Materials and the Style of Buildings used in Iraq during the Islamic period
Entidhar Al-Taie 1, Nadhir Al-Ansari 2 and Sven Knutsson 3

Abstract
The Islamic period in Iraq lasted 1002 years (637-1639 AD). During this period big cities were constructed and old cities were reconstructed. There was development of the materials used and the design. Bricks, grill wage, plaster, gypsum and marble and stones were used. The environmental conditions were taken in the design of the buildings. The walls were thick and basements and badgur were established. This makes it easier to cool or heat the house. Tar was used to protect the buildings from moisture. New style of buildings was established using new engineering innovations. Well-designed arches and domes were noticed during this period. Islamic buildings had special features such as minarets, arches, domes, vaults, gilding, patterns and decorations.

Keywords: mosque minaret, liben wage, tower fence, Umayyad era, Abbasid era, emirate house, dome decorate, mud brick.

1 Introduction
The style of construction and the materials that were used in Iraq passed through different stages during Iraqi history. The history of Iraq can be divides into several stages: The oldest

is what known as the ancient stage (150000 BC- 226 AD). This stage ended at the Islamic age [1]. The Islamic period includes the Rasheden Caliphs Era (637- 661) AD, The Umayyad Era (661- 750) AD, The Abbasid Era (750- 1258) AD, and The Mughal Era (1258- 1639) AD. The third stage extends from (1639 AD onward). This includes the Ottoman Empire, British occupation and finally the Iraq independence.

The Islamic period is characterized by the establishment of big new cities such as Basra, Kufa, and Wasit (Figure 1). In addition, existing cities like Mosul and Anbar were reconstructed. The political, military, and administrative environment helped to achieve these establishments. The cities were characterized by its collector Mosque, emirate house, the places, and the schools, [2].

All the buildings were characterized by an internal courtyard or garden. The courtyard might have ceiling some times. Another feature was the presence of more than one courtyard, and they act as a filter for dust and acts to moderate the air temperature inside the house. Generally, the buildings can be classified into three categories as: buildings surrounded by fence such as palaces and khans, and buildings of a religious nature such as mosques and the shrines, and public houses, [3]. The Islamic buildings are characterized by two main features. They describe the function for which the building was constructed for, and they did not pay that much attention to the external appearance of the building. The Islamic engineer followed firm steps in their work. They used to prepare the plan drawing and calculated the cost and quantities of material required for the construction [4]. The most important features characterizing the Islamic building were the minarets, the domes, the columns, the decorations, inscriptions and the calligraphy which was use in the inscriptions [5].

Style of buildings, material used for construction and the development through the beginning of the Islamic period to the Ottoman Era will be discussed in this paper.
2 Rasheden Caliphs Era (632-661) AD

Islamic conquest of Iraq started 637 AD. At the beginning of the conquest, Basra city was established. The city was actually an army camp to accommodate the soldiers and their families. It was built using canes. Later the camp was developed and re styled. A mosque, emirate house and finance house were built. These buildings were within the center of the city. Surrounding these buildings were the markets, public bathes and residential houses [4]. Streets were also established and all of them led to the mosque. The mosque was open courtyard surrounded by wall. Later part of the courtyard was covered by ceiling to protect worshipers from hot sun. The material used was mud and liben (This is a mixture of clay, water and barley). It was mixed in a special technique referred as “Bakla”: in this technique they dig a trench and they mix the clay with water and barley inside the trench. The mixture is very well compacted and later they build the walls on top of it [6].

Kufa was the second city to be built at 638 AD. It was built in a similar way to Basra city. The materials used for building were mud and liben. The emirate house was built on the southern side of the mosque over foundations having depth of 90cm. The materials were also
similar to those used for building Basra city [6]. Figure 2 shows the plane of mosque and emirate house. Later bricks were used in building but to a limited extent. Wage was used for building houses but limited [7].

![Figure 2: The Planned of the Mosque and the Emirate's House and Photo of Emirate's House Foundations [8]](image)

3 Umayyad Ears (661-750) AD:

This period marks major development of construction and architectural work. The engineers modified the style of buildings that they saw in conquest countries and mix it with the Islamic style. The weather conditions, availability of construction of building for the environment were taken into firm and the topography and the soil type were taken into consideration. Straight roads were straight about 50 m wide. The centre of the city usually has the mosque, emirate house and house of finance. These are surrounded by markets and residential areas [10]. Mosques at that period were considered as governmental house besides its religious purpose. All financial, political and educational transaction was executed at the mosque. In view of this, every city must have a mosque at that period. Engineers were very keen to build the mosques in such a way to reflect the spirit of religion and it also reflects the engineering
development [5].

**Basra** city was headquarters of Umayyad Government in Iraq and was on the way connecting Sham (Syria, Jordan, Palestine, and Lebanon) and the Persian Empire. In addition it was an important port. For these reasons it developed quickly and covered an area of (15*15) km.

A number of merchants lived in Basra and built luxury palaces on the banks of the rivers. The main mosque in the city was reconstructed. They used wage and plaster in its reconstruction, the foundations were used stones and they furnished the ground with read stones [11, 12]. Figure (3) shows the mosque. The house of government was reconstructed in a similar way (Figure 4).

![Figure 3: Basra Mosque with its Minaret [13]](image1)

![Figure 4: Plan of Umayyad Palace in Basra [5]](image2)

The style of construction used to depend on the structural system and the bearing walls. During these period columns, reinforced pillars, and arches of different types (semi-circular, horseshoe, and spire) were used [14]. The external walls of palaces were 1.20 m thick using liben which is the prevailing material south of Iraq. This mixture is durable and does not shrink like mud. The mortar used was from the same mixture. To protect these walls from rain and moisture, they started to build 18 cm thick outer cover from wage cooked. The lime
used for this part was the extinguisher lime (al Nora). This material is resistant to weathering and erosion. In certain occasions they used to mix the extinguisher lime with ash which makes the mixture more resistant. The internal walls were coated with thin layer of 30mm thickness of the extinguisher lime. Sometimes these walls were decorated with inscriptions. All the houses had more or less the same design. They had central court which is about 1m lower than the other parts of the house. In the middle of the court, they usually build a small pool to store water for daily uses. The court is surrounded by wood columns with inscriptions crowns to prevent rooms from heat of the sun [9]. Houses had basements under the ground to be used during summer due to the hot temperatures. These basements had their roofs shaped like arch to provide strength and durability to bear the loads over them and for thermal insulation. Chimney like structure was built starting at the basement to the top roof and they were called Al Malkuf. The upper outlet was opposite the direction of the wind so that it allows air flow inside the structure. All the rooms were connected to this structure by special openings to allow the ventilation. Teaching and prayer rooms were characterized by a hollow structure referred to as “kowa” to allow light in and also for ventilation [4]. Basra city was characterised by its gardens and public bathes. In one of its suburbs” Shaaba” the remains of an Umayyad palace exist (Figure 4).

Kufa City was expanded and it covered an area of (15*9) km, the main mosque was reconstructed and expanded as well (Figure 5). It had a quadrate shape of dimensions (110*116*109*116) m. The height of wall was 20 m supported by semicircular towers in same high. The depth of the foundations for the walls were 5.5m. The towers were distributed on the four corners of the mosque. The materials used in the construction were wage and plaster. Roof of prayer house was raised by columns with beautiful crowns with a diameter (0.90-1.10) m. It consists of sandstone pieces sculptured and ranked over each other. They were tied together by iron rods which penetrate a lead cylinder. The mosque can
accommodated 60,000 persons [6, 14].

The emirate house was built in a square shape with dimension (176*176) m (Figure 7). The house was surrounded by two walls. The external wall had ribs of 176 m long. The average thickness of wall was 3.6 m. It was supported by semicircle towers from the external side, their diameters about 3.6m. All the ribs had 6 towers apart from the northern rib which contained two towers only. The ribs of the internal wall were 170 m long each. The thickness of the wall was 1.8 m. The materials used in the construction were wage (36*36*9) cm and plaster [13; 16]. The wall contains semicircle towers (3m in diameter) except the northeastern
side. The palace was built in a square shape (61*61) m with thick walls (3m) (Figure 8) wage and plaster were used as construction materials. The outer side is of wage painted blue. The palace has a complex design with many interns leading one to other. The entrance width was 1.80 m [14; 6 and 45].

Mosul city resembles other cities in its construction. The construction materials for the buildings in Mosul were stones, geometric stones, gravel and wage. In addition it had a wall surrounding it, which was built with wage. A wide trench was constructed surrounding the wall from the outer side and they used to fill it with water from Tigris during any attack on the city [4].

Wasit city was established at (701- 703) AD, on the western bank of Tigris, and became the headquarters of Umayyad emirate in Iraq. It was located between Kufa, and Mosul, Ahwaz, Egypt and Basrah. The main features of the city were very similar to other cities in Iraq. The main mosque had the dimensions of (182.88*182.88) m, and its walls 2.5m thick. In the middle it had a rectangular courtyard surrounded by five corridors (Figure 9). Remains of the foundation showed that at the intersection of the tiles and corridors, columns were
constructed from several parts of sandstones. They were connected together by a hole in the middle; through this hole an iron cylinder filled with lead was placed to join the successive sandstones blocks together. The construction materials were wage and plaster. The building was characterized by simplicity and attractive view. The emirate house had the dimensions of (365.76*365.76) m. Square columns were constructed using square wage. Three blocks (madamiq) were used in the foundations of the corridors linked together at the base. Each part of the house contains 19 corridors. The most important feature in that house was its green Dome. The dome was overlooking all palace facilities. It was built by stones. It was seen from a distance of 25 km [15; 6]. The city was surrounded by huge wall from three sides and river Tigris was on it’s the fourth side. The walls were 4.5m thick and 2m in height. The walls were supported by towers and they had 6 big entrances (Figure 10). A trench was surrounding the walls from outside. The city had 4 main roads. Each road was 7.32m wide [4]. All Islamic cities have public bathes. They have the same design and are composed of small entrance lead to a room for changing clothes followed by three parallel rooms (cool, warm, and hot). All these rooms were provided with water basin. Water transport pipes were made of clay. Inside the bath, all rooms have domes for lighting and they did not allow the entry of air. The bath ground was furnished with marble, while its building materials were wage, stone and marble to bear water [17]. The city was expanding rapidly because it was the capital and numbers of hotels (khans) were built.

In Nahrown area (near Baghdad nowadays) Umayyad palace was established (Figure 11). It had rectangular shape. In the middle there was a courtyard overlooking the Ewan’s. This design was prevalent later. The palace had plaster decorations
Abbasid Eras (750 – 1639):

This period marks the transfer of power to Abbasid. They changed the capital city to Baghdad later to Samara. Baghdad was chosen because of its strategic site in the middle part of Iraq. The buildings were characterized by architectural decorations and large dome roofs, arches, and unique shaped columns [19]. Baghdad was built in 762 AD. It had a circular shape and surrounded by huge solid walls (Figure 12 and 13). The caliph palace was located in the center and a mosque was attached to it. The size of the palace was double the size of the mosque. Around the palace and the mosque were governmental offices. The city was planned as rings and the further away from the center the wider the ring is. Three walls can
be noticed. The first wall surrounds the central courtyard and followed by the middle wall. Between these two walls are the residential sites. The area between the middle and external wall was left empty. Big trench surrounded the external wall and it was filled with water from Euphrates and Tigris Rivers by canals. Euphrates canal is referred to as Issa branch while the Tigris canal was referred to as Aldajael branch. To inter the city, four bridges were constructed on the trench leading to four gates. These gates were facing certain destinations so they were referred to as: Basrah, Kufa, Sham and Khorasan. The streets were divided Baghdad into four pivotal sections. The widths of the streets were 30.58 m (Figure 13) [18].

The palace had a square shape (365.76*365.76)m (Figure 14). The material used for construction was lebin of two sizes. The first was square in shape “Aljaafari or Aledam” (0.915m*0.915m) weighing 200Kg. The other was rectangular shaped (0.915*0.458) m”munasif” and weighing 100 kg. The first was used in the foundations and the second type was cooked to form wage which was used with plaster to build the palace. The Palace was consists of Ewan in the front having an area of (27.43*18.29) m. In the front of the Ewan was a board place (18.29*18.29) m, thickness 18.29 m.

Figure 12: The Scheme Model of Baghdad [61]
Figure 13: planned of City and Design of One Gate [23]
Over the board at a height of 40 m, another board of the same dimensions exists and over it a green dome was built. The palace was referred to as Bab Aldhab palace. This is so because it was built with marble and stones that were coating with gold. Over the dome was putting statue of a knight on his horse to determine the direction of the wind. Gold Coatings were used to decorate the walls and columns crowns. Wage, plaster, and stones were used for corridors, vents trimmings and columns build. The mosque was square shaped (182.88*182.88) m. Jaafari liben was used for the foundations and liben and mud for building (figure 14). The city was surrounded by external wall and another inner great wall. The walls had 4 entrances which were (1972) m apart. A dome was built on each gate so that the caliph can set there. The thickness each wall was (18.29) m [21; 22].

The space between the two walls is (170.70) m and it was referred to as “Al feasal” and within that space there were no buildings because it was used for military maneuvering. The
external wall was 17 m in height and it was (18.29) m wide at the bottom. The great inner wall was (30) m height and its width at the bottom was (45) m and decreases toward the top till it reach (12) m. Both walls were built using jaafari liben in their foundations and liben and mud for the main wall. Each raw within the wall (162000) jaafary liben pieces that weight 117 kg were used. This is so because liben can be easily penetrated by catapult. The fence was supported from the exterior side by 113 rounded towers (28 between Khorasan and Sham and 29 between Basra and Kufa). The height of each tower exceeding the wall by (4.575) m. Behind each gate was built corridor dimension (76.75*18.29) m. They had arches was built from wage and plaster (Figures 15 and 16). The corridors and water canal surrounding the city were lined with a cement like material called “Al Sarowge” made of extinguished lime and other material such as ash. This material was durable [24; 25].

Baghdad was expanding on both sides of the River Tigris. The eastern side “Al Rusafa” was allocated to the army commander’s residence and princes. The western side “AL Karkh” was allocated for industrial and marketing activities. Later merchants built huge luxury houses (Figure 17) on this side. The common building material was mud apart from the important governmental buildings where they used wage and plaster and sometimes marble. Within the palaces (e.g. Kuled, Rusafa and Fordwas palaces) silver, gold, wood and glass decorations were used [17].

Figure 17: The Entrance of Kuled Palace, [26]
Mosques were used for religious, social and educational purposes. They were characterized by diversity in the plans and the height of their minarets (e.g. Alhadhir, and Kamria mosque) Al kulapha mosque (Figure 18) which was built in rectangular shape (area of 31*17.50 m).

It consists of minaret build on square base (3.50*3.50) m, and height 3.50 m, the total height of the minaret was 11.70 m. The materials used in building the mosque were wage and plaster. They used wage glazed in building the minaret, [6].

Thirty five schools were built in Baghdad and some other cities during the period (1227-1234). The most famous were Nedhamia and Sharabia School. The biggest school was referred to “Mustansiriya” (figure 19 and 20). It was consider as the first Islamic university at that time.

**Figure 18: Photo of Caliphs Mosque and Minaret. [27]**

Mustansiriya building was rectangular in shape covering an area of (4836) m². The construction area was (3121) m². It consists of middle wide courtyard area of (1710) m², surrounded by corridors, in the middle of each side there was big Ewan its width about 6 m, and height 10 m, on both side of Ewan there were two study halls. Mustansiriya was two floor building containing lecture theaters, halls, Ewans, library, pharmacy, hospital, kitchens, bath rooms, dar alhaddath and dar Al-Quran [28]. The building was very well ventilated.
Like all Abbasid buildings the materials used in school building were wage, plaster, and liben. Most famous thing in Mustansiriya was its amazing water watch (Figure 21). It had two Baz birds each one stand up over basin, falling down from their mouths two golden nuts each hour then it opens one of twelve golden doors marking one hour [31]. Sharabia school is one of three schools were established with the same name in the middle of Abbasid era, in Baghdad, Wasit, and Mecca (Figures 22 and 23). The school is one of the luxuries and unique features that are still fixed on since Abbasid period till now a day. It was consist of two flowers, overlook a rectangular courtyard of area 40 m². All the schools had the same design [15].
The School in Wasit is slightly different (Figure 24 and 25) [6]. This school was characterized by its decorations.

Figure 22: Plan of Sharabai School in Baghdad [18]

Figure 23: Photos of Sharabai School in Baghdad [33]

Figure 24: Planned for Sharabia of Wasit [6]

Figure 25: Photo for Sharabia of Wasit [34]
Samarra: This city was established in 836 AD after careful engineering planning and design. It was surrounded by an octagonal fence; the length of each rib was 630 m. Towers were built from the exterior side to protect the fence. Large blocks of liben were used in the foundation of fence. Many palaces were built in Samarra; the most important was referred to as Caliph Palace (Figure 26). The length of its frontal view is 700 m and the distance from the main door to the end about 800 m. The palace had three Ewans. The middle was the largest. It was rectangular in shape (17.5*8) m, and it was 12 m height. It had tapered roof trimmings. It also includes a big door (width 3.8 m and height 7 m). The other two side Ewans were smaller (4.5*4) m. Behind these Ewans were back rooms followed by the Throne hall. The palace has a second floor and basements. The height of the Walls reaches 6 m. The wall foundations were strengthening by plaster decorations. Two basements or crypts were built inside the palace in the northern and eastern sides. The small crypt was dug to 10 m depth in solid rocks. It had dimensions of (21*21) m. It was connected to three caves. The walls were decorated with carved plaster. The big cave was of square shape (dimensions (180*180) m). Inside this cave was a large and extensive pool (diameter 80 m), connected to

Figure 26: Plane of Dar Alama (Caliph Palace) [6]
Khariz (khariz is tunnel dug underground to collect ground water). The big crypt had many divisions and its upper part contains number of rooms. It is believed that it was used as treasury [35].

Water distribution network was established within the palace. The main pipes were made of lead, while the secondary pipes were made of blue glass or pottery. Other palaces include Jawasaq khaqani palace (Figure 27) which is located on the east bank of the Tigris southern Dar Alama palace. This palace was very large and contains throne hall, many large T shape halls, family rooms, internal gardens, soalagan (polo) courtyard, and field race. Wage was the material used for the foundations and walls. Marbles were also used for the walls. The lower portions of all the walls were decorated using plaster coating [32; 36].

The total area of the Gypsum palace is (130000) m² (Figure 28) [6]. The palace inside is a square building (140*140) m, surrounded by external wall, its length about 370 m, supported with 100 towers. The towers at the corners had a diameter 3 m, while other towers were smaller in size and prismatic in shape (2*1.40 m). They were located at a distance of 80 cm from the wall. Inside the palace there is a big hall (15.40*15.40 m), the thickness of its walls 2.20 m, and its roof was a big dome.

![Figure 27: Planned of Jawasaq](image1)

![Figure 28: Planned of Gypsum Palace](image2)
The big hall is connected to four rectangular halls (16.60*6.60) m. The entrances to these halls were located in the middle of each rib of the square halls and they were 3.60 m wide. These halls are leading to rectangular open Ewan (7.80*6.20) m. The rectangular halls are connected to a rectangular open courtyard dimension (80.22*18.80) m, leading to rectangular corridor connected with palace entrance with two identical doors. The most important feature of this palace is the materials used. They were mixed plaster with stones (boulder) looking like concrete [6]. They also used extinguished lime and ash in foundations and the main walls of salons and halls. The offices were built with wage (25*25*7) cm, and plaster. The grounds of halls, Ewans, and salons furnished with square wage (36*36) cm. Other palace facilities furnished with sand mixed with plaster. Bath’s walls were coated with tar over plaster layer. The walls were having gypsum decorations and inscriptions were also coated with tar to prevent moisture effect in gypsum. The fence was built with liben [35].

Pre Islamic style of buildings (Hairi style) was used in building Blkuar palace (Figure 29). This includes one big main hall for the caliph with a big door and two side wings halls for caliph’s followers with smaller doors. This style became dominant in most materials used in its building large wage (called qiz) and plaster, [7, 18].Asheq (Figure 30) was another palace located on Ashaq River. It has dimension (131*96) m, and it was built with wage and plaster [7]. Al Mutawakkil caliph was order to build the main big mosque in Samarra in 825 AD and it was referred to as “Al Mutawakkil mosque” (Figures 31 and 32). It was rectangular in shape (444*376 m). They were supported by 40-44 towers built by wage and plaster. The corner towers were bigger with a base dimension of (5.45*5.25) m, and the small towers with base dimensions of (3.90*2.25) m. the foundation of the walls were from liben and wage and plasters was used to build the walls. The mosque itself was constructed in rectangular shape (240*185) m, composed of courtyard containing rounded large fountain built using single
piece of granite stone. The courtyard is surrounded by prayer house, and two washing places

![Figure 29: Blkuar Palace planned](image1) ![Figure 30: Photo of Al Asheq palace](image2)

on both sides and rear part. The walls were 2 m thick and 10 m height. There exist 25 galleries inside the mosque composed of 24 rows of columns. Each row 9 columns made of pink marble and columns base is (2.70*2.70) m. the base of the columns are composed of plaster and wage. They have octagonal shape at the base and then cylindrical shape with marble and plaster crown at the top having decorations. The walls of the mosque were coated by mirrors (glazed mosaics and gilding). The unique feature of this mosque is its minaret which is referred to as “Malwya” (Figures 31 and 32) [39, 35]. It was built on two square bases. The lower base dimension (31.80*31.80) m, which represent foundations. The upper (30.50*30.50) m was rising from ground surface 4.20 m, decorated with pointed arches and bends some of them covered the spiral stair go up to minaret. Minaret was rising 50 m from the base and spins counter clockwise five times to reach the top by 399 steps of spiral stair of width 2.5m. The area of minaret decreases upward starting from 2.5 m² until be 1.90 m². At
the top, the minerate is cylindrical shape with 6 m height. To reach top, a spiral stairs are used built inside the cylinder.

![Figure 31: plan Samara mosque with minaret [18]](image)

**Abu Dalaf** mosque is the second mosque in Samarra region having a spiral minerate. The minerate of this mosque is 19 m in height (Figure 33) [15]. It’s rectangular in shape (215.47*138.24 m). Its stairs spin three times counter clockwise. Its base is square (18.87*10.60) m and extends above the ground 2.70 m. It was built from wage and plaster. The mosque was rectangular (215.47*138.24) m. The mosque has internal courtyard surrounded by galleries from all sides. Each gallery was 13500 m² constructed by wage and plaster. The external wall was built by liben and coated from both sides with thick plaster layer, its height is 7 m, and its thickness is 1.80m. Semicircular towers were built supporting
the wall. The ones in the corner were relatively larger. They were built on square base (3.60 m the length of each side) and their lower part was 5.5 m height built using wage and the rest with liben. The remainders were built on semicircular base having diameter of 3.1 m. they used liben to build every pair of towers and the following tower was built using wage. Plaster was used in all the towers.

The houses in Samarra were more or less similar in their design (Figure 34) [6]. They have ground floor only with numbers of courtyards having F shape rooms. The houses also contain one or two crypt dug in rock layer. Holess resembling wells were constructed at the top to give light to the crypt. Stable military camp was also constructed in Samarra (Figure 35) [6]. It contains houses for the military leaders and barracks for soldiers surrounded by external long fence, the camp covers an area of 420 acres, [6].
**Ukhaydir fort** is located in western desert to the southern east on Karbala city (now a day) about 50 km, was built 778 AD (Figure 36 and 37) [39; 40 and 3]. It was serving as rest and defense place on the caravan route of trade from the Mediterranean and Damascus to Kufa, Baghdad, and Basra. It is rectangular in shape (112*82 m). It consists of palace, mosque, and independent houses surrounded by rectangular fence. The fort was protected by two walls. The external one was built with liben supported from outside by semi-circle towers. The wall dimensions were (635*311*540*610) m. The main gate was through the west rib. The internal Fence is of irregular dimension (175*169) m, in each corner there is a tower of diameter 5 m. In the middle of each rib a tower was built having an entrance. The overall number of towers is 48 built with limestone to a height of 17 m. An arch at the top of each tower was built which added another 2m to the height of the tower. The towers had defense corridor punctuated by fighting openings. The main palace building inside the fort was adjacent to its north side with three floors. It was supported by 26 round towers having a diameter of 1.2 m. There exists a roofed lobby (15.50*9) m for entering the palace. The living wing contains several parts, each part has small courtyard surrounded from both sides by reception Ewans. The ceiling was built as arches and domes. The materials used were wage and plaster, and its foundations were terrace high above the ground. The Palace was surrounded by several houses resembling warfare castles. Several fountains were built inside the palace. The engineers built an advanced water distribution system within the fort. The baths were built using bricks and hydrated lime.

**5 Mughal Eras (1258 – 1639) AD:**
In the beginning of this period there were no constructions. In 1259 AD, construction started. There was focusing on shrines, schools, palaces and mosques. The most famous schools were Khan Murjan, Ovauah, and Acoli mosque.
Khan Murjan (figures 38 and 39) [43; 17 and 42] was built on strong and solid foundations. It was of two floors building (33*31m) beautifully coordinated apart from the northern part which was trimmed. There were three entrances to the school consisted of three hollows. The small one 3m, the middle one 3.3m, and the large one 3.5m, and their height was the same as that of two floor building. After the entrance, there is a small rectangular corridor connected to wider one and then leading to a Ewan. The Ewan opens to a courtyard (17.90*17.90) m. In the middle of the southern rib exist a chapel (12.30*5.30) m. the ceiling of the chapel had three domes. The middle is the largest. The school had two floors. The lecture rooms were
located in the upper floors. There were four stairs located at each corner of the building. They were built using wage. Beside the main entrance, a cylindrical minaret was constructed for the nearby mosque. The building contains various motifs, inscriptions, embellishment, and gilding.

The Khan was located on the opposite of the school. It was luxury building with two entrances and number of windows. It was used as hotel and also for trade. It was a rectangular lobby (30.25*11.40) m, and its maximum height 14 m. All the 22 Khan rooms were surrounding the lobby. The first floor contains 23 rooms. Their openings is toward the outdoor balcony (height 6m). The rooms surrounded the courtyard.

6 Conclusions

The duration of the Islamic period in Iraq lasted 1002 years (637-1639 AD). This area had its unique features in building’s style and the materials used. The main engineering aspects in this context are:

- Available materials were used in the buildings. In the southern parts of Iraq, clay and plaster were the main building materials while limestones were used in the north. During this period there was development of the building material where bricks, grill wage, plaster, gypsum and marble and stones were used.

- The cities were pre-planned. They had the same main features (Governmental palace, mosques, gardens, schools, public baths and residential places). Ewan's, courtyards and inside gardens were introduced.

- The design of the buildings took the environmental conditions into consideration. The walls were thick and basements and badgur were established. This makes it easier to cool or heat the house. Tar was used to protect the buildings from moisture.

- New style of buildings was established using new engineering innovations. Well-designed arches and domes were noticed during this period.

- Islamic buildings had special features such as minarets, arches, domes, vaults, gilding, patterns and decorations.

Three types of foundations were noticed through this period. The first bakla (mud was used in this type), stripe foundations (brick and plaster or the big, or the big weight liben- al jafarei were used), and the terraces type foundation.
