism. In the Soviet past of social science, the scholars from different regions of the country participated in symposia and conferences, travelled to Georgia, the Baltics, the Ukraine, Leningrad, Moscow, Sverdlovsk, Tartu. That time was framed by the intellectual space of the epoch, meeting with interesting people, scientific “parties”. Philosophical background for many was formed by various bases, not only humanities but also natural sciences. We have recently had the same situation in sociology – sociological education did not exist in Soviet times, and the first sociologists have been recruited from other disciplines, mathematicians and philosophers, technicians and economists. Having criticized positivism, Soviet philosophy itself has its own version, and it seems that saved scholars from the limited and politicized version of philosophy. Positivist installation in this version, sometimes was bordered with physicalism, for example, the academic authorities believed that the concept of time is a parameter of physics, while time inversion was considered as mathematical formalism. The paper is focused on the biographical temporality of social sciences.

THE ROLE OF AN INTELLECTUAL IN KNOWLEDGE SOCIETY

Liubov Yurievna Bronzino, Elena Michailovna Kurmeleva
sociology, PEOPLE’S FRIENDSHIP UNIVERSITY OF RUSSIA, Moscow, Russian Federation
Abstract: The contemporary intellectuals attracted by the idea of emerging knowledge society are looking forward to being involved into it. If the hypothesis of the beginning of the epoch of knowledge is true, there is no way round: the intellectuals acquire the role of experts with idiosyncratic knowledge at their command and specific qualifications differentiating themselves from others, they are capable of comprehending the information obtained, they know how to find their way around the immense data flow and are able to understand the true meaning of information transforming it into Knowledge: via sophisticated interpretation the intellectuals create socially important, practically and theoretically guided “knowledge-power” from data and figures available to anyone able to switch on the computer.

Nowadays, however, knowledge is disseminated by mass media. The Internet can reveal the utmost secrets and ideas of great value compressed compactly in the manner of the laconic telegraphic format of a dictionary entry and easy-to-read on the monitor screen. The given knowledge is “ready-to-use” and therefore is gaining prevalence in the contemporary society. It is this very knowledge which is often criticized by the offended intellectuals for its superficiality, dilettantism and standardization that is the cornerstone of the contemporary society. What is challenging here is the application of knowledge itself rather that its nature. To put it differently, the intellectuals are reluctant to admit that the other type of knowledge, which is so meticulously kept in possession and preserved by them, is not in demand in the contemporary society any more.

The society itself has some sympathy for intellectuals’ claims. Actually, the belief in the relatively high status of the academic career is evident in the public opinion of Russia. Thus, the status value opinion is shared mostly by people with a moderate income, a low level of education, and country-dwellers. In fact, the more remote from the scientist the respondent is, the better is the “third-hand” opinion. However, the belief that it is good to be a scientist is rather persistent, although it is actually so infrequent in the academic circles used to lamenting their lofty mission depreciation and the insufficient reward involved.
RS 28 The Relevance Of Karl Marx’s Theory Today: Does It Exist?

KARL MARX AND ORCHESTRAS WITHOUT A CONDUCTOR: A STEP FURTHER TOWARDS THE ACHIEVEMENT OF EQUALITY?

Danilo Chaib†

†Equality Studies Centre - School of Social Justice, UNIVERSITY COLLEGE DUBLIN, Dublin, Ireland

Abstract: Orchestras with conductors made their initial appearance in tandem with the bourgeoisie revolution. Marx even used the figure of the conductor to illustrate how labor is unified under a unique ‘baton’. According to Marx, all examples of group labor in a capitalist society require a commanding will to co-ordinate and unify the process, like an orchestra’s conductor. The alienation of the musician from the music he is playing is portrayed in Marx’s Economic Manuscripts, as is how a single person, the manager/conductor ends up assuming the responsibility – and credit - for their work. Adorno claims that musicians are forever condemned to have a single leader and will remain vassals as suggested by Hegel’s scheme of master and servant. This paper will provide examples of how abuse of power by conductors continues to the present day.

Nevertheless, there is evidence of resistance by musicians to such exploitation in the form of the conductorless orchestra. This paper analyses four different conductorless orchestras and their attempts at socially renewing the ‘traditional’ orchestra. The organization of the orchestra without conductor attempts to resemble the creation of a “free association” of human beings as proposed by Marx, with musicians organizing themselves towards real autonomy and responsibility to their job. The first attempt actually developed from Marxist underpinnings, five years after the Russian Revolution. Persimfans began their activities in 1922 with an attempt to bring equality and democracy inside the orchestra. It was initially supported by the Soviet Union but unfortunately ultimately deconstructed and dismantled with the rise of the Stalinism in 1932. In 1972, the Orpheus Chamber Orchestra was born in the United States. It practices the idea of a rotating leadership, sharing power among everyone doing the work. The later appearance of more conductorless orchestras, such as Europe’s BandArt and Brazil’s Orquestrário, reassures us that this practice is a persistent reality in the music environment, raising the question as to whether this is truly a step further towards equality and democracy in music. This study will use documents from these orchestras as well as interviews and group discussions with their members, to show if and how these musicians are pursuing equality and the notion of meaningful work within their orchestras.

WHAT IS WRONG WITH MARX – AND CAN ANY OF IT BE FIXED?

Risto Heiskala†

†Institute for Advanced Social Research, IASR, UNIVERSITY OF TAMPERE, University of Tampere, Finland

Abstract: Marx was a thinker of Enlightenment, a critical one, no doubt, but still part of that current. Materialist criticism of religious and idealist thinking in his “Theses on Feuerbach” and other early works show that. Historical materialism too, in his middle production, is one version of linear evolutionary phase theory typical to Enlightenment thinkers and differs from Adam Smith’s phase theory, for example, only in that Marx adds to Smith’s succession, which ends to the “commercial society”, the phases of industrial capitalism and communism. Both Marx’s early and middle production have a rational core in that they share the now common scientific worldview according to which it is reasonable to interpret reality by human-made theories and expect that the material conditions of human communities contribute to the type and direction the life forms typical to these communities take. In both senses, however, Marx is not the only thinker and not even the most important thinker who contributed to the adoption of the scientific worldview. Moreover, especially in the case of historical materialism he made several exaggerated assumptions such as the claim that all human history is driven by class struggles. As this theory has been falsified and phase theories in general are not seen as most fruitful frames to explain the course of history (cf. Mann 1986 and McNeill & McNeill 2003) I will concentrate Marx’s mature production which consists of the theory of the capitalist social formation presented in Das Kapital and related works. I will discuss about seven aspects of that theory: (1) “the great civilizing influence of capital”; (2) the problem or “second nature”; (3) the problem of ideological misrecognition of reality; (4) exploitation; (5) labor theory or value; (6) theory of revolution and (7) the conception of communism. When it comes to the first three, I conclude that Marx was right and his analysis is still useful for the analysis of those phenomena. Concerning the other four themes I claim that Marx’s analysis is either mistaken or outdated. However, there is still room for attempts to reconstruct his analysis, and I discuss about such attempts with the result that at least in the case of two (i.e., 4-5) of the four topics an alternative route to develop a more fruitful approach is opened up.

ETHICAL DILEMMAS IN CULTURAL MANAGEMENT – IN BETWEEN POLITICALLY CORRECT POLICIES AND MARKET DEMANDS

Milena Dragicevic Sesic1
1CULTURAL MANAGEMENT, UNIVERSITY OF ARTS, Belgrade, Serbia

Abstract: This paper aims to explore new issues and controversies linked to the management of public cultural institutions and independent organisations in new democracies. Cultural policies linked to new public management have replaced old administrative patterns of cultural governance, however keeping the inherited routines within new forms and discourses. Institutional logic of operation in public cultural system (where arts and heritage are seen as value per se) had to be replaced by project and organizational logic (logic of sustainability, accountability) – raising the level of efficiency and effectiveness in order to compete with numerous emerging independent organisations.

The research will analyze developmental strategies of:
a) “national” cultural institutions linked to different policy demands (inclusive evenness, accessibility, cultural diversity promotion, intercultural dialogue, etc.) which are challenging their traditional curatorial policy of representation
b) independent organisations often changing their strategies and policies in view of possible donation (criteria of funding).

The research intend to show the ways how cultural organisations are coping with changed context and policies, but also with changed cultural practices of both population and cultural professionals, especially in a time of economic crisis and political instability. Emphasis would be on investigation of value changes within strategic objectives – to see if the demand for better market success and commercialization of the programs had undermine the inherent social responsibility of cultural organisation. The key research question: is there a new ethic in cultural management.

Dynamics of communication: new ways and new actors, 2006, edited by Biserka Cvjeticanin, Culturelink, Zagreb

ARTS MANAGEMENT IN LITHUANIA: CHALLENGES AND TENDENCIES OF CHANGE

Viktorija Zilinskaite1
1Institute of Sociology, LITHUANIAN SOCIAL RESEARCH CENTRE, Vilnius, Lithuania

Abstract: Creative industries and commercialisation of art are everyday agenda in discourse Lithuanian cultural policy. However, transition from traditional arts management in Lithuania is rather chaotic. Most of Western societies experienced gradual change, while Lithuania arts management is still in complicated transition from traditional forms. Rapid common change of role of creativity and arts that took decades in the Western World is one of the main reasons of complications of transition.

The first change is change of place of art and design in economy that started in 19th century. Lithuanian society and economy still doubts importance and meaning of art.

The second change – recognition of importance commercialisation of arts. While formation of strong cluster in art and mass culture overlap requests for recognition of value of popular art, opposition between “real art” and entertainment opposes art to commercial success.

The third change is change of functions of art in society, especially rise of importance of social reflection of art. New understanding of role of art in society equates art to science. Although there is no unique notion of artistic research, the notion is highlight of intellectualisation of art.

The forth change – programs of arts, financed by state. Both state funded cultural and educational, both integration programmes are experiencing constant threat as having no social and commercial impact and are rather additional and subject of prosperity than important for identity creation and development of creative society.

The fifth change deals with rise of creative society and economy. As addition to changes in role and place of art in society, Lithuania is still experiencing social transformations. Lithuania still does not have few generations’ art appreciating elite of and influential creative class.

The presentation will analyse impacts of changes of role of art in society and social changes on arts management in Lithuania. Challenges that arts management meets are tightly related of changes both in artistic world and broader society. Arts management tries to make both parts meet. How much does the success of work of art depend on arts management? How can art be managed? Can the work of art have its own value that does not depend on managed external contents, created by arts management? What are the relations between artist and manager in arts management and artistic creativity?

THE BERLINER PHILHARMONIKER AND THE “DIGITAL CONCERT HALL” – A FIELD STUDY ON AUDIENCE DEVELOPMENT THROUGH THE INTERNET

Lukas Krohn-Grimberge1, Martin Tröndle2
1Communication and Cultural Management, 2Chair of Arts Administration and Art Research, Zeppelin University, Friedrichshafen, Germany

Abstract: The number of people attending classical music concerts is decreasing. In Germany the audience has dropped by 9.3% in...
the last 17 years. Research further shows that the younger generations lack experience with classical music and opportunities to get in touch with it. At the same time a constantly growing surplus of leisure time activities and media-offers competes for visitors and customers, whose available amount of free time is actually declining.

To counteract these trends and in order to attract new target groups and introduce them to classical music, classical music industry is breaking fresh grounds: within only 3 years time (2007-10), the number of German orchestras, using social media has grown from 2 to 50. The use of social media seems promising, allowing orchestras and musicians to connect and in interact with fans, friends, friends of fans (and so on), eventually reaching out to people that have not had encounters with classical music before.

There have been only a handful of surveys, interested in the question which institutions use social media as an audience-development-tool and how. But none of them ever asked the question who actually is attracted by these activities.

Hence the aim of this work is to examine how promising these online activities are, using the example of the online-offer “Digital Concert Hall” (DCH) of the Berlin Philharmoniker: as many others, the German orchestra has started to upload videos on Youtube and to communicate with people around the world via Facebook and Twitter. They also broadcast whole concerts via their own online-platform, the DCH, hoping to attract new target groups by lowering the inhibition of visiting a classical concert. If the online-activities of the Berlin Philharmoniker work that way, one should be able to measure this by conducting a customer-survey on the Digital Concert Hall and comparing (socio-)demographic data of the respondents with those surveyed in a real concert hall.

This study is the first to have a differentiated look on a concrete online-“audience”. By conducting and analyzing a customer survey (n=3,323 out of 40,000) together with a qualitative experiment with non-attenders, this work contributes to costumer-research as well as non-costumer-research and reflects upon the relevance of the internet for classical music industry.

KEYWORDS: arts management, media, sexism, inequality

NEURO-MARKETING AND THE MUSEUM: HOW SOCIAL SITUATIONS AFFECT THE RECEPTION OF FINE ART AND WHAT IMPLICATION THIS HAS FOR THE STRATEGIC MARKETING-MANAGEMENT OF MUSEUMS

Martin Anton Tröndle1, Wolfgang Tschacher2

1Culture, Communication & Management, ZEPPELIN UNIVERSITY, Friedrichshafen, Germany, 2Department of Psychotherapy, University Hospital of Psychiatry, Bern, Switzerland

Abstract: For centuries museums followed the Greek model of a museon, a place of silent contemplation. During the 18th and early 19th centuries, visiting a museum was a rather solitary excursion. The procedures for gaining access to the museum were complicated, time consuming and expensive – museum policy did not provide for a particularly visitor friendly experience (Grasskamp 1981).

Shortly after opening the Louvre to the public, the French intellectual Quatremère de Quince lamented, that by the opening the collection to the “event orientate masses” the “distinguished taste of the connoisseur” would be lost (Belting 2001). Similar complaints were rampant throughout Europe at that time. Nowadays, this sort of conjecture seems to be unthinkable for masses of visitors, students and tourists move through the Tate Modern, British Museum, Metropolitan Museum of Art, the Uffizi or the Louvre daily. The museum has been conceived as a public place, and the increasing visitors numbers are tantamount to its success. Only rarely are doubts on these “public” premises of the museum heard; doubts like those from Arthur Danto who speaks of the “Disneyfication” of fine art museums, and the loss of their aesthetic impact (Danto 1992). Are these complaints merely polemic? Or are they symptomatic of trying to establish a gate-keeper function to the museums as institutions of Bourdieuan social distinction?

With the elaborate technology developed for our Swiss national research project eMotion – mapping museum experience, we analysed the different behaviour of people coming alone and people coming in company to the exhibition, as well as people who spoke and those who were silent during their museum visit. In particular, we analysed the effect of sociality and communication on the act and affects of art reception. Gaining access to this complex realm of visitor reception in the museum required both, interdisciplinary research methods and an innovative technical apparatus.

In this presentation we will analyse the interaction of the work, the space and the beholder. We will show that sociality and communication has a significant impact on the perception of art, and we will discuss how museums and exhibitions can deal with a democratic and hospitable visitor policy without losing the aesthetic power of their exhibits.

PROMOTIONAL STRATEGIES AND AUDIENCE PARTICIPATION FOR NONPROFIT CULTURAL ORGANIZATIONS

Yun Tai1

1Sociology, EMORY UNIVERSITY, Atlanta, United States

IMAGE OF WOMEN ARTS MANAGERS IN SERBIAN MEDIA

Nada Marija Torlak1

1FACULTY OF CULTURE AND MEDIA, Belgrade, Serbia

Abstract: One of the laws of modern society development period is the steady increase in the number of women in relation to the number of men. For a long time they represent more than half of the population. In arts management women in the 20th centuary, in principle, equal status with men. But, formal and real rights are at odds. Primarily, they are the product of a society which tenaciously held relations of inequality. Women as successful arts managers in Serbia are even today often boiled down to an object, which can be easily concluded, at a glance at the print media in Serbia. In short, we are confronted daily with media articles where women are treated in degrading manner, which can be result of the hard competition in economy, especially in the precarious field of arts management in turbulent times.
Abstract: Marketing strategies are essential not only for the interest accumulation of commercial companies but also for the development of nonprofit institutions. How do nonprofit cultural organizations promote their product, that is, how do they attract a larger audience to consume their cultural items? We can approach this inquiry by looking more carefully at three questions: (1) what the characteristics in different types of cultural organizations are; (2) what the organizations have done with respect to marketing—what their promotion strategies are; (3) what the outcomes of their efforts are—what kinds of participation changes they have achieved. My essential statement here is: different types of cultural organizations with distinguishing characteristics may use different promotion strategies to increase the participation in their activities, which may in turn lead to different marketing efficacies. I use the data from Survey of Arts and Cultural Organizations (2000) in which the respondents including government or not-for-profit art and cultural organizations in 5 geographic areas in the United States. Age and size of organizations are used to measure the characteristics of cultural institutions, 14 different strategies are used to measure the promotional strategies, and 5 different kinds of growth in audience participation are used to measure the promotional efficacies. The results indicate that, first, age and size of cultural organizations do matter for the improvement of audience participation; however, when considering the number of promotional strategies along with age and size, the effects of these two characteristic predictors fade—the number of strategies used by cultural organizations significantly influences the promotional efficacies. Second, the effects of individual promotional strategies on the 5 kinds of audience participation improvement reveal that different strategies will lead to different promotional efficacies, which endorses the assumption. Third, by using factor analysis, 3 main factors emerge from the 14 strategies: reach/teach, beyond border, and audience service; beyond border significantly improves all the 5 dimensions of audience participation, reach/teach influences 3 kinds of promotional efficacies, and audience service matters for 3 efficacies.

WILL VENTURE PHILANTHROPY HELP THE ARTS IN TROUBLED TIMES? (CASE STUDY OF MADLENIANUM OPERA AND THEATRE IN ZEMUN)

Smiljka Isakovic

Faculty of Culture and Media, MEGATREND UNIVERSITY OF BELGRADE, Belgrade, Serbia

Abstract: Good art is good business. Motto Philip Morris. Interest in, and acknowledgement of, the value of culture and cultural goods is increasing world-wide. So too is interest in valuing the arts so that efficient funding decisions can be made by government and private sponsors. Today, as in the past, artists need the funding, approval, and friendship of patrons whether they are individuals, corporations, governments, or nonprofit foundations. The training and support of artists is a serious, time consuming and often a costly business, since it involves issues of space, materials, equipment, and personnel. Any serious commitment to the arts today will have to begin with an understanding of their inter-relationship (dance, classical music, performance, theater) and of the necessity to provide the vital resources of space and materials. In difficult times like ours, this system has elevated the status of art in society and reduced art to corporate promotions. Whether or not art “makes the world better,” or “makes us better people,” artworks and artists are part of a market economy. The relation between those two economic spheres is close to the question of patronage and of patronizing. It marks a desire on the part of the new-style philanthropists to be “hands-on benefactors”, managing partners working with nonprofit artistic world and to see what are described as “measurable results.” Thus they, in a way, become socialized into a milieu of arts and culture, also create an image of the socially responsible corporate behavior as a ‘social investment’, or show a beaftified picture of the corporation and philanthropist him/herself. In any case, serious patrons of the arts are to be cherished in our difficult and turbulent times.

Like DeVos family(Kennedy Center), Madlenianum Opera and Theatre was founded in Zemun(Belgrade, Serbia) in 1998, as the first private opera in this part of Europe. The founder and the only donor of Madlenianum is Mrs. Madlena Zepter, whose investments in culture and art represent the largest personal benefactor deed in this domain in Serbia and region. For her philanthropic contribution to the Serbian culture Mrs. Zepter was awarded Golden Crown award in 2011. by the Serbian Ministry of Culture.

Keywords: philanthropy, arts, classical music, opera, socially responsible behavior

COMMUNITY ENGAGEMENT: A CASE STUDY OF THE BRONX MUSEUM OF THE ARTS

Melissa Rachleff Burtt

1 Art and Art Professions, NEW YORK UNIVERSITY, New York, New York, United States

Abstract: Participation in the arts is an area of extensive inquiry, and the NEA (2009), RAND (2008), and Wallace (2001) commissioned surveys measuring American cultural attitudes. Arts management studies pointed to social stratification in museum visitation whereby both frequent and occasional visitors tended to be in higher income brackets (Kolter & Kolter, 2000; Falk/Dierking, 1992, Hood, 1983). These frameworks remain weak because they presume that arts organizations are elite economically, culturally, and that the audience (actual and potential) is predominately middle and upper middle class with a history of attending cultural events. Low-income, non-English speaking, and immigrant individuals are frequently lumped into a category of the “underserved.”

Thus, American models for growing arts participation often leave out organizations like the Bronx Museum of the Arts that were established to operate within ethnically and culturally diverse communities, with lower incomes, and where English is a second language. The absence of such research has been perpetuated academically, (Rosenstein & Brimer, 2005). Turning instead to anthropology, Arlene Davila’s study of NYC’s El Barrio demonstrates the arts are not simply the elevated, elite forms that most arts management studies presume; many recent immigrants to the United States view the arts as much more integral to daily and spiritual life (Davila, 2004). Education specialists further observe that audiences who do not engage with the critical discourse about art need a point of entry to such work as part of the physical design and interpretive strategy of exhibits. (Adams, et. al, 2003)

The paper will analyze the value of stepping of the classroom into the real world of community-centered museums that daily play a dual role as part of the art world and public service organization
through applying Davila’s research of multiethnic perspectives to the discipline of arts management, and drawing from a cultural survey of 1200 Bronx residents as well as empirical research. Without case studies that examine outreach in ethnically diverse neighborhoods, cultural organizations and the arts administration programs that typically train their staff will continue to offer the mainly mainstream cultural perspective, furthering the partial view of the arts’ role in American culture and society and limiting public participation.

**UNPACKING FESTIVALS: CULTURAL WORKERS AS MORAL ENTREPRENEURS**

Valerio Zanardi

Abstract: The narrative of economic crisis in the public sphere, has heightened the perception of the characteristics of instability and segmentation of cultural-work, boosting an increased awareness of the weaknesses of its utopianization.

I carried out an empirical research on the administrative and technical staff working in different art festivals both in Italy and Spain, where the organizational structures are generally configured according to a restricted core of stable employees, surrounded by a consistent number of temporary collaborators and volunteers. Moreover, a growing number of practitioners from academic programmes have lately been joining in as stagehands.

I have used the concept of “moral-panic” to analyze how cultural workers of those festivals, complain and react to new legions of work-avoid aspiring professionals.

Afraid of the possibility that freshmen may supplant them and their occupation be gradually depersonalized - they actively engage in ongoing practices, strategies of professional resistance emphasizing the “real” experience acquired in years of professional activity versus the inadequacy of higher “scholastic” education.

Consequently, new boundaries and patterns of distinction are created while internships do fail to work as bridges for occupational integration becoming a parking area for unemployment.

Broadly speaking, it emerges the idea that behind the myth of cultural-work lays a mechanism for social control.

In this paper I endeavour to illustrate that nowadays, the moral panics fostered by the public narrative of crisis as well as the incoming waves of aspiring professionals make prestige, the charisma of cultural-work melt into air.

**WHERE ARE WE IN DEFINING “THE ARTS?”**

Constance Devereaux

Abstract: We have come a long way in the fields of arts management and arts policy in establishing academic programs, achieving hard-earned legitimacy through academic journals and professional societies – and even a place at the table in areas such as urban development, education, and diplomacy. Yet the present is not rosy for sustainability of the arts and some researchers have questioned the ways in which practices of arts managers may impede, more than support, the development of artists and their work (Foehl 2009, Kuesters 2010). Public funding for artists and arts initiatives is threatened no less today than in the past, and may even be more threatened due to financial crises affecting both domestic and global economies. The proposed solution in the past, to problems relating to arts management, was establishing norms for best practice based on for-profit business ideals. While the global financial crises have cast some doubt upon received wisdom and the applicability of these models to management and policies in the arts, the effect on practice is unlikely to go beyond superficial discourse. This paper will argue that within their limited discourses of practice, arts management and policy have ignored core issues that could inform pedagogy, practice, and research. More precisely, this paper argues that the most salient issue remains our definitions of art.

While it seems simplistic to state that without a definition of the term “art” there could be no such thing as arts management or arts policy (DeVereaux 2003, 2011), the reality of that statement raises a complexity of issues, not to mention a few eyebrows. Defining “art” has occupied many minds and the ideological, political, theoretical, and practical problems that go hand in hand with definitional exercises form a backdrop for controversies in the arts. If defining “art” produces controversy, the failure to provide a definition does nothing to reduce it either. Can one define “art” or “the arts” in way that both avoids controversy and facilitates the day-to-day practice of arts management? Is it necessary to do so?

I draw on previous work examining arts management and the discourse of practice(DeVereaux 2010) to examine whether and how definitions of art affect the roles, functions, and practices of arts managers and why it matters.

**GENDER, FAMILY AND POLITICAL PARTICIPATION IN PORTUGAL. THE CASE OF LOCAL POWER**

Diana Maciel

Abstract: This article examines the family's influence on the political participation of the individual, in Portugal. I discuss results from my master degree's thesis completed in 2008, with the orientation of Professor Anaia Torres, which addressed the relationship between gender and political participation at local power, political context where is evident a great presidentialism, in which the mayor is the symbol of power. Given the impossibility of the research to cover all 308 municipalities of Portugal, the research was limited to a geographic area: Lisbon Metropolitan Area, with nineteen municipalities, mostly led by left-wing parties, thirteen men and six women. After several contacts for months, it was only possible to interview twelve mayors, eight men and four women. After these interviews, I came to three different trends, deeply marked by gender. There is a tendency in men to a total availability to political life, given that the size of family and domestic organization is in charge of wives. While for women, political life must be coordinated with the family structure and organization, even with the support and sacrifice of their husbands. Finally, I emphasize, through an exceptional case, the power of roles and symbolic and real places that the individual occupies. Which revealed that more important than sex, the physical and biological characteristics of each individual, in the construction of its personal, professional and political trajectory, is gender, its social...
meanings and cultural roles that each individual must play and the expectations that are associated to both men and women and that influence in a decisive way the construction of their life course.

THE HIDDEN AGENDA OF GENDER EQUALITY IN THE INTERNATIONAL DEVELOPMENT AID

Juan David Gómez-Quintero¹, Marcuello Servós²

¹psicología y sociología, ²UNIVERSIDAD DE ZARAGOZA, Zaragoza, Spain

Abstract: This paper analyzes the process of implementation of gender equality in development aid as a hidden agenda of modern society. The hypothesis says in the background of these processes involves a homogenizer desire by which the goals of the West Society should be the goals of the world. The theoretical discussion is based on critical theories with modern feminism, the post-colonial theories and some feminist anthropology research. The main findings suggest that the process of gender equality inclusion in development is a surreptitiously way of institutionalize the modern Western feminism principles at the expense of subaltern feminisms.

THE PORTUGUESE CONTEMPORARY FAMILY LAW: IS IT GENDER NEUTRAL?

Paula Casaleiro¹, João Pedroso¹, Patrícia Branco¹

¹CENTRE FOR SOCIAL STUDIES/UNIVERSITY OF COIMBRA, Coimbra, Portugal

Abstract: Following the democratic revolution in 1974 in Portugal, the principle of equality was enshrined in the 1976 constitution. This brought about a series of profound changes in the legislation, which particularly affected family law. Law turns citizens into subjects with rights and duties, consequently standardizing them as they all are equal before the law, and naturalizing them, considering that all are equal before the law (Kapur, 2006). Nonetheless, it has long been recognized that the demand for equal treatment before the law, in contexts where men and women are in an unequal situation, such as family and marriage (McCorckel et al, 2000), has a negative impact by putting women at a considerable socio-economic disadvantage (Verchick and Levit, 2006).

Simultaneously, the practice of law, particularly in Family Law, actively contributes to the production and reproduction of gender identities, although law argues that it is only using natural-scientific or common sense concepts or speeches. In legal discourse the two genres are defined by contrast, suggesting a relationship of "complementarity", which perpetuates, however, the homogenous reproduction of the behavioral characteristics, roles and spheres considered male or female. The law does not create patriarchal relations, but in a complex and often contradictory way, replicates the material and ideological conditions under which these relationships can survive (Smart, 1999).

In this paper we discuss the gender of family law, from the preliminary results of the research project "The gender of family law and justice". We will discuss Family Law as a process of (re)production of gender identities and inequalities, attending to the law in books and the law in action. Thus, first, we analyze the rupture and continuities of transformations in Family Law in Portugal from 1974 to the present, through the Civil Code reforms and legislation concerning Family Law. Secondly, we intend to examine how Family Law is enforced by the Portuguese courts, analysing the legal and ideological discourses which judges use to shape their decisions.

TIME USE: WORKING AND UPPER CLASS WOMEN IN COMPARISON

Maya Becker¹

¹University of Education Ludwigsburg, Ludwigsburg, Germany

Abstract: While for men the length of paid and unpaid work on weekdays is independent from social class, this cannot be said for women. Upper class women record the longest working hours in paid work on weekdays, working class women the shortest. The longest time for unpaid work is found among working class women, especially when they live together with a partner. The "strategy" for balancing paid and unpaid work of upper class women cannot be seen in a reduction of unpaid work only. They deal in a special way with unpaid work: "Time deepening", as described by Scheuch, means that two activities are done in the same time span. Upper class women have the highest rate of "time deepening" in unpaid work. Empirical results are calculated with the German Time Budget survey 2001/2002, a representative cross section survey from the Federal Statistical Office in Germany. Differences among women according to their social class membership are discussed. For the use of time, data for Germany shows that working class women seem to be disadvantaged in comparison to upper class women.
